N.W., by the coming into action of the 1st and 7th Italian armies on Nov. 2. That day the first army captured Monte Majo, attacked the Borcola Pass in the Posina sector, took Monte Cimone on the Tonzella Plateau, and made other gains; while the seventh army captured Col Santo, N. of Pasubio, forced the Vallarsa, E. of Lake Garda, and near the Swiss frontier broke the Austrian front on the Selle del Tonale, thereafter marching up the Vermiglio Valley. In the afternoon the Italians advanced on both sides of Lake Garda, and in the evening held Rovereto.

On Nov. 3 the British belonging to the sixth army occupied Levico, 9 m. S.E. of Trent, and the Italian cavalry entered Trent unopposed in the afternoon of Nov. 3.

During the Second Great War, Trent, because of its position on the Brenner rly. line, was the object of Allied air raids.

Trent, COUNCIL OF. General council of the R.C. church, held at Trent during 1545-63. Its origins have historical significance. A comprehensive definition of dogma and strong internal reforms were needed to enable the Roman church to show an undivided front against the growing strength of the Reformed doctrines. The popes generally had resisted appeals for general councils, e.g. that made by the university of Paris, 1518. In 1530 the Protestant estates demanded a "council of Christendom," and the emperor Charles V (q.v.) was strongly convinced of the necessity of reform. After various delays and postponements from 1537 a council was summoned to Trent by Pope Paul III, 1545. Over 200 fathers attended, and the sittings continued, broken partly by political developments, under Popes Julius III and Pius IV, into 1563.

Among the matters dealt with by the council (the Tridentine decrees), the most important were:

the joint value of Scripture and the tradition of the Church as standards of Divine revelation; the interpretative authority of the Church Fathers; original sin; the authority of the Vulgate, 1546; Divine origin and forms of the sacraments of baptism and confirmation, 1547; the Eucharist and penance, 1551; communion in both kinds and the sacrifice of the Mass, 1562; orders and the regulation of the hierarchy; the sacrament of matrimony; veneration of saints; indulgences; index of prohibited books, 1563. Pius IV confirmed its decrees in 1564.

The council of Trent was of great importance as guiding the R.C. church in what is often called the Counter-Reformation. The catechism of the council, summarising its decrees and definitions, was edited by Dominican scholars, and in 1564 the Roman Congregation of the Council was established to safeguard its decisions and facilitate their practice. *Consult Lectures* on the Council of Trent, J. A. Froude, 1896.

Trent, JESSE BOOT, 1st BARON (1850-1931). British businessman, born June 2, 1850. He opened a chemist's shop in Nottingham, where, forsaking old-fashioned methods, he started a chain of shops and, while selling drugs cheaply, made other goods, and established a large lending library and book-

Lord Trent

Trent found the money for the new buildings of University College (later Nottingham univ.), and gave large sums for other im-

provements. He died June 13, 1931, and was succeeded in the title and as chairman of the co. by his son, John Campbell Boot (b. Jan. 19, 1889).

Trent Affair. Incident in the American Civil War. Towards the close of 1861 two commissioners named Mason and Slidell, dispatched by the Confederacy, embarked at Havana in the British ship Trent, bound for England. The Trent was stopped on the high seas by a Federal man-of-war, and the two commissioners were taken prisoners. Popular sentiment in America approved of the action, but President Lincoln recognized that a breach of international law had been committed, and, in response to the British govt.'s formal demand, restored the prisoners to liberty, thereby averting the menace of war with Great Britain.

Trent Bridge. Locality in the city of Nottingham, England. The bridge over the river Trent leads S. from the city to the urban dist. of West Bridgford. Here is a cricket ground famous for international as well as county matches.

Trente et Quarante (Fr., thirty and forty). Game of chance, also known as Rouge et Noir (q.v.).

Trentino-Alto Adige. Region of Italy. Formerly part of the Austrian prov. of Tirol, it lies between Lake Garda and the Brenner Pass, and is divided into the provs. of Bolzano and Trento. Roughly triangular, it touches Switzerland and Lombardy on the W., Austria on the N., and Veneto on the S.E.

The area had belonged to the old republic of Venice, and before the First Great War Italian irredentism was strong in regard to it. In 1915 Austria offered to cede the south part, where most of the people were Italian-speaking, to her then ally Italy who, however, demanded much more—a demand rejected by Austria. Under the treaty of St. Germain-Laye, 1919, Austria was compelled to give Italy even more than she had asked for in 1915.

The area ceded was formed into the region of Venezia Tridentina, divided into the provs. of Alto Adige (Bolzano) and Trentino (Trento). Until 1924 the German-speaking inhabitants enjoyed liberal treatment. Then the fascist govt. subjected them to forcible Italianisation. Many of them remained, however, German in feeling, and after Hitler occupied Austria in 1938 the German and Italian govts. came in 1939 to an agreement under

which German-speaking inhabitants were allowed to choose German citizenship and move to the Reich. In Bolzano prov. 73 p.c., in Trento 53 p.c., of those eligible voted for migration. By the peace treaty of 1947 Italy undertook to give equal rights to German-speaking inhabitants of Venezia Tridentina; to place German on an equality with Italian; and to permit those whose German family names had been forcibly Italianised to resume their former names. The name of the region was changed to Trentino-Alto Adige in 1947. Area 5,252 sq. m. Pop. 670,000.

Trento. Prov. of Italy. It forms the southern part of the region of Trentino-Alto Adige. Mountainous and with many beautiful valleys, it is a favourite tourist area. It produces wine, silk, fruit, cattle, marble, timber, and hydro-electric power. Its capital, Trento, is described under its historic German name Trent.

Trenton. City of New Jersey, U.S.A., the state capital, and the co. seat of Mercer co. It stands on the Delaware river, at the head of tidal navigation, 34 m. N.E. of Philadelphia, and is served by rlys. and the Delaware and Raritan Canal. The falls at this point of the river supply water power for various industries, among which pottery is notable. Trenton is a leading centre of education and transport as well as manufacture. It was settled about 1680, incorporated as a borough 1745, made the state capital in 1790, and chartered as a city two years later. The commission form of government was adopted in 1911. During a strike in 1936 the state legislative chamber was occupied by malcontents. Washington surprised and captured a British force in the battle of Trenton at Christmas, 1776. Pop. 124,697.

Trenton. Town of Ontario, Canada. At the head of the Bay of Quinte, in Northumberland co., 100 m. E.N.E. of Toronto, it is reached by C.P.R. and C.N.R. Industries include the transformer stations of the hydro-electric commission of Ontario, sash and door factories, and lumber, woolen, cotton, and paper mills. There are iron, limestone, and marble in the vicinity. Pop. 8,323.

Trenton Beds. In geology, name given to one of the divisions of the Ordovician system in America. The rocks are chiefly limestones and black carbonaceous shales. They are frequently used as building stones.

Tresco, Scilly Is. The Valhalla, or hall of the spirits of the departed, containing figure-heads of wrecked ships and other relics

Trenton Falls. Village of New York, U.S.A., in Oneida co. It is a popular summer resort, 17 m. by rly. N. by E. of Utica, and is noted for five magnificent falls on the West Canada creek, with a descent of 300 ft. in 2 m. Power from these falls operates factory processes in Utica. Pop. 310.

Trent Valley Canal. Incomplete Canadian waterway. Its object is to connect Georgian Bay on Lake Huron with Lake Ontario, 200 m. apart. By utilising several rivers and lakes it was necessary to cut only about 15 m. of new canal, and the work was in progress in 1880, but was delayed by political disputes. The existing waterway, starting from Georgian Bay, follows the river Severn to Lake Simcoe, from which it passes by several small lakes beyond Peterborough to Rice Lake in the Trent valley, thence to Trenton and so into Lake Ontario. The term canal is a misnomer: only 33 m. of the total 240 m. is artificial waterway.

Trepang. Native name for sea cucumber or bêche de mer (*q.v.*).

Trepanning (Gr. *trypanon*, a boring instrument). Surgical operation. The improved kind of trepan, or trephine, is a cylindrical saw, used in cutting out a piece of bone from the skull. This operation is done to remove a bullet or a fragment of bone which may

Trepanning. Trepan or trephine used in this surgical operation

be pressing on the brain as a result of fracture of the skull, or to open an abscess in the brain, or remove a blood clot or tumour, or relieve pressure within the skull due to the growth of a tumour or some other disease. Very ancient skulls have been found with rounded perforations in them, which suggest that this operation was performed in early times.

Tresco. Second in size of the Scilly Isles. Considered by many visitors the most beautiful, it lies 1 m. N.W. of St. Mary's. It contains the ruins of a 10th century Benedictine abbey church. The residence of the proprietor of the Islands, Major Dorrien-Smith, is built on the site of the monastic buildings, and world-famous tropical gardens are maintained. At the N. end of Tresco stands the ruined Cromwell's castle, to the E. of which is Piper's Hole, a low cavern extending 600 ft. There are two fresh-water lakes. Pop. 191. See Scilly Isles.

Trespass. In English law, a wilful injury to the person or property of another. There are three kinds of trespass, viz. to land, to goods, and to the person. Trespass to land, called in the old books trespass *quare clausum fregit*, wherein the trespasser broke and entered the plaintiff's close, was in theory an act of violence: therefore the old pleaders always described it as having been committed *vi et armis*, by force and arms, even when the defendant had merely walked across a field. It is merely a tort, not a crime, except in a few special cases like trespass on rly. property. The plaintiff is entitled to recover the actual damage done by the defendant, and the court or jury may award exemplary damages in aggravated cases.

Trespass to goods is any wrongful touching of, or damage to, or taking of the plaintiff's goods. Damages may be awarded on the same principles as above. Trespass to the person is another name for assault. Damages in this case may be nominal; if not, they are generally exemplary, proportioned to the violence used, the injuries inflicted, and other circumstances.

Tressure. In heraldry, a thin border round a shield, but not touching the edges. It is really a diminutive of the border or orle (*q.v.*). See Heraldry colour plate.

Trestle. Vertical framing, formed by vertical and horizontal

members and diagonal bracing, which serves as a support, *e.g.* trestle piers of bridges. Trestles are sometimes of great height, *e.g.* the iron piers of the Loã bridge on the Antofagasta rly., one trestle of which is 300 ft. high from its base.

Trevelyan, GEORGE MACAULAY (b. 1876). British historian. Third son of Sir George Trevelyan (*v.i.*),

G. M. Trevelyan,
British historian

he was born Feb. 16, 1876, and educated at Harrow and Trinity College, Cambridge. Studies of England in the Age of Wycliffe, and England under the Stuarts, 1907, gave him reputation; then came the great trilogy, later issued in one volume, on the adventures of Garibaldi in 1848 and 1860, to produce which Trevelyan covered every yard of ground he wrote about in Sicily and Campania. He went back to Italy in command of the 1st British ambulance unit in 1915. Lives of Bright (1913) and Grey of Faldoon (1937), British History in the 19th Century (1922), and the 700-page History of England (1926) established him as an historian who, with the slightest bias in favour of the Whig and Liberal tradition, presents brightly and profoundly British constitutional development.

Trevelyan was made regius professor of modern history at Cambridge in 1927. The award of the O.M. in 1930 suggested that he was the acknowledged leader in his field. That year Blenheim came out, first of a trilogy on England under Queen Anne, to be followed by Ramillies and the Union with Scotland (1932); The Peace and the Protestant Succession (1934). In 1940 he was elected master of Trinity. English Social History proved in 1944 that scholarship could produce a best-seller. Autobiography and Other Essays appeared 1949. Chairmanship of the estates committee of the National Trust and presidency of the Youth Hostels association indicated other interests. Trevelyan became chancellor of Durham univ. 1950.

Trevelyan, SIR GEORGE OTTO (1838-1928). British politician and author. A nephew of Lord Macaulay, he was born at Rothley Temple, Leics, July 20, 1838, and educated at Harrow and Trinity College, Cambridge. He entered parliament in 1865 as Liberal M.P. for Tynemouth, afterwards

Sir George Trevelyan,
British politician

representing the Hawick Burghs, 1868-86, and a Glasgow division, 1886-97. Trevelyan began his official career as civil lord of the Admiralty in 1868, but resigned from that post in 1870, and soon became known as an advanced Radical. Secretary to the Admiralty in 1880, in 1882 he succeeded Lord Frederick Cavendish as chief secretary for Ireland. During 1884-85 he was chancellor of the duchy. In 1886 he succeeded to the baronetcy, and was secretary for Scotland during 1892-95. In 1897 he resigned his seat in parliament.

Long known as a scholar and a wit—a reputation enhanced by his humorous skit *The Ladies in Parliament*, published in 1867—Trevelyan's reputation as a writer rests on his excellent *Life and Letters of Lord Macaulay*, 1876. His *Early History of Charles James Fox*, 1880, shows an intimate knowledge of the great Whig and his times, but in *A History of the American Revolution*, 1909, he is perhaps on less sure ground. He died Aug. 17, 1928. A memoir by his son, G. M. Trevelyan (*v.s.*) appeared in 1932. His eldest son, Charles Philips (b. Oct. 28, 1870), was Liberal M.P. for Elland, 1899-1918, and Labour M.P. for Central Newcastle, 1922-31, being president of the board of Education in 1924 and during 1929-31. Another son, Robert Calverley (b. 1872), was a poet and translator of Greek and Latin verse.

Trevelyan, HILDA (b. 1879). British actress.

Born Feb. 4, 1879, her real name being Tucker, she was educated at the Ursuline convent, Upton, first appeared on the stage in 1889, and started on tour in 1894. Her first London appearance was in 1898. She took the part of Wendy in *Peter Pan* 1904, and in several revivals, and also

Hilda Trevelyan as
Wendy in *Peter Pan*

acted in Barrie's *The Little Minister*, *Little Mary*, *Alice-Sit-by-the-Fire*, *The Admirable Crichton*, *A Kiss for Cinderella*, and *Mary Rose*. She also scored a success in *Housemaster* by Ian Hay, 1936. She married Sydney Blow, author of *Lord Richard in the Pantry*, and other successful light comedies.

Trèves. French name of the German city of Trier (*q.v.*).

Treves, SIR FREDERICK (1853-1923). British surgeon. He was born at Dorchester, Feb. 15, 1853, and educated at Merchant Taylors'; was Hunterian professor of anatomy and Wilson professor of pathology at the Royal College of Surgeons, 1881-86, and examiner in surgery at Cambridge, 1881-96. During the S. African War, as consulting surgeon to the army, he served with the Ladysmith relief column. In 1902 he operated upon Edward VII and was made a baronet. A prolific writer, Treves published books of travel, including *Highways and Byways in Dorset*, 1906, and *The Country of the Ring and the Book*, 1913; war experiences and works on his own subject, *e.g.* *Surgical Applied Anatomy*, 1883; *System of Surgery*, 1895. He died Dec. 7, 1923.

Trevesa. British merchant ship which in June, 1923, sank suddenly in the Indian Ocean about halfway between Africa and Australia. The crew took to two open boats, one under the captain, Cecil Foster, the other under First Officer J. S. Smith. Despite severe suffering from exposure and limited supplies, these officers navigated the two boats safely to land, with the aid of compass and sextant only, the first reaching Rodriguez (1,556 m.) in 23 days, the second arriving at Mauritius (1,747 m.) in 25 days. Of 44 men in the boats, 11 died. Foster and Smith received a special presentation from the board of trade for their fine seamanship and resolution.

Trevethin, ALFRED TRISTRAM LAWRENCE, 1ST BARON (1843-1936). British judge. Born at Pontypool, Nov. 24, 1843, he was educated at Trinity College, Cambridge, and called to the bar in 1869, building up a large and varied practice. Junior counsel to the Admiralty, 1882, he became in 1885 recorder of Windsor, an office he held until his elevation to the bench in 1904, when he was knighted. He succeeded Reading as lord chief justice in 1921 and was made a baron, but resigned next year. He died Aug. 3, 1936, and was succeeded in the peerage by his son Charles (b. 1879).

Treviso (anc. Tarvisium). City of N.E. Italy, capital of the prov. of Treviso. It is a rly. junction 18 m. N. by W. of Venice at the confluence of the Sile and Botteniga. The cathedral of San Pietro, ornamented with five cupolas, was founded in 1141 and rebuilt in the 15th century; some of its frescoes by Titian and Paris Bordone, a native of the city, were damaged by bombs in the Second Great War. Other churches and medieval houses suffered more or less severely. The Borgo Cavour contains a large library and a picture gallery. Silks, woollens, metal goods, and machinery, chemicals, and paper are the principal manufactures. Treviso was an important city at the end of the Roman Empire, a member of the Lombard League, and subject to Venice in the 14th century. In the First Great War it was a base of the Italian army. Pop. 53,886.

Trevithick, RICHARD (1771–1833). British engineer and inventor of steam engines. Born at Illogan, Cornwall, April 13, 1771, he was trained as a mining engineer to assist his father. He made a study of the steam engine and quickly began to improve its method of working. In 1800 he invent-

Richard Trevithick,
British engineer

ed a double-acting high-pressure engine, which came into wide use in the mining districts.

On Christmas Eve, 1801, a steam road carriage invented by Trevithick achieved the first passenger journey ever made by steam in England. His vehicles were seen in London in 1803, and next year he opened a steam railway for haulage at a mine in S. Wales. His fame was established in 1808, when he started a miniature public railway on a circular track at Euston Square, London. Trevithick applied steam to machines which he invented for boring and dredging; and amid general ridicule upheld the use of iron for boats and buoys. In 1812 he produced a steam threshing machine.

Invited to Peru to improve the engines used in the mines, he left England in 1816, and after six laborious and thankless years moved to Costa Rica, having lost all he possessed in the Peruvian war of independence. He came back to England in 1827, but his name had been forgotten; he was

refused a pension by parliament, and, though given employment by Robert Stephenson, he died in poverty at Dartford, April 22, 1833.

Trevithick remains a standing example of unappreciated genius. A brilliant mathematician and mechanic, but lacking the social graces, he surpassed Watt and anticipated Stephenson. It may be that he lacked application, trying to lay too many foundations. Of gigantic stature and strength, he was celebrated in Cornwall for wrestling. His life was written by his son, Francis, 1872; he is noticed in *Lives of the Engineers*, S. Smiles, new ed. 1904; consult also a study by H. W. Dickinson and A. Titley, 1934.

Triad (Gr. *trias*, group of three). Association of three kindred or correlated deities. In ancient Egypt, cycles of this type usually arose out of the association with the chief local god of other deities; in some instances the members were deemed to stand in the relationship of father, mother, and child. Such were the Theban triad of Amen, Mut, and Khons; the Memphite of Ptah, Sekhet, and Nefertum; and the Osiris-Isis-Horus triad which, in its Alexandrian form, comprised Serapis, Isis, and Harpocrates.

In Babylonia triads were derived from early conceptions of a cosmic trinity, such as Anu, Enlil, and Ea, representing sky, earth, and water; and Sin, Shamash, and Ishtar, representing moon, sun, and star. Early Aryan thought moved in the same direction in the Vedic triad of Agni, Indra, and Surya, representing fire, wind, and sun. Out of this emerged the Brahman Trimurti, or three aspects, portrayed as a three-headed image in a famous sculpture at Elephanta, and comprising Brahma the creator, Vishnu the preserver, and Siva the destroyer.

Buddhism adopted the principle in the Triratna, or three jewels, which were at first the Sangha or monastic order, portrayed as a man holding a lotus, the Buddha, and the Dharma or sacred law.

The Triad Society of China, denoting the union of heaven, earth, and man, arose in the 18th cent., becoming a powerful anti-dynastic movement. See Cave Temple.

Triad. In literature, a statement illustrated by three examples. Medieval Irish and Welsh collections exist, some being of historic interest; and there are good examples in Prov. 30. In music, the triad is the commonest chord, made up of tonic, third, and dominant, e.g. C. E. G., in key C.

Trial. In law, the examination of a cause, or a prisoner, before a judge, with or without a jury. The judge has jurisdiction to try the case according to the law of the land.

At common law in England trial by judge and jury is the normal method. The case is called on, and then the jury is empanelled; the parties, or the crown counsel, or the prisoner has the right to challenge anyone objected to for proper reasons. The counsel for the prosecution, or for the plaintiff, opens the case in a speech that is supposed to tell the jury what it is all about and what he proposes to prove. He then calls his witnesses. He examines the first witness, i.e. asks him questions in order to elicit the facts. The witness is cross-examined by the opposing counsel, who tries to elicit facts in favour of his client, and to show that the witness is unreliable. After cross-examination the prosecuting, or plaintiff's, counsel re-examines. He can ask questions only on points raised by the defendant's cross-examination.

After all the witnesses on this side have been called, the defending counsel opens his case and calls his witnesses, who are examined, cross-examined, and re-examined. Then the defending counsel sums up in a speech, and after that the prosecuting, or plaintiff's, counsel replies on the whole case. If the defending counsel has put in no other evidence than that of the accused, he is normally entitled to make the closing speech. The judge sums up. He ought to tell the jury what issues to direct their minds to, to call their attention to the evidence on all these issues; and he may or may not, in his discretion, express an opinion on any of the evidence given. After the summing-up the jury give their verdict, and then the judge gives judgement on their findings. Questions of fact are for the jury to decide, and questions of law are for the judge alone.

In civil cases trial may in general also be by jury, although cases are more frequently tried by a judge alone. In the king's bench division there is a right to trial by jury in cases of fraud or libel unless the judge considers the case unsuitable. In the probate and divorce division trials are occasionally by a jury; but in chancery they are almost without exception by a judge alone. So are most actions in the county court. Alternative methods of trial are by a judge with assessors—e.g. in Admiralty actions—or by an official referee. See Auto-da-fé; Evidence; Ordeal.

Trial by Battle. Ancient form of trial. In it the parties in a civil case or appeal of felony could decide the action by personal combat. In the first case men were usually hired to fight the duel, but in cases of felony or murder accuser and accused fought personally until one was slain. If the accused gave in, he was put to death; if he killed his opponent or the fight lasted from sunrise to sunset, he was acquitted. Introduced into England by the Normans, trial by battle, abolished 1818, was last waged in the court of common pleas, Westminster, 1571; in the court of chivalry, 1631; and in the court of Durham, 1639. *See* Ordeal.

Trial by Jury. Operetta by Gilbert and Sullivan. Produced March 25, 1875, at the Royalty Theatre, London, it ran for 128 performances, and was one of the early pieces in which they collaborated. It presented a burlesque trial for breach of promise, culminating in the proposal of the judge to marry the plaintiff.

Triangle (Lat. *tres*, three; *angulus*, angle). Plane figure bounded by three straight lines or sides. Any of the angles formed by the sides may be regarded as the vertex; the side opposite it is then called the base. The height or altitude of a triangle is the length of the perpendicular drawn from a vertex to the base or the base produced. An equilateral triangle has three equal sides, and hence three equal angles (each 60°); an isosceles triangle has two equal sides, the angles opposite to them being equal; in a scalene triangle, all sides are unequal. An acute-angled triangle has each angle less than 90° ; a right-angled triangle has one angle 90° ; an obtuse-angled triangle has one angle greater than 90° . The area of a triangle is half the base multiplied by the height. In a right-angled triangle the side opposite the right angle is called the hypotenuse, and the square on it is equal to the sum of the squares on the other two sides (Pythagoras's theorem). Similar triangles are those with the same shape; congruent triangles, those with identical shape and size.

A spherical triangle is a portion of the surface of a sphere bounded by three arcs of great circles. Its properties differ in many ways from those of plane triangles. The triangle of forces is a conception of mechanics: if three forces acting at a point can be represented in magnitude and direction by the sides of a triangle taken in order,

the forces will be in equilibrium. Triangulation is a process used by surveyors for accurate mapping of areas. *See* Geometry; Surveying; Trigonometry.

Triangle. In music, a percussion instrument. It is a steel rod bent into triangular shape, with one open angle.

Triangle used in bands and orchestras

Suspended by a cord, it is struck by another small steel rod of spindle form so as to allow of heavier or lighter strokes, as desired. Possessing a bright and silvery tone, it is useful for rhythmical effects, and is in general use in military bands.

Triangulum. In astronomy, small, inconspicuous constellation between Perseus and Andromeda. Its brightest star is of the third magnitude, and it contains a number of double and variable stars and the nebula Messier 33.

Triangulum Australe. In astronomy, southern constellation placed by Bayer on the edge of the Milky Way. Its three principal stars make a diamond with Alpha Centauri. Its brightest star is of the second magnitude, and the constellation contains short-period variable and double stars.

Trianon. Buildings in the park of the palace of Versailles (*q.v.*). The Grand Trianon is a long, single-storey building built by Hardouin-Mansart on the site of a smaller pleasure-house erected in 1662. It was built in 1687, and a wing was added in 1703. It contains interesting pictures, chiefly of the French 18th century schools. The Petit Trianon lies a little to the E. Originally built, 1762-68, by Louis XV, for Madame Dubarry, it was presented by Louis XVI in 1774 to Marie Antoinette, who here established a miniature country village and farm. At the Grand Trianon on June 4, 1920, the treaty between Hungary and the Allies was signed.

Triassic. In geology, a system of rocks laid down after the Permian and before the Jurassic, i.e. between 150 and 200 million years old. The name was derived from the fact that in Europe the rocks of the system could be divided into three main groups: the Bunter, Muschelkalk, and Keuper, in ascending order. In Great Britain the Muschelkalk is not represented. Triassic sedi-

ments are characteristically red, and were formed under desert conditions, continuing those which began in the Permian period. In England they are found in Cumberland, surrounding the N. edge of the Lake District; in W. and S. Lancs, and thence into the Midlands. In Yorkshire they lie E. of the Pennines and join with the Lancashire beds to form the great undulating plain of the Midlands. Further deposits occur in Glos, the Mendips, and on to the S. coast. The Bunter beds are made up of sandstone and pebbles. The Muschelkalk in Germany is of marine origin, and contains limestones and dolomites. Above it lies the Keuper, which in Great Britain consists of a lower sandstone overlain by red or red and green mottled marls. The rocks carry gypsum and rock salt in important quantities in Cheshire. Some of the sandstones have been used for building, e.g. Hereford cathedral; and at Mansfield Bunter sands are dug for moulding. Many sandy horizons in the Triassic are water-bearing, and the system forms an important source of underground water.

During the Triassic period cycads, conifers, and gigantic equisetums flourished, amphibian labyrinthodonts were common, and ichthyosaurs, dinosaurs, crocodiles, and plesiosaurs among reptiles were numerous. The earliest mammal remains come from rocks of this period.

Tribe. Social group having a common speech, cultural level, and body of customs, occupying a circumscribed food-producing area, and claiming a common ancestry. As thus used in ethnology the term denotes the simplest social political unit, based on endogamy, marriage outside the tribe being discouraged, but often comprising two or more exogamous phratries or clans.

Government is effected by means of tribal or customary law, maintained either by public opinion expressed through the elders, or by headship, elective or hereditary. Among the Australian aborigines, whose physical environment offered no incentive to the development of warfare, tribal cohesion was maintained by the initiation ceremonies and other periodic gatherings. In aboriginal America the tribal organization passed through every stage, from the simplest (Fuegians) to such complex unions as the Iroquois confederacy. Negro and Bantu Africa are essentially tribal. No-

madism usually leads to tribal autocracy. See Ethnology; Race; Society.

Tribromethanol. Substance originally introduced into medicine as a surgical anaesthetic to be administered by rectal injection. Now mainly used as a basal narcotic. See Anaesthesia; Bromethol.

Tribunal. Literally, the place in Rome where the tribunes sat to discharge their official duties. It has therefore come to mean any place where judges and others sit to administer justice. During both Great Wars the name was given to the bodies set up to hear claims for exemption from military service. Another phrase of wide currency was international tribunal, in connexion with the trials of war criminals in 1945-46.

Tribunal of Inquiry. Body which can be set up under the Tribunals of Inquiry (Evidence) Act, 1921. Such a tribunal was intended to inquire into a matter of urgent public importance on the passage of a resolution by both houses of parliament. It can compel witnesses to attend and give evidence on oath, and insist on the production of documents. Possible divulgence of information about the budget, 1936, was inquired into by such a tribunal, as were allegations in 1948 of irregularities at the board of trade.

Tribune (Lat. *tribunus*). Title of various military and civil officers of ancient Rome. Military tribunes were originally commanders of the tribes. Six were appointed for each legion, being all elected from 207 B.C. by vote of the people. When more than two armies took the field, those which were not commanded by consuls were placed under military tribunes with consular power. Tribunes of the treasury (*tribuni aerarii*) were paymasters of the army.

More important were the tribunes of the people or plebs. When Rome established the republic in 509 B.C., the plebeians shared in the *comitia centuriata*, or national assembly, but the magistracies, the high offices of state, were confined to the patricians. In 494 the plebeians obtained the right to appoint from among themselves two tribunes authorised to intervene for the protection of plebeians against arbitrary action on the part of the magistrates. The numbers were raised to five and then in 457 to ten. In 287 the exclusively plebeian assembly, the *comitia tributa*, became an independent legislative body, while

the tribunes individually had the power of initiating legislation, of imposing a veto upon the enactment of proposed laws, and of prohibiting administrative acts on the part of the magistrates.

The latent powers of the tribunate were suddenly developed when Tiberius Gracchus was elected tribune in 133. Hitherto democratic legislation had been held in check because the senate could always count on procuring one tribune willing to impose his veto upon obnoxious proposals. But Gracchus formally deposed an antagonistic tribune by the vote of the *comitia tributa*. Sulla's legislation in 81 temporarily deprived the tribunate of some of its powers, which were again partially restored in 75 and 70. See Augustus.

Tribune, THE. Former London daily Liberal newspaper. It was founded by Franklin Thomasson, Jan. 15, 1906, a paper of 16 seven-column pages, with William Hill as managing editor and L. T. Hobhouse as assistant editor. It ceased to appear, Feb. 7, 1908, having involved a loss of £200,000. Its brief but interesting career is understood to have inspired Sir Philip Gibbs's novel, *The Street of Adventure*, 1909. Another Tribune, a left-wing weekly, was founded in 1937 by Sir Stafford Cripps, Aneurin Bevan, G. R. Strauss, and Ellen Wilkinson.

Triceratops (Gr. *treis*, three; *keras*, horn; *ops*, face). Fossil horned dinosaur. One of the most remarkable of the giant fossil reptiles, the triceratops flourished in the Cretaceous epoch, and skeletons have been found in deposits of that period in N. America. It had a skull over six ft. in length, and the total length of the animal was 25 ft. It had three horns, a small one on the nose, and two just above the eye-sockets. Triceratops was herbivorous, and in proportion to its size had the smallest brain of any other vertebrate of the time. Its heavily built legs were supported on three large toes. See Dinosaur.

Trichiasis. Turning inwards of the eyelashes, which thus cause irritation to the cornea. Treatment consists in destroying the ingrowing eyelashes by electrolysis where they are few in number, or in more serious cases operation upon the eyelid to turn the eyelashes in their proper direction. See Eye.

Trichina. Genus of Nematoda or threadworms. *Trichina spiralis* is one of the most dangerous

parasites in man and other animals. It is less than a sixth of an inch long, and some millions may be present in one host, in which case they give rise to the disease known as trichiniasis. The eggs are hatched out in the intestines of the host, and the trichinae then migrate to the muscles, where they become encysted and develop no further unless the flesh of the host is eaten by some other animal. They are then set free in the alimentary canal, where they become sexually mature. The natural host of this parasite is the rat, but it is often found in pigs. See Cestodes.

Trichinopoly. Dist. and city of Madras state, India, lying mainly N. of the Cauvery. Here

Trichinopoly, India. One of the great temples for which the town, a pilgrimage centre, is famed

the ancient system of irrigation was used by engineers of the E. India co. as the basis of the first irrigation canals in India. Rice, millet, oilseeds, and tobacco are the chief crops, and Trichinopoly has given its name to a form of cheroot. The district came into British possession when the Carnatic was taken in 1801. The city, properly called Tirusirapalli (city of the three-headed demon), is famous for its three rocks, and for temples which make it a great place of pilgrimage. It is also the h.q. of Christian missionary effort. Bishop Heber is buried in S. John's church, and the missionary college is called after him. Christ Church was the first English place of

worship founded in India (1765), and there is also an R.C. cathedral. S. Joseph's College, founded by the Jesuits in 1844, was transferred from Negatapatam to Trichinopoly in 1883, and is part of Madras university. Area, dist., 4,329 sq. m. Pop., dist., 2,244,543; city, 159,566.

Trick (Old Fr. *trichier*, to beguile). Primarily, a fraud or deceit; by extension, a contrivance intended to puzzle and amuse people. In card games a unit of cards, e.g. four in bridge and whist, won by a player is known as a trick. (See Bridge; Puzzle; Three-card Trick: Whist.)

In heraldry, a trick is a coat of arms roughly drawn with figures and letters to denote numbers and colours. This is said to be trick or "tricked" and is a method adopted by heralds, heraldic painters, and students for purposes of record.

Tricolor. Term generally applied to the blue, white, and red national flag of France. It originated in the early days of the 1789 Revolution, and was a blending of the colours of the national guard of Paris, who bore cockades of the city colours, red and blue, and of the royalist troops, who bore white cockades. These were grouped in a flag of three perpendicular stripes of equal width, the white being placed between the blue (against the pole) and the red. Though for a time eclipsed by the red ensign of the Commune, it was finally adopted as the national flag, and, under Napoleon, led the republican and then the imperial troops to victory. Louis XVIII and Charles X replaced it by the Bourbon white flag with its three golden fleurs-de-lis, but with Louis Philippe the tricolor came back, and has never since been abandoned. For other tricolors adopted by nations, see Flag colour plate.

Tricuspid Valve. Valve between the right auricle and right ventricle. See Heart.

Tricycle. Vehicle having three wheels. It originated as a pedal-propelled cycle and was introduced in 1878. Most pedal tricycles are steered directly by one

wheel in front, though some have two steering wheels in front and a single pedalled wheel behind. The pedal variety is seldom used except when fitted with a box body for delivery of goods, or equipped as an invalid chair, in which form it is driven by cranks operated by hand-levers.

Tricycle motor cars normally have two steerable wheels in front, and one at the rear, but transmission from the engine may be to either the front or rear. Some aircraft have tricycle undercarriages, the third wheel being fitted to the nose instead of below the tail. The advantage of this is that when on the ground the fuselage is horizontal, instead of sloping to the rear.

Trident. In Greek mythology, the three-pronged spear which Poseidon (the Roman Neptune), god of the sea, bore as the symbol of his sovereignty. It has come to be generally regarded as the emblem of sea power, and as such is carried by Britannia (*q.v.*).

In gladiatorial combats in ancient Rome, the trident was used by the class of gladiators called *retiarii*. These fought with a net, with which they endeavoured to entangle their opponent, the trident being used to dispatch him after he had been so entangled. See Neptune.

Tridymite (Gr. *tridymos*, three-fold). A form of the mineral silicon dioxide. Stable between 870° and 147° C. at atmospheric pressures, it differs from the usual form of quartz in having a lower specific gravity and in its atomic structure and crystalline form. The mineral is found chiefly in acidic volcanic rocks.

Triennial Act. There have been in English history two Acts bearing this name, both dealing with the duration of parliament. In 1641 the Long Parliament passed an Act declaring that more than three years must not elapse without the houses being called. The second Triennial Act, passed in 1694, fulfilled a very different purpose, ordaining that no parliament should last longer than three years. The second Act was virtually repealed by the Septennial Act of 1716.

Trier, Germany. Cathedral of SS. Peter and Helena, which was laid in ruins during the Second Great War

Trier (Fr. *Trèves*). City of the Rhineland. One of the oldest and, once, most important towns of Europe, it lies on the right bank of the Moselle, 65 m. S.W. of Coblenz. Built 15 A.D. by Augustus as Augusta Treverorum at the sanctuary of the Celto-Germanic Treveri tribe, Trier (*Trèves*) became the capital of Belgica I, c. 250, of all Gaul towards 300, holding that rank until 414. Its bishopric, allegedly dating from the first cent., was promoted to an archbishopric by Charlemagne, 811. The period of its greatest power was the 13th cent., when its archbishops, ruling over about 3,300 sq. m., were second in rank among the German Electors, a sovereign rank they held until 1803. French until 1814, most of the electorate then fell to Prussia. Trier was occupied by first U.S., then French, forces, Dec. 1, 1918, to June 30, 1930.

During the Second Great War, Trier was captured March 2, 1945, by Gen. Patton's 3rd U.S. army after ineffective resistance by the *Volkssturm* (*q.v.*) of the city, the German army having retreated eastward. The city was found two-thirds destroyed. The Roman amphitheatre and baths were badly damaged. The cathedral, oldest in Germany, was in ruins: in Romance style, and dating back to the 4th cent., with reconstructions and additions of the 6th, 11th, and later cents., it had some fine old sculpture and sheltered the Holy Coat (*q.v.*) and many other relics. The churches of S. Matthew (12th cent.), S. Gangolphus (15th), S. Paulinus (1734), and S. Gervasius (1765-68); the Holy Cross chapel (1050); the electoral palace (1756-61) incorporating parts of a 4th cent. building; the rich town library (17th cent.) were others of Trier's beautiful buildings. Trier's industries included iron foundries,

Tricycle. Modern form of a machine first introduced about 1878

tobacco, leather, and glass manufactures; it was a centre of the wine trade. Pop. (1935) 76,692. After the surrender of Germany in 1945 Trieste came within the French zone of occupation.

Trieste. Seaport on the Adriatic, at the head of a gulf of the same name. Picturesquely situated around a

Trieste arms

320-ft. hill crowned by an old castle and bearing the cathedral of S. Giusto (11th to 14th cents.) built upon the remains of a Roman temple, the old city consists of narrow, winding, colourful streets; the new, round the harbour, of avenues with palatial buildings, town hall, shipping offices, etc. The Grand Canal runs from the old harbour to the (modern) Greek church of S. Antonio; other buildings, especially churches of several oriental rites, emphasise the cosmopolitan nature of this ancient and important trading city, e.g., the Jesuit church S. Maria Maggiore (1627-82) and the Orthodox church of S. Nicolo (1786). The Carciotti palace (1800) is a fine building. There is a university specialising in economics, and high schools of shipping and navigation, of pedagogy and music, theatres, libraries, and museums.

Remnants of Trieste's Roman past are preserved; the Arch of Ricardo, near the public gardens, dates back to 200. Shipbuilding, oil- and soap-making, jute, pot-

tery, and liquor factories, engineering, and stone industries flourished in the past, but international trading and shipping were the backbone of Trieste's economic life for many centuries. Some of Italy's principal shipping lines had their h.q. in Trieste between the two Great Wars—e.g. Lloyd Triestino, Cosulich, Navigazione Libera Triestina. The port, originally with 6 jetties, was expanded after 1867 to take the biggest vessels. In 1938 imports reached 930,914 tons in 3,165 ships; exports 654,189 tons in 3,159 ships; in 1946 imports were 1,447,773 tons in 1,302 ships, exports 45,109 tons in 1,290 ships.

HISTORY. Trieste existed in pre-Christian days as Artemidorus. Under Augustus it was called Tergeste, became a Roman colony and gained moderate importance, as shown by architectural and other remains. It came under the rule of bishops at the beginning of the 10th cent., but was made a republic at the end of the 13th; unable to compete with Venice, it accepted Duke Leopold III of Austria's rule in 1382, and soon became a trading and shipping centre for the Hapsburg dominions. Made a free port by the Emperor Charles VI in 1719, except for its occupation by Napoleon, 1809-14, it remained Austria-Hungary's chief outlet to the sea until 1918. It was made a free city of the empire 1849, a *Land* of the Austrian crown 1867. The free port was abolished 1891.

After the unification of Italy a strong irredentist movement developed in Trieste, to secure which became one of the chief aims of Italy during the First Great War;

the Isonzo (*g.v.*) battles were directed towards that goal.

Occupied by Allied forces Oct. 31, 1918, Trieste fell to Italy by the St. Germain treaty (*g.v.*), 1919. The composition of its pop. justified that transfer: the Austrian census of 1910 showed it to consist then of 95,583 of Italian speech; 21,672 of Slav speech; 9,255 of German speech. But Yugoslavia

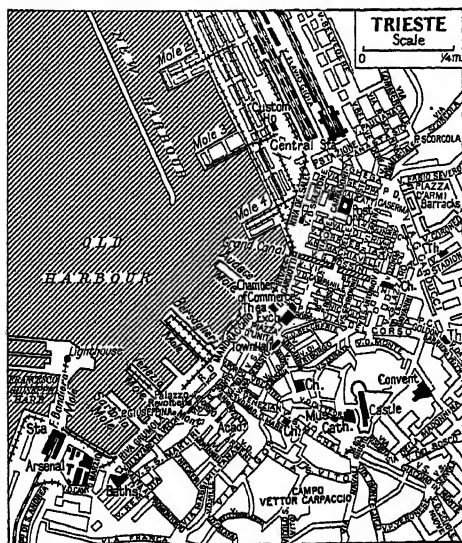

had claimed, and continued to covet, this great port. The Germans in Trieste during the Second Great War surrendered to Lt.-Gen. Freyberg on May 2, 1945. When New Zealand troops entered the city next day, however, they found already in it, besides Italian guerrillas, Yugoslav forces, both Tito's and Chetnik bands, who had occupied positions previously evacuated by the Germans; and Yugoslavia claimed the city by right of conquest. After discus-

sions between British and U.S. representatives and the delegates of Marshal Tito in Belgrade and Washington, an agreement for the temporary military administration of Istria was reached under which Trieste, with the rlys. (some 84 m.) and roads connecting it with Austria, came under the supreme Allied command; a force of regular Yugoslav troops was to be allotted a district of occupation by the supreme commander; Yugoslav forces in the area to come under Allied military govt. were to be withdrawn by 8 a.m. on June 12. This was effected without incident. The city escaped war damage.

Under the peace treaty with Italy, 1947, Trieste with a stretch of country behind it from Duino on the N. to Cittanuova on the S., measuring in all c. 320 sq. m., was to be constituted a demilitarised free territory under a governor to be appointed by the United Nations. Failure of the U.N. to agree on the choice of a governor led the U.S.A., the U.K., and France to propose to Russia, March 20, 1948, that Trieste should be returned to Italian sovereignty. This proposal was rejected by Russia, and military occupation by 5,000 British, 5,000 U.S., and 5,000 Yugoslav troops continued, the Yugoslav zone being virtually incorporated

Trieste. The broken line shows 1939 frontiers; the area within the unbroken line it was proposed in 1947 to place under U.N. administration

Trieste. Plan of the Adriatic seaport

Trieste. 1. The Corso, principal thoroughfare, which runs between the old and new towns. 2. The quay. 3. The Grand Canal and the church of S. Antonio. 4. Air view of the port

in Yugoslavia. Pop. of the city in 1947 was 270,012, of whom more than 200,000 were Italian speaking; pop. of the Anglo-U.S. zone of the free territory, 300,000.

Triforium. In ecclesiastical architecture, an upper storey over the aisle of a cathedral or large church with a series of openings into the nave immediately above the crowns of the nave arcade. These openings were arcaded, and in Norman and E.E. work were of considerable height. In the Christian basilica the triforium accommodated women. Noteworthy examples in English ecclesiastical buildings are at

Westminster abbey and Peterborough cathedral. *See* Architecture; Blind Storey; Cathedral.

Trigeminal Nerve. Fifth of the cranial nerves which spring from the brain. The roots of the nerve pass into an enlargement, the Gasserian ganglion, from which three main branches of the nerve are given off: (1) the ophthalmic nerve; (2) the superior maxillary nerve; (3) the inferior maxillary nerve. The first two divisions of the trigeminal nerve are purely sensory; the third is partially sensory and partially motor.

Tic douloureux or neuralgia of the trigeminal nerve is a very

severe form of neuralgia, probably due to an affection of the Gasserian ganglion. The condition generally begins after middle life, with sudden paroxysms of violent pain which may last a few seconds or a minute. The muscles of the face become contracted and the pain is intense. The paroxysms may follow each other for a few hours, and then

remission may occur for days or even months. Gradually the periods of remission become shorter, and the patient may never be entirely free from pain. Treatment consists at first in building up the general bodily health and removing all causes of reflex irritation, such as carious teeth. Aspirin or morphia may be given to relieve the pain when the attacks occur. Applications of chloroform liniment, camphor, or menthol may be helpful, but the only cure may be to cut the trigeminal nerve or destroy the Gasserian ganglion. *See* Nerve.

Trigger. Device on a firearm or on an artillery piece of 20-mm. calibre to release the firing-pin to strike the cartridge and so detonate the propellant charge of the missile. In revolvers, rifles, and automatic weapons of .303 calibre, the trigger is a lever placed beneath the lock and protected by a curved piece of metal. Pressure on the trigger by the forefinger actuates a lever (the sear), disengaging it from the bent of the firing-pin and allowing the latter to spring forward. In single-shot weapons the trigger must be

Triforium above the north transept of Westminster Abbey, a fine example of Gothic tracery

squeezed for each shot fired; in automatics a continued single pressure on the trigger will discharge every round in the magazine. On hammer-fired pistols and shot-guns the trigger is in direct contact with the hammer when the piece is cocked, and pressure on the trigger drives the hammer forward against the cartridge. In artillery pieces the trigger generally takes the form of a grip lever which, when squeezed by the hand, operates a cable, which disengages the sear and bent on the lock. *See Rifle.*

Triglyph (Gr. *treis*, three; *glyphē*, carving). In classic architecture, an ornament of the Doric frieze, consisting of a block grooved into three vertical sections and chamfered on the outside edges. One is placed over each column and, in the simple form, one between the columns. *See Doric Order; Frieze; Greek Art and Architecture.*

Trigon. Ancient triangular harp. Probably of Assyrian origin, it was adopted by the Egyptians, who frequently represented it in their mural paintings. The wooden frame often had only two sides, the third being formed by the longest string. The instrument was placed under the arm or upon the shoulder when played. It was in use as late as the days of Pompeii. *See Harp.*

Trigonometry (Gr. *trigōnon*, triangle; *metron*, measure). Branch of mathematics concerned with the measurement of plane and spherical triangles.

From this are evolved the calculations of their angles and areas, together with other qualities related to these. Any plane triangle can be divided into right-angled triangles; and the ratios between the sides of right-angled triangles depend only on the acute angles of such triangles. Ultimately, therefore, trigonometry is resolved into the measurement, tabulation, and classification of these functions of the magnitudes of angles.

The figure shows how the trigonometrical ratios of an angle are defined. XOX^1 , YOY^1 , are lines at right angles, P , P^1 , etc., any point on the circumference of a circle having O as centre. PM is perpendicular to X^1OX . Then, if

the angle XOP is called θ , the *sine* of θ is PM/OP ; the *cosine*, OM/OP ; the *tangent*, PM/OM . The reciprocals of these ratios are known as the cosecant, secant, and cotangent respectively. With the usual convention of signs in Cartesian coordinates, the sine of an angle in the first and second quadrants is positive and negative in the third and fourth quadrants, the cosine positive in the first and fourth quadrants and negative in the second and third, and the tangent positive in the first and third quadrants and negative in the other two.

The sum of the squares of the sine and cosine of an angle is equal to unity. If A , B , are any two angles, then

$$\sin(A+B) = \sin A \cos B + \sin B \cos A;$$

$$\cos(A+B) = \cos A \cos B - \sin A \sin B.$$

The chief triangle formulae of trigonometry are, if A , B , C are the angles of the triangle, and a , b , c the sides,

$$a/\sin A = b/\sin B = c/\sin C;$$

$$\cos A = (b^2 + c^2 - a^2)/2bc, \text{ etc.}$$

Among the earliest mathematical astronomers, Hipparchus constructed a table of chords of arcs of the circle, which is practically the same as that of natural sines, and he was followed by Hero of Alexandria. The work of Hipparchus was reconstituted by Ptolemy, who in his first book treated of trigonometry, plane and spherical, and gave a table of chords or natural sines which may be identical with that of Hipparchus. *See Logarithms; Sine; Symbols. Consult Trigonometry, A. W. Siddons and R. T. Hughes, 1928.*

Trilby. Novel by George Du Maurier, first published serially in Harper's Magazine, 1894. It is a discursive, sentimental romance, set among the ateliers of Paris, the heroine, Trilby O'Farrell, being an artists' model, and the hero, "Little Billee" Bagot, an art student. The villain is Svengali (*q.v.*), under whose evil hypnotic influence Trilby is turned into a famous singer. Not least of the work's attractions were the author's own illustrations. The plot was based on a story heard by Du Maurier in Paris, but the title was used earlier by Charles Nodier and Alfred De Musset. A dramatised version of Trilby, by Paul Potter, was first produced at The Haymarket, London, Oct. 30, 1895, Tree playing the part of Svengali and Dorothea Baird that of the heroine. For many years from 1920 Phyllis Neilson-Terry excelled in the latter rôle.

Trilithon (Gr., triple stone). Megalithic structure comprising a horizontal lintel supported by two uprights. There are five at Stonehenge (*q.v.*).

Trill (Ital. *trillo*). Literally, a shake or tremulous vibration. In music the term is used for an ornament, also called a shake (*q.v.*).

Trilobites (Gr. *treis*, three; *lobos*, lobe). Group of fossil marine animals belonging to a sub-class

Trilobites. Examples from the Cambrian system (left to right): Hypoparia, Agnostus princeps; Opisthoparia, Olenus catarractes; and Proparia, Stauropetalus Murchisoni. By courtesy of the Trustees, British Museum.

of Crustacea. The animals were extremely numerous in the Cambrian, Silurian, and Devonian periods; during the Carboniferous they disappeared. Trilobites were covered with a hard shell, oval in shape, and divided by two dorsal furrows into three longitudinal lobes, a mesial and two lateral, which occasioned the name. The shell was also divided into three parts transversely, a head shield, a body or thoracic shield, and a tail shield or pygidium. The head was semicircular, with a central protuberance, the glabella. The animal possessed lateral or compound and median or parietal eyes, and many were capable of rolling themselves up so that the soft lower parts of their bodies were protected from attack, a position in which many fossils are found. During the Cambrian, trilobites were the chief forms of life, but very little is known of their habits, save that they inhabited the sea bottom. Over 2,000 species have been found, of all sizes up to 2 ft. long.

Trilogy. Term originally employed to denote a series of three separate plays on one continuing theme. A classic example is found in the Agamemnon, Choephoroi, and Eumenides of Aeschylus; Shakespeare's three parts of Henry VI may be regarded as a trilogy; as also may Schiller's Piccolomini, Wallenstein's Camp, and Wallenstein's Death; and Swinburne's Chastelard, Bothwell, and Mary Stuart. The word has come to be used of novels and other works in which a writer has given a con-

tinuity of theme to three separate books, as Galsworthy did twice with his Forsyte novels, and G. M. Trevelyan with his studies of Garibaldi and of England under Queen Anne.

Trim. Urb. dist. and co. town of Meath, Eire. Standing on the Boyne, 30 m. N.W. of Dublin, on

Trim, Eire. Ruined walls and keep of King John's Castle, seen from the Boyne

the Eire State rlys., it is the centre of an agricultural dist. It was an important town in the 15th century and was also the site of an early bishopric. King John's castle, now in ruins, was originally built by Hugh de Lacy in 1173. Sir John Talbot, lord lieutenant in 1415, erected Talbot's castle, remains of which still stand. A Norman tower marks the site of S. Patrick's abbey of S. Mary near by. The ruins of the great abbey of SS. Peter and Paul extend on both sides of the river. Trim was incorporated under Edward III. Its town hall and other buildings were burnt in the disturbances of 1920. Market day, Sat. Pop. 1,455.

Trim, CORPORAL. Character in Sterne's novel, *Tristram Shandy* (*q.v.*). He is manservant to Uncle Toby, whose orderly he had been in the army in Flanders, and is a skilfully drawn portrait of the old soldier, loquacious but respectful, his master's trusted companion.

Trimeter. In English verse, a line containing three feet or stresses. It is not commonly found throughout a poem, though by its use great strength can be expressed; a fine example is Nashe's *In Time of Pestilence*, and a popular one Byron's *Vision of Belshazzar*. Bridges was fond of the measure and Cecil Day Lewis used it effectively.

Trimethylamine (C_3H_9N). Colourless liquefiable gas with a penetrating fishy odour. It forms salts by direct combination with acids, like ammonia. It is prepared on a large scale from the vinasses or residues obtained in refining beet sugar. Trimethylamine has several technical applications.

Trimmer. Term applied to vacillating politicians, the allusion being to one who trims his sails to catch every favouring breeze. It was coined by the marquess of Halifax (1633-95), who in a work entitled *The Character of a Trimmer*, 1684, ably defended his policy as being well balanced and moderate. Mommsen in his *History of Rome* applied the term to Cicero. See Halifax, Marquess of.

Trimmer. In building, a joist or beam which trims an opening and supports the ends of trimmed joists or rafters. It is used in forming an opening in a floor or roof,

particularly a hearth opening in a timber floor, a staircase well, or a roof light in a pitched or flat roof. The trimmer may be of timber, steel, or reinforced concrete. It must be heavier than the members it supports. In timber floors the trimmer joist to a hearth or a staircase well is usually joined to heavy trimming joists, which run at right angles to it. One end of the trimmer is sometimes supported on a wall. The joists are usually housed to the trimmer. In timber roofs the trimmed opening for a light is formed similarly, though the timbers are lighter.

A trimmer arch is a brick arch under an upstairs hearth; it spans between chimney breast and trimmer joist, supporting the hearth.

Trincomalee. Seaport on the N.E. coast of Ceylon, 99 m. N.E. of Kandy. It is built on a peninsula separating the outer from the inner harbour in the Bay of Trincomalee. The inner harbour is about 4 sq. m. in area and deep enough to take the biggest ships. Long the h.q. of the E. India squadron, it was later used only as an oil depot and subsidiary base to Singapore. While Singapore was in Japanese hands, 1942-45, Trincomalee again became a British naval base. It was heavily bombed by Japanese carrier-borne aircraft on April 9, 1942. The ships in port when the attacking force was sighted put to sea; three, the 10,000-ton cruisers *Dorsetshire*, completed 1929, which sank the Bismarck (*q.v.*), and *Cornwall*, completed 1927, which sank the German raider *Pinguin* in the Indian Ocean in 1941, and the 10,500-ton aircraft carrier *Hermes*

(*q.v.*) were sunk by air attack some 10 m. off shore; a large proportion of the crews was saved.

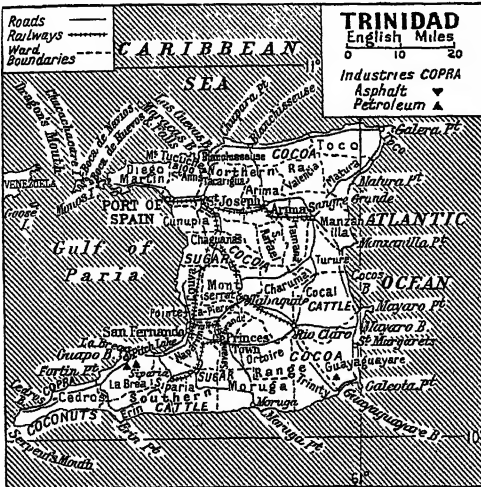

Trincomalee was one of the earliest settlements of the Tamils in Ceylon. They built the temple of a thousand columns, dedicated to Konatha, which was destroyed by the Portuguese, who took the port in 1622 and put up their own Fort Frederick, which still stands. The old Tamil temple is still remembered by a weekly ceremony at which a Brahman throws offerings into the sea from the top of the rock on which the temple stood. Subsequent possessors after the Dutch ejected the Portuguese in 1639 were the French (1673), Dutch (1674), English (Jan., 1782), French (Aug., 1782), Dutch (1783), English (1795). Into Trincomalee Bay flows the Mahaweliganga, biggest river of Ceylon. Pop. 20,000.

Trine, RALPH WALDO (b. 1866). American author. Born at Mount Morris, Ill., Sept. 9, 1866, and educated at Wisconsin and Johns Hopkins universities, he was successively a teacher, lecturer, bank cashier, newspaper correspondent, and fruit grower. Deeply interested in ethical and social subjects, he was director of the American Humane Education Society, and the author of *In Tune with the Infinite*, 1898; *The Land of Living Men*, 1910; *The New Alinement of Life*, 1913; *My Philosophy and My Religion*, 1921; and many other books on ethical and religious matters.

Tring. Market town and urban dist. of Herts, England. It is 32 m. by rly. N.W. of London, and is also on the Grand Union Canal. It stands at the base of the Chiltern Hills. The chief building is the Perp. church of SS. Peter and Paul. There is a trade in agricultural produce. The museum, founded by Lord Rothschild, was taken over by the trustees of the British museum. Pop. 5,080.

Trinidad. Most southerly island of the W. Indian Is. Geologically and biologically, it is a part of the S. American continent. Separated from Venezuela by the Gulf of Paria, it lies 7 m. N. of the mouth of the Orinoco between 10° 3' and 10° 50' N. lat. and 60° 55' and 61° 56' W. long. Its average length is 50 m., average breadth 37 m., area 1,864 sq. m. Pop. 500,000. The climate is tropical, rainfall averaging 1-3 ins. a month in the dry season, and 7-10 ins. a month in the rainy season (June-Dec.).

The white inhabitants are of English, French, Spanish, and

Trinidad. Map of the southernmost island of the British West Indies, discovered by Columbus in 1498. Right, the Government House

Portuguese origins; the coloured of African and Indian (from India). Those of E. Indian origin, numbering c. 190,000, are descended from indentured labourers imported during the 19th cent. to work in the sugar fields; they remain a distinct community with their own costume and language. Those of African origin are descended from slaves. Port of Spain (pop. 107,499) is the capital.

Agriculture is the main occupation; sugar, cocoa, coconut, and citrus fruits are the chief products. The sugar production in 1946 was 109,603 tons, providing employment for about 60,000. At St. Augustine is the Imperial College of Tropical Agriculture. Production of oil and asphalt are the principal industries, employing more than 14,000. Trinidad is one of the most important producers of petroleum in the Commonwealth, crude oil produced in 1946 amounting to 20,232,461 barrels; in the same year output of asphalt was 93,851 tons. Shipping is also an important industry. The chief imports are food, raw materials, manufactured goods, and cotton textiles. The deep water harbour of Port of Spain, opened in 1940, is the most important harbour in the W. Indies. At Port of Spain also is the principal air port.

During the Second Great War, defence bases were leased to the U.S. govt., 1941, for a period of 99 years. U.S. construction in and occupation of the areas concerned brought prosperity to the island, but depleted the ranks of agricultural workers so that food had to

the remaining members of the executive council are appointed; six other members of the legislative council are appointed, nine are elected. Men over 21 and women over 30 have the vote.

Trinidad was discovered by Columbus in 1498. Sir Walter Raleigh in 1595 destroyed St. Joseph, its chief town at that time, and the island later was often raided by freebooters of the sea. At the time of the French Revolution many French families settled in Trinidad, which still has a strong French element. The British took the island in 1797 when they were at war with Spain; it was ceded to them by the treaty of Amiens, 1802. *Consult* Trinidad and Tobago Year Book (annually); Constitution of Trinidad, C. Reis, 1929; History of Trinidad, M. T. Benjamin, 1939.

Trinidad. Small island of the S. Atlantic. Rocky and uninhabited, it lies 745 m. E. of Rio de Janeiro. It belongs to Brazil.

Trinidad Town of Bolivia. Capital of the dept. of Beni, it lies c. 220 m. N.E. of La Paz, and close to the river Mamore. Here was formerly a celebrated Jesuit mission station. Floods in 1947 inun-

dated the town, U.S. army flying boats helping in the rescue of more than 3,000 people clinging to trees and rooftops. Pop. 8,000.

Trinidad. Town of Cuba, in the prov. of Santa Clara. It is situated about 5 m. from its port, Casilda, and 46 m. S.E. of Cienfuegos. Sugar and coffee are produced locally. The present town is a few miles distant from the original settlement, founded 1514, where the house in which Cortes lived is still standing. Pop. 15,455.

Trinidad. City of Colorado, U.S.A., the co. seat of Las Animas co. It is 88 m. by rly. S. of Pueblo, and is served by the Atchison, Topoka, and Santa Fé and other rlys. It lies in a coal mining region, from which annually 1,500,000 tons are shipped; cattle ranges and sheep flocks in the charge of shepherds of Basque origin are adjacent. Trinidad was incorporated in 1876, and became a city in 1879. Pop. 13,223.

Trinidad OR PORONGOS. Town of Uruguay. Capital of the dept. of Flores, it lies c. 105 m. N.N.W. of Montevideo. A town of wide streets, it has a municipal building of note, schools, a R.C. and a Protestant church, and a fine cemetery. Pop. 81,000.

Trinil Man. Parts of a skull and of a thigh bone found at Trinil, Java, by Dubois in 1891-92. They have been established as the remains of a sub-human creature midway between the orang-utan and man in development. The probable period is Pleistocene, approx. 10 m. yrs. ago.

Trinitarians OR REDEMPTIONISTS. Religious order for men, founded in Paris, 1198, by S. John of Matha and S. Felix of Valois, with the object of redeeming Christians who were in slavery under the Moors. Members wore a white habit, with a red and blue cross on the breast. They divided their income equally for their own support, the relief of the poor, and the redemption of captives. In England in 1244 they established 11 small houses.

The Trinitarian nuns were originally an association of women who raised funds for the Trinitarian Order, and later became a religious congregation. Their mother house at Valence was founded in 1685. They have English establishments.

Trinitrin OR GLYCERYL TRINITRATE OR NITROGLYCERINE. Explosive substance. The glyceryl ester of nitric acid, it is given medicinally in the form of tablets to relieve angina pectoris. See Nitroglycerine.

Trinitrocresol. Highest nitration product of cresol. Formula, $C_6H_3CH_3.OH.(NO_2)_3$. It is manufactured like trinitrophenol, which it greatly resembles in properties, but it is less sensitive, slightly less powerful, and does not form such sensitive salts. Trinitro-metacresol is a yellow solid which crystallises as long needles, is slightly soluble in water, and melts at $100^\circ C$. Mixed with trinitrophenol it formed the standard French high explosive for shell filling and similar purposes before the First Great War, under the name of cresylite.

Trinitrophenol. Compound formed by the complete nitration of phenol; formula $C_6H_5(NO_2)_3.OH$. Three isomerides are known, but the symmetrical one is the only variety of any commercial importance which can be prepared in quantity by direct methods. This isomeride is also known as picric acid, is an important military high explosive, and was formerly used as a dye—the oldest artificial dye known.

Picric acid was first prepared by Woulfe in 1771 by the action of nitric acid on silk. It found extensive use as a yellow dye, but its explosive properties were unknown until Sprengel discovered them in 1871. In 1885 Eugène Turpin took out patents for the use of picric acid as an explosive, and it was rapidly adopted for military use by most countries. In the dyeing industry it has now been largely displaced.

Picric acid is a high explosive of considerable brisance and is moderately insensitive. For military use it has been mixed with a variety of substances, especially dinitrophenol, to make it less sensitive and lower its melting point. The ease with which it combines with metals to form sensitive picrates is a marked disadvantage. See Lyddite.

Trinitrotoluene OR T.N.T. One of the most important high explosives, formed by the substitution of three nitro (NO_2) groups in the benzene nucleus of the toluene molecule. The chemical formula is $CH_3.C_6H_3(NO_2)_3$. Trinitrotoluene was first prepared by Wilbrand in 1863, and in a very pure state by Hepp in 1880, whilst much information regarding its manufacture and explosive properties was published by Häussermann in 1891,

when the German authorities experimented with it. The Germans adopted it as the standard military explosive in 1902.

In England it was manufactured only in small quantities for industrial use until the First Great War, when large plants were installed to meet the military requirements, and it became the most important high explosive in military use. The girls who filled shells during the First Great War were, owing to their T.N.T.-yellowed skins, called "canaries."

Trinitrotoluene is somewhat less powerful and brisant than trinitrophenol, but is much more advantageous, as it is less sensitive, is insoluble in water, is not acid, and does not form dangerous compounds like the picrates, has a lower melting point, simplifying casting, and is less dangerous to manufacture and use. It enters into the composition of many industrial explosives and is the most widely used military explosive. Because of its relatively low m.p. ($81^\circ C$) it can be easily liquefied by steam; shells, bombs, etc., can thus be filled directly by pouring. Its lower sensitivity, as compared with picric acid, has made possible the use of high-explosive shell of the largest calibres carrying a weight of explosive considered impossible before the introduction of trinitrotoluene. It is used for filling mines and torpedo warheads, bombs, hand grenades, etc. Owing to its marked deficiency in oxygen, T.N.T. is widely used in admixture with other substances rich in oxygen, particularly ammonium nitrate. Amatol (*q.v.*) is one of these mixtures. Ammunition was filled with later explosives, *e.g.* R.D.X., as a slurry in molten T.N.T. The wide use of this explosive is indicated by its many names. In the British service T.N.T. and Trotyl, in France Tolite, in Italy Tritolo, and in Spain Trilit. See Ammunition; Detonation; Detonator; Fuse; Exploder; Explosives; Gaine; Nitrator; Safety Explosive; Shell; Universal Shell.

Trinitroxylene. Tri-nitration product formed by the substitution of three nitro (NO_2) groups in the benzene nucleus of the xylene (dimethylbenzene) molecule. Formula, $C_6H_4(NO_2)_3(CH_3)_2$. Trinitroxylene is a somewhat less sensitive explosive than trinitrotoluene and about equal to it in power and brisance. See Amatol; Ammunition; Explosive; Melinite; Safety Explosive; Shell; Xylene.

Trinity, THE HOLY. Theological term for the mystery of one God in three persons—the Father, the Son, and the Holy Ghost, co-equal in all things. The doctrine is derived from the O.T., is implied in the N.T., and is affirmed by the Athanasian, Apostles', and Nicene Creeds and Article I of the Church of England; but the word Trinity originated with Theophilus of Antioch, who wrote about A.D. 180. See Arianism; Hypostasis; Unitarianism.

Bibliography. Essays on the T. and the Incarnation, ed. A. E. J. Rawlinson, 1928; The Holy Trinity, J. P. Arendzen, 1937; The Interpreter Spirit, A. J. Macdonald, 1944; Doctrine of the Trinity, L. Hodgson, new ed. 1946.

Trinity College. The largest college of Cambridge university. It was founded by Henry VIII in 1546 by the amalgamation of nine earlier foundations, including Michaelhouse, founded by Hervey de Stanton in 1324, and King's Hall, founded by Edward III in 1337. The Great, or King's, Gate dates from 1518–35. Much of the buildings was remodelled by Thomas Neville, master 1593–1615. The interior of the Tudor chapel was restored 1870–75. The hall, 1604–08, has much in common with that of Middle Temple, London. The library, designed by Christopher Wren, 1676–95, is of remarkably fine proportions, and contains 150,000 volumes, collections of coins, medals, and Roman and Anglo-Saxon

Trinity College, Cambridge, arms

Trinity College, Cambridge. Great court and fountain; left of the main gateway are the rooms formerly occupied by Newton, Macaulay, and Thackeray

antiquities, carvings by Gibbons, MSS. of Milton, Thackeray, and Tennyson, the death mask of Newton, and Thorvaldsen's statue of Byron. There are five courts: Great Court, the fountain in the centre of which, erected in 1602, was rebuilt in 1716; Neville's or Cloister Court, c. 1612; New or King's Court, 1823-25; and two small ones, 1859-68, memorials of the munificence of Whewell.

Under statutes of 1926 Trinity is governed by a master, appointed by the crown; has about 75 fellows; and includes scholars, librarian, and the regius professors of divinity, Greek, and Hebrew. About 700 men are normally in residence in *statu pupillari*. Educated here were E. D. Adrian, Bacon, 1st Earl Baldwin, Lord Balfour, Isaac Barrow, Sir W. H. and Sir L. Bragg, Byron, Clerk-Maxwell, Coke, Cowley, Sir H. H. Dale, Dryden, Sir A. S. Eddington, Capt. Eyton, Dean Farrar, Fitzgerald, Sir J. G. Frazer, Galton, George Herbert, H. Jackson, Sir J. H. Jeans, Sir R. C. Jebb, Kinglake, Macaulay, Desmond MacCarthy, F. D. Maurice, A. A. Milne, Newton, Porson, Lord Rayleigh, Lord Rutherford, Stanford, Tennyson, Thackeray, Sir J. J. and Sir G. P. Thomson, Archbishop Trench, Sir G. O. and G. M. Trevelyan, R. Vaughan Williams, Whewell, A. N. Whitehead. Another former student was Pandit Jawaharlal Nehru, first premier of India. Among masters were Whitgift, Barrow, Bentley, Whewell, Sir J. J. Thom-

freshmen and later sophisters—while the rest reside in authorised lodgings. At its head is a provost, and its legal complement of members is, in addition to him, seven senior fellows, 25 junior fellows, and 70 scholars. Since 1903 women have been admitted to its degrees. Three members were sent to the Dáil until 1937.

The Palladian façade (1759) faces College Green in the centre of Dublin. Queen Elizabeth's original

Trinity College, Dublin, arms

Trinity College, Oxford. New quadrangle, containing the chapel, left, and the president's lodging adjacent. To the right are the buildings erected in 1887

charter placed the college on the site of the monastery of All Hallows, and its quiet quadrangles are in the heart of a bustling city. In Parliament Square are the chapel, examination hall, a beautiful campanile (1853), and the library. This last, begun in 1712, receives a copy of every book published in the U.K., and contains the Book of Kells and hundreds of priceless

known as Durham College. It is under a president. The buildings lie between Broad Street and Parks Road and are surrounded by beautiful grounds. They include the remains of Durham College, and a quadrangle by Wren, later modified. The classical chapel, 1691, contains the founder's tomb and carving by Gibbons. Distinguished members of Trinity were Chatham, Newman, Lord Goddard, Cyril Alington, A. E. W. Mason, Ronald Knox, Sir Kenneth Clark.

Trinity College, Oxford, arms

Trinity College of Music. Association in London for the encouragement of musical study.

Trinity College of Music, arms

Founded in 1872 and incorporated in 1875 as Trinity College, London, it obtained its present title in 1904. All branches of music are taught, and a full professional curriculum is in force, as well as facilities for amateur study. The college was the pioneer in local examinations in musical knowledge, 1877, and in practical music, 1879. Under the scheme for higher examinations started in 1874 diplomas of licentiate and associateship are awarded to external students as well as to pupils of the college. The building is in Mandeville Place, Manchester Sq., W.1.

Trinity Hall. College of Cambridge university. It was founded in 1350 by William Bateman, bishop of Norwich, for a master, 13 fellows, and certain scholars, specially for the study of canon and civil law. The chapel was consecrated in 1513 and restored 1729-30 and 1864. The library, c. 1590,

Trinity Hall, Cambridge, arms

Trinity College, Dublin. First Quadrangle, called Parliament Square, with the campanile. Left, portico of the chapel; right, the examination hall

son, and from 1940 G. M. Trevelyan. First Trinity boat club represents the original club, while Third Trinity is confined to Eton and Winchester men.

Trinity College. Irish university in Dublin. Founded in 1591, it was for long confined to members of the Anglican Church. In 1873 religious tests were abolished and it was thrown open to all, but it still remains in many respects a Protestant society. It consists of one college only and is residential, accommodating about 270 undergraduates—who are called

Irish MSS. Elsewhere are laboratories, the museum, and buildings of the medical school: There is an observatory in the gardens, and the college park serves for recreation and sport. The college has a botanic garden at Balls Bridge and an astronomical observatory at Dunsink. See Gowns colour plate; University. Consult History, C. Maxwell, 1946; K. C. Bailey, 1947.

Trinity College. College of Oxford university. It was founded in 1555 by Sir Thomas Pope, who obtained for the first buildings a house of Benedictine monks

Trinity Hall, Cambridge. First court and main gateway, looking towards the east side, rebuilt after fire in 1852

possesses a remarkable collection of law books, with the original bookcases equipped with locks and staples, but the old chains have been renewed. New buildings were added in 1909-10, 1926 and 1934. Fifteen milestones on the London road, set up by the college in the 18th century, bear its crest. Notable members have included Stephen Gardiner, Gabriel Harvey, Tusser, Herrick, the 4th earl of Chesterfield, Bulwer Lytton, F. D. Maurice, Henry Maine, Leslie Stephen, Lord Maugham, J. B. Priestley, and Arthur Henderson, jr.

Trinity House. British corporate authority. It governs pilotage in England and Wales and as the general lighthouse authority for the same area together with the Channel Islands and Gibraltar, controls lighthouses, lightships, beacons, and buoys around those coasts, and has certain statutory jurisdiction regarding lighthouses in Scotland and N. Ireland and over local harbour lights. It is also responsible for marking and removing wrecks dangerous to navigation. Trinity House was already a guild of mariners when granted its first royal charter in 1514. It has considerable property, maintains almshouses, and gives pensions to distressed mariners and their widows. Elder brethren of Trinity House are chosen from among members of the royal family, statesmen, retired naval officers of high rank, and prominent officers of the merchant navy. Winston Churchill made the elder brother's uniform famous by the frequency with which he wore his. The h.q. is Trinity House, Tower Hill, London, E.C.3. There are Trinity Houses at Hull and Newcastle. See *Pilot*. Consult Trinity House, H. P. Mead, 1947.

Trinity Sunday. In the Church calendar, the Sunday after Whitsun. The octave of Pentecost has long been specially dedicated to the worship of the Trinity. The festival was first authorised by

Celtic bishops to the supposed early connexion of their church with S. John. Observance first became general under Becket at Canterbury, as the anniversary of his appointment to the see. In the Church of England, Sundays between Trinity and Advent are designated 1st, 2nd, etc., after Trinity. At Oxford and Cambridge Trinity Sunday is a "scarlet" day, on which doctors of divinity wear their red robes.

Trinobantes. Celtic tribe settled in Essex and thereabouts at the time of the Roman occupation of Britain. They submitted to the rule of the Romans until A.D. 61, when they joined the revolt of the Iceni under Boadicea. After the suppression of this the Trinobantes disappear from history.

- Trinoda Necessitas (Lat., threefold necessity). Term used for the three obligations laid upon land-holders in Anglo-Saxon times

Gregory IV in 828, and has been held on the present day since 1334. There are grounds for believing that the name Trinity Sunday originated in England, where S. Augustine found its observance among other local customs attributed by

of an instrumental piece, e.g. of the scherzos or minuets which form third movements of many classical symphonies, may also be called a trio, having been assigned originally to three instruments only.

Triode. Simplest form of radio valve. It contains three electrodes: a cathode which may be either a directly heated filament or indirectly heated by electrical means; an anode; and a grid to control the passage of current from one to the other. Triodes are generally used for rectification or detection of radio currents, but serve also for amplification of radio frequency or low frequency currents. A triode on a regenerative circuit can be made to generate audio-frequency currents. See *Thermionic Valve*.

Triplet. Verse form derived from the early French dance-songs. It consists of eight lines, usually octosyllabic, though trimeters are common in English; the 1st, 4th, and 7th lines are identical, rhyming with the 3rd and 5th, while the 8th line is the same as the 2nd and rhymes with the 6th, having usually a feminine ending. The Little Child, by Louis Tiercelin, is a perfect French example, and in English, Graham Tomson's *The Roses are Dead* may be given as an example of the triplet in trimeter:

The roses are dead
And swallows are dying:
White, golden, and red,
The roses are dead;

Yet tenderly tread
Where their petals are lying.
The roses are dead
And swallows are flying.

Bridges and Dobson revived the

Trinity House. Headquarters of the maritime corporation at Tower Hill, London, built 1793-95

in England. They were the necessity to serve in the fyrd (*q.v.*), to repair bridges, and to man fortified places. The describing phrase was not used until the 17th century, but documents of Anglo-Saxon times refer to the three obligations.

Trio. Musical term for a composition, vocal or instrumental, for three soloists. The middle section

form in the 19th century, and Coulson Kernahan applied it lightly to sport.

Tripe. Name given to a food dish prepared from either the paunch or the reticulated second stomach of a ruminant animal. Having been cleansed and boiled, it is cut in slices and reboiled, usually with onions, and served with a

milk sauce or thick brown gravy.

Tripe de Roche or **ROCK TRIPE** (*Umbilicaria*). Genus of lichens growing on rocks, chiefly in the mountains and the Arctic regions. The fact that they contain some nutritive value, like Iceland moss (*Cetraria*), has caused them to be eaten when other food failed, e.g. by Franklin and Richardson on

their Arctic expeditions. The lichens contain, however, a bitter purgative principle dangerous to some persons.

Triphenylmethane ($C_{19}H_{15}$). Solid hydrocarbon obtained by the interaction of chloroform and benzene in the presence of aluminium chloride. The liquid thus obtained is distilled and yields benzene, diphenylmethane, and triphenylmethane, the last product being separated by crystallisation. Triphenylmethane is the parent substance of a group of dyes.

Triple Alliance. Name given to certain alliances involving three countries. The most famous was made between Germany, Austria, and Italy in 1882. Renewed several times, it was broken when, in 1914, Italy refused to join in the war against France, Russia, and Great Britain. See Europe; Germany; Italy.

Triple Entente. Name given to various agreements or understandings made in the 20th century, between Great Britain, France, and Russia, which were insufficiently formal to be called alliances. See Entente Cordiale.

Triplet. In music, an abnormal division of a note into three, instead of two, equal notes of lesser value.

Triplets. Three young at a birth. Human triplets, occurring about once in 10,000 births, may arise from the fertilisation of one, two, or three ova. Any woman of British parentage giving birth to triplets receives the King's bounty (£3).

Tripoli (Gr., three cities). City and port of Libya, North Africa, the capital of Tripolitania. On a point of land jutting into the Mediterranean, it is a typical Moorish city, containing mosques, a Spanish fortress, and many gardens. The Italians put up numerous govt. buildings. The most celebrated monument is the marble arch of Marcus Aurelius. The city stands on the site of the ancient Oea, one of the three cities, of which Leptis and Sabrata were the others, forming the federal union called Libya Tripolitania. In the 7th century Tripoli fell under Arab domination, and in the 16th century was captured by the Turks. From it famous caravan routes diverge to Lake Chad, Timbuktu, and Darfur. The Italians constructed a fine harbour here and rlys. to Zuara (68 m.), Garran (61 m.) and Tagiura (13 m.). During

the Second Great War, Tripoli escaped with little damage. It was entered by the British 8th army Jan. 23, 1943. See North Africa Campaigns. Pop. (1938) 108,240. See Africa; Tripolitania; Tripoli War.

Tripoli or **TARABULUS.** Town of Lebanon. About 40 m. N.N.E. of Beirut, it lies 2 m. from the Mediterranean, its port being El Mina. It is connected by rly. with Homs (Syria) to the E., Haifa (Palestine) to the S. It has a considerable trade in silks, wool, grain, oranges, and sponges. It figured in the Crusades. During the First Great War it was occupied, without resistance, by the British, Oct. 13, 1918, in the course of the conquest of Syria. Pop. 71,501.

Tripoli Powder. An earthy mineral, white, yellow, or pink in colour, consisting of friable silica derived from the natural leaching of rock. It is used in various grades of fineness as an abrasive and polishing powder.

Tripolis or **TRIPOLITSA.** Town of Greece. Situated nearly in Central Peloponnese, it is the capital of the dept. of Arcadia. It stands on a plain 2,000 ft. alt., 20 m. W.S.W. of Argos, with which it is connected by rly. It was the capital of the Morea when the Turks held Greece. During the War of Independence it was stormed and burned by the Greeks in 1821, but was recaptured from them by Ibrahim Pasha in 1825. Pop. 14,397.

Tripolitania. Name given by the Italians to the western portion of Libya, sometimes called Tripoli. Until 1912 it was a Turkish vilayet. It has four distinct geographical regions. The first along the seaboard is fertile, and contains palms and fruit trees. The second, formed by the highlands of Jebel Nefusa and Tarkuna, includes large areas suitable for cereals. Much of this part of Tripolitania is covered with esparto grass. The third region has many oases, while the fourth, extending into Fezzan (*q.v.*), is mainly desert, except in the W. The climate is healthy, but hot, with the world's record shade temp. of 136° F. (Sept. 13, 1922).

Great quantities of dates, figs, olives, cereals, grapes, and almonds are grown and exported, and esparto grass is an important article of commerce. There is a considerable trade with the interior over the caravan routes, most of which have been used since the earliest times. The principal

caravan trade is between Benghazi, in Cyrenaica, and Wadai and Tripoli and the Central Sudan, via the oases of Fezzan. The chief centres of population are Tripoli (*q.v.*), Aziez, Homs, Misurata, Sirte, Nofilia, and Ghadames, the last an important oasis in the W. The pop., (est. 806,000 in 1947) is principally Arab and Berber in the N., negroid in the S. Europeans, the great majority Italian, constitute less than 10 p.c. of the whole. Area, 96,500 sq. m.

Tripolitania contains many remains of antiquity, in particular at Leptis and Sabrata (*qq.v.*). The original settlements of the Phoenicians passed to the rulers of Barca (Cyrenaica) and afterwards to the Carthaginians. Later the region was occupied by the Romans, the Arabs, the knights of S. John, and in 1551 by the Turks, who ruled it until it was taken by Italy (see Tripoli War). The course of the Second Great War in Tripolitania is described under North Africa Campaigns. From the conquest of the country by the British 8th army in 1943, Tripolitania was administered by the U.K. In 1949, the U.N. decided that the whole of Libya—Cyrenaica, Tripolitania, the Fezzan—should be united and independent by 1952. Pending Libyan independence, British administration of Tripolitania continued.

Tripoli War. France having secured Tunisia (*q.v.*) on which Italy had set her heart, that country determined to secure Libya, where there was, by the beginning of the 19th cent., some considerable Italian settlement. During the summer of 1911 she carried on diplomatic exchanges with the Sublime Porte, and then on Sept. 28 sent a 24-hr. ultimatum intimating that her interest in Tripoli made it necessary for her to undertake, by means of a military occupation, a civilizing mission in the area. Next day she declared war on Turkey, attacking Tripoli from the sea on Oct. 3. The Turks withdrew from the city in face of a landing party, and the Italians occupied it. They also occupied Derna, Homs, and Benghazi (Cyrenaica) without serious opposition. Desultory fighting continued until the spring, when the Italians began to attack once more, defeating the Turks and the Arabs, who supported them, at a number of points. In Oct., 1912, Turkey signed with Italy the treaty of Ouchy, renouncing her sovereignty over Libya. Italy, was, however, in

possession only of the coast, and she had to contend with the opposition of the Arab inhabitants of the interior (who as Muslims owed religious as well as political fealty to the sultan) until the break-up of the Turkish empire during the First Great War, after which she secured control of the whole of Libya.

Tripous (Gr. *tripous*, three-footed, tripod). In Cambridge university, name given to the honours degree examination in certain subjects. As far back as the 16th century tripous was the name given to the three-legged stool on which the champion of the university sat during the disputations held when undergraduates were admitted to the degree of B.A. The oldest of these examinations is the mathematical tripous, 1747. See Cambridge University.

Triptolemus. In Greek mythology, son of Celeus, king of Eleusis. In gratitude for the hospitality shown to her by Celeus when she was wandering over the earth in search of her daughter Persephoné (*q.v.*), the goddess Demeter gave Triptolemus a chariot with winged dragons with which to visit the whole world and give mankind seeds of corn. On his return Triptolemus instituted the festival of the Thesmophoria (*q.v.*), one of the two great festivals to Demeter. *Pron.* Trip-tolly-mus.

Triptych (Gr. *triptychos*, three-fold). In ecclesiastical painting, a set of three upright panels, joined together by hinges, each one being painted with a distinct subject. The wings were usually painted on both sides, so that when they were folded a fresh picture was presented. In later triptychs canvas pictures were often inserted in the compartments. The Van Eycks and nearly all the great religious painters of the early Renaissance used the triptych, which disappeared in the 16th century. *Pron.* triptik. See Byzantine Art.

Tripura. Indian state which until 1947 was in the Eastern states agency but attached for some administrative purposes to Bengal. It lies E. of the Tippera and S. of the Sylhet districts of Pakistan, covering 4,116 sq. m. of mountainous country. The state has its own chronology, starting an era in A.D. 590. Agartala is the chief town. Pop. (1950 est.) 580,000.

Trireme (Lat. *triremis*, from *tres*, three; *remus*, oar). Warship of the ancient Greeks and of the Romans under the republic, provided with three tiers of oars. Such vessels are said to have been first

built at Corinth. The fully-developed trireme was about 140 ft. long, with two masts and a beak or ram. The complement was 200, of whom

Trireme. Reconstruction of an oar-driven ship used on the Mediterranean in early Classic times

170 were rowers, one to each oar. How the rowers were disposed is much disputed. Ships were also built with four, five, or more banks of oars—quadriremes, quinqueremes, etc. See Galley; Ship. Consult Ancient Ships, C. Torr, 1894.

Trisagion (Gr. *tris*, thrice; *hagios*, holy). In theology, the name of a liturgical formula, which was based upon Isaiah 6, v. 3, and came into use towards the end of the 4th century. The words are: "Holy God, Holy Mighty, Holy Immortal, have mercy upon us." They are sung in the liturgy of Constantinople; and in the R.C. liturgy are said by the celebrant at the Adoration of the Cross on Good Friday.

Trismegistus. Word meaning thrice greatest. The Greeks applied it to Thoth, the Egyptian god, who was to them Hermes Trismegistus. The name also appears in Sterne's *Tristram Shandy*. See Thoth.

Tristan and Isolde. Opera in three acts by Wagner. The poem, based on the Arthurian legend, was begun by Wagner at Zürich in 1857 (at the reputed suggestion of the emperor of Brazil); the second act was written at Venice, and the third at Lucerne, 1859. Not produced until 1865, at Munich, when Ludwig Schnorr sang the part of Tristan to his wife's Isolde, it was first given in London at Drury Lane in 1882, and received its first performance in English by the Carl Rosa co. at Liverpool, 1898. A masterpiece of eroticism and beauty, this opera ranks with Siegfried in its ingenious use of *leit-motiv*. The love duet is a famous example of the emotional intensity and poetic feeling with which the entire work is imbued.

Tristan da Cunha. Lonely island group in the S. Atlantic. It

comprises four small islands, 44 sq. m. in extent, Tristan da Cunha proper, Gough's, Inaccessible, and Nightingale, as well as a number of rocks. It is situated 1,500 m. S.S.W. of St. Helena, and almost midway between Cape Town and Buenos Aires. Tristan da Cunha proper, the largest and only inhabited island, is an extinct volcano, 8,000 ft. high, the habitable area being a plateau on the N.W. side, 100 ft. above sea level,

and 12 sq. m. in extent. Only about 30 acres is cultivated, mostly for potatoes; there are fruit trees, and cattle, sheep, and geese are kept. In 1880 the pop. was 109, in 1944, 222.

The group was discovered in 1506 by Tristan da Cunha, Portuguese navigator, and it came under British rule in 1816. Most of the inhabitants are descended from shipwrecked sailors, and soldiers who elected to remain when the garrison was withdrawn in 1817, and coloured women from Cape Colony. In 1932 the colonial office sent out the Rev. A. G. Partridge to organize the island. He set up a chief, with three officers to assist. The chief's mother was appointed head woman. In 1942 the island was commissioned as H.M.S. Atlantic Isle. It is a valuable meteorological and radio station. Consult I Went to Tristan, A. B. Crawford, 1941.

Tristram OR TRISTAN, SIR. Hero of a medieval legend of Welsh or Cornish origin, which was drawn into the Arthurian cycle. Nephew of Mark, king of Cornwall, Tristram is sent to Ireland to bring Isolt or Isolde as his uncle's bride; but when he and she have unwittingly drunk a magic potion, they love each other. Discovered by Mark, he flees to Brittany, where he marries another Isolt, of the White Hand. Having summoned Isolt of Cornwall to heal him of a wound, he is falsely told by his wife that her rival refuses her aid, and the lovers die of grief. There are medieval versions of the legend in many languages, which appear to be based on an Anglo-Norman poem of the 12th century. The finest is the German poem of Gottfried von Strassburg, followed by Wagner. Malory retells the story

in *Le Morte d'Arthur*. It is the theme of Swinburne's *Tristram of Lyonesse*, Arnold's *Tristram and Iseult*, and Tennyson's *The Last Tournament*, while it has also been used by Gaston Paris and other French writers. Wagner's opera is known in English as *Tristan and Isolde* (*q.v.*). See *Iseult*; Thomas the Rhymer.

Tristram Shandy. Humorous novel by Laurence Sterne, published in nine volumes, 1759-67. The full title is *The Life and Opinions of Tristram Shandy, Gent.* Sterne's only work of fiction, it is a loosely constructed narrative, full of digressions, and follows the tradition of Rabelais and Cervantes, although it is a great original creation. The delineation of character in Walter Shandy and his brother Uncle Toby, in Corporal Trim and the Widow Wadman, is masterly. Full of curious learning, whimsical indecorous wit, sentimentality and self-revelation, and poignant humour, it is a landmark in the history of English fiction.

Tritium. An artificial radioactive isotope of hydrogen (^3H), having one proton and two neutrons in the nucleus, and hence at wt. 3. It emits β -rays; has half-life 12 yr.; and is made in an atomic pile by bombarding deuterium with neutrons ($^3\text{H} + \frac{1}{2}\text{n} = ^3\text{H}$). It has been suggested that the synthesis of tritium with ordinary hydrogen to produce helium might form the basis for the so-called hydrogen or super bomb. See *Atomic Bomb* in N.V.

Triton. In Greek mythology, a minor sea deity, son of Poseidon. According to later legends there were several Tritons attendant upon Poseidon. These were represented as part men, part fish, and blew shells as trumpets.

Tritonal. Explosive used with great effect as a bomb filling during the later stages of the Second Great War. It is a mixture of T.N.T. and aluminium powder. In the filling process the molten material was used.

Tritonia or **MONTBRETIA.** Genus of bulbous herbs of the family Iridaceae, natives of S. Africa. They have sword-shaped leaves in two rows, clasping at the base, and before flowering they look like delicate forms of gladiolus. The tubular flowers are borne on two-rowed spikes. The most generally cultivated species is the hardy *T. pottii* with orange flowers.

Triumph (Lat. *triumphus*). In ancient Rome, the ceremonial entry into the city of a successful general.

The honour could be granted only by the senate. The general was received at the gate by the senate and magistrates who headed the procession. They were followed by men bearing specimens of the products of the conquered territory, by the chief prisoners taken, walking in chains, and finally by the general in a chariot drawn by four white horses, with his troops marching behind. The procession passed along the Sacred Way to the Capitol, where a sacrifice was offered to Jupiter.

Triumphal Arch. Ornamental archway such as those erected by the ancient Romans to commemorate victories. Of the 38 built in Rome, those of Titus, Septimius Severus, and Constantine still stand, the last two being triple. Roman triumphal arches were often surmounted by a *quadriga* or four-horse chariot. Similar arches were built in other Roman cities in honour of benefactors, or simply to decorate important streets. There are fine examples in S. France, the one at Orange being regarded as the finest in the country. It was restored after 1825. Among modern examples are the arches built or begun by Napoleon in Paris and Milan, the Brandenburg Gate in Berlin, built 1789-93, and in London, the Marble Arch (*q.v.*), the arch on Constitution Hill,

Triumphal Arch of Titus, in the Via Sacra, Rome, celebrating his capture of Jerusalem, A.D. 70

and the Admiralty arch in the Mall. See *Arche de Triomphe*; Arch; Berlin; Lille; Paris; Rimini; Saintes; S. Rémy.

Triumvir. In ancient Rome, member of a commission of three charged with some specific duty, such as repairing temples, coining money, or establishing Roman rule in overseas territories. The most noted Triumvirate was that of Octavian, Antony, and Lepidus, who in 43 B.C. were charged with the duty of "restoring the republic." This was known as the Second Triumvirate, to distinguish it from the private combination of Caesar, Pompey, and Crassus in 60, which, though without an official title, was popularly known as the First Triumvirate. See *Rome*.

Trivandrum. Capital of the union of Travancore-Cochin, India. It contains fine buildings, e.g. the university, the maharaja's palace, and the museum. In the fort are several palaces and a famous shrine, dedicated to Vishnu called the Padmanabha, and a great resort for pilgrims, around which the city has been built. Quilon (Marco Polo's Kailum where the Chinese once had a colony manufacturing porcelain) is 44 m. to the S.E. The port of Trivandrum cannot take large vessels; ships have to lie off shore at anchor. Pop. 128,365.

Trnovo. Alternative spelling of the name of the Bulgarian town entered under Tirnovo.

Tritonia. Flower spike and sword-shaped leaves of the South African herb

Trochee (Gr. *trechein*, to run). In prosody, a metrical foot containing a long, accented syllable followed by a short, unaccented one, as used in *e.g.*

Táll me | nó | in | mó | ún | ful | ná | úm | bers

Troezén. Ancient Greek city. Its ruins lie near the modern village of Damala in Argolis at the N.E. corner of the Peloponnesus. Troezén was the birthplace of Theseus. A Dorian city, it was active in the defence against Xerxes, and was a place of refuge for the Athenian women and children; during the Peloponnesian War it was an ally of Sparta. Hippolytus (*q.v.*) is supposed to have met his death here.

Trogir (Ger. Trau). Town in Dalmatia, Yugoslavia. It is 10 m. W. of Split, on an island in the Adriatic between the mainland and the island of Brač. A republic in the 10th century, it then fell under Venetian sway, and so remained until both it and Venice were added to Austria in 1797. The produce consists mainly of oil, wine, and fruit.

Troglodytes (Gr. *troglē*, cave; *dyein*, to creep into). Tribes of primitive cave-dwellers located by classical writers on the outskirts of the ancient Greco-Roman world. The most renowned inhabited a region (Troglodytica) along the southern Red Sea coast of Egypt. Though they had domesticated cattle, their scanty clothing, use of shell necklaces, and other customs indicated a culture derived from a remoter Stone Age. Those of the N. African coast similarly perpetuated a Palaeolithic past; their caves are still occupied by Libyan communities. *See* Cave Dwelling.

Trogon. Family of tropical birds. Remarkable for their brilliant plumage and often having very long tail feathers, they are native to Africa, S. Asia, and Central and S. America, and include nine genera and many species. The S. American trogons are especially striking, their plumage being mainly metallic green and blood red; their tail feathers are several times the length of the body.

Troilus and Cressida. Play by Shakespeare. The scene is laid in Troy, and the story ostensibly concerns the love of Troilus, son of King Priam and brother of Hector, for Cressida, daughter of a Trojan priest who has gone over to the Greeks and taken her to their camp. Thus far the plot is based on a medieval legend treated in Boccaccio's poem, *Il Filistrato*, Chaucer's *Troilus and Criseyde*, Caxton's *Recuyell of the Historys*

of Troye, Lydgate's *Troy booke*, and a play by Dekker and Chettle. But Shakespeare's play is far more to be read as a cynical commentary on the ideas of romantic love and glorious warfare. He seems to be giving vent to an embittered philosophy in the characters of Therisites, a slave who rails at everybody; Ulysses, who has magnificent speeches on the motives of men; and Cressida's uncle Pandarus, who has given the word *pander* to the language. Composed probably about 1603, and first printed in quarto, 1609, the play contains 3,423 lines, including 2,025 of blank verse, 1,186 prose, and 196 pentameter rhymes. Not often revived, it was played at Stratford memorial theatre in 1936; Westminster Theatre (modern dress), 1938; Regent's Park (open-air), 1946.

Troitska or **TROIKA** (Russ. *troi*, three). Form of sleigh on runners. It is drawn by three horses abreast, and is much used in Russia as a carriage when the roads are snow-bound. The word is also used for a team of three horses. *See* Sleigh.

Trojan War. Name given to the semi-legendary ten years' war between the Greeks and Trojans. Originally caused by the abduction of Helen by Paris, it ended in the defeat of the Trojans and the capture and destruction of Troy. The story probably had its origin in the struggle for supremacy between Greek colonists and the non-Greek early inhabitants of the district. As well as being the basis for immortal epics by Homer and Virgil, it was a favourite subject of the French romance writers, in particular Benoît de Sainte-Maure. *See* Aeneid; Helen; Iliad; Priam.

Troll or **TROLD**. In Scandinavian folklore, a creature sometimes described as a mere unearthly spectre. Sometimes, however, trolls are giants or giantesses possessed of magical and generally maleficent powers. The term is also used of vague beings approximating to the earth-dwelling dwarfs and gnomes. In Icelandic legends the trolls are cannibalistic.

Trolley-bus. Passenger road vehicle, electrically driven by a motor taking its power by trolley-wheel collector from an overhead cable, like an electric tram, the return being made not through rails on the ground but by a second and parallel trolley to a second and parallel overhead cable. The double cable and double trolley are therefore the distinguishing features of a trolley-bus system; but for the rest, the vehicle is fitted with pneu-

matic tyres and is as manoeuvrable as a petrol-driven vehicle. It was developed experimentally in German towns before the First Great War, and several routes were put into operation in the U.K., but after the First Great War trolley-buses rapidly replaced trams in many populated areas where the permanent tracks of the latter were found to contribute to traffic congestion. The change was made to trolley-buses rather than motor-buses because the existing generating stations used for tramways could be retained. One great disadvantage of the trolley-bus system is inherited from tramways, namely, that vehicles cannot be diverted from their routes, and a breakdown at the power station brings the whole system to a standstill. *See* Electric Traction, and *illus.* p. 3001; Tramway.

Trollhätten. Town of Sweden, in the co. or *län* of Göteborg and Bohus. It stands on the Göta river, 45 m. by rly. N. of Gothenburg. The Falls of Trollhätten supply motive power for rolling mills, cellulose factories, machine shops, and foundries. The Göta and Trollhätten canals avoid the six main falls and other smaller rapids. The town covers several islands as well as parts of both banks of the river. Pop. 22,108.

Trollope, ANTHONY (1815-82). British novelist. Born in London, April 24, 1815, he was the third

son of Thomas and Frances Trollope (*v.i.*). Educated at Winchester and Harrow, he entered the postal service in 1834, and in 1841 was transferred to Ireland. His duties there involved much travelling, and there he wrote his first novels. Back in England, he reached a high position in the postal service, his work being mainly that of an inspector, an occupation pleasantly varied with long official journeys to foreign countries and British colonies. He retired in 1867 and died Dec. 6, 1882.

Of Trollope's novels the best known are the so-called Barchester series. This began with *The Warden*, 1855, and was followed by *Barchester Towers*, *Framley Parsonage*, *Dr. Thorne*, and *The Last Chronicle of Barset*. They give a picture, often satirical, of what Trollope supposed life about an English cathedral city to be.

Trollope's gift for drawing characters true to themselves and to life is seen on almost every page, notably in Mrs. Proudie, Mr. Harding, and his son-in-law, Archdeacon Grantly. His other novels include *The Prime Minister*, *The Claverings*, *Orley Farm*, *Rachel Ray*, *The Small House at Allington*, and *The Three Clerks* containing some of his experiences in the civil service. Besides this enormous output of fiction Trollope wrote many books of travel, *Lives of Thackeray and Caesar*, and contributed largely to the reviews and magazines; for some time he edited *St. Paul's Magazine*. He also wrote an *Autobiography*, edited by his son, H. M. Trollope, 1883. This, though interesting, revealed so much of his methodical way of working that his popularity at once declined. The enormous volume of his work is accounted for by the fact that he wrote steadily a fixed number of words every day and was free from sentiment about inspiration and moods. *Consult Life*, H. Walpole, 1927; *Trollope: A Commentary*, M. Sadleir, rev. ed. 1945; *The Trollopes: A Chronicle of a Writing Family*, L. P. and R. P. Stebbins, 1945.

Trollope, FRANCES (1780-1863). British author. Born at Stapleton, Bristol, March 10, 1780, daughter of

J. Trollope
After L. Adams

William Milton, she married in 1809 Thomas Anthony Trollope (1774-1835), with whom she spent 1827-30 in the U.S.A. As a result of this visit she published in 1832 *Domestic*

Manners of the Americans, a book which gave a good deal of offence in the U.S.A., especially in its reference to slavery. Having returned to Europe, she wrote a long succession of novels, including *The Vicar of Wrexhill*, 1837, and *Widow Barnaby*, 1838, until her death at Florence, Oct. 6, 1863. These are all but forgotten, though they enabled her to maintain herself and her family in comfort after her unlucky husband died a ruined man. Anthony Trollope (v.s.) was her third son.

Trombone. Wind instrument, developed from the sackbut (q.v.). It consists of two lengths of cylindrical brass tube, bent so as to render it easy to handle, and having a mouthpiece at one end and a bell at the other. One length of the tube is

the slide, by moving which the player is able to vary the length of the instrument and thus obtain different harmonic series. These variations, seven in number, are called positions. The first is when the slide is not pulled out; each successive position lowers the pitch by a semitone. Owing to the necessary difference in the diameter of the two tubes, and to the unavoidable disproportion between the bore and the varying lengths, correct intonation is not mechanical, but depends upon the efficiency of the performer. Notes actually to be played are written. The trombone is made in three or more sizes: alto in E flat, tenor in B flat, and bass in G or F. The tenor is a 4th higher than the bass. The tone is rich and noble, making the trombone indispensable to a full orchestra.

Tromp, CORNELIUS (1629-91). Dutch sailor. Born at Amsterdam, Sept. 9, 1629, the son of

Martin Tromp (v.i.), he commanded a ship in the expedition to Morocco, 1650, and served against the English in the Mediterranean, 1652-53. He was defeated in the North Sea battle of 1665, and next year was deprived of his commission. This was restored to him in 1673, in which year he took part in the battle of Schooneveld. In 1675 he visited England and was received by Charles II, who made him a baron. Tromp was appointed lieutenant admiral-general of the United Provinces, 1676, and had been given command of an expedition against France when he died at Amsterdam, May 29, 1691, and was buried at Delft.

Tromp, MARTIN HARPERTZON (1597-1653). Dutch sailor. Born at Briel, April 23, 1597, he entered the navy as a boy, rising to admiral at 40. In 1639 he defeated a Spanish fleet off Gravelines, and he served in the campaigns of 1640-41. He was defeated by Blake, May 19, 1652, off Dover, but took revenge on Nov. 29 at the battle of Dungeness, after which, it

is said, he sailed up the Channel with a broom tied to his masthead to symbolise the sweeping of the

seas. This sea-man, often miscalled Van Tromp, was one of the most gallant and successful that the Netherlands produced. In 1653 he encountered the English off Portland, N. Foreland, and Scheveningen, in the last of which engagements he was defeated by Monk, losing thirty men-of-war, and was killed by a bullet through the heart, July 31. He was buried at Delft. His *Journal* was trans. and ed. C. R. Boxer, 1930.

Tromsø or **TROMS.** Amt or co. of Norway. It lies in the N. of the peninsula, between Finmark and Nordland, and has a deeply indented fjord coast flanked by Senjen, Ringvassø, and numerous smaller islands. Fishing is the chief occupation. There are settlements of Lapps. Area 10,005½ sq. m. Pop. 113,229.

Tromsø. Seaport of N. Norway. Within the Arctic Circle, on the island of Tromsø, it is the chief port for Spitsbergen, and the seat of a bishopric. Despite its lat., 69° 50' N., it has a relatively mild climate. The chief industry is fishing. Boats and ships are built, ropes and nets made. The town dates from 1250. Pop. 10,785.

Tromsø first figured in the Second Great War as the port to which the U.S. steamer *City of Flint* (q.v.) was taken by a prize crew from the German pocket battleship *Deutschland* on Oct. 21, 1939. In the early stages of the German invasion of Norway, it was the base of the British aircraft carrier *Furious*. After occupation by the Germans, the port was developed as a seaplane base, whence air attacks were delivered on Allied convoys to Murmansk. On Nov. 12, 1944, British bombers sank the battleship *Tirpitz* (q.v.) at anchor in Tromsø Fjord.

Tron or **TRONE.** Obsolete Scottish standard of weight. The name is derived from the post supporting

Martin Tromp,
Dutch sailor
After Elzevens

Cornelius Tromp,
Dutch sailor

Trombone. Tenor instrument
in B flat

Courtesy of Boosey & Hawkes

the balance of the town scales set up in market places for weighing wool, cheese, butter, etc. The tron lb., nominally of 20 oz., ranged from 21 to 28 oz., according to the usage of the several market towns. The tron stone contained 16 lb. The word survives in Trongate, Tron Steeple, and Tron Church, Glasgow.

Trona. Native form of hydrated basic carbonate of soda known to the ancients as nitrum.

Trona is found in saline residues in Egypt, Mexico, California, and S. America.

Trøndelag. This region in the middle of Norway is described under the Norwegian names of the two counties composing it, Nord-Trøndelag and Sør-Trøndelag.

Trondhjem OR TRONDHEIM. Third city of Norway, seaport, and principal town of Sør-Trøndelag. It is situated at the mouth of the river Nid, on Trondhjem Fjord, 240 m. direct and 350 m. by rly. N. of Oslo. A fort crowns the hill of Christianssten, and a second is on the neighbouring islet of Munkholm.

Trondhjem was founded in 997 when Olaf Trygvesson built a palace. The cathedral, founded by Olaf Kyrre in the 11th century, is the most imposing church in Norway. It was built over the tomb of S. Olaf, and has a Gothic nave and choir with a Romanesque transept. Frequently damaged by fire, it has been rebuilt, added to, and restored. Since 1818 it has been the place of coronation of the kings. Notable buildings are an arsenal in the old Kongsgaard, the museums of the society of sciences, of art, industry,

Trondhjem, Norway. The port, which became an important German U-boat base during the occupation of Norway in the Second Great War. Left, the 11th century cathedral

and of fisheries, and the Stiftsgaard. Wood pulp and tobacco factories, sawmills, machine shops, shipyards, and fish-curing factories provide most of the employment, while timber, copper ore from the Rörös mines, fish, train oil, wood pulp, and cordage are the chief exports. Pop. 56,444.

Trondhjem was occupied by German troops on April 9, 1940, the first day of the invasion of Norway. The port was bombed by the R.A.F. in June, when two cruisers and a transport were hit. A U-boat base, its heavily protected pens and workshops were the targets for frequent Allied air attack; the German cruiser Prinz Eugen (*g.v.*) was seriously damaged here by the R.A.F. while undergoing repairs. In 1942 a sermon by the dean of Trondhjem against collaborators led to the mass resignation of the Norwegian clergy as a protest against the German appointment of Quisling as premier. Trondhjem was liberated with the arrival in Norway of Allied forces on May 10, 1945, after the German surrender.

Trondhjem Fjord. Inlet of the Atlantic Ocean on the coast of Norway. It runs inland about 80 m. to Stenkjaer, and, owing to the warm Atlantic drift water, is never frozen over.

Troon. Seaport and urban dist. of Ayrshire, Scotland. Situated 9 m. S.W. of Kilmarnock, with a rly. station. It is a popular resort and residential town for Glasgow. The harbour, which is well sheltered and can accommodate large vessels, contains dry docks and shipbuilding and rope-making yards. Coal is exported. Pop. 10,271.

Troop (late Lat. *truppa*, crowd). In the military sense, the fourth part of a squadron of cavalry or armour; if the former, it consists

of 40 horses and men, if the latter, of four tanks or armoured cars. Cavalry or armoured troops are usually commanded by a captain, and privates in such units are called troopers. In British artillery regiments the troop is the smallest self-contained firing unit, generally of four guns. The plural, troops, is a synonym for soldiers. A variant of the word is troupe, a company of actors or circus performers.

Trooping the Colour. British military ceremony, described under Colour, Trooping the.

Troopship. Sea-going vessel engaged in carrying troops. The British govt. maintains a few ships specially built for this purpose, but when large numbers of troops have to be moved in wartime, it is customary to requisition privately owned vessels such as passenger liners. These are generally called transports.

Tropacocaine. Alkaloid obtained from Java coca and also prepared synthetically. It is a powerful anaesthetic and is used in place of cocaine, over which it has the advantage of being more stable in solution; also the solution can be sterilised by boiling. Tropacocaine is used for operations on the eye and for intraspinal anaesthesia.

Tropaeolum. Annual and perennial plants of the family Tropaeolaceae. They are natives of S. America, introduced into Great Britain in 1596. They are all easy of culture in any ordinary garden soil, the best-known species being the popular nasturtium, *T. majus*, with its dozens of brightly coloured garden varieties, and the canary creeper, *T. peregrinum*. See Indian Cross.

Trope (Gr. *tropos*, turn). In rhetoric, a deviation from the plainest form of speech for the sake of greater effect. The ancient rhe-

toricians restricted the use of the term to the substitution of one word for another, as in metonymy, metaphor, and synecdoche; but it is now generally applied to all figures of speech whose form is intentionally more than usually striking, including antithesis, apostrophe, asyndeton, epigram, hyperbole, innuendo, irony, litotes, or meiosis, and polysyndeton. *Pron.* troap.

Trophy (Gr. *tropē*, defeat). Originally, a memorial of victory dedicated to Zeus by the Greeks after a successful battle. It generally consisted of the trunk or branch of a tree, upon which were hung captured weapons and other spoil. This developed later into a monument in metal or stone with symbolical statues and bas-reliefs.

Tropical Diseases. Illnesses due to infection by parasites, animal or vegetable, which are either confined to hot countries or occur only exceptionally in temperate and cold countries. Research in tropical medicine is pursued in laboratories and hospitals all over the world, and special training is given in such institutions as the London School of Tropical Medicine and Hygiene. See Bilharziasis; Cholera; Delhi Boil; Dengue; Dysentery; Framboesia; Kala-Azar; Leprosy; Malaria; Plague; Yellow Fever.

Tropical Year. Period between two successive vernal equinoxes, i.e. between two successive passages of the sun across the first point of Aries. Its length, 365 days, 5 hrs., 48 mins., 46 secs., is shorter than the sidereal year because of the precession of the equinoxes. The tropical year is that of ordinary chronology and the Christian calendar, as it ensures that seasons recur at the same dates.

Tropic Bird (*Phaethon*). Group of marine birds, including about six species, which rather resemble large terns. They are swift fliers and are notable for two long feathers in the tail. The general colour of the plumage is white, more or less barred and marked with black.

Tropics. Two parallels of latitude, one $23\frac{1}{2}^{\circ}$ N. and the other $23\frac{1}{2}^{\circ}$ S. of the equator. The name is also given to that part of the earth's surface lying between these lines. If the axis of the earth were exactly at right angles to the plane of the ecliptic, the sun would never be seen overhead at noon except at the equator. It is because the earth's axis is tilted that the sun appears to migrate

into the N. hemisphere in the N. summer and vice versa.

The most northerly limit of the sun's migration is reached on June 21, when it is seen overhead at the tropic of Cancer, the parallel of latitude $23\frac{1}{2}^{\circ}$ N. of the equator. On Dec. 21 the southern limit, the tropic of Capricorn ($23\frac{1}{2}^{\circ}$ S.), is reached. The words Cancer and Capricorn are used because in June the sun appears to enter the constellation of Cancer, and in Dec. that of Capricorn. Between the tropics lie the great equatorial forests, tropical grasslands, and hot deserts. See Equator.

Tropine. White crystalline basic substance, $C_8H_{15}ON$, formed when atropine is boiled with baryta water. See Atropine.

Troposphere. Term first applied by Teisserenc de Bort to the lowest region of the atmosphere, where the temp. normally falls with increase of altitude. This lapse rate of temp., taken as positive for an upward decrease, is slightly greater in summer than in winter and has a mean value of approx. 3° F. per 1,000 ft. Diurnal variation of temp. is confined to the surface layers, disappearing between 3,000 and 6,000 ft. The tropopause, or upper limit of the troposphere, varies with atmospheric conditions and lat.; on the average, in lat. 50° it is 6-7 m. above sea level. Since the lapse of temp. is continued up to the level of tropopause a high tropopause corresponds to a low temp. in the lower stratosphere (the region above the troposphere) and vice versa. This temp. lapse is of fundamental importance in determining the vertical stability of the atmosphere. A negative lapse is termed an inversion. Nearly all

clouds, and certainly all weather phenomena and precipitation, are confined to the troposphere. See Stratosphere; Temperature.

Troppau. Town of Czechoslovakia, its Czech name being Opava. It is better known in Europe by the name it bore as part of the Austrian empire. It stands on the Oppa, 27 m. N.E. of Olmütz (Olomouc), and thus was in the territory annexed by Germany in 1938. The buildings include the church of S. Mary, a Gothic edifice of the 15th century, and the chief industries are making woollens, clothing, and machinery. It was founded in the 13th cent. Pop. 30,105.

The congress of Troppau was a conference of representatives of five European powers held Oct.-Nov., 1820, which met at the instigation of Metternich to discuss the affairs of Naples, where a revolution had just taken place. Austria, Russia, and Prussia signed a protocol threatening any state which, like Naples, changed its form of govt. by revolutionary means with exclusion from the European concert and, if other states were disturbed by such proceedings, with armed force. Great Britain, but not France, protested. The conference adjourned to meet at Laibach (*q.v.*), 1821.

Trossachs, THE (Gael, bristling country). District of Perthshire, Scotland. It lies in the parish of Callander, and is a mt. pass stretching W. from Loch Achray to Loch Katrine, dominated by Ben Venue, 2,393 ft., and Ben A'an, 1,850 ft. The rough steep sides of the hills are thickly wooded. The dist. is associated with Scott's Lady of the Lake, and many tourists visit the picturesque scenery of

Trossachs, Scotland. Ben Venue seen from across Loch Achray, from which it rises 2,393 feet

Trossachs, Scotland. The road through the pass, one of the most picturesque districts of Scotland

the defile. See Achray, Loch; Ben Venue; Callander; Lomond, Loch; Perthshire.

Trotsky, LEON (1877-1940). Name assumed by the Russian Bolshevik leader Lev Davidovich

Leon Trotsky, Russian Bolshevik leader

Bronstein. Son of a Jewish chemist, he was born in the Kherson government and educated at Odessa. In 1899 he was arrested at Odessa as a member of the S. Russian

workmen's league, and banished to Siberia for four years, but escaped in the third year of his exile, and joined Lenin in London. During the attempted revolution in Petrograd, 1905, he was president of the Petrograd council (soviet) of workmen, was again arrested, and banished to Siberia, the sentence being for life. Within six months he escaped, and for some years lived in France, Switzerland, and elsewhere, supporting himself by journalism.

At the outbreak of the First Great War Trotsky was in Paris, where he edited a Russian Socialist paper. He was expelled from France in 1916, and was for a time in New York. After the March Revolution of 1917 he set out for Russia, was arrested by the British authorities at Halifax, but ultimately allowed to proceed. He joined Lenin, and was a chief protagonist of the successful revolution of Nov., 1917. On Nov. 8 he, with Lenin, seized the reins of government and established the council of the people's Commissars,

Lenin being its president, and Trotsky commissar for foreign affairs. In 1918 he became commissar for war, holding this post until 1925. With the death of Lenin in 1924 Trotsky's influence declined, and Stalin gradually ousted him from all his posts. In 1927 he was expelled from the party, and in 1929 he left the country. Later he lived in France, and in 1937 settled in Mexico. Attacked on Aug. 20, 1940, by one Jason-Mornard, Trotsky died in Mexico City the following day. His *History of the Russian Revolution, 1929-30*, is a book of outstanding value. See Bolshevism; Russia; Soviet.

Trotting. Form of horse-racing. In modern trotting races the horse is driven in a sulky having two bicycle wheels 28 ins. in diameter with pneumatic tires; this racing machine weighs only about 25 lb. Races are run in heats, and a horse has generally to win three heats to be declared the winner of a race. The ideal trotting-ground is an oblong-shaped track with rounded ends, either half a mile or a mile in circumference, and the record time is a little under two minutes for a mile. Mud tracks are most prevalent in America.

Horses have two styles of trotting gaits—trotting proper, in which the off fore and near hind legs strike the ground simultaneously; and pacing, in which action the two legs on the same side act together.

Trotwood, BETSEY. Character in Dickens's novel *David Copperfield*. She is David's paternal aunt, who becomes a second mother to him. Though she masks her kindness of heart behind an abrupt, uncompromising exterior, she is a woman of character, humour, and real sense, she is one of the few sympathetic persons among the author's female eccentrics. Her home is on the cliffs at Dover, where she wages perpetual war with donkey-boys.

Troubadour. (Prov. *trobador*, from *trobar*, to invent). Name given to a class of medieval poets, chiefly

Troubadour accompanying himself on a fidel

From a 14th-century sculpture, church of St. Denis, Paris

increasingly artificial. Among the kinds of poem they cultivated were the *canzone* (q.v.), the *sirventes* or service song, the *alba* or dawn-song, the *planh* or lament, and the *tenson* or dispute. They usually accompanied themselves on the fidel, a five-stringed instrument played with a bow, somewhat resembling the later viol.

The troubadours were often men of good social position. They exerted a remarkable social and political influence. Their lyrics were mainly addressed to married ladies, who were the objects of a conventional devotion expressed in extravagant language, but this cult was of great importance in developing the chivalrous and romantic conception of love, and refining the relations of the sexes. The troubadours also made poems in praise of their lords, and some chose political, elegiac, satirical, and religious themes. Among the most eminent were Bernard de Ventadour, Bertran de Born, and Marcabrun. There were also troubadours in Italy and N.E. Spain; the German Minnesingers (q.v.) owed much to them, and

Trotting. A race in progress at Goshen, New York. The light bicycle-wheel carriage has a weight of only about 25 lb.

their influence on the later poetry of Europe was far-reaching. About 400 troubadours are known, and several medieval collections of biographies exist.

Troubridge, SIR THOMAS (c. 1758-1807). British sailor. Commissioned in the frigate *Seahorse*, as Nelson also was, in 1773, he served in the E. Indies. Captured by the French in 1794, he was freed as a result of the Glorious First of June, and in command of the *Culloden* he fought at the battle of St. Vincent, 1797. He was made a baronet in 1799 and was lord of the Admiralty, 1801-04. Next year he hoisted his flag in the *Blenheim* and sailed for the E. Indies. The *Blenheim* was lost off Madagascar in Feb., 1807, and the admiral was presumed drowned.

His great-grandson, Vice-Admiral Sir Thomas Troubridge (1875-1949), commanded H.M.S. *Nelson* and the aircraft-carriers *Furious* and *Indomitable* in the Second Great War, serving in Norwegian, Madagascan, Mediterranean and N. African operations. He was 5th sea lord (air) 1945-47.

Trough. Originally, a depression between two ridges, e.g. the space between the crests of two waves. By extension, a trough in meteorology means a region of low pressure on the weather map.

Trousers (Fr. *trousses*, bundles, breeches). Masculine garment, covering the lower part of the body and legs to the ankles. Worn in ancient times by the nations of N. and Central Europe, as well as the Phrygians and Persians, they were occasionally used in Rome from the 2nd century. Beau Brummel is said to have introduced trousers into England. The type worn in the days of the Regency was fastened to the foot by a strap passing under the instep. The trend of fashion since then has been towards a wider and looser style, seen in its most exaggerated form

in the so-called "Oxford bags" of the 1920s. The fashionable centre "crease" was introduced in the 1890s. Various types of employment called for special types of trousers, e.g. the corduroys of the navy, often looped up by straps below the knee, and the wide-bottomed trousers of sailors, easy to roll up. From about 1912 the trousers of lounge suits were made with the ends permanently "turned up." Trousers have frequently been made of a different material from the coat and vest to form a contrast. Between the two Great Wars, women began to wear trousers, or "slacks," on informal occasions or for work. See Breeches; Costume; Pyjamas; Sansculottes.

Trout (*Salmo fario*). Fresh-water food fish of the family Salmonidae. It is a native of the rivers that flow into the N.E. Atlantic, the Mediterranean, Caspian, and Black Seas. It has a rather short and compressed body, a small well-shaped head with blunt conical snout, and is clothed with rounded scales marked with concentric lines of growth. The colour of the upper parts is a greenish brown, paling below to a dirty white. The dorsal fin is nearly central, and as in the salmon (*q.v.*) there is a small appendage (adipose fin) of fatty tissue between the dorsal and the tail fins. On the lower side are a pair of pectoral or breast fins just behind the gill covers, a ventral fin below the hinder edge of the dorsal, and the anal fin below the adipose. Head and sides, as well as back and tail fins, are dotted with round or X-shaped black spots.

Trout in size and weight vary considerably in different streams or in the upper and lower reaches of the same stream. Corresponding differences are found in the flavour and the colour of the flesh. Average length is a foot and weight from $\frac{1}{2}$ lb. to 2 lb., but there are numer-

ous records of trout weighing 12 or more lb.; and one taken in Loch Stenness, Orkney, measured 3 ft. 2 ins. and came to 30 lb.

Trout. Common or brook variety found in European streams and rivers

Owing to the great variability of the trout, systematists have given species names to over 20 forms, but modern authorities incline more to the view that most of these are either local races or inconstant variations found in immature or poorly fed fish. Trout live in running, clear streams, or in the lakes from which such streams originate. Like salmon, they seek the shallow upper waters for spawning, and in these journeys—performed in autumn—they will leap out of the water in order to pass over weirs and small waterfalls. The female begins to breed when 7 or 8 ins. long, and deposits her eggs under stones or in excavated gravel much as the salmon does. At this season trout become black and shiny and unfit for food; they do not recover condition until late in spring. Their food consists of crustaceans, insects, snails, worms, the eggs of salmon and other fishes, and small fishes. The common trout is sometimes known as brown trout, river trout, and by other names. The salmon or sea trout is sometimes considered distinct on account of its larger size and its migrations to the sea. See Angling; Bull Trout; Fly Fishing; consult also A History of Fly Fishing for Trout, J. W. Hills, 1921; Trout-Fishing on Hill Streams, R. Clapham, 1947.

Trouvère (Fr. *trouver*, to discover). Name for a class of courtly lyrical poets of the Middle Ages in N. and central France and England. Most of the trouvères, who first appeared about 1140, were imitators of the troubadours, but wrote in the *langue d'oïl*, and confined themselves to amatory subjects. See Troubadour.

Trouville. Town of France, in the dept. of Calvados. It lies at the mouth of the Touques, on the right bank, 10 m. S. of Havre, with Deauville (*q.v.*) on the left bank, the two forming practically one town. It is 132 m. by rly.

Trout. Varieties of artificial flies used in dry-fly fishing. Left to right: top row: Greenwell's Glory; March Brown (female); Cooch-y-Boddu; Welshman's Button; Sedge; bottom row: Spent Gnat; Black Zulu; Ten Black; Green Midget

from Paris, and a boat service runs to Havre. Fishing is carried on from the small harbour. A fashionable summer resort, it owes its fame to the number of French artists and men of letters who frequented it. In German occupation from June, 1940, Trouville was liberated Aug. 24, 1944, by Belgian troops of the British 2nd army, who had reached the town Aug. 22.

Trovatore, *Lt.* (It., *The Troubadour*). Opera in four acts with libretto by Cammarano, and music

church of S. James, restored in 1546 and 1848, contains interesting monuments, including that of George Crabbe the poet, who was rector here, 1813-32. The town hall, with a lofty clock tower, is partly Elizabethan, and contains the sessions court. The principal industry is woollen manufacture, established since the early 16th century. Market days, Tues. and Sat. Pop. 14,000.

Trowbridge arms

from Homer's Troy lay in its control of the Dardanelles outlet of the Black Sea trade. Hence the Trojan plain became a mart for exchanging the produce which converged along four trade routes, traversing the Thracian coast, the S. coast of the Euxine, the Phrygian hinterland, and the island route from Lycia. The fall of Troy opened the Euxine to Greek trade and colonisation, weakened the Lycian supremacy, and made Greece paramount in the Aegean. Influenced by its former greatness, Constantine chose it as the site of New Rome; the abandonment of this project in favour of Byzantium sounded for ever the death-knell of Priam's ancient heritage. See Aegean Civilization; Archaeology; Homer; Iliad; Priam; consult also Schliemann's Excavations, C. Schuchhardt, trans. E. Sellers, 1891; Troy, A Study in Homeric Geography, W. Leaf, 1912; Dawn of European Civilization, V. G. Childe, 4th ed. 1947.

Troy. Ancient city in Asia Minor. Immortalised in Homer's Iliad as Priam's citadel, whose capture was the objective of the Trojan War, its site was disputed even in antiquity. It was finally identified in 1893 by W. Dörpfeld's excavations, completing H. Schliemann's in 1870-82, on the ruin-mound of His-

sarlik, 162 ft. high, and $3\frac{1}{2}$ m. from the Dardanelles mouth.

The excavations, at first somewhat ruthless and unsystematic, ultimately revealed nine superimposed layers of debris. (1) A small Neolithic settlement of hut-dwellers built rough stone walls on the virgin rock, used stone implements, and produced primitive hand-made pottery. (2) A more advanced stronghold of the early Metal Age had gated walls and towers of cyclopean masonry, with sun-dried brick houses of early Aegean type. Thrice rebuilt, the traces of fire on the topmost level led to its being called the burnt city. It yielded an extraordinary hoard of silver jars, gold daggers, and diadems, hailed at first as Priam's treasure. (3-5) Three successive occupations were hardly more than village farmsteads.

(6) Upon these pre-Mycenaean foundations arose about 1500 B.C. a substantial citadel, covering five acres, with massive gated walls of ashlar, wells, brick houses, and painted pottery of the Mycenaean Age. This was long thought to be the scene of Homer's Troy, but the American excavations begun

in 1932 showed that it was destroyed by earthquake about 1300 B.C. (7a) The Homeric city, which came to a violent end in the 12th century B.C. (7b) A settlement of European intruders, ushering in the early Iron Age. (8) After the visit of Alexander the Great the debris of Priam's city was removed from the summit, and New Ilium arose. Strengthened by Lysimachus, and enriched with Hellenistic sculpture, it was destroyed by the Roman legate Fimbria in 85 B.C. (9) Julius Caesar's visit led to its rebuilding, with a temple of Athena and there Greco-Roman features.

The strategic importance of Homer's Troy lay in its control of the Dardanelles outlet of the Black Sea trade. Hence the Trojan plain became a mart for exchanging the produce which converged along four trade routes, traversing the Thracian coast, the S. coast of the Euxine, the Phrygian hinterland, and the island route from Lycia. The fall of Troy opened the Euxine to Greek trade and colonisation, weakened the Lycian supremacy, and made Greece paramount in the Aegean. Influenced by its former greatness, Constantine chose it as the site of New Rome; the abandonment of this project in favour of Byzantium sounded for ever the death-knell of Priam's ancient heritage. See Aegean Civilization; Archaeology; Homer; Iliad; Priam; consult also Schliemann's Excavations, C. Schuchhardt, trans. E. Sellers, 1891; Troy, A Study in Homeric Geography, W. Leaf, 1912; Dawn of European Civilization, V. G. Childe, 4th ed. 1947.

Troy. City of New York state, U.S.A. Capital of Rensselaer co., it extends 7 m. along the Hudson at the head of navigation, and is 6 m. N.E. of Albany. Communications are provided by several rlys. and the state barge canal. The Rensselaer Polytechnic Institute is one of the finest institutions of its type in the U.S.A. Important manufactures are shirts, collars, and cuffs, a detachable collar having been invented by a Troy housewife in 1825. Other manufactured articles include laundry machinery, stoves, and ventilators. Settled in 1659, Troy was chartered as a city in 1816. One of the U.S. earliest labour unions was started here in 1868. Pop. 70,304.

Troyes. City of France. It stands on the left bank of the Seine 103 m. S.E. of Paris, being the capital of the dept. of Aube. The chief building is the cathedral of S.

Trowbridge, Wiltshire. Market Hall and, left, the Town Hall with its clock tower, 101 ft. in height
Frith

by Verdi. Based on a lurid story of a gipsy's vengeance in medieval Aragon, it contains much descriptive and lyrical music. First produced at Rome, Jan. 19, 1853, it became immediately popular and was later one of the standard works in Italian operatic repertory. It was first given at Covent Garden, May 17, 1855.

Trover (Fr. *trouver*, to find). English legal term. Form of action from which the action for conversion developed. Originally an action of trover could be brought where one person found goods lost by another and converted them to his own use. Soon the losing and finding became mere fictions, and trover was used wherever one person converted the goods of another, as by doing any act in relation to the goods which amounted to a denial of the title of the true owner. A person who sells goods which he has on hire purchase may thus be sued for conversion.

Trowbridge. Urb. dist. and market town of Wiltshire, England. It is 11 m. S.W. of Devizes, has a rly. station, and is served by a canal. The fine Perpendicular

Peter, a 13th century building, famous for its choir and other objects of medieval art. The city has other fine old churches, notably those of S. Urban, S. John, S. Nicholas, and La Madeleine, each with notable decorations, glass, or relics; some suffered bomb damage in the Second Great War. The abbey of S. Loup is now a museum and library, while the buildings of another abbey are used by the municipality. Secular buildings include the hôtel de ville and the

Troyes, France. West front of the cathedral of S. Peter, completed, except for the S. tower, in the 16th cent.

Hôtel Dieu (also slightly damaged). There are a number of fine old houses. The chief industry is the manufacture of hosiery, and there is a trade in wine. It was the seat of a bishop about 400, and in the Middle Ages one of the richest cities in Champagne, famous for its fairs. Pop. 58,805. *Pron.* Trwa.

Troyes, TREATY OF. Name given to two treaties between England and France. The first was concluded May 21, 1420, between Henry V of England, Charles VI of France, and the Burgundians. By its terms Henry gave up the title of king of France, but was to marry Charles's daughter, Catherine, have the title of regent and heir of France, and succeed to the throne of France on Charles's death. Normandy and all Henry's conquests were to be restored to France on Henry's accession to the French throne. The dauphin was to be disinherited. The second treaty was signed in 1564, after the English surrender of Havre. By it France undertook to pay England 120,000 crowns and free trade was to be allowed between the two countries.

Troyon, CONSTANT (1810-65). French painter. Born at Sévres, Aug. 28, 1810, he studied under

Riocreux, keeper of the porcelain factory, and Poupert, exhibiting at the academy from 1833. At first purely a landscape painter, he began about 1849

Constant Troyon, French painter

to introduce animals into his works, and became one of the greatest animal painters. Closely associated with the Barbizon group, he obtained substantial material reward, though he died insane in Paris, Feb. 21, 1865. He is well represented in the Louvre.

Troy Town. Name given to Fowey, Cornwall, in the fiction of Sir A. Quiller-Couch (*q.v.*). The name first appeared in *The Astonishing History of Troy Town*, 1888, but was later used in other of his novels and short stories. While it purported to be a fictitious town, the disguise was thin, and its identity with Fowey was soon assumed.

Troy Weight. Measure used in the U.K. Introduced probably from Troyes, France, early in the 15th century, it was legalised as standard for weighing gold and silver in 1527. By an Act of Henry VIII the weight of the pound troy was fixed at 5,760 grains. But by the Act of 1878 troy weight was abolished with the sole exception of the troy ounce, its decimal parts and multiples, to be used for the sale of gold, silver, platinum, and precious stones. The ounce was divided into 20 pennyweights, each of 24 grains. *See* Weights and Measures.

Truancy (Welsh *truau*, wretched). Absenting oneself from school without permission. Under the Education Acts for England, a parent is held *prima facie* responsible for his children's attendance at school, and the education authority may serve on the parent a school attendance order in respect of a child.

Truce (A.S. *treow*, compact). Term used for a suspension of hostilities, usually for a definite time. In the Middle Ages truces were frequently made for periods of years. A flag of truce is carried by those who are sent to an enemy to ask for a cessation of hostilities. *See* Armistice; White Flag.

Truce of God. In medieval times, the prohibition by the Church of hostilities during certain specified times with sacred associations. Thus it was forbidden to wage war from Thursday evening until Sunday evening, on certain

feast days, and in Advent and Lent. The first proposal for a truce of God was made at the council of Charroux, 989, and during the 11th century it was widely observed in France, Italy, and Germany. Penalty of excommunication for breach of the truce was later imposed.

Trucial Sheikhs. Rulers of seven Arabian sheikhdoms occupying 400 m. of the coast of the Persian Gulf between Sha'am and Khor el Odeid, formerly called the Pirate Coast, now known as the Trucial Coast. From 1820 Great Britain ensured the suppression of piracy and the slave trade here. Pop. est. 95,000 (10,000 nomads).

Truck Act. This Act of the U.K. (1831) made it illegal for an employer to pay workmen for their services in goods instead of cash.

Trueba y la Quintana, ANTONIO DE (1821-89). Spanish novelist and poet. Born at Sopuerta in Biscay, Dec. 24, 1821, he abandoned commerce for journalism and literature, and wrote a series of sentimental tales, historical novels, and songs. His works include *El Cid Campeador*, 1861, and *Cuentos Campesinos*, 1865. Trueba died March 10, 1889.

True Case. British murder trial. On March 6, 1922, Ronald True (b. 1891) battered to death Gertrude Yates, known as Olive Young, in her flat at Fulham, S.W. London. He was arrested that evening in a theatre at Hammer-smith. True, whose record was coloured by megalomania, a persecution complex, and addiction to drugs, had told acquaintances that he would kill somebody in a Fulham flat on the day in question; he stayed in the flat with the corpse until after the charwoman arrived; so there could be no plea of not guilty, and at the trial before Mr. Justice M'Cardie on May 1-5, Curtis-Bennett defended him on the ground of insanity. The jury convicted, and an appeal was dismissed; but in view of medical testimony that True was certifiably insane, the Home secretary, acting on the Criminal Lunatics Act, 1884, appointed a medical commission to examine him. Their report unanimously confirming this evidence, True was sent to Broadmoor. Popular indignation at this reprieve, in view of the recent execution of Jacoby (*q.v.*), was such that the Home secretary made a speech in the commons to prove that he could not legally have acted otherwise than he did.

Truffle (*Tuber aestivum*). Underground edible fungus, belonging to the Ascomycetes (*q.v.*), and the

family Tuberaceae. The spore-bearing body is potato-like, irregularly round, with a blackish-brown exterior covered with hard warts. The interior flesh is at first white,

Truffle. The underground fungus eaten as a delicacy. Inset, section

then brown, with irregular cavities in which the large netted spores are produced. Its taste is rather insipid, and the smell suggests yeast. Truffles occur just below the surface of the ground in woody places. As there is no above-ground indication of their presence, pigs and dogs are trained to hunt for truffles by scent. The famous Périgord truffle is a distinct species (*T. melanosporum*).

Trujillo. State of Venezuela, touching Lake Maracaibo on the W. Its capital has the same name and is on the Trans-Andean highway, about 45 m. E. of the lake port of La Ceiba. The state is one of the leaders in output of Venezuelan cocoa, and near the capital coffee, sugar, maize, and tobacco are also grown. There are flour mills and a refrigeration plant. Pop., state, 264,270; town, 18,254.

Trujillo (Lat. Turrís Juli). Town of W. Spain, in the prov. of Cáceres, Estremadura. It is situated in a mountainous dist., 24 m. E. of the city of Cáceres on the main road from Madrid to Portugal, and 44 m. by road S. of the rly. station of Navalmoral. The tomb of Pizarro, conqueror of Peru, born at Trujillo, is in the church of Santa Maria de la Concepción. Among Roman ruins in the neighbourhood is the Tower of Julius. Chocolate, linens, pottery, and leather are manufactured, and there is trade in wheat, wine, oil, and fruit. Pop. 15,000.

Trujillo or **TRUXILLO.** Seaport of N. Honduras. It stands on the Caribbean coast, 137 m. N.N.E. of Tegucigalpa. It was founded in 1523, and was for a time a flourishing port and capital of the republic. Trade has revived with the export of bananas to the U.S.A. Pop. 7,547.

Trujillo or **TRUXILLO.** City of N.W. Peru, capital of the prov. of Libertad. It is 320 m. N.W. of Callao, 1½ m. from the coast, with rly. connexions to its port, Salaverry, and to Huanchaco. The 17th century walls still stand, and the chief buildings are the cathedral, the university, and a seminary. Sugar, rum, tobacco, and coffee are the principal products. The ruins of the Inca city, Gran Chimú, are in the vicinity. The city was founded in 1535 by Pizarro (born at Trujillo, Spain) and was destroyed by earthquake in 1619. Pop. 30,000.

Trujillo. Cap. of the Dominican Republic. See Ciudad Trujillo.

Truk. Island in the Pacific Ocean. One of the Caroline group, it was in German possession 1889-1914, when Japan occupied it. It was later placed by the League of Nations under Japanese mandate. Contrary to the terms of the mandate, Japan developed Truk into a strong air and naval base. For its part in the Second Great War, see Caroline Islands. With other Japanese mandated islands it was placed under U.S. administration by the U.N., 1947.

Trullan Councils. Name given to two church councils held in Constantinople (now Istanbul) in 680 and 692. The name is derived from the *troullos*, or domed hall, in the imperial palace where they were held. The first was the 6th oecumenical council, which condemned the Monothelite heresy. The second, also called the Quinisext council, was not acknowledged by the Western Church. It issued 102 canons, and permitted the marriage of priests.

Truman, HARRY SHIPPE (b. 1884). Thirty-second president of the U.S.A. Son of a horse dealer, he was born at Lamar, Mo., May 8, 1884, and brought up as a farmer. He had a high school education and served on the Meuse-Argonne front in the First Great War. A Democrat, after being road overseer, tax collector, postmaster, he was appointed county court judge in 1922 (all these appointments being political in the U.S.A.). He studied law at Kansas City 1923-25, and was a presiding judge 1926 until elected to the senate for his native state in 1934; he was re-elected in 1940. The political corruption in Missouri at that time never touched Truman personally. But he did not forget that he owed his career to "Boss" Prendergast; and, when that politician died after serving a term of imprisonment, Truman, al-

though by then vice-president, attended his funeral. During his first term as senator, Truman served on a committee appointed to investigate rlys.; in 1941 he was made chairman of a special committee examining national expenditure which, after the U.S.A. became involved in the Second Great War, exercised a powerful check on waste and corruption in the carrying out of war contracts.

Chosen to run for the vice-presidency with Roosevelt in his fourth candidacy, Truman succeeded to the presidency on Roosevelt's death, April 12, 1945. The oath was administered to him in the name Harry Shippe, but he responded Harry S. After Germany's surrender, he represented his country at the Potsdam Conference (q.v.), July-Aug., 1945. He gave the order to drop the first atomic bomb on Hiroshima, Aug. 6, and announced its use to the world from the White House 16 hrs. after it had fallen.

Harry S. Truman, President of the U.S.A.

Truman had pledged himself to carry out his predecessor's domestic and foreign policies; but his pronouncements and actions as president-by-chance were marked by changes of mind which created national and international uncertainty in a critical period and led his own party in 1948 to seek feverishly, but in vain, for some other "strong" presidential candidate. Against the forecast of all political experts and public opinion polls he was elected president in Nov., carrying 28 states with 304 seats in the electoral college against T. E. Dewey's 16 states with 189. Truman won in spite of a revolt against the Democratic party in four southern states over his call for full civil rights for all U.S. citizens, the loss of New York state (carrying 47 electoral seats)

to the Republicans, and a poll of less than 50 p.c., though a low poll usually favours the Republicans. The popular vote for Truman was 23,667,727. See N.V.

Trumbull, JONATHAN (1710-85). American patriot. Born at Lebanon, Conn., Oct. 12, 1710, and

educated at Harvard, he studied theology and law and held various posts in the legislature of his state, of which he was governor, 1769-83. He was the intimate friend and valued counsellor of Washington, whose frequent remark, "Let us hear what brother Jonathan has to say," is supposed to have been the origin of the popular nickname for the American people. Trumbull died at Lebanon, Aug. 17, 1785. His son John (1746-1843) was a distinguished painter.

After John Trumbull

Trumper, VICTOR THOMAS (1877-1915). Australian cricketer. Born at Sydney, Nov. 2, 1877, he played for New South Wales and represented Australia in test matches against England and South Africa. During the Australian tour of 1902 he totalled 2,570 runs, then the highest aggregate obtained by an Australian in England. Altogether in test cricket he scored 2,263 runs with an average of 32.79, and six times exceeded the century, his best effort being 185 not out at Sydney in 1903. He died June 28, 1915, leaving the reputation of one of the most exciting batsmen known to the game.

Victor Trumper, Australian cricketer

Trumpet. Musical instrument which, in various forms, is of great antiquity. The modern trumpet consists of a cylindrical brass tube, which becomes conical as it widens out towards the bell. It is bent so as to make it convenient for holding. Originally it could produce only the notes in the harmonic series of the key in which it was pitched, necessitating the use by the player of different crooks whereby the length of the tube could be altered.

These crooks gave the keys of F, E, E flat, and D, all of which

Trumpet used in military bands
Boosey & Hawkes

be altered by a semi-tone or a tone without change of crook. The modern trumpet is fitted with valves (see Cornet; Horn), so that any note can be obtained within the compass.

Simple trumpets, without slide or valve, are used by British cavalry units, artillery regiments, and the R.A.F. for sounding salutes and calls, instead of the bugles used by infantry and the Royal Navy. The principal trumpet calls are royal salute, air salute, reveille, retreat, first post, tattoo, last post, lights out, and alarm.

Trumpeter (*Psophia*). Genus of S. American birds, nearly allied to the cranes. They resemble cranes with a shortish neck and the head of a domestic fowl. The plumage is usually black with greenish reflections on the back and bluish grey beneath. They occur in large companies in the forests, feeding on fruit, grain, and

Trumpeter. Loud-voiced bird, found in South American forests

insects; and have a loud trumpet-ing note. The name is also given to a rare swan of N. America.

Trumpet Flower. Popular name of climbing shrubs belonging to the genus *Bignonia*. See *Bignonia*; *Tecoma*.

sounded higher than the notation of C in which the part was written. With the C crook, the notation and the pitch were in unison; with the B flat crook, the sound was a tone lower. Even with the crooks, however, there were inevitable lacunae in the scale. The first notable attempt to remedy this defect consisted of an adaptation of the slide principle (see Trombone), by which the pitch could

Trumpet Major. Non-commissioned officer in the British army. Having been in disuse for many years this title was revived in 1928, replacing sergeant-trumpeter. The Trumpet Major is the title of one of Hardy's novels, set in the time of the Napoleonic wars.

Trumpet Tree (*Cecropia peltata*). Evergreen tree of the family Moraceae. It is a native of tropical

Trumpet Tree. Leaves and flower spikes; inset, flower spikes

S. America and the West Indies. The hollow branches are used as musical instruments.

Trunk Road. Highway forming part of a national system of routes for through traffic. For this class of roads in Great Britain, brought into being by the Trunk Roads Act of 1936, the ministry of Transport was made responsible (local councils being formerly responsible for all roads in the area under their authority).

Truro. Episcopal city, mun. bor., and market town, giving its name to a co. constituency of Cornwall, England.

On the Truro river, a branch of the Fal, it is 11 m. N. of Falmouth, with a rly. station and a steamer service to Falmouth.

Truro arms

The junction of Boscawen and Lemon Streets is Cornwall's busiest traffic spot. Truro became a bishop's see and a city in 1876. The cathedral was begun in 1880, the old parish church of S. Mary forming the S. aisle. The building is in E. E. style, designed by J. L. Pearson; the nave was completed 1903, the central and W. towers by 1910. Adjoining the S. transept is a circular baptistery commemorating Henry Martyn the missionary, a native of Truro. Also born here were the brothers Lander, African explorers. The grammar school dates from 1549 and the market hall from 1847. The museum and art gallery contains Phoenician and ancient

Truro, Cornwall. Cathedral of St. Mary. It was built, 1880-1910, on the site of the old parish church

Cornish remains. There are pottery works and other factories. Market days, Wed. and Sat. Pop. approx. 13,000.

Truro. Town of Nova Scotia, Canada. The co. town of Colchester, it is 2 m. from the sea at Cobequid Bay, and 62 m. N.N.E. of Halifax. Truro was founded in 1761, and is a rly. centre, being on the C.N.R. and Dominion Atlantic rly. Pop. 10,272.

Truss. In engineering, a supporting frame or structure used for spanning a space between supports. Such structures are chiefly used in the construction of bridges and roofs. See Bridge; Roof.

Truss (Fr. *trousse*, bundle, truss). Apparatus applied externally to the body for the prevention or control of hernia (*q.v.*).

Trust (Old Norwegian *traustr*, strength). In English law, a confidence reposed in a person so that he may hold certain property for the benefit of some other person or object. Trusts may be either express, i.e. where the trust has been created; or implied, where a person holds property in circumstances in which he is bound in equity to hold it for the benefit of some other person. Another classification divides trusts into public and private. Public trusts are usually charitable, private for the benefit of individuals. A person may declare himself a trustee of his own property, or may transfer the property to other persons to be held on trust by them. (See National Trust.)

In commerce and industry the word trust is used to denote the linking of a number of cos. either by the transfer of shares of the individual cos. to trustees, who issue trustee certificates, or by the exchange of shares in a holding co. for shares of the other cos., the holding co. thus securing control of the constituent cos. The object of such trusts is to eliminate competition, and thus secure total or partial monopoly and ability to control level of prices and production in a particular commodity or class of commodity. The Standard Oil co. founded in the U.S.A. by J. D. Rockefeller in 1882 with a capital of \$100 m. was a trust. Another was the German I.G. Farbenindustrie, biggest chemical combine in the world, seized by the Allied control council Oct., 1945. Such trusts, characteristic of industry during the late 19th and 20th cents., were made illegal in the U.S.A. by the Sherman Anti-Trust Act, 1890; and Theodore Roosevelt, president 1901-09, earned the title trust buster through the energy with which he fought American trusts. The U.S. supreme court in 1911 ordered the Standard Oil co. and the American Tobacco co. to disintegrate. (See Monopoly; Sherman, John; Standard Oil Companies.)

An investment trust is one formed to invest in marketable securities money subscribed by its shareholders who receive dividends from the income received through the management of the investment

fund. Some investment trusts restrict their operations to stated classes of securities.

A unit trust is a group of marketable securities, the property in which has been divided by the managers of the trust into a number of units. Members of the public can buy units in the trust, receiving a unit certificate, entitling them to a share in the net income derived from the whole of the group of marketable securities. Unit trusts are either (a) fixed, when the securities to which the unit certificates relate are known to the certificate holders and cannot be changed by the managers, or (b) flexible, when the managers have some power to vary the constitution of the portfolio of investments. The prices at which certificates in the various unit trusts can be bought or sold are advertised from time to time. Corporations must be appointed as trustees for the certificate holders, and the activities of managers of unit trusts are subject to many restrictions. By investing in a unit trust instead of directly in marketable securities the investor of a small sum of money gets the advantage of investment in a number of undertakings, thus spreading his risk.

Trustee. Person who has the legal ownership of property, but holds it for the benefit of others, who are called the beneficiaries. A trustee's business is to execute the terms of the trust strictly. If he is in doubt as to his duty in any special instance, he may take out a summons, asking a judge to direct him as to the course to be pursued. If he finds himself with trust property in his hands, and does not know to whom to pay it—e.g. if the beneficiaries or some of them cannot be found—he should transfer it to court for the court to deal with. A trustee is not entitled to any remuneration, unless the trust deed or will says he is to have it; but he may be recouped out of the trust property for any expense he may be put to. Trustees are not liable for breaches of trust if they act honestly and reasonably.

Trustee savings banks are described separately below. The term trustee stocks is used for those securities in which, by English law, trustees may invest trust funds. These include public funds and certain corporation stocks, set out in the Trustee Act, 1925.

A trustee or trust company is a corporation formed or appointed to discharge the duties of a trustee. Most British banks and insurance cos. act as trustee cos.; others

have formed special cos. to undertake trustee business.

Trustee Savings Bank. Institution, intended mainly for the small saver, established under an Act of 1863. Its assets are vested in trustees, usually local men of repute, approved by the national debt commissioners, by whom, except for such sums as are required for the daily conduct of the business, the funds deposited are held. Interest is paid on sums deposited, and each customer receives a pass book which must be produced whenever a withdrawal takes place. Cheques cannot be issued on such accounts. The funds held by these banks have increased enormously in recent years. In many they supplement the services of the Post Office savings bank and compete with the services offered to small savers by the clearing banks. See Savings Bank.

Trust House. British public house having for its object the promotion of temperance by supplying food and drink under conditions that do not encourage the sale of alcoholic liquor. The movement was initiated about 1905, the chief promoters being Earl Grey and Bishop Jayne. The system provides that the managers shall have a fixed salary, and no interest in selling alcoholic liquor, their profits coming from the sale of food and other drinks, e.g. tea, coffee, mineral waters. H.q. of Trust Houses, Ltd., are at Shorts Gardens, London, W.C.2.

Truth. In philosophy, the correspondence of perception or inference with reality. Since the dawn of Greek speculation, the question has been debated whether absolute truth is possible, or all truth is relative. Plato held that the mind naturally apprehends external verities or ideas. Later intellectualist schools, following Descartes and Spinoza, affirmed that absolute truth, e.g. in mathematics and geometry, was attainable, apart from the senses, by pure disinterested thought. The ultimate bases of truth, it was agreed, are unprovable assumptions, and the issue turns on their validity. Intellectualism tended to scepticism. Pragmatism started afresh by insisting that all thought was interested, and related to action, the test of truth being its practical consequences. Truth was only gradually attained by a succession of ventures or acts of faith, which were put to the test of experience. The philosophical view of truth is, in fact, continually being adapted to scientific discovery. See Eleatic

School; Metaphysics; Protagoras; Relativity of Knowledge.

Truth. London weekly paper. It was founded Jan. 4, 1877, by Henry Labouchere (q.v.), with the motto, *Cultores veritatis, fraudis inimici* (cultivators of truth, enemies of fraud). Giving much space to exposure of fraud, it has devoted special attention to stock exchange affairs, also to all phases of court, society, and political life, and literature, art, etc. A "queer story" has been a regular feature. Truth in general stands for constitutional procedure and free enterprise. Collin Brooks became editor in 1940. The offices are at 10, Carteret Street, W.1.

Tryon, GEORGE CLEMENT TRYON, 1st BARON (1871-1940). British politician. Born May 15, 1871, and educated at Eton and Sandhurst, he went into the army and fought in the S. African War. He entered politics in 1910, as Conservative M.P. for Brighton, holding the seat at every election. Parliamentary secretary to the ministry of Pensions, 1920, he became head of that ministry in all the Baldwin administrations, 1922-24, 1924-29, and 1931-35. Then during five years as postmaster-general, he introduced important reforms. Major Tryon was raised to the peerage in 1940, but died on Nov. 24, being succeeded by his son Charles (b. 1906) as 2nd baron.

Tryon, SIR GEORGE (1832-93). British sailor. Born Jan. 4, 1832, he entered the navy at 16, and the saw service in the Crimean War, 1854-56. He commanded the Warrior, the first British ironclad, 1861-64, and in 1867 directed transport in the Abyssinian campaign. During 1874-81 he held commands in India and the Mediterranean, and was commander-in-chief of the Australian station, 1884-87, being knighted in the latter year. Appointed commander of the Mediterranean fleet in 1891, he was engaged in manoeuvres off Tripoli when his flagship Victoria (q.v.) was rammed and sunk on June 22, 1893, with the loss of Tryon and over 300 others.

Trypanosoma (Gr. *trypanon*, borer; *soma*, body). Genus of flagellate protozoa, which are parasitic in man and other animals. In man they produce the fatal sleeping sickness (q.v.), and in mammals

the equally serious tsetse fly disease. The parasites are conveyed from one victim to another by the bite of the tsetse fly (q.v.).

Trypsin. Enzyme or ferment present in the juice secreted by the pancreas. It acts like pepsin in the digestion of proteins, converting them into simpler substances; but differs in that it acts in an alkaline instead of an acid medium, takes effect more rapidly, and carries digestion farther.

Tsaidam, CHAIDAM, OR ZAIDAM. Dist. in central Asia, in the Chinese prov. of Chinghai (Tsinghai), lying W. of Lake Koko-Nor. It is a lofty plateau, with a central depression of sandy and marshy soil.

Tsana, TZANA, TANA, OR DEMBEA. Large lake in Abyssinia, situated on the high plateau S. of Gondar, about 60 m. long by 40 m. broad. From it issues the Blue Nile, and not far N. of the lake the river Atbara has its source. The floods on both these rivers, due to heavy summer rains in the neighbourhood of the lake, are the cause of the annual flood which inundates the Nile valley. Proposals to dam the lake for hydro-electric power have to consider the risk of interfering with the seasonal flow of that river.

Tsar, TZAR, OR CZAR (Lat. caesar). Slav title, signifying emperor. It was used in the Middle Ages in the Balkans, the Bulgarian kings being early known as tsars, and later in Russia, where Ivan the Terrible was the first to be crowned tsar of all Russia, and Nicholas II (q.v.) the last. The feminine is tsaritsa.

Tsavo. River and settlement of Kenya Colony. The former flows E. from Mt. Kilima-Njaro, and the latter is on the Uganda rly., 133 m. N.W. of Mombasa. Consult Man-Eaters of Tsavo, J. H. Patterson, 1911.

Tschaikowsky. Continental transliteration of the name of the Russian composer for which the form Tchaikovsky is preferred in this Encyclopedia.

Tschiffely, AIMÉ FELIX (b. 1895). Swiss traveller and author. Born May 7, 1895, he

came to England and was a teacher. Later he went to Buenos Aires as headmaster of the English high school and writing in English and

Sir George Tryon,
British sailor

A. F. Tschiffely,
Swiss traveller

Spanish for journals and magazines on both sides of the Atlantic. As a traveller his greatest exploit was his ride of 10,000 m. from Buenos Aires to Washington, D.C., which he described in his most popular book, *Tschiffely's Ride*, 1936.

Other books included Don Roberto, 1937; Coricancha, 1943; Ming and Ping, 1946. Tschiffely married Violet Marquesita, singer of Spanish songs.

Tsetse Fly (*Glossina*). Genus of flies allied to the house fly and belonging to the family Muscidae. Confined to Africa S. of the tropic of Cancer, these flies are prevalent in areas of forest and bush known as fly belts.

Twenty species are known, nearly all larger than the house fly, with a prominent proboscis in front of the head, used by both sexes for blood sucking. The female tsetse brings forth a single larva which is nourished within the uterus until mature. It is then deposited in a sheltered place, where it speedily turns to a pupa; and the fly issues about a month later. Researches by Sir David Bruce and others showed that certain species of tsetse are the sole carriers of the trypanosomes, or causal organisms, of sleeping sickness in man and of nagana in domestic animals. Infection and death is comparatively low among human beings; but in parts of Africa it is impossible to keep cattle, on which much of the African pop. depends for its livelihood. The tsetse is the greatest menace to the development of much of tropical Africa.

Control is exceedingly difficult; eradication of vegetation around villages has helped, since the fly needs shade and avoids areas exposed to full sunlight. Spraying with D.D.T. has been tried experimentally. Many game animals, as well as reptiles, act as natural reservoirs of infection by harbouring the trypanosomes causing the diseases named. Attempts to cure cattle by injection with a preparation called dimidium have met with some success. See also Antrycide in N.V. *Consult Insects of Medical Importance*. J. Smart, 1943.

Tsinan. City of China, capital of Shantung prov. Situated on a fertile plain, 4 m. S. of the Hoang-ho, to which it is joined by an excellent road. and 245 m. S. by E. of

Peking, it existed under the name of Tan c. 2000 B.C. On the Tientsin-Pukow rly., it was declared open for foreign trade in 1904, and is now also linked by rly. with Kiaochow. Close by on the E. are iron mines. Trade is chiefly in silk brocades, precious stones, and glass. There are fine temples, and an R.C. cathedral. Communists captured Tsinan in 1948 as an important junction threatening Nanking. Pop. 512,686.

Tsingtao. Seaport of China, in the prov. of Shantung. On the Bay of Kiaochow, it is connected by rly. with the Tientsin-Pukow line at Tsinan. Tsingtao was the chief town of the Kiaochow territory leased in 1898 to Germany for 99 years. Almost at once it was opened to foreign trade. In 1914 the place was defended by about 5,000 Germans and, being heavily fortified, was able, with the help of warships in the harbour, to maintain for a time a stubborn defence against combined British and Japanese attempts to capture it, Sept. to Nov. The fortress surrendered to the Japanese on Nov. 7. Pop. 756,000.

Tsitsihar. Town of Manchuria. In the prov. of Heilungkiang, it stands on the Nonni river and the Chita-Harbin rly. line. It is an important Mongol cattle market, and a centre for agricultural products for export. Pop. 81,624.

T-Square. Draughtsman's accessory for drawing parallel horizontal lines. It usually consists of a thin, flat piece of wood. At the left end a thick cross piece is rigidly secured on the under side, so that its inner edge is at right angles to the main strip. The cross bar sits firmly against the edge of a drawing-board and can be slipped upwards or downwards; the main strip is used as a ruler.

Tsu. Town of Japan. It stands on Owari Bay, in the Mie prefecture of Honshu Island, and is connected by rly. with Kyoto, 50 m. direct W.N.W. It has a number of temples, notably that of Ko-no Amida, and produces porcelain, textiles, fans, and parasols. Pop. 56,812.

Tsugaru Strait. Channel of the N.W. Pacific Ocean. It connects the Sea of Japan with the Pacific, and separates Honshu Island from Hokkaido. Length about 175 m., extreme breadth about 35 m.

Tsunamis (Japanese). In geology, so-called tidal waves caused by submarine earthquakes. Such great waves have done enormous damage and caused

great loss of life. At Lisbon in 1755 the sea, after retreating, rushed inland in a wave estimated as being 40 ft. high; and at Sanriku, Japan, a wave rising over 90 ft. was reported in 1896. See Earthquake.

Tsuruga. Seaport of Japan. Situated on the W. coast of Honshu, on an arm of Wakasa Bay, about 50 m. N.N.E. of Kyoto, with which it is connected by rly., it has a good harbour. In normal times passenger and cargo services are maintained with Vladivostok. Ships are built and agricultural produce and manufactured goods are exported. Heavy damage to life and property in the town was caused by the earthquake which struck Fukui (q.v.) June 28, 1948. Pop. 22,513.

Tsushima. Naval engagement between the Russians and Japanese, May 27-28, 1905. The Russian fleet, under Rozhdestvensky, after a seven months' voyage, was almost annihilated by an approximately equal force under Togo. There were 12 capital ships on either side. The advantage both in tonnage and in gun-power lay with the Russians; but this was more than offset by Japanese efficiency and by Togo's superior speed. The main action was fought in the afternoon of the 27th. After nightfall several flotillas of Japanese torpedo craft, in spite of heavy weather, were sent against the battered and scattered remnants of the Russian fleet; and on the 28th a surviving division of battleships was compelled to surrender, minor craft being rounded up and captured or destroyed. See Russo-Japanese War.

Tsushima Strait. S. channel of the Strait of Korea, Japan. It separates Tsushima (Tsu Island) from Kyushu and Honshu. The N. channel is called Chosen Strait. Tsushima possesses an elevated surface reaching 2,100 ft. at its highest point, and is 40 m. in length. At high water it is divided into two portions. Its area, including some 40 adjacent islands, is 271 sq. m. Pop. 44,606.

Túa. River of N. Portugal. An affluent of the Douro, it rises in the Sierra Segundera, N. of the Spanish border, and flows S. through the prov. of Tras os Montes to join the main stream below Túa, after a course of 120 m.

Tuam. City and market town of Galway, Eire. Situated 20 m. N.N.E. of Galway, with a station on the Eire state rlys., the city grew up around the abbey of S. Mary, which was made a

Tsetse fly,
natural size

cathedral by S. Jarlath early in the 6th century. It is the seat of a Protestant bishop, the 12th century church of S. Mary being rebuilt as the cathedral in 1861; also of an R.C. archbishop. Tuam Cross, in the market place, is one of the oldest and finest Irish examples. Here is a state-aided beet sugar factory. Market days, Wed. and Sat. Pop. 3,873.

Tuapse. Russian seaport on the Black Sea. In the Azov-Black Sea area of the R.S.F.S.R., it is 100 m. S.E. of Novorossiisk, and the terminus of a branch rly. to Armavir on the main line across Caucasus. Shortly before the Second Great War, Tuapse became an important oil refining centre and was also developed as a base for the Soviet Black Sea fleet. It was an objective, never quite reached, of the German Caucasus offensive of 1942, and a base for the Soviet counter-offensive of 1943.

Tuareg or TAWAREK. Arabic nickname for islamised pastoral nomads of Berber stock in central and W. Sahara. Calling themselves Imoshagh, and estimated at 300,000, they include the Asjer between Ghadames and Ghat, the Ahaggar in the S.W. uplands, and the partly negritised Kelowi of Air. See Berbers.

Tuat. Oasis district in the W. Algerian Sahara, part of the Southern Territory of Algeria. The villages of Tuat have a pop. of 17,000.

Tuba. Term applied loosely to the lower brass instruments, but particularly to the bombardon in F (see Saxhorn). It has a wide conical tube about 13 ft. in length, and is fitted with four or five valves. Its tone is soft and thick, its depth of pitch making it a useful member of the orchestra.

Tube (Lat. *tuba*). Literally, a hollow cylinder, generally used for conveying fluids. Tubes serve a great variety of purposes in engineering work, surgery, etc. The term tube or tube rly. is also used for the deep underground rly. system of London. See Twopenny Tube; Underground Railway.

Tube Flower (*Clerodendron siphonanthus*). Shrub of the family Verbenaceae, growing native in the Indian sub-continent. It attains a height of about six ft., and has opposite undivided leaves and terminal clusters of white, funnel-shaped flowers with long projecting stamens and style.

Tuber. Fleishy enlargement of the stem or root of biennial or perennial plants. Tubers are stored with food to enable the plant to survive periods of frost or

Tube Flower. Leaves and cluster of white flowers, showing the projecting stamens

drought when its parts above ground are destroyed. Potato tubers are the swollen ends of underground stems, the eyes containing buds which develop into new shoots. See Artichoke; Potato; Rush Nut.

Tuberaceae. Family of subterranean fungi of the family Ascomycetes. See Hart-truffle; Truffle.

Tuberculin. Substance prepared from cultures of the bacilli of tuberculosis. Introduced by Koch in 1890, it was expected to provide an effective cure for tuberculosis. Its use, however, proved disappointing, and it is now rarely administered to human beings, streptomycin having replaced it. Tuberculin is still a test for the presence of tuberculosis in cattle. See Bacillus.

Tuberculosis (Lat. *tuberculus*, little bump). Infectious disease of world-wide incidence. As a disease of the lung it was known to the physicians of ancient Greece as a wasting disease; hence its other name, phthisis. The cause is a micro-organism called the tubercle bacillus, or the bacillus of Koch, the physician who discovered it. There are three known types of bacilli—human, bovine, and avian. The first two attack the human race, the human type producing infection by inhalation, the bovine by ingestion of the milk of tuberculous cows. Efficient pasteurisation, and proper handling, of milk protect man from bovine tuberculosis. The bovine bacillus can cause widespread disease in animals, especially cows and pigs.

No child is born with tuberculosis; the disease is the result of direct infection. It affects glands, bones, joints, and the genito-urinary system (bladder, testicle, and kidney) when it is often referred to as surgical tuberculosis. When present in the lungs it is called pulmonary tuberculosis. These forms of disease may be in-

tercurrent, or one can result from the other, while both can lead to tuberculous meningitis.

Whatever be its route of entry to the body, the tubercle bacillus can always reach the lungs. Usually this takes place in infancy or early childhood from minimal infection. It produces but little clinical effect, leaving only a small hard nodule, called a Ghon's focus, in the lung substance, and calcified glands at the root of the lung. If, however, the child's resistance is poor, or it gets repeated infections, which do not allow it to develop immunity, it gets blood-borne extension (miliary tuberculosis), or a spread of infection through the air passages (pneumonic or broncho-pneumonic tuberculosis). Such forms are almost invariably fatal; many sufferers have terminal tuberculous meningitis.

From childhood up to adolescence the disease may show the form called epi-tuberculosis in which the infection is resisted by acquired immunity; the condition is therefore an allergic response of the body. The child so affected is usually fretful and feverish. The illness may last many months before resolution. Fortunately most children recover, and the result is similar to that mentioned above, a calcified lung focus and enlarged root glands. Some, however, go on to the adult form of pulmonary tuberculosis.

If adolescent life is reached before primary infection, the disease takes a special form called adolescent primary phthisis. Very enlarged glands are seen on the X-ray film. The condition is often associated with swellings and discoloration on the shin-bones, called erythema nodosum—indeed this may be the only evidence of the recent tuberculous infection. It follows that every young person with erythema nodosum should have an X-ray photograph taken of the chest. With rest, adolescent primary phthisis has, in the vast majority, a good prognosis. Without it the patient may progress to true adult phthisis; the usual form of pulmonary disease above the age of fifteen.

Adult phthisis takes three main forms:

(a) acute, usually rapidly fatal; it has become rare in the U.K.;

(b) fibro-caseous: this means that healing, or fibrosis, accompanies the tendency to extension and breaking down of lung tissue, called caseation; it is the usual form, giving a slowly advancing

process that may be quite extensive before the patient seeks medical advice;

(c) fibroid, in which fibrosis is much more in evidence than active spread; it is common after 45 when it is often of the type called senile phthisis. It is dangerous to the community as it simulates chronic bronchitis, and is therefore the unknown source of infection to the contacts of the sufferers, especially those in very close contact, such as children and grandchildren. French physicians are wise in stating that all elderly chronic bronchitics are potential sources of tuberculous infection until proved to be otherwise.

The onset of pulmonary tuberculosis is slow and insidious, and symptoms are often ignored until the disease is advanced. Cough which lasts more than a month requires full investigation, including an X-ray film. Sputum is a fairly early sign: later come fatigue, indigestion, loss of weight, and night sweats. In many the first evidence of established disease is a perianal abscess. A few fortunate sufferers get a warning of early disease by bringing up blood, or by an attack of pleurisy. Such signs in a young adult should demand rigorous examination, and experience has shown that the patient should be treated as suffering from early pulmonary tuberculosis even if no other sign or symptom appears, for many such individuals, if untreated, develop the disease in unmistakable form within three to four years.

High cost formerly made mass examination of the supposedly healthy population out of the question; but the use of a 35 mm. film to take miniature photographs of the image of the chest thrown on a fluorescent screen by X-rays made it possible for up to a hundred persons an hour to pass before specialised apparatus, the resulting film being projected and enlarged on the magic lantern principle so that the expert eye can see any abnormal shadow which requires further investigation. Some three per 1,000 of the supposedly healthy in the U.K. have active disease unknown to themselves; the age groups of highest incidence are 17-24 and 35-39. Another five to six per 1,000 have disease which is quiescent or apparently healed at the time of the first examination; many of these require continued observation.

TREATMENT OF PULMONARY TUBERCULOSIS. Basic treatment of active pulmonary tuberculosis

is rest. Open air treatment was preached for many years by Boddington before, at the beginning of the 20th cent., sanatorium treatment became the rule, and hygienic conditions in country districts with good food were relied on to arrest the disease. After histories of patients so treated, however, showed that most of them died within five years of returning home. Failure was due to the advanced stage the disease had reached before being diagnosed; lack of active forms of treatment for the diseased lung to supplement rest and graduated exercise; and return to unsuitable conditions of life and work.

The commonest form of active treatment is artificial pneumothorax. Air introduced into the pleural cavity (*see Lung*) removes the negative, sub-atmospheric pressure in this space, so that the elastic lung is allowed to relax. The diseased area is no longer under tension; its movement is much restricted. This simple operation leads to cure in many sufferers. Where disease has caused adhesion between the lung and the chest wall, however, this treatment may fail, and to relieve tension and allow relaxation of the lung it may be necessary to make the chest wall fall in. This is done by various modifications of an operation called thoracoplasty, which removes parts of the ribs. In expert hands it has brought arrest of disease to large numbers.

Chemotherapy has been attempted for centuries in the treatment of tuberculosis. The ancient Greeks tried gold and antimony. Quinine was used in the 17th cent.; in the 19th iodine, iron, creosote, chlorine, and various gases including CO₂ were used. None of these had success. It has, however, been discovered that several agents will kill the tubercle bacillus in a test tube and sometimes in an animal, but will not kill it in a human being without killing the patient.

Gold sodium thiosulphate, popular before 1939, is considered to be at best only an aid to healing in patients who have already fibroid disease. Promine has been tried with good results in animals, and some allied substance may prove effective in man.

Streptomycin (*q.v.*) has proved effective in a proportion of cases of acute type. *See B.C.G.*, in N.V.; also Papworth Village Settlement. *Consult Manual of Tuberculosis*, E. Ashworth Underwood, M.D., D.P.H., 1945.

R. E. Trail, M.D., F.R.C.P.

Tuberose (*Polianthes tuberosa*). Bulbous herb of the family Amaryllidaceae. It is a native of Mexico.

Tuberose. Lance-like leaves and spray of fragrant cream flowers

It has narrow lance-shaped leaves and a tall flower stem ending in a spray of many creamy-white, funnel-shaped, highly fragrant flowers. *Pron. tu-ber-ose.*

Tübingen. Town of Württemberg-Hohenzollern, Germany, on the left bank of the Neckar, 22 m. S. of Stuttgart. The old quarter, with its narrow streets and gabled houses, is built round the 16th century castle, which now houses the observatory and university library. The church of S. George (1470-1529), with the tombs of the dukes of Württemberg, the town hall (1435-46), and the R.C. church are other notable buildings. The university, founded 1477, is famous for its influence on Theological Controversy, hence the term Tübingen school applied to the followers of F. C. Baur, who inaugurated here a specially critical type of Biblical scholarship. J. A. Möhler founded a similar R.C.

Tübingen, Germany. The Market Place, showing the town hall on the right

school of thought. Here the poet Uhland was born.

Tübingen has many industries, including engineering, paper, textiles, and the manufacture of surgical instruments. Fruit is grown on the hills, and wine is made in the neighbourhood. The town was known in 1078, and came within the jurisdiction of Württemberg in 1342. It sustained some damage in the Second Great War, when it was captured by the French, April 20, 1945. After the surrender of Germany Tübingen was capital of the French zone of occupation. Pop. (1939) 28,686, increased by 1950 to over 36,000 by an influx of refugees.

Tubocurarine. Alkaloid derived from curara, the S. American arrow poison. Although curara was first mentioned in English literature by Hakluyt in his account of Raleigh's voyage up the Amazon in 1595, not until the 20th century was curara therapy placed on a sound basis. *D*-tubocurarine chloride, the alkaloid which produces the classical action was isolated in 1935. Recent investigations into the botanical source of the drug prove that *d*-tubocurarine chloride occurs in the S. American liana *Chondrodendron tomentosum*. The principal use of tubocurarine is as an adjunct to anaesthesia to relax the muscles. See Curara.

Tubuai OR AUSTRAL ISLANDS. Lonely group of coral islets in the South Seas. It lies S. of the Society Islands, and is rarely visited even by the French, to whom the group has belonged since 1881. The islets are Ravaivai, Tubuai, Rurutu, Rimatara, and an outlier Rapa. The pop. is 3,921. Chief exports are copra, sponges, arrowroot.

Tucker, CHARLOTTE MARIA (1821-93). British author. Born May 8, 1821, she wrote a large

Charlotte Tucker,
British author

number of books for children under the pseudonym A. L. O. E., *i.e.* A Lady of England. She was also much interested in missionary effort, and in 1878 went to India, where she was active in visiting the zenanas and promoting native education. She died at Amritsar, Dec. 2, 1893.

Tucket (Ital. *toccata*, touched). Old musical term for a flourish of trumpets. It is frequently met with in the Elizabethan dramatists. Its exact form is unknown,

but it was similar to the sennet, though less elaborate.

Tucson. City of the U.S.A., capital of Pima co., Arizona. It stands on the Santa Cruz river, 130 m. S.E. of Phoenix, and is served by the Southern Pacific rly. Here are a magnetic observatory, the university of Arizona, and S. Joseph's academy. Tucson was settled in 1700, when Spanish friars established a mission to the Pima Indians there. It was the state capital, 1867-77, shortly becoming famous as a resort for invalids needing a dry, sunny climate. Pop. 36,818, but rising by some 10,000 each winter.

Tucumán. Prov. and city of Argentina. The prov. is the most densely peopled in the republic.

Tucumán arms

Among the W. mountainous offshoots of the Andes there is lumbering in the forested valleys and mining for gold, silver, and copper. The rolling plains of the E., which abut on the Gran Chaco, yield maize, tobacco, wheat, grapes, and other fruit, especially where irrigation is possible.

The capital, also known as San Miguel de Tucumán (pop. 157,926) is situated on a plateau near the Tala or Salí, and has rly. connexion with Buenos Aires. A university was opened in 1914 and the cathedral is modern. There are sugar factories, breweries, distilleries. Here in 1816 the first congress of the republic was held, and the declaration of independence from Spain was signed. The city was founded in 1565. The prov. was originally part of the lands of the Incas. Its area is 8,817 sq. m. Pop. 604,526.

Tudela (anc. Tutela). Town of Spain, in the prov. of Navarre. It stands on the Ebro, 52 m. by rly. N.W. of Saragossa. Lumbering and the production of silk goods, oil, and wine are the principal industries. After being in Moorish hands for 300 yrs. the town was recaptured by Alphonso I of Aragon in 1114. Pop. 12,000.

Tudor. Type of British civil aircraft. Built by A. V. Roe and co., it was originally designed as a commercial version of the Lancaster bomber. The prototype first flew in 1945, and the production type went into service next year. Powered by four Rolls-Royce Merlin engines developing a

total of 7,080 h.p., the Tudor 1 had a maximum speed of 346 m.p.h. and a range of 3,700 m. It carried a crew of five and had accommodation for 24 passengers. There were eight versions, Marks 1 to 8; these differed in accommodation, and the last was fitted experimentally with gas turbines.

Tudor. Name of five sovereigns of England (1485-1603). The earliest members of the family lived in Anglesey. About 1429 Owen Tudor appears as a member of the court circle and later was married to Queen Catherine, widow of Henry V and mother of Henry VI. After the queen's death in 1437, Owen went back to Wales. He fought for the Lancastrians in the Wars of the Roses and was beheaded at Hereford in 1461. Tudor and the queen had two sons, Edmund and Jasper. Edmund was made earl of Richmond and married Margaret Beaufort, a descendant of Edward III through John of Gaunt. Their only child became Henry VII. Jasper died without sons in 1495, having been made earl of Pembroke and duke of Bedford. The Tudors retained the throne until the death of Elizabeth in 1603. From Henry VII, through his daughter, Margaret, wife of James IV of Scotland, James I was descended (see England; Royal Family).

The name Tudor rose is given to the union of the red and white roses of Lancaster and York, which formed the royal badge of England in 1486; it is often found in Tudor architecture. Consult Tudor Geography, 1485-1583, E. G. R. Taylor, 1930; Tudor Constitutional Documents, 1485-1603, ed. J. R. Tanner, 1930.

Tudor Style. Late stage of Gothic architecture which prevailed in England under the Tudors, 1485-1603. In its later phase it is sometimes called Elizabethan, as classic detail, under Renaissance influence, became more assertive in Elizabeth's reign. Tudor architecture was throughout transitional in character (see Transition). In church building it manifested itself in the late Perpendicular (*q.v.*) style, as in Henry VII's chapel, Westminster. The character of the style is essentially English and individual, and we owe to it the noblest domestic dwellings in the country, such as St. James's

Tudor rose as depicted in heraldry

Palace; Hampton Court; Sutton Place, Surrey; Haddon Hall; Hever Castle, Kent; and Wolsey's college buildings at Oxford.

Tuesday. Third day of the week, so called from an old Saxon deity, Tiw. The Romans called the day Dies Martis (day of Mars), cf. French *mardi*.

Tuff. Rock formed of consolidated volcanic ashes. If the large fragments exceed 32 mm. in diam., it is referred to as agglomerate or volcanic breccia. The term tuff is usually confined to finer grades of material, which is spoken of as coarse, medium, or fine tuff. Very fine material, less than 0.05 mm., forms dust tuff. See Rock. Consult Geology for Engineers, F. G. H. Blythe, 1943.

Tug. Self-propelled vessel used for towing. The steam tug was introduced in 1802, when a boat fitted with engines by Symington towed barges on the Forth and Clyde canal. There are four principal types of tugs: harbour, river, canal, and ocean-going. The first displace some 150 tons and have engines developing about 450 h.p.; working in groups of two to six, they manoeuvre ocean-going ships into and out of dock. River tugs are engaged mainly in towing lighters, as on the Thames; canal tugs have shallow draught and less powerful engines. Ocean-going tugs are engaged principally in salvage work delivering such structures as floating docks; a typical vessel displaces 650 tons and has engines developing 6,000 h.p.

Tugela. River of Natal, S. Africa. It rises in the Mont-aux-Sources, where are the Tugela Falls, about 2,050 ft. high, and runs E. to the sea between Umvoti and Port Durnford. The river forms the boundary between Zululand and Natal proper.

Tugela, BATTLES OF THE. Series of actions fought between Dec., 1899, and Feb., 1900, in order to bring about the relief of Ladysmith. After the investment of the latter, the Boers, having failed in an attempt to invade S. Natal, took up under Botha a position along the Tugela river to the S. of Ladysmith, with the Colenso kopjes and other heights in their rear. Buller, advancing from the S., attacked on Dec. 15, and was severely defeated at Colenso (*q.v.*).

In the second half of Jan., Buller again tried to break down the barrier. Spion Kop (*q.v.*) was captured and lost again. On Feb. 5 Buller made a third attempt to reach Ladysmith by way of Vaal Krantz, about 3 m. N.E. of Pot-

Tuileries, Paris. Air view of the palace gardens, now a public park

gieter's Drift. Vaal Krantz was captured by Lyttelton, but North Hill to the N. of it was deemed unassailable, and Vaal Krantz itself was found to be exposed to heavy artillery fire. Buller accordingly withdrew once more across the river.

On Feb. 14 a fourth attempt was made, in the course of which Monte Christo and Hlangwane Hill on the S. or right bank of the Tugela were seized. But further progress was found to be impracticable, and it was not until Feb. 26 that Buller, after crossing the Tugela for the seventh time, was able to make his fifth and final advance on Ladysmith, which was entered by Dundonald's cavalry two days later. See South African War.

Tugendbund (Ger., league of virtue). Prussian patriotic association. It was formed at Königsberg (now Kaliningrad) in 1808 to promote the moral and educational regeneration of Prussia after its humiliation by Napoleon, and was dissolved by Frederick William III next year.

Tuileries, PALAIS DES. Former royal palace in Paris, so named from the tile-yards (*tuileries*) once on the site. It stood between the Louvre and the Place de la Concorde. Designed by Philibert de l'Orme for Catherine de' Medici, and begun in 1564 on the site of a former structure just outside the walls of Paris, the Tuileries long served as a pleasure house for the kings of France. Jean Bullant succeeded de l'Orme as architect. When Louis XVI was brought back to Paris by the revolutionaries in 1791 after his attempt at escape, the palace became his regular residence; it was subsequently used by the Bonapartes and Bour-

bons until 1871, when it was burned by the Commune. Its garden, however, remains as a public park, and retains some remarkable statuary. See French Revolution; Paris.

Tuke, HENRY SCOTT (1858-1929). British painter. Born at York, June 12, 1858, he became well-known as a painter in both oils and water colours, mostly of anecdotal subjects, especially for his variations on the theme of boys bathing in the sea. He exhibited regularly at Burlington House, and became R.A. in 1914. Two of his works are in the Tate Gallery: August Blue (boys bathing) and All Hands to the Pump! He died in March, 1929. Consult Life, M. T. Sainsbury, 1933.

Tuke, WILLIAM (1732-1822). British philanthropist, born at York, March 24, 1732, of Quaker parents.

He became a tea and coffee merchant, and in 1792 drew the attention of the Society of Friends to the need of reform in the treatment of the insane, with the result that the Retreat was opened at York four years later. He introduced many improvements, including the teaching of industries and the abolition of excessive restraint and of antiquated remedial measures. Tuke died Dec. 6, 1822.

Several descendants of William Tuke, including his grandson, Samuel Tuke (1784-1857), and Samuel's son, Daniel Hack Tuke (1827-95), rendered great service in the study and amelioration of

William Tuke, British philanthropist From a medallion

insanity. Daniel's brother James (1819-96) advocated economic reforms in Ireland, and did much to relieve the sufferers from famine in that country. *Consult* Chapters in the History of the Insane, D. Hack Tuke, 1882.

Tula. Town of Russia, capital of the region of the same name. A junction on the Moscow-Kursk and Syzran-Vyazma rly., 121 m. S. of Moscow, on the Upa, it contains a government firearms factory established by Peter the Great in 1712, and is famous for its so-called tula metallic wares (niello). There are large tanneries, soap and leather factories, and a small coalfield in the neighbourhood. Pop. 272,000.

Tulip. Brilliantly coloured cup-shaped flowers of the bulbous plant

Although almost encircled by the Germans in their advance against Moscow in Oct.-Nov., 1941, Tula was never captured by them. It remained the centre of very bitter fighting until Russian counter attacks during Dec. drove the Germans from their most advanced positions in this area.

Tulagi. Island in the Pacific Ocean. One of the British Solomon Islands protectorate group, it was until 1945 the seat of govt. It lies 40 m. W. of Malaita, and has an excellent anchorage. In the Second Great War, the Japanese occupied Tulagi early in 1942; there was little resistance as the island was unfortified. On Aug. 7 formations of the U.S. 1st marine div. landed in face of strong opposition; the Japanese garrison, although only some 500 strong, fought almost literally to the last man, and were not overcome until Aug. 10. This was the first victory of the first Allied offensive in the Pacific; but the diversion of U.S. troops it entailed from the operations simultaneously started on Guadalcanal (q.v.) weakened initial Allied effort there, and helped to prolong the battle for that island.

Tulcan. Town of Ecuador, capital of the province of Carchi. It lies 100 m. N.E. of Quito, to which there is a modern highway. Many cattle are reared, and wool, garments, and carpets are manufactured. The elevation is nearly 10,000 ft. Pop. est. 10,000.

Tulcea, TULCHA, OR TOULCHA. Port of Rumania. It is situated near the head of the delta of the Danube, but above the separation of the middle and S. arms of the great river, in the Dobruja. It lies 30 m. almost due E. of Braila, and before the First Great War was a thriving port. Here the Russians defeated the Turks in 1791.

Tulip (*Tulipa*). Genus of brilliantly flowering bulbous plants of the family Liliaceae. They are natives of Europe and N. and W. Asia, one species being indigenous to Great Britain. Garden tulips were introduced into England through Holland in the 16th century. They are of various heights, 9 ins. to over 2 ft., and the flowers are of all shades and colours and combinations thereof, except blue, from white to very dark purple. Tulips should be planted during Oct. or Nov. in a light and dry sandy soil. They will not thrive in heavy soils, particularly those with a wet clay subsoil.

The parent of garden tulips is *T. gesneriana*, a rich deep crimson flower with a cup almost as large as a clenched fist, and from it have sprung, by hybridisation, hundreds of nursery-raised kinds. After the foliage has died down, tulip bulbs may be lifted and stored in a dry place, until the time for planting again arrives. They are propagated by seeds and bulblets, and may be forced in the greenhouse in pots in a temperature of 50° to 60° F., for the purpose of winter table decoration. *See* Bulb.

Tulipomania. Name given to the financial speculation in tulip bulbs in the 17th century. The first garden tulip bulb imported from Constantinople in 1559 was planted in a garden in Augsburg. Within ten years the flower became popular. By 1634 competition to possess unusual varieties was so great in the Netherlands that industry and commerce were neglected and all classes were speculating in the bulbs, which changed hands at prices up to £4,000. Soon tulip markets and exchanges were opened at Amsterdam, Leyden, Rotterdam, Haarlem, and other towns, where jobbers dealt in them; and the states-general drew up a code of laws for the guidance

of dealers. For a time the price of tulip bulbs governed that of all other commodities. In 1639 the mania suddenly ceased; thousands of persons were ruined; and the states-general was obliged to declare all existing tulip contracts void. Tulipomania provides the theme of Dumas's novel, *The Black Tulip*.

Tulip Tree (*Liriodendron*). Beautiful flowering, summer-leaving tree of the family Magnoliaceae. It is a native of North America and was introduced into Great Britain in 1668. It frequently attains a height of 80 to 100 ft., and, when matured, bears in summer large green, lemon, and orange-coloured flowers, shaped like the

Tulip Tree. Leaves and large showy flowers of the North American tree

cups of a tulip. It should be planted in autumn or spring in a sandy loam, either in a sunny position in the shrubbery, or a sheltered position upon a lawn. It is propagated by seeds or by layers in autumn.

Tull, JETHRO (1674-1741). British agriculturist. Born at Basingdon, Berkshire, he was educated at St. John's College, Oxford, and became a barrister, but passed his life mainly in farming and in travel. He farmed some of his own land in Oxfordshire and Berkshire from 1699 to 1711, and after spending three years in travelling abroad returned to Prosperous Farm, near Hungerford, where he remained until his death, Feb. 21, 1741. Tull invented a drill for sowing seed. *See* Agriculture (with portrait, p. 175).

Tullamore. Market town and urban dist. of Offaly, Eire, also the county town. It is 58 m. from Dublin, being served by the Eire state rlys. It is the principal town on the Grand Canal, all boats from Dublin to Limerick passing through here; brewing, distilling, and wool-spinning are carried on. Pop. 5,894.

Tulle. Thin silk bobbinet used for veils, hat and dress trimmings, etc. In France the term is used for

bobbinet generally. The word comes from Tulle, France, where the fabric was originally made.

Tulle. City of France. The capital of the dept. of Corrèze, it stands on the river of that name, 45 m. from Limoges. The chief building is the cathedral of Notre Dame, built in the 12th century. Parts of it were burned down in 1783, but a fine old tower still stands. There are remains of an extensive Benedictine abbey and some old houses. Modern buildings include the prefecture. The chief industry is the manufacture of firearms, there being a government factory in the suburb of Souilhac. Pop. 18,202.

Tullianum. Subterranean prison of ancient Rome, on the Capitoline Hill. Here the captives of victorious generals were put to death after the triumph (*q.v.*), and criminals were executed. Its name of Mamertine Prison dates only from the Middle Ages. See Rome.

Tulliver, TOM AND MAGGIE. Brother and sister who are the central figures in George Eliot's novel, *The Mill on the Floss* (*q.v.*).

Tulloch, JOHN (1823-86). Scottish theologian. Born June 1, 1823, at Bridge of Earn, Perthshire, and educated at the universities of St. Andrews and Edinburgh, he served for a few years as a parish minister. In 1854 he was appointed principal of S. Mary's College, St. Andrews, and also professor of theology. One of the most prominent ministers of the Church of Scotland, he became moderator of the General Assembly in 1878. He wrote a number of works on theological and philosophical subjects and a book for young men entitled *Beginning Life*, 1862. He died Feb. 13, 1886. His son, W. W. Tulloch (1846-1920), was also a distinguished minister of the Church of Scotland and a noted writer. He enjoyed the friendship of Queen Victoria, who revised the *Lives* he wrote of her and the prince consort.

Tullus Hostilius. Third of the seven legendary kings of ancient Rome, reputed to have reigned from 670 to 640 B.C. During his conquest and destruction of Alba the famous incident of the *Horatii* (*q.v.*) and *Curiatii* occurred. Tullus was also credited with the conquest of the Sabines. He was killed by a thunderbolt for seeking from Jupiter more than mortal might rightfully know.

Tully. Obsolete Anglicised name for Marcus Tullius Cicero (*q.v.*).

Tulsa. City of Oklahoma, U.S.A., the co. seat of Tulsa co. It stands on the Arkansas river, 121 m. N.E. of Oklahoma City,

Tummel, Perthshire. Falls of the river near the Pass of Killiecrankie

and is served by the Atchison, Topeka, and Santa Fé and other rlys. Bricks, glass, cotton-seed oil are manufactured, and coal-mining and oil-refining are carried on. Tulsa was laid out in 1887 and became a city in 1902. Race riots laid waste the negro quarter in 1921; later this was rebuilt by popular subscription among the whites. Pop. 142,157.

Tulse Hill. Dist. of S.E. London. In the bor. of Lambeth (*q.v.*), it lies E. of Brixton Hill and Streatham Hill, and includes Brockwell Park (*q.v.*).

Tulwar. Type of Oriental sword, known also as *Talwar* (*q.v.*).

Tumbes. Prov. of N. Peru. It lies between the Cerros de Amotane and the S. shore of the Gulf of Guayaquil, and adjoins Ecuador. Area, 1,590 sq. m. Pop. 25,709. The capital, of the same name, stands on the Tumbes river near the Gulf of Guayaquil, 70 m. N.W. of Loja; it is on the Pan-American Highway.

Tumilat. Wadi, 30 m. long, connecting Ismailia on the Suez Canal with the cultivated Delta at Abu Hammaed, Lower Egypt. Its fertility is due to its fresh-water canal, representing the ancient ship-canal of Necho II and Darius I. It lay on the immemorial Syrian trade-route, and was the initial stage in the Hebrew exodus, Pithom being near its E. end (Exod. 1). In 1882 it was the scene of British operations against Arabi.

Tummel. Name of a river and loch in Perthshire, Scotland. The river empties from the E. end of Loch Rannoch, flows E. 9½ m., and then broadens into the loch, ½ m. wide and 3 m. long. The river thence flows 8 m. E.

to the picturesque falls of Tummel, where it turns to the S.E. to join the Tay, 7 m. N.N.W. of Dunkeld, receiving the Garry about 1 m. below the falls. In 1945 a scheme was made to divert and impound the waters of the rivers Tummel and Garry, Errochty Water, Loch Tummel,

and Bruar Water to produce hydro-electric power; the first turbo-alternators began to run at Clunie in 1950.

Tumour. A swelling or morbid enlargement due to a mass of tissue which grows independently of the surrounding tissue. Tumours are described as "innocent" or "malignant." The former grow only in the spot on which they first appear, pushing aside the neighbouring tissues; they do not spread to other parts of the body. From malignant tumours small pieces become detached and are carried in the blood or lymph stream to various parts of the body, where they set up secondary growths. The cause of tumours is unknown. Malignant tumours eventually cause death by destroying essential tissues and by producing poisonous substances. One theory is that they are due to minute masses of foetal cells which become included in the tissues and later take on vigorous growth.

Tumuc Humac Mts. Range of low mts. in the N.E. of S. America. It divides Brazil from French and Dutch Guiana and forms an extension of the Serra Acaray, both ranges forming part of the Guiana Highlands. It culminates in Timotokem at 2,625 ft. Gold is found in the range.

Tumulus (Lat., hillock). Burial or memorial mound, especially one distinguished by size, form, or association. Such were Silbury Hill (*q.v.*); the grave, 100 ft. across, of Patroclus at Troy; the

Tumulus. Silbury Hill, a large tumulus in the Kennet Valley, Wiltshire, probably dating from Neolithic times

mound, 30 ft. high, raised to Athenian warriors at Marathon, 490 B.C.; the Lydian tomb near Sardis, 200 ft. high, of Alyattes II, 560 B.C.; the Lion Mound at Waterloo. See Barrow; Burial Customs; Dagoba; Mastaba; Mound; Stone Monuments; Stupa; Teocalli.

Tun. Measure of liquid capacity, containing 252 wine gallons. As the name of a large barrel, holding approx. 2,000 pounds of water, the word is probably an older form of ton. A tun of sweet oil is 236 galls. See Heidelberg; Ton.

Tunbridge Wells. Borough and watering place of Kent, England. Picturesquely situated on the border of Sussex, in which co. part of it was included until 1894, it is 5 m. S. of Tonbridge, and 34½ m. by rly. S.E. of London. The common covers 170 acres. At the S.W. end of the

Tunbridge Wells arms

Parade, long famous as The Pantiles, first laid out in 1638, are the mild chalybeate springs which, discovered in 1606 by Dudley, 3rd Baron North, and enclosed by his friend the earl of Abergavenny, made the place a celebrated resort of fashion in the 18th century. The church of King Charles the Martyr was built in 1685, and enlarged later; there are a public hall and theatre. There are several recreation grounds and golf courses, as well as facilities for tennis and bowls. Near the town are Penshurst, Rusthall Common with the Toad Rock, Eridge, Crowborough, and other places of interest. Rock-climbing is a notable recreation of the neighbourhood. An annual county cricket festival is held here. Pop. 35,866. Consult Society at Tunbridge Wells in the 18th Century— and After, L. Melville, 1912; Royal Tunbridge Wells, Past and Present, J. C. M. Given, 1946.

Tunbridge Wells Sand. Group of sandstones and unconsolidated sands occurring at the top of the Hastings Beds of the Sussex Weald. They are named after Tunbridge Wells, where they are exposed. See Cretaceous; Wealden Deposits.

Tundra. Extensive barren lowlands bordering the Arctic coastlands of N. America, Europe, and Asia. The mean temp. remains below freezing point except for two to three months, when it rises nearly to 50° F. Annual precipitation does not reach 10 ins. Therefore the tundra is a cold desert. The soil never thaws below a depth of about 2 ft., so that the only plants are stunted berry-bearing shrubs, mosses, and lichens. The chief animals are reindeer, caribou, and musk oxen. In winter the tundra is a dreary wilderness of ice and snow. The rivers have laid bare cliffs of ice and frozen soil, in which are embedded bones of mammoths and other extinct animals. The tundra is sparsely inhabited by Eskimos (N. America); Finns and Lapps (Europe); and Ostyaks, Samoyedes, and Yakuts (Siberia).

Tung or **KUKUI OIL.** Oil expressed from the kernels of the fruit of several species of *Aleurites*. The oil, one of the best drying oils, is used in quick-drying varnishes and paints. See Candle-nut.

Tungabhadra. River of India, in the Deccan. The Tunga and Bhadra rise close to each other in the W. Ghats, and unite at Kudali in Mysore to form the Tungabhadra, which flows N., N.E., and E. to join the Kistna below Kurnool. Principal affluents are the Varada on the left and the Hagari on the right. Coracles are used for the conveyance of passengers. The city of Vijayanagar is near the river.

Tunbridge Wells, Kent. The Pantiles, the once fashionable promenade where visitors to the Wells met when taking the waters

veyance of passengers. The city of Vijayanagar is near the river.

Tung-kwan. Town of China, on the right bank of the Yellow river, at the angle where the three provinces of Shensi, Honan, and Shansi meet. Two important arteries of traffic cross here, leading E. and W., and S.W. and N.E., respectively. There is a pass of the same name in the neighbourhood. Pop. est. 80,000.

Tungsten. Chemical element. Its symbol is W (wolfram); at. no. 74; at. weight, 183.82; specific

gravity, 19.3; electrical conductivity, 29 (silver being 100); melting point 3,370° C.; crystal structure, (a) alpha-tungsten, body-centred cubic, with lattice constant $a=31.58$, and (b) beta-tungsten, a unique cubic structure with a unit cell containing eight atoms, its side being $a=5.038$.

A new acid, tungstic acid, was first isolated by Scheele in 1781 from a mineral (calcium tungstate) now called scheelite; the following year Bergman obtained the same acid from wolframite, later preparing the metal. The name tungsten comes from the Swedish for heavy stone.

The two chief natural sources of tungsten are still wolfram or wolframite ($(\text{FeMn})\text{WO}_4$) and scheelite, CaWO_4 , but in certain parts of the U.S.A. the minerals ferberite, FeWO_4 , and hubnerite, MnWO_4 , are of economic importance. The largest producer is China, closely followed by Burma, and between them they produce about five-sevenths of the world's annual production of some 35,000 tons of tungsten concentrates, with an average content of over 60 p.c. WO_3 . Smaller producers are the U.S.A., Portugal, and Bolivia. Scheelite is used largely to make ferro-tungsten, for alloy steels; tungsten metal is prepared chiefly from wolframite. The first stage in production of the pure metal is the preparation of tungstic oxide.

Wolfram concentrate is either fused with sodium carbonate or treated with a strong caustic soda solution. Calcium chloride is added to precipitate calcium tungstate and this is treated with hot 50 p.c. hydrochloric acid to recover the tungstic acid. Scheelite concentrates are usually treated with dilute acid, leaving the tungstic acid as a sludge. Tungstic oxide is reduced to tungsten powder by heating in an atmosphere of hydrogen, or, if it is to be used in the production of alloys when high purity is not so essential, by heating with carbon.

It cannot be melted or cast, but is treated by the methods of powder metallurgy. The powder is compressed and sintered at 1,300° C. in hydrogen and then heated to 3,200° C. by passing an electric current through it. It may then be swaged at 1,500° C. until sufficiently malleable to be drawn through tungsten carbide dies and finally through diamond dies to give very fine wire. This process was developed by Coolidge in 1909. The metal as thus produced has a purity of more than 99.75 p.c., and it is a ductile steel-grey ma-

terial with great strength and hardness. It has a tensile strength of 200 tons per sq. in. and a diamond hardness of between 400 and 500. The first use of tungsten was as wire for electric light filaments and later for radio valves, X-ray tubes, and other electronic devices. But these uses now account for only a small proportion of the world's production, by far the larger part being consumed by the steel industry. Tungsten is added to steel to increase its hardness, and its chief use is for high-speed tool steels. A typical tool steel contains 18 p.c. tungsten, 4 p.c. chromium, and 1 p.c. vanadium, and similar steels are used for making valves and valve-seats in internal combustion engines and as dies for swaging and wire-drawing. Tungsten carbide tool tips, dies, electrical contacts, etc., are extremely hard and wear resisting, being second only to diamond in this respect. Tungsten is also used in certain non-ferrous alloys to increase their hardness, density, and resistance to high temps. Certain tungstates are useful for making blue and green pigments for ceramics and paints; and certain tungsten salts render various types of cellulose non-inflammable. Tungsten has three oxides, WO_3 , W_4O_{11} , and WO_2 , and it forms numerous chemical compounds. In 1949 its name was officially changed to wolfram.

Tunguragua. Active volcano of Ecuador. It rises to 16,700 ft. among the Andes in the S. of the prov. to which it gives its name.

Tunguragua. Prov. of Ecuador. It is crossed by the E. Cordillera of the Andes and is adjacent to the provs. of León, Bolívar, Chimborazo, and Oriente. It is drained by the Pastaza and other affluents of the Marañón. The cap., Ambato, was virtually destroyed by earthquake in 1949. Area 1,685 sq. m. Pop. 223,100.

Tungus (Chinese, eastern barbarians). People of Altaian stock in E. Siberia. Numbering perhaps 70,000, their many tribes, between the Yenisei and the Pacific, include the Lamut, Orochons, and Golds. Once horse nomads along the Amur, they moved N. before the 12th century, adopting forest hunting, coast fishing, reindeer herding, riding, and husbandry in the Amur valleys. The Manchu are an offshoot of this people. The aboriginal shamanism is venerated by either Lamaism or Orthodox Christianity.

Tunguska. Name of three rivers of Siberia, tributaries of the

Yenisei. They are called the Upper Tunguska (Angara), the Middle or Stony (Podkamenai), and the Lower (Nijnaia). The Angara (*q.v.*) issues from Lake Baikal. All flow generally W. across the Krasnoyarsk region.

Tun - Huang.

Town and oasis in outer Kansu, China, close to Sinkiang. Its former importance arose from its propinquity to the high-roads from China to the Roman Orient, and from Tibet to Mongolia. In 1907 Stein explored its hundreds of cave shrines, and from a cella walled up in 1036, at the Caves of the Thousand Buddhas, procured for the British Museum 500 paintings on silk, linen, and paper, mostly of the Tang period, 620-907; 150 textile pieces, and 6,500 MSS. and printed books. See Turkistan; consult The Thousand Buddhas, M. A. Stein, 1922; Six Centuries at Tunhuang, L. Giles, 1944.

Tunic (Lat. *tunica*). Woollen undergarment in the nature of a shirt worn by the Romans, both men and women. With short sleeves a man's tunic reached to the knees and over it the toga was worn. Women's tunics reached to the feet, and were worn under-

neath the palla. Today the word is used for a short, loose garment, and for a military uniform jacket. See Costume; Toga.

Tunicata. Group of marine animals, holding a position between the vertebrates and the invertebrates. They are familiar on all rocky coasts as Sea Squirts or Dead Men's Fingers (*q.v.*), and many of them assume the form of a tubular bag of leathery tissue, attached by the base to a rock or other object. They were formerly regarded as molluscs, but are now known to be related to the vertebrates. In the larval stage they are free-swimming tadpole-like animals, with a well-developed notochord in the tail, and a central nerve tube ending in an expansion which is a forerunner of the brain in the vertebrates. When the animal becomes adult it attaches itself to some object; the tail, notochord, and "brain" disappear, and the animal assumes a tubular form.

Tuning. In music, the adjustment of sound-producing media, both to a standard pitch and to their relative positions in regard to key. Wind instruments are made in certain keys, and completed with scrupulous attention to the proportion of bore to length, and to the proper position of valves, slides, or holes. In the harp and the string instruments, fundamental tuning is effected by the player.

-Piano and violin strings

and the like are tuned by regulating their tension. Organ pipes are tuned in different ways according to their nature and material; metal flue pipes by having the tops widened (sharper), or narrowed (flatter) by a tuning cone: wooden, open pipes by adjusting a tuning flap at the back; stopped pipes by altering the position of the stopper; reeds by tapping the wire holding down the ends of the tongue, to alter the vibrating length.

Tunis. R.C. cathedral, built 1893-97. Top, minaret of the Great Mosque ez-Zeitouna. See facing page

Tuning-fork. Steel rod bent in the middle, and having at the fold a handle or foot. Owing to its permanence of tone and its almost complete lack of upper partials, it is much used for indicating definite pitch. By means of an electro-magnet and a light "make-and-break" contact, tuning-forks can

Tuning-fork used for indicating musical pitch
By courtesy of Boosey & Hawkes

be maintained continuously in vibration by an electrical supply.

Tunis. City of N. Africa, capital of Tunisia. It is situated on a small lagoon near the Gulf of Tunis, in the N. of the country, and is connected with Bizerta and the other principal cities of Tunisia and Algeria by rly. Ocean-going vessels can reach Tunis by a 7-m. channel dredged in the lagoon to Goletta (q.v.), and opened in 1893. The ancient Arab city is of great interest, and contains many elegant mosques, notably that of Sidi-Mahrex. Tunis was occupied by the French, May 12, 1881. During the Second Great War it was occupied by the Germans in Nov., 1942, and taken without serious fighting by British and Americans May 7, 1943. About three miles distant are the ruins of Carthage (q.v.). Pop. (1936) 219,578, including 93,356 Muslims, 27,345 Jews, 42,878 French, 49,978 Italians, 4,855 Maltese.

Tunis arms

Tunisia (Fr. La Tunisie). French protectorate in N. Africa. It lies between Algeria and Tripolitania, and has a coastline c. 550 m. long. It is c. 48,300 sq. m. in area, and occupies a commanding strategic position upon the N. African littoral. The inhabitants, 2,608,313 in 1936, most of whom are Beduin Arabs and Kabyles, included a large Italian element, 94,000, some 60,000 Jews, about 7,000 Maltese, and a French population of 108,000, exclusive of the military.

Much of the country is mountainous; in the S. lie desert steppes, in the E. low and sterile desert; but some parts are extremely fertile. The interior is traversed by three mountain chains. Between these ridges are numerous elevated val-

leys extensively cultivated in the N. and producing cereals, oranges, dates, figs, vines, almonds, and olives. The most important river, the Medjerda, flows from Algeria, and falls into the Gulf of Tunis near Porto Farina. There are numerous lakes; those in the S., however, generally dry up during the hot season. The climate is warm and agreeable in the coastal and elevated regions, but hot in the more sterile dists. The chief industry is agriculture, but there are deposits of iron, lead, zinc, lignite (production 68,560 tons in 1946), and phosphates (695,000 tons in 1946).

Rlys. connect the chief centres of pop. and are linked with the Algerian system. The principal cities are Tunis (q.v.), the capital; Sfax (93,333), a port on the Gulf of Gabes; Susa (28,465), a port on the Gulf of Hammamet; Bizerta (28,468), a strongly fortified harbour at the extreme N. point of Africa; Gabes (18,611); and Kairwan (22,991), the holy city of the Muslims.

In the earliest times a possession of Egypt, Tunisia was later occupied by the Phoenicians and Canaanitish wanderers. In the 7th cent. B.C., exiles from Tyre, and Phoenicians, under Dido founded the celebrated city of Carthage (q.v.). Subsequently passing under the domination of the Romans, the Arabs, and, in 1575, of the Turks, Tunisia contains numerous remains of antiquity, vast ruins, and evidences of its former fertility and great prosperity. Under Hussein ben Ali, who seized the country in 1705, Tunisia became virtually independent, although at times it was tributary to Algeria, and Turkish suzerainty was always acknowledged. In 1881 the French invaded the country, and on May 12 forced the bey to sign the treaty of Kassar-Said, subsequently strengthened by a convention signed June 8, 1883, under which the bey placed Tunis under French

Tunisia. Map of the French protectorate in North Africa

protection. Sidi Mohammed al-Amin (b. Sept. 4, 1881) succeeded as bey his cousin Sidi Mohammed al-Mounsaf, who abdicated May 15, 1943; he is descended from Hussein ben Ali. The country is administered by a French minister resident-general, who is responsible to the foreign office, with a cabinet of eleven heads of depts., eight of them French, three Tunisian. Each of 19 civil dists. has a French governor with Tunisian officials; there are also six military areas.

During the Second Great War Tunisia came under the control of the Vichy govt. after the Franco-German armistice, and remained so until the landing of the Allies in

Tunisia. Three Arabs of the country. Left, a sheik; centre, woman with her baby; right, a water-carrier

Morocco and Algeria and their advance into Tunisia led the Germans to fly in troops and occupy the city of Tunis and the surrounding country. An account of the fighting is given under Tunisia, Battle of (v.i.). Consult *La Tunisie*, J. Despois, 1931; *L'État Tunisien et le Protectorat Français*, 1925-1931, Fitoussi and Benazet, 1931.

Tunisia, BATTLE OF, 1942-43. The principal object of the Allied landings in N.W. Africa on Nov. 8, 1942, was to secure Tunis and Tunisia before Axis forces—either those retreating from Alamein or others landed across the Mediterranean—could do so. Those landings were the signal for the start next day of German landings by sea and by air, the first at El Oūina airport just outside Tunis; and these, unlike the Allied landings, were unopposed by the French. French opposition to Eisenhower's force lasted only two days (see North Africa Campaigns); but it gave the Germans that additional advantage over the Allies, whose nearest landing to Tunis was at Algiers more than 450 m. away.

By mid-Nov. the Allies had established a forward base at the port of Bône, some 60 m. from the Tunisian frontier. From Bône a coast road runs comparatively straight to Bizerta. It is not a good road, and traverses for most of its length deep scrub-covered valleys or high bare hills. A N.-S. road links near Souk Ahras with an inland road which runs E. to Béja, splitting there into three: the N. arm joins the coast road about 30 m. E. of Tabarca; the centre arm, incomplete in 1942, cuts through the deep valley of Sidi Nsir to Mateur; the third is the old Carthaginian road to Tunis by Medjez-el-Bab. At Medjez, 35 m. from Tunis, this third road forks, the N. fork reaching Tunis by way of Tebourba and Djedeida, the S. going straight there across low rolling hills.

British Parachute Drop

A British parachute bn. dropped on Nov. 16 at Souk-el-Arba in the wide Kroumirie valley, securing the airfield there without opposition. Commandeering French transport, the parachutists went forward next morning to Béja and, continuing to advance along the centre road, met the Germans 6 m. beyond Sidi Nsir. Meanwhile the British commander, Gen. Anderson, sent half his infantry (three bns.) with some 25-pdr. artillery along the coast road in an attempt to reach Bizerta. The other three bns. went along the wide and easy

main road from Béja to Medjez-el-Bab, in the hope of taking Tunis by frontal assault. Between them, through the defile of Sidi Nsir, Anderson sent a small, composite force of tanks with supporting elements.

Forty miles beyond Tabarca the northern force met German tanks, overcame them, and advanced a few miles farther to a little pass between two hills, named by the men "Green Hill" and "Bald Hill." There it was stopped by German parachutists well dug in and supported by mortars and heavy machine-guns. The southern force, in spite of German air superiority, pushed on and secured Medjez-el-Bab on Nov. 25. The centre force, also heavily bombed, reached Sidi Nsir, crossed the high hills by the half-made road in spite of mortar and anti-tank fire and mines, to secure Tebourba on Nov. 27.

Concentration of German Forces

By this time German forces, commanded by Gen. Walter Nehring, a tank specialist, were massed at Djedeida in prepared positions against which British, now reinforced by some American, troops thrust in vain, to be forced back through Tebourba to the hills N. of Medjez. On Dec. 8 the rains came; but in spite of the difficulties of tank warfare in the resulting mud, on Dec. 10 and 11 Nehring thrust in strength from Djedeida, and from Massicault to the S.W. towards Medjez. These attacks were repulsed, though a column of U.S. armour lost most of its tanks, much of its artillery, and a number of its vehicles to the mud. But the Germans left a garrison on Jebel Ahmera (soon to earn the name Longstop Ridge), a hill dominating the exits from Medjez. The 2nd Coldstream Guards, detailed to throw the Germans off the hill on the night of Dec. 22-23, succeeded in establishing themselves on the crest after severe and confused fighting. A U.S. bn. relieved them, was heavily counter-attacked, and, mistaking orders, withdrew from the crest. The 1st Guards bde. regained the summit on the 24th but, after bitter fighting, lost it again on Christmas Day. The mud was so bad that the Germans were left in position, the Allied troops falling back on Medjez. Hope of a quick seizure of Tunis had to be abandoned, and major operations postponed until the rain ceased.

New men and materials were reaching the Allies; but the Ger-

mans were also being reinforced, and Maj.-Gen. Jürgen von Arnim arrived to take command. On Jan. 3, 1943, the Allies attacked unsuccessfully in the Green Hill-Bald Hill area. On the 18th the Germans attacked from Pont-du-Fahs; at Bou Arada about 18 m. to the W., they were beaten off. In the valley of the Ousseltia they were held, but they were not repulsed until Jan. 23. On that day, the 8th army occupied Tripoli, and it was decided in Tunisia to try to occupy the narrow neck of land between the Chott Djerid, an enormous shallow salt lake, and the coast, in order to stop a junction of Rommel's forces retreating from the E. with those of von Arnim. A strong force assembled near Bou Chebka, to the S.E. of Tebessa, principal Allied base in the S., succeeded in advancing only as far as Station Sened, 10 m. W. of Maknassy. The Germans held a second advance from Sbeitla at the edge of the Faid Pass, and then on Feb. 14 swept through the pass, capturing Sbeitla on the night of Feb. 17-18. As a result of the loss of Sbeitla, the U.S. 2nd corps began to withdraw through the narrow Kasserine Pass on Kasserine. Gafsa to the S. was abandoned in conformity. On Feb. 20 the Germans thrust through the Kasserine Pass, sending armoured forces N. towards Thala, W. towards Tebessa. Both thrusts were held; and the Germans began to withdraw, followed—slowly because of great numbers of mines—by British and U.S. units. By the evening of the 28th the Kasserine Pass was in Allied hands again, and Sbeitla had been reoccupied. This, the last German attack in S. Tunisia, was under Rommel's command, and it gave him time and space for the withdrawal to the Mareth Line of his army of Egypt, which made no attempt to stand on the indefensible Tripolitania-Tunisia frontier.

8th Army's Entry into Tunisia

Patrols of the 8th army crossed the frontier in the last days of Jan. In accordance with decisions taken at the Casablanca conference between Roosevelt and Churchill, the 8th army after entering Tunisia came under Eisenhower's supreme command, Gen. Alexander assuming the fighting command of all Allied forces in the country from Feb. 19. On Feb. 15 the 8th army occupied Ben Gardane; on the 18th Medenine. An attempt to recapture Medenine on March 6—Rommel's last battle in Africa—failed. The battle of the Mareth

Line (q.v.), in which the Italian Gen. Messe commanded the Axis forces, followed; it was not over until March 28. The Axis lost heavily, but escaped annihilation, retreating to the Wadi Akarit, a dry gully lying a little beyond Gabes and running down to the sea. The 8th army paused for reorganization near Gabes. Then on April 6 it attacked the Wadi Akarit and, in fighting "heavier and more savage" than any since Alamein, drove Messe from it. On April 7 a patrol of the 8th army met a U.S. patrol 15 m. E. of El Guetar; the Allied armies from E. and W. had met across N. Africa. The Allies occupied Pichon on the 8th, Sfax on the 10th, Kairwan on the 11th, Susa on the 12th.

Messe reached Enfidaville on April 13 and joined von Arnim, who assumed command of all Axis forces left in Africa. Some quarter of a million Germans and Italians were in the "box" running from Enfidaville through Pont-du-Fahs, the hills E. of Béja, E. of Sedjenane to the coast some 10 m. E. of Cape Serrat. They were strongly entrenched in well-sited hill positions which they had had six months to prepare. At sea, however, the R.N. maintained constant watch, cutting down their seaborne supplies; in the air the Allies had complete superiority, and transport planes flying in petrol and reinforcements were shot down in numbers.

Strengthening of the 1st Army

Alexander decided that the 1st army was to make the main effort in the final battle, and seasoned troops from the 8th were transferred to it for this purpose. The battle began, however, on April 19 with a subsidiary attack by the 8th which took Enfidaville. For the rest of the battle, the 8th held a line just N. of that town. An Axis attack on the night of April 20-21 immediately to the E. of Medjez was defeated. On the 22nd the Allies attacked Longstop Ridge; in three days of the hardest fighting in Tunisia they captured it. In the N. an attack through the scrub country of the coast hills brought French African troops within 6 m. of Garaet Achkel, outermost of the two great lakes of Bizerta. Along the Sedjenane valley and up into the hills beyond Sidi Nsir the Americans thrust on April 23, smashing the main Axis defence line and opening the road to Mateur, entered May 3.

More reinforcements for the 1st army were taken from the 8th. On May 5 Bou Aoukaz, a dominating hill 4 m. downstream from Long-

stop and on the opposite side of the river, was attacked with strong air support. Fighting was severe, and the summit was taken by the 1st Irish Guards at the cost of many casualties. On May 6 massed artillery and air bombardment of the Axis positions followed, and two armoured divs. pushed forward, finding resistance "gallant and desperate" but disorganized. By nightfall they were in Massicault. At first light next morning they moved forward, and at 2.45 p.m. on May 7 entered Tunis, to be greeted with unrestrained enthusiasm by the population. An hour and a half later Americans entered Bizerta.

Isolation of Cape Bon Peninsula

After passing through Tunis, Allied armour wheeled down the road that runs across the base of the Cape Bon peninsula. It was held in the exceptionally strong position of the Hammam Lif defile by the Hermann Goering div., but on May 10 broke through to Hammamet. Next day infantry swept rapidly round the peninsula, encountering no opposition. On May 12, after a brief resistance, the forces remaining in the hills raised the white flag. The forces to the S. of the Allied wedge, larger than those to the N. and including six generals, had surrendered unconditionally on May 9. Among the remaining Axis forces in isolated pockets N.W. of Enfidaville, mass surrenders occurred on the 12th. Von Arnim surrendered to the commanding officer of the 2nd Gurkhas. He was taken to Alexander's h.q. at Le Kef where, says Alexander, "he still seemed surprised at the suddenness of the disaster. Gen. Messe delayed his surrender until the morning of the 13th; shortly before he had been informed by radio of his promotion to the rank of marshal. The troops in general surrendered to anyone they could find willing to accept their surrender. It was an astonishing sight to see long lines of Germans driving themselves, in their own transport or in commandeered horse-carts, westwards in search of prisoner-of-war cages." Some 250,000 men laid down their arms; 663 escaped, the German command having, in fact, made no effort to evacuate troops.

The British "1st army" which entered Tunisia in Nov., 1942, under the command of Lt.-Gen. K. A. N. Anderson, consisted of one incomplete infantry div. and one tank regt.; the div. was completed on Dec. 1; the 6th armoured div. was completed Dec.

15; the 46th div. reached the front in the first week of Feb., 1943, the 1st div. by March 22, the 4th div. in the second week of April. In Tunisia there were also the U.S. 2nd corps, of necessity raw to battle, and the French 19th corps, in Tunisia under Vichy, and regarded at first as of somewhat uncertain loyalty to the Allies. The Americans were directly under Eisenhower, the supreme commander; the French under Gen. Juin were responsible to Gen. Giraud. It was Jan. 25, 1943, before Anderson was made responsible for coordinating the whole small Allied force. In the final stages of the battle, on the other hand, notably close cooperation developed not only between army, navy, and air force, but also between the Allied groups engaged.

Trene Clephane

Tunja. Town of Colombia, in the dept. of Boyaca. About 80 m. N.N.E. of Bogotá, it is reached by road and rly. One of the oldest towns in America, it is remarkable for well preserved old Spanish buildings. Pop. 27,080.

Tunja OR TUNDJA. River of the Balkans. Rising in the S. slope of the Balkans Mts., it flows E. and then S. through a region much of which is a succession of gardens of roses, and joins the Maritza at Adrianople. Its length is about 150 m. The Tunja Valley produces large quantities of otto of roses.

Tunnel (Fr. *tonneau*, cask). Excavation underground to form a passage for conveying rail, road, or pedestrian traffic, sewage, water, cables, etc. Tunnels are also used in mining. The design and method of construction vary considerably, largely depending on the nature of the ground. When the material is loose, e.g. sand, silt, or shattered rock, it becomes necessary to support the sides and top of the excavation; in water-bearing strata, or when tunnels are driven at shallow depths below rivers, it is often necessary to use compressed air. Except for tunnels in sound rock, and when it is considered unnecessary to provide any special exposed surface, tunnels are lined with cast iron, concrete segments, concrete *in situ*, brickwork, or masonry, according to the uses to which the tunnels are to be put.

Deep tunnels are often driven by first sinking shafts to the required depth, thus providing working faces, and also means for removing the excavated material (spoil). In rock, small headings precede the main excavation. In soft ground such as clay, pneumatic spaders

are used, and in tunnels of large diameter it is customary to use a Greathead shield, which not only supports the ground until the lining is built, but also carries working platforms and movable tables

actuated by hydraulic jacks to give support to the face of the excavation. Most of the London underground rly. tunnels were constructed in this manner.

It is sometimes possible to solidify wet, granular ground by the injection of sodium silicate and calcium chloride in small measured doses, which give increased strength and impermeability. This is particularly useful in forming a temporary safe foundation under existing buildings, below which tunnels are being driven, to support the buildings before the tunnel lining is fixed. Cement grout is invaluable to fill voids behind tunnel linings and to seal fissures in rock through which water might flow. An important feature in tunnelling, especially where explosives are used, is the matter of ventilation; a supply of fresh air must be carried near the face, and the gaseous products of blasting and the exhaust air from pneumatic tools must be removed. In long tunnels used for road or rly. traffic, adequate ventilation must also be provided.

Tunney, JAMES JOSEPH (b. 1898). American boxer, known as Gene Tunney, born May 25, 1898. He was a rates clerk who won a boxing championship while in the U.S. army in France. He beat Jack Dempsey (*q.v.*) for the heavyweight championship of the world, Sept. 23, 1926, at Philadelphia; and again in a return match before

Gene Tunney,
American boxer

130,000 people at Chicago, Sept. 22, 1927. These were sensational contests, and Tunney would probably have lost them but for his cool thinking. Having knocked out a challenger, Tom Heeney, July 26, 1928, he retired from the ring undefeated. He married a grand-niece of Andrew Carnegie.

Tunny (*Thunnus thynnus*). Large fish, belonging to the mack-

Tunny. Large Mediterranean food fish, occasionally found in British waters

erel family. Common in the Mediterranean, it occurs round the U.K. The fish frequently grows to a length of over ten ft., sometimes weighs half a ton, and is a valuable food fish, with flesh which looks very much like beef. It is eaten both fresh and preserved in oil. See Bonito.

Tunstall. Market town of Staffs, England. In the heart of the Potteries, it is one of the five towns which form the co. bor. of Stoke-on-Trent, lying in the N. thereof. It has a rly. station. The Victoria Institute, 1889, contains a public library. The principal occupations are making earthenware and bricks; there are also coal and iron works in the neighbourhood. Tunstall was long a stronghold of Primitive Methodism. Pop. approx. 22,000.

Tunstall, CUTHBERT (1474-1559). English prelate. Educated in England and Italy, he entered the Church, and in 1511 was appointed chancellor to the archbishop of Canterbury, and bishop of London in 1522. He had been employed on various political missions since 1515, and

Cuthbert Tunstall,
English prelate

in 1525 and 1529 was special ambassador to the emperor Charles V. Given the see of Durham in 1530, Tunstall followed Henry VIII in his break with the pope, and in 1537 was appointed president of the council of the north. Temporarily losing his mitre under Edward VI, he was reinstated by Mary, but, refusing to take the oath of supremacy to Elizabeth, was imprisoned, dying in prison at Lambeth, Nov. 18, 1559.

Tupac Amaru (c.1740-82). A Peruvian revolutionary, whose real name was José Gabriel Condorcanqui, known as The Last of the Incas. He was born at Tinta, S. of Cuzco. For a time he ruled a district under the Spaniards, but in 1780 placed himself at the head

of an extensive and at first successful revolt against them. Eventually he was taken prisoner and, on May 18, 1782, at Cuzco was executed with barbarous cruelty, his family suffering a similar fate.

Tupelo Tree. Sprays of leaves and flowers. Inset, left, female flower and, right, head of male flower

Tupelo Tree or OGECHEE LIME (*Nyssa capitata*). Small tree of the family Nyssaceae, native of the southern U.S.A. It grows in swamps, and has alternate, oval leaves, cottony on the under-side. The small greenish flowers have the sexes separate, the males forming little heads, the females solitary. The plum-like fruits are red.

Tupman, TRACY. Character in Dickens's *Pickwick Papers*, one of the four "corresponding members" of the *Pickwick Club*. He is a middle-aged beau, extremely susceptible to feminine charms.

Tupper, SIR CHARLES (1821-1915). Canadian statesman. Born at Amherst, N.S., July 2, 1821, and educated in Edinburgh, he became a doctor. He entered the state legislature in 1845, was prime minister, 1864-67, and one of the fathers of the confederation of 1867. In 1870 he became president of the privy council of Canada, and under Macdonald was minister of inland revenue and of customs, and, in the 1878 ministry, in charge of public works and of rlys. He was high commissioner for Canada in London, 1884-87 and 1888-96, arranging the loan for the C.P.R. as finance minister in the interval. In 1896 for a few weeks Tupper was prime minister of the dominion. Then for four years he led the opposition in the house of commons. Knighted in 1879 and made a baronet in 1888, he spent most of his time in England in his last years, dying Oct. 30, 1915. Tupper published *Recollections of Sixty Years*, 1914.

Tupper, MARTIN FARQUHAR (1810-89). British author. Born in London, July 17, 1810, and educat-

ed at the Charterhouse and Christ Church, Oxford, he is remembered solely for his Proverbial Philosophy, 1838, a didactic work in blank verse, which at first attracted little notice, but eventually achieved extraordinary popularity, particularly in the U.S.A. Tupper also wrote mediocre verse, and was an indefatigable inventor. He died at Albury, Surrey, Nov. 29, 1889. *Consult* M. T., His Rise and Fall, D. Hudson, 1949.

Martin Tupper,
British author

Tu Quoque (Lat., thou also). An answer to an opponent, in which the imputing of some offence is answered by bringing exactly the same charge against the accuser. The schoolboy retort "You're another!" is an obvious instance.

Tura. River of Russia. Rising in the E. slope of the Urals in the region of Sverdlovsk, it flows S.E. into the prov. of Omsk, and after a course of 450 m. discharges into the Tobol, 70 m. S.W. of Tobolsk. The river is frozen from Nov. to May. The valley yields timber of good quality.

Turanian. Persian term for the non-Iranian nomads of central Asia. Philologists have applied it inexactly to the Ural-Altaic language-family, and to such unrelated tongues as Dravidian; ethnologists have intensified the confusion by still looser applications. During the First Great War a Pan-Turanian movement aimed at the political cohesion of the Ottoman Turks with their central Asian congeners. *See* Altaian.

Turban. Head-dress worn by Mahomedans. It consists of a scarf of cotton or silk wound round the

Turban as worn
in N. Africa

head, the manner of arranging the folds varying according to rank and country. The tarbush or fez, or a cap of similar description, is sometimes used as the foundation for a turban. Early in the 19th century the turban became fashionable among some European women. It was also adopted by some Indian army units. *See* Cap.

Turbary (late Lat. *turbaria*, fr. *turba*, turf). In law, the right to dig upon another's land or to dig turf

upon it. The word is sometimes used to define ground upon which turf is dug.

Turberville OR **TURBERVILL**, EDWARD (c. 1648-81). Welsh informer. Having been employed in the house of the marquis of Powis, he served in the French army, 1676, and then studied at the English college at Douai. At the trial of Lord Stafford, 1680, he alleged that he had been importuned by the prisoner to kill Charles II. Turberville was likewise a witness at Shaftesbury's trial next year, in which he died on Dec. 18.

Turberville, GEORGE (c. 1540-c. 1610). English poet and writer. Born at Whitechurch, Dorset, he was educated at Winchester and New College, Oxford. He became secretary to Sir Thomas Randolph, whom he accompanied on his mission to Ivan the Terrible in 1568. Turberville wrote Epitaphs, Epigrams, Songs, and Sonets, 1567; *The Book of Faulconrie or Hawking*, 1575; *Tragical Tales*, 1587, from the Italian; and translated Ovid's *Heroical Epistles*, 1567. He helped to make popular Italian poetical models, and was a pioneer of English blank verse.

Turberville, HENRY DE (d. 1239). English soldier. A loyal follower of King John, he took part in the victory on behalf of Henry III over the French fleet in Dover Straits, 1217; was seneschal of Gascony, 1226-31 and 1234-38; and fought in the Welsh war, 1233, when he captured Carmarthen. In 1233 he was in arms for the emperor Frederick II against the Lombards, and was about to go on crusade when he died, Dec. 21, 1239.

Turbine. The various classes of this machine are described under the headings Gas Turbine; Steam Turbine; Water Turbine.

Turbine, RALPH DE (d. 1122). English primate. Also known as Ralph d'Escures, he became a monk of Sees, then abbot, and, settling in England in 1100, was made bishop of Rochester. Appointed archbishop of Canterbury in 1114, he is remembered chiefly on account of his refusal to consecrate Thurstan to the archbishopric of York unless the latter acknowledged obedience to Canterbury.

Turbot (*Rhombus maximus*). British flat food fish. Next to the sole, it is the most highly esteemed of the flat fish for the firmness and delicacy of its flesh. It is greyish-brown in colour, with darker spots, and the scales when present are very small and inconspicuous. A turbot may grow to over 3 ft. in

Turbot, the flat food fish caught off the British coasts

length. It feeds mainly on other fishes. The turbot fishery is carried on off the N.E. coast of England, usually beginning in May, trawling being practised. *See* Brill.

Turbulence. Name given to the irregular or "eddy" motion which appears in fluids, whether liquid or gaseous, when they flow past solid surfaces or when neighbouring streams flow past or over each other, provided that the velocity exceeds a certain level. There is no mathematical definition of turbulence; fluid motion is said to be turbulent when it is impossible to specify the details of the motion. The motion of the lower layers of the atmosphere is turbulent, e.g. the wind consists of a series of gusts and lulls.

Turco. Name given to Algerian riflemen. They belong to the regiments which constitute the native portion of the African infantry in the French army. Commanded partly by French and partly by native officers, their official description is *Tirailleurs Algériens*.

Turcoman OR **TURKOMAN**. Tribes of Turkic stock and speech, mostly in W. Turkistan and thus inhabitants of the U.S.S.R. Numbering some 290,000, they are found as far W. as the Caucasus, and there are outlying bands in Asiatic Turkey and across the Persian and Afghan frontiers. Hardy, thick-set, predatory, stock-breeding nomads of Altaian type, they form nine tribes, mostly dwelling in winter villages and summer encampments. Since the Russian subjugation in 1881 many Turcomans have adopted agriculture. *See* Turkmen.

Turenne, HENRI DE LA TOUR D'AUVERGNE, VICOMTE DE (1611-75). French soldier. Nephew of Maurice of Nassau, and grandson of William the Silent of Orange, he was born Sept. 11, 1611, at Sedan, was brought up as a Protestant, and joined the French army in 1630. He distinguished himself in the earlier French campaigns of the Thirty Years' War (q.v.),

and from 1641 onwards held the highest commands, although he was periodically superseded by

Vicomte de Turenne,
French soldier
After Latourne

Condé, a brilliant soldier in the field, but on a much lower plane than Turenne in the sphere of real generalship. In 1644-45, when Turenne was commanding the armies of the Upper

Rhine with much skill under great difficulties, Condé spoils his work by bringing upon their joint force a heavy defeat at Freiburg, and then stole credit by winning a lucky victory at Nördlingen. In 1646, however, Turenne, relieved from the embarrassment of his rival, conducted a brilliant campaign in which he made himself master of Bavaria in the last campaign of the war in Germany.

During the civil wars of the Fronde, 1648-52, when it was hard for Frenchmen to decide where their loyalty lay, Turenne changed sides between the rebels and the court. In 1650 he suffered at Rethel his only significant defeat, but in the last campaign proved decisively superior to Condé, winning the victory of the Faubourg St. Denis to regain Paris for the court. Against the Spaniards he won battles at Arras and Dunkirk, compelling them to sign the peace of the Pyrenees. Louis XIV appointed him marshal-general in 1661, and stopped short of making him constable of France only because of his Protestantism. As Turenne was received into the R.C. Church as late as 1668, his conversion scarcely seems due to a desire for secular advancement.

In the Dutch war, 1672, and against the German princes he again proved the greatest master of the art of war of his day. But when in 1674 he took the Palatinate, much hatred was aroused by his campaign of devastation. Then came his sensational winter march secretly through the length of the Vosges to crush the allies at Turkheim, Jan. 5, 1675, and recapture Alsace. Giving battle again on July 27 to Montecuccoli at Salsbach, he was killed early in a victorious action. Turenne was the early teacher of Marlborough, and his later campaigns were a model to Napoleon. Esteemed for daring and strategical skill by both enemies and allies, he has also left, on the whole, the reputation

of a man of noble character, appealing to all generations of Frenchmen. The best English biography is by T. O. Cockayne, 1853. That by Max Weygand was translated into English in 1930. Turenne's memoirs were published by P. Marichal in 1909.

Turf. Term used for the grassy surface of the soil; also the sods of earth and grass roots cut for various purposes. By association it is used for the sport of horse-racing and all its connexions. See Horse-racing.

Turfan. Town and oasis N.E. of the Tarim basin, Sinkiang. Situate in a depression 300 ft. below sea level, with a pop. of 50,000, mostly Mahomedan, it lies on the great highway from E. China to Kashgar and Central Asia. The chief article of commerce is cotton, irrigation being effected by karez, or underground channels. Explorations of its ruined Buddhist monasteries yielded remains and MSS. in the local Kuchan dialect.

Turf Club. London club founded in 1868, mainly for sportsmen. Its house is at 85, Piccadilly.

Turgenev, IVAN SERGEEVICH (1818-83). Russian novelist. He belonged to an old impoverished noble family, probably of Tartar ancestry, and was born at Orel. Educated in Moscow, St. Petersburg, and Berlin, he began his literary career by writing

Ivan Turgenev

verses, which, however, he soon abandoned for prose, publishing his first sketch of peasant life in 1847. In 1850 he wrote his one popular play, *A Month in the Country*, and in 1852 came a volume of studies of peasant life, *A Sportsman's Sketches* (Eng. trans. 1895). This work showed that a new great Russian writer had arisen, and contributed to the emancipation of the serfs in 1861. Having suffered a month's imprisonment for an article he wrote on the death of Gogol in 1852 and two years' banishment to his estate, he left Russia in 1855, and, but for rare brief visits home, passed the rest of his life in self-imposed exile, living for the most part in Baden and in Paris.

Then followed half a dozen novels: *Rudin*, 1856; *A House of Gentlefolk*, 1859; *On the Eve*, 1860; *Fathers and Sons*, 1862,

which is generally accepted as the author's masterpiece; *Smoke*, 1867; and *Virgin Soil*, 1876. Turgenev died at Bougival, near Paris, Sept. 4, 1883. Most of his works have appeared in English translations. *Consult* Landmarks in Russian Literature, M. Baring, 1910; *La Vie de Tourguénieff*, E. Haumant, 1910; Turgenev, *The Man*, A. Yarmolinsky, 1927; *Tourguéniev*, A. Maurois, 1931.

Turgot, ANNE ROBERT JACQUES (1727-81). French statesman and economist. Born May 10, 1727, he

was educated at the Sorbonne, and in 1761 became Intendant of Limoges. Holding that office for 13 years, he effected remarkable economic reforms in that district.

In Aug., 1774, he was entrusted by Louis XVI with the financial administration of France, taking office as comptroller-general.

Called to the ministry when France was unconsciously heading towards the Revolution, Turgot made a gallant effort to save the situation. He instituted drastic economies, which infuriated the classes who made their profit out of the existing system; he secured the king's support in abolishing the internal barriers to the freedom of trade in corn within the kingdom; he sought to establish a system of local self-government; and at the beginning of 1776 he attacked the *corvée*, the vested interests of the guilds, the *gabelle*, or salt tax, and the exemption from taxation of the privileged classes. Those classes, with the support of the queen, united in an attack upon the minister, which Louis was unable to resist. In May, 1776, Turgot was dismissed, and retired into private life. He died March 20, 1781. See Physiocrats.

Turgutlu or **KASSABA**. Town of Asiatic Turkey, in Manisa vilayet. It is about 30 m. E. of Izmir, on the rly. to Alashehr. Famed for melons, it exports them together with cotton, silk, and silkworms. The pop. of some 20,000 is mainly Muslim.

Turiamo. Seaport of Venezuela which in 1948 was in course of construction. It lies between Puerto Cabello and La Guaira. Quays were planned to accommodate the largest ocean liners, and the port, connected by highway with the Maracay-Valencia road,

Louvre

Turin, Italy. 1. Royal Palace on Piazza Castello dating from 1660, which suffered war damage. 2. La Superga, the church where many kings of Sardinia are buried. 3. The 15th cent. Gothic cathedral of S. John the Baptist, containing interesting frescoes. 4. Vittorio Emanuele I bridge, one of four bridges in the city crossing the Po, showing the church of Gran Madre di Dio

was intended to play a leading part in Venezuelan commerce.

Turin (Ital. Torino). Most westerly prov. of Piedmont, Italy. It is bounded W. by France, N. by Aosta prov., E. by several provs., and W. by Cuneo; and is drained by the headstreams of the Po, which flow E. from the Graian Alps. It is mostly mountainous. Copper, coal, marble, chestnuts, cattle, silk, cottons, and linens are produced.

Turin (Ital. Torino; anc. Augusta Taurinorum). City of N.W. Italy, fourth largest in the country, and

Turin arms

capital of Turin prov. It is situated at an alt. of 785 ft. on the Po, which is here navigable. Genoa is some 80 m. S.E., Milan the same distance E.N.E., and the Mont Cenis Tunnel 54 m. W. Turin is a modern, well built, open, and unfortified city of rectangular plan with straight streets, parts of which are arcaded. The Piazza Castello in the N.E. is the focus of civic life. Here are the huge, unlovely Palazzo Madama, once a Roman gateway, damaged in air raids of the Second Great War; the Porta Decumana, later a castle; and a

Turin. Plan of the central districts of the Italian city

13th century fortress, enlarged at various dates.

From the Piazza radiate important streets, the chief, the Via di Po, leading to one of the four city bridges. N. of the Piazza is the plain brick royal palace, which dates from 1660, and also suffered war damage. Near by is the

duction to England it was supposed to have come from the Muslim east, then loosely called Turkey, and the bird was accordingly thus named ;

hanging from the forehead being extensible and erectile when the bird is excited. The bill and feet also are red.

The plumage in general is coppery bronze colour marked with black. There is a broad band of white at the tip of the tail-coverts and a similar band on the feathers of the tail proper. The male bears on the chest a hanging bunch of black bristles about 9 ins. long. A turkey is omnivorous, and attains a weight up to 50 lb. Mating takes place in March, and from nine to 15 or more brown-spotted, whitish eggs are laid. From this wild fowl the smaller domestic turkey originated, first appearing in Europe early in the 16th cent., when Spanish explorers brought it from Mexico.

Under domestication the turkey needs ample range and freedom. The chief domesticated breeds are the mammoth bronze, the Cambridge bronze, and the Norfolk black. The first is fairly hardy, and attains a weight of over 30 lb. The Cambridge bronze is slightly smaller. The small Norfolk black is the easiest to rear on a farm where no special attention can be devoted to it.

a similar error being perpetuated in France, where it was called *poule d'Inde*, bird of India, since contracted into *dinde* or *dindon*. It is distinguished by its large size, heavy body, and almost bare neck and head, which are bluish with red warts, the head covered with fleshy excrescences, one process

Gothic cathedral of S. John the Baptist (1492-98), with interesting frescoes and relics. On an eminence reached by cable rly, is the Superga, the burial church of the house of Savoy. The university was founded in 1404; part of its library was destroyed. The palace of the academy of sciences contains a picture gallery and a museum of antiquities. Roman remains show that there was a theatre. Altogether 31 churches and 67 palaces were more or less badly bombed late in 1942.

Manufactures include motor cars, steel and iron goods, silks, ribbons and velvets, cottons and woollens. Turin became a Roman colony under Augustus. It passed to the house of Savoy in the 11th century, and during 1861-65 was the capital of Italy. Liberated from the Germans April 27, 1945, by Italian patriots after two days' fighting, Turin was entered by Japanese-American troops of the Allied 5th army April 30. Pop. 712,983. See Arcade, illus. p. 553.

Turkey (*Meleagris gallopavo*). Large bird of the pheasant family (Phasianidae). It is a native of N. America from S. Canada to Mexico, but is now extinct in the wild state in the settled areas. On its intro-

TURKEY: REPUBLIC OF EUROPE & ASIA

Edgar Stern-Rubarth, Ph.D.

An account of the republic of Turkey set up in 1923 is here followed by a history of the Ottoman empire from its origin to its downfall. See also Ankara; Istanbul; Izmir; Trabzon, and other towns; under Bulgaria; Greece; Persia, and other countries formerly under Turkish suzerainty; Abdül Hamid; Atatürk, M. K.; Osman; Solyman the Magnificent, and other noted figures in Turkish history. The fighting between Turks and the Allies during the First Great War is described under Dardanelles, Attacks on; Gallipoli Campaign; Kut; Mesopotamia, Campaign; Palestine; Salonica; see also Lawrence, T. E.

The Turkish republic, established Oct. 29, 1923, by one man with a few faithful assistants and disciples, has little in common with the former Ottoman empire, which, a conquering military power in the Middle Ages, had been ever more rapidly disintegrating for two centuries. The republic consists of the mainland of this former empire, Anatolia, and the prov. of (Turkish) Thrace, its last European territory, and contains the original stock of its once nomadic population, the Turks, with but small settlements of other races; the language and the flag, crescent and star in white on red, have not changed.

The republic of Turkey (Türkiye Cümhuriyeti) lies between lat. 36° and 42½° N. and long. 26° and

45° E. It covers an area of 296,107 sq. m. and has a growing pop. (1945) of 18,860,223; of these 1,493,976 live in European Turkey with Istanbul, pop. 845,316, and Edirne (Adrianople) as the biggest towns. Istanbul, capital of the empire, has been replaced as capital by Ankara, pop. 226,712, a provincial town on the plateau of Anatolia before 1923 with fewer than 40,000 inhabitants. Izmir (200,088) is the chief port in the Aegean, Adana (100,367) is the chief port on the S. coast. Bursa, Eskişehir, Gaziantep, Koni, Kaisariyeh, and Erzurum also exceed 50,000 inhabitants, but by far the majority of the population live and work in villages and small farming communities,

Turkey arms

Turkey flag. Red with white crescent and star

about four-fifths of all Turks still being peasants, and cultivating the soil in their age-old way—about 6 p.c. of the total area is under agriculture—or breeding horses, cattle, sheep, goats, poultry, etc. A law of 1929 turned them from tenants into owners of their land. Fishing and trading by sea are industries of the long coastline. The main part of Anatolia is a high plateau rising in the centre to 3,000 ft. and bordered by mt. ranges in the N., E., and S., with a narrow strip of plain along the N. and S. coasts, a wider strip in the W. There are large swamps and marshes and, in the centre, salt lakes and steppes; forests, chiefly in the E., cover 36,000 sq. m.; the mts. reach over 16,000 ft. in the E. in the highest point of the mts. of Ararat, and some 12,000 ft. in the centre in Mt. Argæus.

Climate, Flora, and Fauna

Turkey in Europe has a Mediterranean climate, the mean temp. of Istanbul ranging from 42° F. in Jan. to 74° F. in July. Asiatic Turkey is a region of varying climate. Heavy autumn and winter rains occur along the N. coast; summer showers decrease towards the E., and in the interior and south precipitation is confined to the cold season. Under maritime influences the coastal areas experience mild winters and cool summers; inland there are extremes of temp., e.g. the Jan. and July means at Mazara are 21° F. and 77° F. respectively.

Palm trees and cotton plantations flourish in the semi-tropical plain of Adana in the S.; Mediterranean plants and shrubs grow along the W. coast and the Straits. Alpine vegetation is to be found near the Black Sea to the E. and on the Transcaucasian border ranges; plants of the steppe in the centre. The animals of these different characteristic zones range from bear and wolf to jackal and bustard. Long-haired species of cat, goat, and rabbit take their name (Angora) from the capital; camels are bred in many parts; tobacco from the Black Sea area (Samsun, Trabzon) and the W. coast (Aidin, Izmir) has world-wide markets, and the large town of Afyon Karahisar N.W. of Konieh takes its name from the huge opium-producing poppy-fields in its prov. Turkey's exports include raisins and almonds, hazel nuts, olive oil, cotton and wool, figs and eggs, and carpets, most of them hand-woven in antique patterns either in the home or in factories near Istanbul and Izmir.

Within a quarter of a century Turkey developed considerable industry. Possessing valuable deposits of coal, lignite, chromium, manganese and magnesite, zinc, sulphur, antimony, marble, meerschauum, and some iron ore and copper, Turkey devoted great care and effort, from 1935, to the exploration of these resources and started digging oil wells and building power stations, cement and other works of basic industries. Textile, paper, iron, and ceramic industries, at first with Russian, then with western assistance, were created and a great programme of rly. building was vigorously put into effect. Thus, while at the end of the First Great

vilayet), each with an *ibay* (formerly *vali*) at its head; four *il* are in European Turkey. Their size varies between 1,400 and 11,000 sq. m., the largest being that of the capital Ankara.

Military service is obligatory for three yrs. and men between 21 and 46 are liable to be called to the colours. Peace-time strength is about 200,000 officers and men, war strength approx. 2 million. Military service is combined with education and craft training; men of the minorities—Armenians, Greeks, Arabs, etc.—are excluded from training in arms, but receive the educational training. Education, in fact, is one of the govt's. main purposes; elementary

Turkey. Map showing the extent of the country as determined by the treaties of Sévres, 1920, and Lausanne, 1923

War there was but one through rly. line, that linking Istanbul with Syria and, by way of the Bagdad rly., Iraq, and a few unconnected lines inland from several coastal towns, by 1945 there were 4,339 m. of well-connected, state-owned lines covering the whole country.

ADMINISTRATION. The constitution, which has been amended several times, dates from April 20, 1924. It declared Turkey to be a republic and decreed that an assembly should be elected every four years. A law of 1946 gave men and women the vote at 22, made them eligible to sit at 30. Secret ballot was introduced by a law of July 10, 1948. The grand national assembly (Büyük Millet Meclisi) of 465 deputies returned in 1946 consisted of 397 members of the People's party, 61 Democrats, and 7 Independents. The national assembly elects the president of the republic who forms his cabinet from members of parliament, which has the power to dismiss the govt. The president is elected for four years and can be re-elected.

The country is divided up into 63 depts., called *il* (formerly

education is in theory obligatory for boys and girls, and the adoption of Latin (instead of Arabic) characters from Dec. 1, 1928, made education simpler, but in 1935 only 2½ million could read Latin characters. There are secondary, higher technical, and teachers' training schools as well as the university of Istanbul and Ankara, founded 1900. Gymnastics and sport, under the Ottoman empire almost entirely neglected, are encouraged in all schools and training courses. The formerly numerous foreign schools—American, French, English, German—are rapidly vanishing; new ones are not permitted.

RELIGION. Most of the people are Sunni Mahomedans; a minority belong to the Shiite Muslim community. There are about 150,000 Christians, mostly Orthodox, and about 90,000 Jews. Religion of every denomination is tolerated but has no political standing or influence; the wearing of clerical garb is permitted only on special occasions. Religious schools, whose main teaching under the sultanate and caliphate was the reading and learn-

ing by heart of verses (*sura*) of the Koran, were abolished in 1928.

Turkish is the language of 87 p.c. of the people; Kurdish of 8 p.c.; Arabic 1 p.c.; Greek 0.8 p.c.; Circassian, Yiddish, and Armenian about 0.5 p.c. each. The people's houses, in every town, and a number of them abroad, with assembly halls, libraries, etc., help to unify and educate a nation formerly split into many classes and sects. In 1926, a code of law modelled upon the Swiss, and granting women equal rights, was introduced; so also was a new penal code. The introduction of social insurance and other up-to-date measures, and the abolition in 1934 of ranks and titles (pasha, bey, effendi, etc.) have contributed to unification and development. Addition of a family name was also made compulsory.

CURRENCY AND MEASURES. The unit of currency is the Turkish pound (£T), theoretically worth 18s. 6d. in British gold currency. The Turkish pound is divided into 100 piastres. From Jan. 1, 1934, the metric system was adopted for all weights and measures, formerly mainly of Arabic and Persian origin and very complicated. From 1925 the international calendar and clock were adopted.

LITERATURE AND ART. All through the Ottoman period, both literature and art ranked as branches of those of Islam. The Young Turk revolt of 1908 provoked the beginnings of a national literature, principally under the influence of Zia Gökalp. With the Kemalist reforms came poetry, drama, music, and art of specifically Turkish character. Authors like Halide Edib, Jacob Kadri, Fatih Rifki, and the poet Yahya Kemal Beyatli; and composers like Necim Kazim Akses, Hasan Ferid Alnar, U. C. Erkin, A. A. Saygun, C. R. Rey are promising representatives of a development which combines current western elements with autochthonous and traditional Turkish forms. (*Consult Anthologie des Ecrivains Turcs d'Anjourd'hui*, 1935.)

HISTORY. Present day Turkey is the heir and the one time cradle of the Ottoman empire whose history comprises 6½ centuries—the first half devoted to growth, the second to decay. Migrating Turkish tribes comprising five groups spread from E. Asia to Europe, and—including Huns, Turkmens, Krim Tatars, Kirghiz, and others—invasions of Asia Minor in the 11th cent.; the Seljuk tribe there estab-

lished its rule and was converted to Islam. Nomadic and loosely united, this tribe succumbed to Mongol invaders, one of its smaller tribal rulers, Ertoghrul, however, making himself independent. His successor Osman, or Othman, founded, about Karahisar, a small state and is considered the founder of the Turkish empire named after him.

Assuming leadership of his clan in 1288 and, in 1307, declaring his independence of the decaying Seljuk kingdom of Rum, East Rome, Osman handed to his son Orkhan (reigned 1326–59) a small but well organized state which the latter extended to the shores of the Sea of Marmara; fighting other Turkish tribes and the Greeks, conquering Gallipoli after crossing the Straits, winning over Christian peers, and setting up a court at Brussa (Bursa). Orkhan's son Murad I and his grandson Bayazid I spread their domain in Europe, conquering and turning into their capital Adrianople (Edirne) in 1361, beating Serbs and Hungarians and laying siege to Constantinople towards the end of the 14th century. An essentially military power, preserving many of their nomadic traits and virtues, the Turks yet had by this time a sensible and, in many respects, farseeing and tolerant regime created by Orkhan; their guards, the janissaries, were formed from the (fifth) sons of their Christian subjects, trained from early childhood in athletic and moral accomplishments at the sultan's palace, and, if qualified, admitted to the highest offices of the state.

Spread of Turkey into Europe

The advance of the Ottoman sultanate to world power was stopped, however, by Tamerlane's sanguinary invasion in 1402. Mohammed I and his son Mohammed II re-established the Turkish rule, Mohammed II taking Constantinople in 1453 and subsequently overrunning the whole Balkan peninsula. Mesopotamia and Kurdistan were taken from Persia; in the early 16th cent. Hungary was conquered and, with the exception of Belgrade, held by the Hungarians, turned into an Ottoman prov., so recognized, except for Transylvania and the Banat, by Austria in 1547. Bagdad was taken; suzerainty over Mecca and Medina was established; Egypt was won; and Selim I in 1517 adopted the title kalif (Prophet's deputy), hitherto held by the Abbasside Arab dynasty, and, though exercising

towards subjects of other religions more tolerance than any other contemporary rulers, he and his successors claimed the leadership of all Mahomedans. Under Solyman the Magnificent (1520–66), who gave the Turks a constitution based upon the feudal system, the army, and the Byzantine administration, the Ottoman empire reached its peak about 1560, having treaties with France, Venice, and other Western powers. Solyman made the first Turkish attack on Vienna in 1529.

Reduction in Sultans' Power

A defeat of the Turkish fleet at Lepanto, 1571, by a Christian league, of which Spain and Venice were the chief members, was the first serious setback. Intrigues by ambitious grand viziers under weaker rulers, assassinations of potential successors, plots of the janissaries reduced the power of the sultans. The recovery of Persia under its energetic Abbas I (1587–c. 1628) cost Turkey Mesopotamia and parts of Armenia. But for another century the empire held its own, thanks chiefly to capable viziers (among whom members of the Koprili family were outstanding), although former vassals gained steadily more independence in Kurdistan, in the Lebanon, in Crete. Dynastic strife, however, the consequence of the Turkish inheritance law which established not the eldest son of a sultan, but the oldest male member of his family as heir presumptive of the throne, harem life, and luxury undermined an originally vigorous regime. Thus, the 17th century saw no less than 10 different sultans of whom one only, Murad IV (1623–40), is worth mention.

The salient feature of that century was the defeat of the Turks by the Hapsburg empire and their retreat in Europe. After the loss of the battle of St. Gothard on the Raab, 1664, Mohammed IV attacked Vienna with a huge army in 1683, and was defeated. Successively Hungary and Transylvania were lost, Poland took the Ukraine and Russia the Turkish Black Sea territories, including Azov; the Venetian conquest of S. Greece (the Morea) had to be accepted. Treaties with western powers took the form—and the name—of capitulations, and encroached upon many formerly sovereign rights of the empire. Jealousy among its western opponents rather than the recovery of its own strength preserved Ottoman power through the 18th century. The Turks fought with varying fortunes

against Austria; suffered heavy territorial losses, *e.g.* under the Passarowitz peace of 1718; enjoyed temporary success as allies of Charles XII of Sweden against the tsar; but from this time Russian pressure became Turkey's principal danger. It took the form of a claim to protect the Orthodox Christian subjects of the sultan, and a demand for the re-erection of the cross on S. Sophia; but it aimed at the Straits, as a way into the open seas. By the peace of Kuchuk Kainarja, 1774, Russia won a protectorate over Moldavia, Wallachia, and the Christians in Turkey, and regained the Crimean peninsula.

Attempts at Reform

France, who, with rare exceptions, had maintained friendly relations with Turkey, clashed with her over Bonaparte's Egyptian expedition, which, in effect, encouraged all the great powers to consider the Ottoman empire as its prey. Mehemet Ali, its Egyptian vassal, made himself independent and established his dynasty in Cairo; Serbia in 1804, Greece in 1821 emancipated themselves.

The necessity for drastic reform became obvious: Abdul Mejid (1839-61) tried to transform the old empire on western lines, his predecessors having taken on French and Prussian officers, abolished the corps of janissaries (massacred 1826), and reorganized the armed forces. Abdul Mejid established the full equality of all his subjects, whatever their race or religion, abolished the farming of taxes, and promised other reforms, realized only partially—the rival great powers interfering. This, in particular, was the case when Russia insisted upon her right of intervention on behalf of her protégés. Intervention, in favour of Turkey, by the western powers, led to the Crimean War (*q.v.*) of 1853-56, to more Turkish reform projects, and to loans from Europe. A new constitution, western in form, with a parliament of two chambers, and a responsible cabinet, was promulgated Dec. 23, 1875, under Abdul Aziz, who died six months later. Abdul Hamid (1876-1909), who promptly abolished it, is remembered as one of the empire's worst tyrants. The Young Turk movement, which aimed at transforming Turkey into a democratic state, was the result of his tyranny. Founded in 1876, it gained the support of the younger army officers from 1900 and led in 1908 to a revolt which forced the sultan to restore the

constitution and, in 1909, to abdicate. Austria-Hungary annexed Bosnia-Herzegovina, 1908; Bulgaria declared her independence, 1909; Tripoli was lost to Italy, 1912. The Balkan wars of 1912-13 left Turkey with only (Turkish) Thrace in Europe. The Young Turks, led by Enver Pasha, Talaat Pasha, and Djemal Pasha, decided in 1914, after some hesitation, to take the German-Austrian side in the First Great War. Badly equipped and poorly supplied, the Turks fought bravely, as always, and, in the defence of the Dardanelles, at Kut-el-Amara, and elsewhere had some remarkable successes. But the empire disintegrated during, and as a result of, this war, large parts of it being occupied by the Allies. After the Mudros armistice, Oct. 30, 1918, the last sultan, Mohammed VI, was forced to sign the treaty of Sévres, Aug. 10, 1920, which left him Anatolia, with Constantinople (Istanbul) and Smyrna (Izmir) under foreign control.

Rise of Kemal Atatürk

The aims of the Young Turk committee of unity and progress, of uniting the heterogeneous peoples of the Ottoman empire as a religious community but under a new, progressive regime, had proved unattainable during the war. Nationalism, confined to a homogeneous Anatolian state, replaced this ideal and led *e.g.* to adventurous enterprise on Russian soil. A small group of Turkish officers, led by Gen. Mustapha Kemal Pasha (later Atatürk, *q.v.*), went to Anatolia in May, 1919. At two nationalist congresses, held July-Aug. at Erzerum, and Sept. at Sivas, Mustapha Kemal was given a mandate to liberate, with the remnants of the Turkish army, the occupied country and to resist a landing at Smyrna. He succeeded up to a point and, after dissolution of the Constantinople parliament by the Allies, April 11, 1920, received the backing of many deputies who had come to Ankara. On April 23, 1920, he opened there the grand national assembly, which accepted him and his supporters as a provisional govt. Backed by Ismet Pasha (later İnönü), Rusht Bey (later Aras), and other gifted and patriotic men, he at once began instituting radical reforms.

In his first endeavour—to rouse the patriotic spirit and the faith in a rebirth of the nation—Mustapha was aided by a Greek military enterprise meant to enlarge the Greek base at Smyrna; while inter-allied disagreements gave

him the chance to rid the country of French as well as Italian occupation forces. In an indecisive battle at the Sakaria river, Aug. 23 to Sept. 12, 1921, and a brilliant offensive, Aug.-Sept., 1922, he decisively defeated the Greek armies on Turkish soil. All other allied forces soon vacated Anatolia.

A year later, on Oct. 29, 1923, the national assembly proclaimed Turkey a republic, and elected Kemal its first president. The caliphate was abolished, 1924, the religious colleges and courts were closed. The fez was forbidden, polygamy (already rare) was abolished. Women were granted the same rights in law as men, and in 1934 received the franchise. Another law of 1934 compelled all Turks to adopt a surname.

Treaty of Lausanne

A peace treaty negotiated by the foreign minister Ismet (later İnönü, *q.v.*) was signed at Lausanne, July 24, 1923. It recognized the new govt., liberated Turkey's soil within her ethnic borders, demilitarised the Dardanelles and Bosphorus straits, and provided for an exchange of populations with Greece. The last drastic, though ultimately successful, operation involved 1½ million Greeks from Turkish, half a million Turks from Greek, soil. The Montreux convention, 1936, revised this treaty by giving Turkey full sovereignty over the straits. This was confirmed in 1946.

On Nov. 10, 1938, Kemal Atatürk died. His closest collaborator Ismet İnönü was elected as his successor. During the Second Great War Turkey observed an armed neutrality until March 1, 1945, when she declared war on Germany and Japan in order to qualify for admission to the U.N.

The unbroken rule of the People's party, founded by Kemal in 1923, was broken at the elections of 1950, which gave the Democratic party 408 seats out of 497. İnönü himself, defeated at Ankara, was returned for Malatya. Only one member of his last cabinet was elected. The new assembly chose as third president of the republic Celal Bayar, leader of the Democratic party.

Turkey Buzzard (*Cathartes aura*). Vulture of the family Cathartidae. It is found from Sas-

Turkish bath was introduced into London in 1860, by a Turk named Mahomet, who also started massage. See Baths.

Turkistan or **TURKESTAN**. Conventional name for a huge region, variously defined, in central Asia.

A W. and an E. division are generally recognized.

W. Turkistan comprises the regions formerly known collectively after the tsarist conquests in the 1860s as Russian Turkistan, besides the northernmost prov. of Afghanistan. Under the

occupy the towns, Sarts are the resultant of constant intermixture of all these stocks. Kirghiz cattle and sheep, and Turcoman horses, furnish the nomadic wealth. The crops include wheat, barley, lentils, rice, lucerne, and latterly cotton. Despite shortage of forest trees—both cause and effect of the progressive desiccation—there are many garden fruits; mulberry is grown, especially near Ferghana, for silk production. Mineral deposits are hardly worked, because of the lack of fuel.

E. or Chinese Turkistan comprises that portion of Sinkiang prov. lying S. of the Tian-Shan ranges, beyond which extend the Kulja and Zungaria valleys. The prov., created after Yakub Beg's short-lived kingdom of Kashgaria was suppressed in 1877, has a total area of 705,962 sq. m. with a pop. of 4,360,000. It is separated on the S. from the Tibetan plateau by the Kwenlun ranges, flanked by the Astin-tagh or Altyn-tagh, and from Kashmir by the Karakoram massif. Its E. boundary, cutting across the W. flanks of the Gobi desert, separates it from the Mongolian plateau and Kansu and Chinghai provs. On the W. the Pamir plateau, culminating in the peak of the Mustaghata, 24,400 ft., cuts it off from W. Turkistan.

Within this mountain rim, traversed by seven passes ranging from 4,500 ft. to 18,500 ft., lies an arid depression, sinking to 200 ft. below sea level at Turfan. Its W. half, the Taklamakan desert, is surrounded by the great curve of the Tarim. This river, after a steep descent to the Yarkand plain, flows for 1,000 m. into the Lop-nor marshes, collecting in its course scanty contributions from 60 streams. Round the desert fringe stand the urban oases of Kashgar, Yarkand, and Khotan, which carry on a trade in silk stuffs, coarse cottons, felts, carpets, gold, and jade.

ARCHAEOLOGY. Until the middle of the 19th century Turkistan was to Europeans an unknown land, save for the narrative of Marco Polo, who in the 13th century visited the Lop desert, Kashgar, Yarkand, and Khotan. In 1863 Vambéry crossed the Turcoman desert, penetrating to Khiva, Bokhara, and Samarkand. In 1868 Shaw and Hayward reached Yarkand, and in 1870 Trotter mapped E. Turkistan for the first time. Przhevalsky, crossing the Tian-Shan in 1877, was the first European since Polo to reach

Turkey Buzzard, in Jamaica called John Crow, sunning itself with wings outspread

catchewan to Tierra del Fuego and the Falkland Isles. It is mainly black, with whitish bill and a tuft of bristles in front of the red eye. The head and upper neck are naked, the crimson skin smooth. In Jamaica the bird is known as John Crow. There are two other species: *C. burrovianus*, from Mexico to Brazil, with orange head and neck and the nape feathered; and *C. perniger*, of the Amazons, with yellow head and neck. Carrion feeders, the birds act as scavengers, and are not known to be eaten by any people. See Vulture.

Turkey Carpet. Floor covering of woven pile made in Asiatic Turkey. It forms one of the best-known Oriental carpets, but is of coarser texture than the Persian, from which it differs slightly in the method of knotting. The industry centres largely round Izmir, but is carried on privately in most parts of Asia Minor. See Carpet.

Turkey Red. One of the alizarin dyes. The fibres of the fabric are mordanted with metallic salts, and then dyed in a separate bath of the colouring matter. The metallic hydroxide for Turkey red is that of aluminium. Turkey red oil is sulphonated castor oil, prepared by the action of sulphuric acid on castor oil. It is used as a fatty acid mordant in Turkey red dyeing. See Alizarin; Dyes.

Turkish Bath. Hot air bath. The temp. varies from 116° to 165° F., inducing copious perspiration, which clears the skin and eliminates noxious matter from the blood. The air bath is followed by soaping, washing, shampooing, massage, and cooling in rooms of suitable temp. before clothes are resumed. The first

imperial regime four Russian provs., Ferghana, Samarkand, Syr-Daria, and Semirychensk, aggregating 421,000 sq. m., with a pop. of 6,685,000, constituted the governor-generalship of Turkistan, administered from Tashkent. In 1917 they were declared an independent republic. With this territory were sometimes reckoned Transcaspia, the Khiva khanate, and the emirate of Bokhara. The whole territory is now divided among five republics of the U.S.S.R., Kazakh, Kirghiz, Tadzhik, Turkmen, and Uzbek, each of which has an entry in this work. There are about 700,000 sq. m. of desert, 40,000 sq. m. of indifferent grassland, and only 11,000 sq. m. of cultivated land.

Afghan Turkistan, between the Oxus river and the Hindu Kush, roughly corresponds with the ancient Bactria. The W. Pamir glaciers, culminating in Kaufmann Peak, 23,386 ft., and the N. slopes of Hindu Kush, not less lofty, furnish the water supply of the Amu-Daria (Oxus) and Syr-Daria (Jaxartes), which fall into the landlocked Aral Sea. Between them an immense loess region, the ancient Sogdiana, is traversed by the Zarafshan. This river, after replenishing the innumerable canals on which the age-long marts of Samarkand and Bokhara depend, disappears in marshland several miles short of its former confluence with the Oxus.

Throughout recorded history the population has been a medley of Turanian and Iranian elements. The uplands and the steppes are occupied by Altaian nomads, especially Kirghiz and Turcomans, the plains by Uzbeks. Iranian Tadzhiks, mostly Sunni Muslims,

Lop-nor. Two years later the botanist Regel first saw the Turfan oasis.

In the course of four expeditions, between 1890 and 1908, Hedin made important additions to our knowledge of Gobi, E. Turkistan, and Tibet. He drifted down the Tarim, discovered the ancient Loulan, and expounded the wave-like action of the desert dunes. Although the Forsyth mission to Kashgar in 1873 heard rumours of Lop-nor's buried cities, nothing resulted until Bower acquired in 1889 some birch-bark MSS. emanating from Kucha, north of the Tarim basin. Simultaneously some stone inscriptions in Turkish and Uiguric were discovered in the Orkhon valley. In 1892 de Rhins secured MSS. at Khotan. Archaeological work inaugurated in 1897 round Turfan by Klements and Donner witnessed to the Ugar domination of the 9th-12th centuries, while Hedin reported sand-buried ruins between Khotan and Lop-nor. From 1902 Grünwedel and von Lecoq worked at Turfan and Kucha, and Pelliot in 1906-09 secured important MSS.

Greatest achievements of all were those of three British expeditions under Stein in 1900, 1906, and 1913.

The priceless remains secured for the British Museum and Delhi include thousands of pieces of stucco ornament, fresco panels, wood carvings and implements, metal objects, and woven fabrics. Paper, wood, and other materials bear inscriptions in Sanskrit, Chinese, and Tibetan, besides three vanished Indo-European dialects, Sogdian, Khotanese, and Kuchean, with Manichaean and Nestorian texts.

Exploration of the Pamir region has revealed a primitive Indo-European dialect antedating the separation of Sanskrit from Iranian speech, besides the purest types of Aryan stock. Russian workers have been active in exploring their share of the territory. Consult The Marches of Hindustan, D. Fraser, 1907; Explorations in Turkestan, R. Pumpelly, 1908; The Pulse of Asia, E. Huntington, 1908; Turkestan, W. E. Curtis, 1911; and works mentioned under S. Hedin and A. M. Stein.

Turkmen, OR TURKMENISTAN. Constituent republic since 1925 of the U.S.S.R. It has Afghanistan and Persia to the S., the Caspian to the W., and elsewhere touches the Kazakh, Kara-Kalpak, and Uzbek republics. Its area is 189,370 sq. m.; pop. approx. 1,254,000; capital, Ashkhabad, or

Poltoratsk; most historic city, Merv; chief seaport, Krasnovodsk, which is also the terminus of the Transcaspian rly. The country mostly fell under Russian authority with the storming of Geok Tepe in 1881. Most of the people are of Turcoman stock, many retaining their nomadic habits, and are Muslims of the Sunnite sect.

The main occupation of the people is agriculture, and much of the land is artificially irrigated. Turkmen produces wool, cotton, and Astrakan fur. Carpets are woven. A special breed of horses and the Karakul sheep, bred here, are famous. Three-quarters of the area of the republic is occupied by the Kara Kum desert, but this is being gradually rendered fertile by irrigation from the waters of the Amu-Darya river, and by tapping subterranean water supplies. The black sands of the desert also cover deposits of magnesium, coal, and salt, and considerable chemical and other industry has been developed since 1925. Some 50 research institutes operate in the republic, administered by the Turkmenian branch of the U.S.S.R. academy of sciences.

Turk's Cap. Popular name for the common species of *Melocactus* (*q.v.*) and also given to the Martagon lily. See Lily.

Turk-Sib Railway. Name given to that branch of the Trans-Siberian rly. running from Novosibirsk in Siberia to Tashkent in Uzbek S.S.R. (Russian Turkistan). Opened in 1930, it carries cotton from Central Asia to the N. and timber from Siberian forests to the S. The Russian film Turk-Sib was made during the construction of the line.

Turks Islands. Group of small islands in the British W. Indies. They lie S.E. of the Bahamas, and with the Caicos Islands form a dependency of Jamaica. Grand Turk, 7 m. long by 2 m. wide, is the seat of government and about 1,693 inhabitants. A hurricane on Sept. 14, 1945, did immense damage to the islands.

Turku. This is the modern name of the historic Finnish seaport Abo; and Turku-Pori is that of the prov. of Abo-Björneborg. The old names are preferred in this Encyclopedia.

Turmeric. Rhizome of *Curcuma longa*, a perennial reed-like plant of the sub-continent of India, largely cultivated in tropical countries. Turmeric, when powdered, has a bright yellow colour and a hot, peppery taste.

It is the most important constituent of curries, and is used in India and China for dyeing cotton and silk. A tincture of turmeric is used in making a paper which is a test for alkalis and boric acid.

Turn. In music, an ornament consisting of a given note alternated with the note next above it in the scale, and with the semitone below, the whole forming a group of five notes. The turn may be upon or after the note.

Turnbuckle. Coupling screwed at both ends, one end having a right-hand and the other a left-hand thread, to which the ends of two bars are screwed. By turning it the screw threads enter farther into the screwed sockets, and the bars are drawn nearer together. Turnbuckles are principally used for applying tension to tie bars and steel-wire ropes in which the initial tension is insufficient or liable to vary.

Turner, Sir BEN (1863-1942). British trade unionist. As a boy at Holmfirth, where he was born Aug. 25, 1863, he worked at the domestic hand loom, earning 3½d. a day when aged nine. He became prominent among the textile workers in Yorkshire and a delegate of their union at 18. Unpaid secretary of the union from 1902, he was Labour M.P. for Batley and Morley, 1922-24 and 1929-31, being in charge of the mines dept. in the second Labour govt. President from 1922 of the national union of textile workers, and founder of the Yorkshire federation of trades councils, he was chairman of the T.U.C. in 1928 and knighted 1931. He died Sept. 30, 1942.

Turner, CHARLES (1773-1857). British engraver. Born at Woodstock, he studied at the R.A. schools, and practised aquatint, stipple, and mezzotint engraving, obtaining most success in the last. He was elected A.R.A. in 1828, and died Aug. 1, 1857. Engravings after J. M. W. Turner, Hoppner, and Lawrence may be cited.

Turner, Eva. Contemporary British singer. A native of Oldham, she studied at the R.A.M., and having joined the Carl Rosa opera co. in 1916, became its prima donna until 1924, when she was engaged by Toscanini to appear at La Scala, Milan. For an English artist she won unusual

Eva Turner,
British singer

admiration in European capitals, achieving world fame after her performances as Turandot and Aida at Covent Garden in 1928. Her powerful soprano voice was at its best in Wagner, her most famous rôle being that of Brunhild in *Götterdämmerung*.

Turner, Sir George (1836-1915). British bacteriologist. Educated at Cambridge and Guy's Hospital, he entered the S. African civil service as a medical officer of health in 1895. He devoted special attention to the rinderpest cattle plague, a serious outbreak of which occurred in 1896. The Turner serum stamped out the outbreak within a year, and was successful with another epidemic in 1901. Turner became medical officer of health for the Transvaal in 1900, and made important researches into leprosy at Pretoria. Resigning in 1908, he was knighted in 1913, and died at Colyton, Devon, March 12, 1915.

Turner, Joseph Mallord William (1775-1851). British painter. Son of a barber, he was born near Covent Garden, London, on April 23, 1775, and was educated in small schools in London, Brentford, and Margate. From early boyhood he showed promise of his artistic future, spending much time sketching with his friend, Thomas Girtin (*q.v.*), and in 1789 entered the R.A. schools, exhibiting in 1790 a drawing of Lambeth Palace. He then travelled widely in England, producing many architectural drawings, mostly of the great cathedrals, for publication as engravings, and in 1799 was elected A.R.A. In that year he exhibited five oil paintings, although hitherto known chiefly as a draughtsman and painter in water-colours. In 1802 he became R.A., and paid his first visit to France and the Alps, showing his oil painting of Calais Pier, 1803, with *The Shipwreck*, in similar manner, in 1805.

In such paintings as the last, the influence of the Dutch seascape painters, notably of Van de Velde, is marked, though they are by no means imitative; for Turner suffused his paintings in this genre with a strain of romantic turbulence which the Dutchmen did not know. The influence of Claude and Poussin, again, was profound on Turner's development; the inspiration of these masters may be seen in *Crossing the Brook*, 1815; *Dido Building Carthage*, 1815; *Childe Harold's Pilgrimage*, 1832.

To fuller expression he was gradually finding the way through his developing sense and mastery

of vivid and moving colour effects. In 1829 came *Ulysses Deriding Polyphemus*, with a riotous exuberance of rich colour new to English painting. Other works showing like qualities of those effects of massed and variegated colour which have come to be

After
Charles Turner

John Turner

termed "Turneresque," appeared in 1838-39, *The Fighting Téméraire*, and *Modern Italy*, where a classic composition is blended with romantic colour treatment.

Meanwhile he had been travelling in England, Scotland, France, Switzerland, and Italy, and, selling but few paintings, earned a considerable income from his engravings. In 1807, partly inspired by the example of Claude's *Liber Veritatis*, he began the *Liber Studiorum*, a collection of parts of five plates each, designed to illustrate landscape composition, grouped under the heads of historical, mountainous, pastoral, marine, and architectural. For this work he made sepia drawings, transferred to copper partly by himself, partly by other engravers. Its publication continued until 1819, when 70 out of the 100 projected plates were issued. The combined line and mezzotint plates of the *Liber*, however, had not the popularity of his line engravings.

From about 1840 came a remarkable change in his style. More and more he concentrated attention on the suggestive effects of colour, whether glowing and brilliant, as in the *Burial at Sea*, 1842, or the cold greys of the much-discussed *Snowstorm*, a seascape of 1842. He continued this tendency to leave behind him the form and composition of his earlier work, and some

of his late painting almost seems to foreshadow Impressionist work. Here should be mentioned for 1844-46 *Light and Colour; Rain, Steam, and Speed*; several Venetian pictures; and *Undine*.

In 1843 Ruskin attracted attention by his high praise of Turner in face of much adverse criticism. The artist's last years, however, were spent in diminishing health and determined secrecy; he lived for a time under the assumed name of Booth in Chelsea, where he died on Dec. 19, 1851, being buried in S. Paul's cathedral. His property was the cause of long litigation. In the end the R.A. received £20,000 of the total effects of £140,000. His pictures and drawings, the latter numbering nearly 20,000, passed to the nation, and the Turner galleries at the Tate Gallery contain most of his great works, a few being in the National Gallery. At the Tate are the paintings long stored in the cellars of the National, but brought out in 1906, when their astonishing qualities of "impressionist" colour made some stir. Turner's reputation has perhaps suffered from his later vagaries, and from the undiscriminating praise which Ruskin's influence stimulated. But in spite of all, a study of his paintings and, no less important, of his water-colours, leaves him unchallenged as the English painter whose sense of the poetic value of landscape and whose command of blended colour remain unsurpassed.

Bibliography. Among many *Lives* may be mentioned those by G. W. Thornbury, 1877; W. C. Monkhouse, 1879; Sir W. Armstrong, 1902; H. Townsend, 1923; A. J. Finberg, 1939. Consult also *Modern Painters*, J. Ruskin, 1843; T.'s *Liber Studiorum*, W. A. Rawlinson, 1906; T.'s *Lectures on Perspective*, ed. D. S. MacColl, 1908; T. the Painter, B. Falk, 1938.

Turner, Walter James (Redfern) (1889-1946). British poet and critic. Born Oct. 13, 1889, at Melbourne, Australia, where he was educated at the Scotch College, he came to Europe in 1910, travelling on the Continent until 1914. During 1916-18 he served in the R.G.A. Music critic of the *New Statesman* 1916-40, he was literary editor of the *Daily Herald* 1920-23, making the book page an outstanding feature of daily journalism through the standing of the writers he invited; and of the *Spectator* from 1942 until his death in London, Nov. 18, 1946.

He published his first book, *The Hunter and Other Poems*, in 1916; *The Dark Fire*, 1918, and *Paris*

and Helen, 1921, led critics to see in him a poet of rare merit, who, using old forms, could create new effects; he was to produce further good poetical work in *Landscape of Cytherea*, 1923, *The Pursuit of Psyche*, 1931, and other vols. Selected Poems appeared 1939. The poem *Romance* has found its way into many anthologies.

His essays in musical criticism, some of them republished in book form in *Music and Life*, 1921; *Variations on the Theme of Music*, 1924, were fresh and stimulating, with a dogmatic tone oddly at variance with his keen but courteous manner in personal argument. He published studies of Beethoven, 1927; Wagner, 1933; Berlioz, 1934; and Mozart, 1938. The faintly autobiographical novels *Blow for Balloons*, 1935; *Henry Airbubble*, 1936; *The Duchess of Popocatepetl*, 1939, were witty, lively, and full of unexpected twists.

Turners' Company. London city livery company. It was granted a charter in 1604, and though its activities have been curtailed, it has done much to promote the different branches of the art of wood and metal turning. A hall in Philpot Lane, destroyed by the Great Fire of

Turners' Company arms

1666 and rebuilt, was held until about 1737, when a new hall was acquired on College Hill, to be sold in 1766. Among members have been Baron Armstrong, Bessemer, Sir W. Siemens, Sir J. Whitworth, Sir Benjamin Baker, Lord Leighton, Sir E. Poynter, Leopold II of Belgium, Gladstone, Sir Henry Stanley, Lord Cadman. The office is at Apothecaries' Hall, Black Friars Lane, E.C.4.

Turnham Green. District of Greater London in the Middlesex bor. of Brentford and Chiswick. It is served by District line, and by buses and trolley buses. On Nov. 13, 1642, the royalist forces were checked here on the way to London, and Charles I had to fall back on Oxford. The 1st Baron Heathfield, defender of Gibraltar, and Wainwright, the poisoner, were residents, and at the Old Pack Horse Inn, in 1696, Sir G. Barclay and others plotted to assassinate William III. Cricket is still played on the green.

Turnhout. Town of Belgium. In the prov. of Antwerp, it lies in the flat Campine Anversoise, 33 m.

by rly. E.N.E. of Antwerp, with which it has also canal connexion. Industries include paper, playing-card, and cloth manufactures, lace-making, brewing, and tanning. The law courts occupy the remains of a castle built by the duchess of Guelders in the early 15th century. In 1648 the Spaniards were defeated near here by Maurice of Nassau. Pop. est. 29,000.

Turning. This process of cutting and shaping wood or metal is described under Lathe.

Turnip (*Brassica campestris*). Biennial herb of the family Cruciferae, native of Europe and N.

Turnip. Edible leaves and rootstocks of the white or garden variety

Asia; a common British weed. It is erect in habit, from 1 ft. to 2 ft. high, with bristly leaves, deeply cut in from the margins, and yellow flowers. Cultivated from ancient times, it has produced the valuable food plant of the same name, also the colza and the swede.

In the cultivated turnip the primary root and lower portion of the stem have become enlarged as a store for reserve material, and by selection and intercrossing this tendency has been increased until it has produced the juicy, white-fleshed garden turnip and the more solid-fleshed Rutabaga, or swede, used also as a winter cattle food.

The white turnip may be sown in drills, in succession, from mid-March to July or Aug., the drills being a foot apart and the young plants thinned out to a distance of 9 ins. The ground between the rows should be frequently hoed to keep it loose. Judicious thinning of the leaves will yield the table greens known as turnip tops.

The field turnip, or swede, is a great aid to the cattle farmer, supplying nutritious food for his stock in winter. As compared with the white turnip, it yields a higher percentage of solids, greater nutritive value, and is less liable to disease. The yellow flesh of the root is often tunnelled by the caterpillar of the turnip moth; and seedlings are ruined by the fungus *Plasmadiophora*, which produces the malformation finger and toe (*q.v.*).

Turnov (Ger Turnau). Town of Czecho-Slovakia, in Bohemia. It stands on the Iser, among the Lausitz Gebirge, 65 m. N.E. of

Prague. The chief industries are cutting diamonds and other precious stones, and making artificial gems.

Turnpike. Gate across a road to prevent the passage of vehicles or pedestrians until a toll is paid. A turnpike road was one upon which such gates were established by law, and which was kept in repair by the tolls paid. See Rebecca Riots; Roads; Toll.

Turnsole. Dye-stuff obtained by grinding a small Mediterranean plant, *Crotophora tinctoria*, of the family Euphorbiaceae. It is also an old name for the Sun Spurge (*Euphorbia helioscopia*) and the Heliotrope (*Heliotropium peruvianum*).

Turnspit. One who turned a spit or long rod or bar on which meat was roasted before the fire. Large spits were often turned by means of dogs, the animal being attached to the wheel that turned the spit on which hung the meat.

Turnstone (*Arenaria interpres*). Shore bird, belonging to the plover tribe. It is about 9 ins. long, and the plumage is black and white on the head and neck, black and chestnut on the back, and white on the underparts, the breast banded with greyish black. It arrives in Great Britain about the beginning of Aug. and remains about the S. and W.

Turnstone, a British shore bird which breeds in the Arctic regions

coasts all through the winter, leaving in May for the breeding grounds in the Arctic regions.

Turntable. Revolving platform by means of which wheeled vehicles may be turned so as to face in a different direction. Small turntables are made for road vehicles where turning space is limited, but the most general application is to railway vehicles. A locomotive turntable comprises a pair of girders carrying a railway track. The girders are suspended at their centre upon a steel cup and ball pivot resting on a pedestal in the middle of a circular pit and forming a fulcrum and centre round which the girders may be turned. This pivot supports the weight of the turntable and its load and sometimes rests upon a nest of steel balls or

conical rollers. The girder ends are fitted with wheels which just clear the circular rail laid round the inside of the pit.

When a locomotive passes on to the turntable one end is depressed, so that the wheels bear upon the rail, affording it temporary support; the locomotive then passes right on to the table until it is approximately balanced upon the centre pivot, when the whole turntable with the locomotive upon it can be revolved by two men pressing against levers or handles, as in the figure. An electric motor is sometimes substituted for hand power. By this means a locomotive may be turned so as to face in the opposite direction. See Locomotive.

Turnus. In Roman legend, king of the Rutuli, an Italian tribe, and betrothed to Lavinia, daughter of Latinus, before the arrival of Aeneas. When Latinus promised his daughter to the latter, Turnus and his people took up arms and fought with the stranger, but he was killed outright in single combat with Aeneas. In the Aeneid, the genius of Virgil has invested Turnus with a personality which makes him a really heroic figure.

Turnu Severin. Town of Rumania. It is situated on the N. side of the Danube, at the E. end of the Iron Gates, about 60 m. N.W. of Craiova, with which it is connected by rly. In normal times it is a busy river port, with a trade in grain and petroleum. It has shipyards and repair shops for the river steamers. During the First Great War the town was captured by the Austrians, Nov. 24, 1916. In the Second Great War it fell to the Russians on Sept. 6, 1944, giving them control of the N. bank of the Danube opposite Bulgaria.

Turonian Deposits. In geology, a division of the Upper Cretaceous system of rocks. They are found typically in the French Alps and Pyrenees. See Cretaceous.

Turpentine. Oleo-resin which exudes from various species of Coniferae and from which oil or spirit of turpentine is obtained by

distillation. The term turpentine is, however, often applied to the distillate as well as the crude oleo-resin to which it more properly

Turntable. Sectional and plan diagrams illustrating construction and working parts. A. Central pivot. B B. Runners. C. Handle for turning by hand. D. Motor for rotating by power through pinion D¹ and pinion track E. F F. Railway track

belongs. European turpentine is obtained from *Pinus sylvestris* in Russia and Finland, *P. laricio* in Austria and Corsica, and *P. maritima* in France. American turpentine, which comes from the U.S.A., is the product of *P. australis*, the swamp pine, and *P. taeda*, the loblolly.

The crude turpentine is distilled with water in copper stills, the oil of turpentine passing over as vapour while the residue in the still is resin or colophony. The chief use of oil of turpentine is as a solvent for making varnishes and as a diluent of paint. Venice turpentine, a semi-solid substance, obtained from *P. larix* in Tirol, is used in varnishes and in lithography. Canada turpentine, also known as Canada balsam, is the produce of *Abies balsamea*, and finds application in medicine, in the preparation of collodion, and in microscopy.

Turpin or **TILPIN** (d. c. 800). Frankish prelate. Probably from a monastery at St. Denis, he was appointed archbishop of Reims in 753, and in 769 attended the council held under Pope Stephen II, which condemned the anti-pope Constantine. In a highly romanticised guise he appears in the Chanson de Roland, Renaud de Montauban, and other chansons de geste. The remarkable historical romance known as the Chronique de l'Archevêque Turpin was probably a composite production of the 12th century.

Turpin, RICHARD (1706-39). English highwayman. Born at Hempstead, Essex, the son of an innkeeper, he was apprenticed to a butcher. Detected in cattle-stealing, he joined a gang of robbers, who under his leadership plundered many lonely farms. In 1735 he is said to have entered into partnership with Tom King, the highwayman. Traced by the theft of a horse to Whitechapel, Dick Turpin there accidentally shot his companion, but escaped to York, where under the name of Palmer he became a horse-dealer. Romanticised in legend and fiction, he was in reality a conscienceless scoundrel, and was hanged for horse-stealing, April 7, 1739.

Turquoise (Fr., fem., Turkish). In mineralogy, a hydrated aluminium and copper phosphate. One of the precious stones, opaque, waxy in appearance, its colour varies from blue to green, the blue varieties being the most valuable. It is found in thin veins or patches in certain igneous rocks that have been profoundly altered. The finest turquoisees are Persian in origin, and their importation thence into Europe via Turkey is commemorated in the name. Mines in the U.S.A., Egypt, and Russia also yield valuable stones. See Precious Stones colour plate.

Turret (Lat. *turris*, tower). Small tower, usually built for decorative purposes, on a large building. Turrets were often erected at the angles of medieval buildings, or attached to large towers, as encasements for circular staircases. (See Tower.)

In a battleship (q.v.) the turret is a circular armoured structure on the deck in which the heavy guns are mounted. By hydraulic or electrical power the turret can be moved round as required. Its under-structure goes to the bottom of the ship where are the magazines, and the gun ammunition is sent up inside the turret.

Bombing aircraft are fitted with transparent turrets to carry their defensive armament. The turret is powered from the aircraft engine, and makes it possible for the gunner to swing his guns on to a target without being subject to the effects of air flow which otherwise would deflect his aim. A turret also makes it possible to use belt-fed ammunition, the weight of which would be impracticable in the open, or scarf-ring mounting. On bombers there is usually a turret in the nose, tail, and on the top of the fuselage. The largest turret-mounted gun on British

bombers is the 20-mm. cannon of the Lincoln bomber. The first fighter to carry a power-operated turret was the British Defiant. On some U.S. bombers the turrets are armoured and unmanned, the guns being fired by remote control from within the fuselage.

The main armament of tanks is mounted in a central armoured turret which can traverse a complete circle.

Turriff. Mun. and police burgh, of Aberdeenshire, Scotland. It is 11 m. S. of Banff on the rly. Still to be seen is the 16th century choir of a church once belonging to the Templars. The Trot of Turriff was the first skirmish of the Civil War, May 14, 1639. Pop. 2,300.

Turtle (*Chelone*). Name given to members of the tortoise group specialised for marine life. They

coriacea) has a series of longitudinal ridges on its carapace, and is sometimes over six feet long. It occurs in the tropics and is occasionally found in the British seas, but appears to be gradually becoming extinct. See Animal colour plate; Reptile; Tortoise.

Turtle Dove (*Streptopelia turtur*). Species of small migratory pigeon, which visits Great Britain in the summer. It has a reddish tinge on the head and neck, a black and white collar, rusty red wings with black spots, and a dusky tail. It is slightly under a foot in total length. It arrives in April, and is not uncommon in the S. and Midland counties of England, but is rather rare in the W. counties, Wales, and Ireland; and it does not appear to visit Scotland. It lives in the woods, where it

Turveydrop is one of the most satirical of Dickens's gallery of great grotesques.

Tuscaloosa. City of Alabama, U.S.A., the co. seat of Tuscaloosa co. It is 55 m. S.W. of Birmingham and is served by the Louisville and Nashville and other rlys. Coal-mining is carried on in the neighbourhood, and cotton and lumber products are manufactured. Alabama university is here, housed in fine old mansions dating from the prosperous era of cotton-growing in 1820-40. Tuscaloosa was settled in 1815, and received a city charter in 1819. It was the state capital 1826-46. Pop. 27,493.

Tuscan Order. In classic architecture, one of the orders used by the Romans. It was a modification of the Greek Doric with the mouldings bolder and fewer, and the triglyph (*q.v.*) omitted. See Rome: Art and Architecture.

Tuscany (Ital. Toscana). A region, and former grand duchy, of Italy. The region is situated in the W. central portion of the peninsula and bounded W. by the Mediterranean, N. by Liguria and Emilia, S. by Latium and Umbria, E. by the Marches. The Apennines traverse the E. parts, and on the Mediterranean coast is the wide Maremma (marshes), formerly an unhealthy waste, but now irrigated and pasture land. Rich in minerals, among which are iron, copper, salt, and marble, the country is also one of the most fertile in Italy, producing wheat, maize, olives, and wine. The principal river is the Arno (*q.v.*). Florence is the largest city, others being Pisa, Lucca, Leghorn, Siena, and Arezzo. From Florence are rly. connexions to all parts of Italy. With an area of 8,880 sq. m., and a pop. of 3,099,000, Tuscany consists of the provs. of Arezzo, Florence, Grosseto, Leghorn, Lucca, Massa-Carrara, Pisa, Pistoia, and Siena. Tuscany was long one of the centres of Italian art, and the Tuscan school of painting flourished from the 13th century, producing many famous artists.

On the fall of the Western empire Tuscany, which roughly corresponded to the ancient Etruria (*q.v.*), passed through the hands of many conquerors and was eventually granted by Charlemagne to the Frankish Boniface, whose descendants ruled until 1114, when the last representative of the family, Matilda, bequeathed her estates to the Church. The emperor disputed the will and, amid the confusion which followed, the chief Tuscan cities declared their inde-

Turtle. 1. Leatherly turtle of tropical seas. 2. Hawksbill turtle, whose carapace supplies tortoiseshell. 3. Edible green species, famed for its use in making soup. 4. Snapping turtle, *Chelydra serpentina*, found in the E. Pacific from S. Canada to Ecuador

differ from land tortoises in having the feet modified into paddles; the carapace is usually heart-shaped and somewhat flattened; and the head can be only partly retracted. They spend all their time in the water except in the breeding season, when they visit the shores to deposit their eggs in the sand; but they have to rise to the surface at intervals to breathe. The most widely famed species is the green turtle (*C. mydas*), used in making soup. It is confined to tropical regions, and is distinguished by the smoothness of its shield-like carapace and the shortness of its beak.

The Hawksbill turtle (*Eretmochelys imbricata*) is in great demand as the chief source of the best grades of tortoiseshell. The Logger-head is a very large species, remarkable for the great head; it occurs in the Mediterranean, and occasionally off the E. shores of Europe. It feeds mainly on marine molluscs, the shells of which it cracks with its powerful jaws. The Leatherly turtle (*Dermochelidae*

usually nests in low trees and hedges, and is extremely shy and wary. See Ground Pigeon.

Turton. Urban dist. and town of Lancashire, England. Containing four rly. stations, it is 4 m. N.

Turton arms

of Bolton. The principal industries are connected with cotton mills. Turton Tower, a castellated mansion in the town, dates from the early

12th century, and was rebuilt in 1596. Turton votes in the Darwen co. constituency. Pop. 10,720.

Turveydrop, Mr. Character in Dickens's novel *Bleak House*. He is a "Model of Deportment," who apes the style and appearance of the Prince Regent, whom he claims as a patron, while living in selfish idleness upon the meagre earnings of his son Prince (named after the Regent), a dancing master, just as during her lifetime he had lived upon those of his wife.

pendence and proclaimed themselves republics. These included Florence, Pisa, Pistoia, Lucca, and Siena. The rise of the great families was fatal to the republics of Italy; Florence became a principality under the authority of the Medici family, who in 1567 became grand dukes of Tuscany.

Successive generations of indolent and feeble rulers reduced the once flourishing country to a lifeless condition. After the extinction of the Medici line, 1737, the Powers granted Tuscany to Francis of Lorraine, afterwards emperor of Austria, who bequeathed it to his younger son, Leopold I. Under this enlightened monarch the country awoke and began to flourish. In 1790 Leopold ascended the imperial throne and the duchy fell to his son Ferdinand, who was driven out by the French nine years later. Napoleon made Tuscany the core of the kingdom of Etruria, but the fall of the emperor in 1814 enabled Murat to occupy the country and buy his own peace with the Powers by handing it to Austria. Ferdinand was reinstated by the congress of Vienna. His son, Leopold II, who succeeded him in 1824, granted a constitution which he abrogated as soon as he could, and in 1859 he was finally expelled by the popular movement. The provisional government then formed, after overcoming various difficulties, handed over the duchy to Victor Emmanuel, to be incorporated in 1860 in the kingdom of Italy. Tuscany suffered serious devastation during the Second Great War. See Florence; Italy; Painting; Italy, Campaigns in, 1943-45.

Tusculum. Ancient city of Latium. It is situated among the Alban Hills, 15 m. S.E. of Rome. Probably an older foundation than Rome itself, the city became an ally in 497 B.C. Near the end of the Roman period Tusculum was a municipium and a favourite country residence of wealthy Roman citizens. In 1191 the ancient city was razed by the Romans. An amphitheatre, theatre, and city walls have been excavated in modern times. See Frascati.

Tusitala. Name by which R. L. Stevenson (*q.v.*) was known to the natives of Samoa. The word signifies "teller of tales," and was first given to the novelist by the missionary J. E. Newell at Malua in 1889. The words "the tomb of Tusitala" are inscribed in Samoan on Stevenson's tomb.

Tusk. Name given to certain teeth of beasts, developed enor-

mously in excess of the others in a set. These are always either incisors or canine teeth, and they may be in the upper or lower jaw in different species. Perhaps the most remarkable is the single tusk of the narwhal, which stands straight in front of the upper jaw to a length of ten feet and has a pulp cavity almost throughout; externally it appears as though spirally twisted. The stout, slightly curved tusks of the elephant represent a pair of incisors in the upper jaw, as did those of the extinct mammoth and mastodon.

The dinotherium, on the other hand, had a pair of downward, backward-curving tusks from its lower jaw. In the existing Atlantic walrus are a somewhat similar pair of tusks, but they are in the upper jaw, and represent canines. In the pig tribe the lower canines of the wild boar develop into curved tusks far too large to be covered by the upper lip. The lower canines of the hippopotamus develop into enormous tusks with chisel edges. See Africa; Ivory; Narwhal; Teeth.

Tussac or **Tussock Grass** (*Aira caespitosa*). Perennial grass of the family Gramineae. It is a native of the temperate, Arctic, and mountain regions. It has stout, smooth leafy stems, three or four feet in height, the leaves leathery. The flower cluster is plume-like, many-branched, bearing shining purplish spikelets. The celebrated tussock grass of the Falkland Islands is *Dactylis caespitosa*, allied to the European cock's-foot grass (*D. glomerata*).

Tussaud, Marie (1760-1850). Swiss wax modeller. Born at Berne, daughter of an officer, Joseph Gros-

Marie Tussaud,
Swiss wax modeller
From a waxwork

holtz, she was taught modelling by her uncle, J. C. Curtius, who established in 1780 a wax cabinet in the Palais Royal, Paris, and they modelled the heads of many victims of the guillotine in the Revolution. She married in 1794, and in 1802 transferred the waxwork museum, with its many relics, to London, establishing it first at the Lyceum, then at Blackheath, and in 1833 in Baker Street, whence in 1884 it was transferred to Marylebone Road. Madame Tussaud died April 16, 1850.

On March 18, 1925, Madame Tussaud's was burned down. It

was rebuilt on the same site on a much larger scale, the block including a cinema and a restaurant, and opened 1928. On Sept. 8, 1940, the cinema was damaged by a German bomb. Perhaps the most popular features of the exhibition are effigies of all the sovereigns of England, and the "chamber of horrors." See Coach; Effigy; Waxworks. Consult Romance of Madame Tussaud's, L. Tussaud, 1937. *Pron.* Too-so.

Tussore, Tussur, or Tussah (Hind. *tassar*, shuttle). Silk produced chiefly by the larvae of two species of moth of the genus *Antheraea*. Tussore silk has a strong, coarse filament, flat in section, and is washable. Though called a wild silk, it is generally cultivated. See Shantung; Silk.

Tutankhamen. Egyptian king of the XVIIIth dynasty. Though little is known of his life, the reign (1358-53 B.C.) of this pharaoh has considerable historical importance. He was a mere youth when, after an interregnum of a few weeks, he succeeded Akhnaton (*q.v.*), the so-called heretic pharaoh, who sought to establish the monotheistic cult of Aton, symbolised in the disk of the sun, in place of that of Amen or Ammon (*q.v.*). Akhnaton had to move his capital from Thebes to Tell el-Amarna owing to the opposition of the priests of Ammon. Tutankhamen, his son-in-law, was believed also to be a convert to the cult of Aton, but after becoming pharaoh returned to Thebes (1355 B.C.) and formally restored the old religion, changing his name from Tutankhamon (image of Aton) to Tutankhamen (image of Amen). He was buried in the Valley of the Kings at Thebes.

Despite the ancient plundering of the tombs of the kings, systematic excavations in this valley, begun early in the 19th century, revealed an astonishing collection of treasures, and it was thought nothing more of moment remained to be unearthed. But in 1906 the 5th earl of Carnarvon (*q.v.*) began archaeological researches which in cooperation with Howard Carter (*q.v.*), he patiently and systematically pursued for 16 years. It fell to Carter, while Carnarvon was absent in England, to discover, in almost the last piece of unsifted ground, the entrance to the tomb of Tutankhamen, Nov. 5, 1922. The two excavators removed the seals which had been affixed by the inspectors of Rameses IX in the 12th century B.C. and entered the tomb. On Feb. 16, 1923, they opened the sepulchral chamber, afterwards

1. Site of Tutankhamen's tomb, the spot marked by an arrow indicating where entrance was discovered. 2. Ante-chamber, with sealed doorway leading to the inner chamber. 3. Doorway pierced by the excavators,

revealing the outermost canopy of the first shrine of sepulchral chamber. 4. Diagram showing position of the tomb, with its corridors and chambers, deep-cut in the rock, compared with that of Ramses VI.

TUTANKHAMEN: THE TOMB OF THE PHARAOH AND ITS MARVELLOUS CONTENTS

1, 2, and 3 "The Times" world copyright. Photographs in these pages by arrangement with "The Times," taken by Mr. Harry Burton of Metropolitan Museum of Art, New York. Expedition, and lent by courtesy of Trustees and the Director of the Egyptian Department

Among the marvellous discoveries made when the tomb of Tutankhamen was opened in 1923 were these vases of alabaster, exquisite in taste and craftsmanship, which

were grouped in a corner of the ante-chamber of the tomb. The faint fragrance of the perfumed essences they once contained was still perceptible after 3,300 years

TUTANKHAMEN: MATCHLESS ALABASTER VASES FOUND WITHIN HIS TOMB

"The Times" world copyright

The statue of Tutankhamen seen here was one of two which stood outside the sealed entrance to the sepulchral chamber. Seven feet high, they were carved from wood, later bituminised, and gorgeously decorated with beaten

gold. The painting on the clothes chest, also seen here, exceeds in delicacy of brushwork and charm of design even the famed work of the Chinese and Japanese. Other views are given in Figs. 2 and 3 in the plate facing p. 8232

TUTANKHAMEN: GLOWING COLOURS THIRTY-THREE CENTURIES OLD

"The Times" world copyright

1. Side view of Tutankhamen's coronation throne.
2. The throne overlaid with sheet gold. Its arms are formed of crowned and winged serpents supporting the king's cartouches. The back panel depicts the king and queen in the palace. 3. Life-size wooden model of Tutankhamen, thought to be a portrait of the young king.

4. Showing in detail the superb panel of the throne. The picture is of intaid polychrome glass, faience, and stones.
5. Oval boxes containing mummified food for the dead king are seen under the gilt-and-blue ceremonial couch, the sides of which are Hathor cows; the royal bedstead, a papyrus chair, and various other objects are also shown

TUTANKHAMEN: FUNERARY OBJECTS THAT WERE REVEALED AFTER 33 CENTURIES

Photographs "The Times" world copyright

superintending removal of the funerary furniture and art treasures. Among the immense number of things thus brought to light were gorgeous golden beds and couches of state, chariots, caskets, candlesticks, the actual garlands of flowers placed with the dead, nearly all in splendid preservation. Regarded as the gem of the whole collection was the throne, encrusted with gold and silver and sparkling with jewels. Carnarvon died on April 5 from the effects of a mosquito bite while the work of clearing the tomb was in progress; but his colleague on Jan. 3, 1924, reached the sarcophagus of Tutankhamen, the lid of which was opened on Feb. 12. *See Egypt; Tell el-Amarna.*

Tutbury. A town of Staffs, England. It stands on the Dove, 4 m. N.N.W. of Burton-upon-Trent, and has a rly. station. The chief building is S. Mary's church, which contains Norman work of the 12th century when it was part of a Benedictine house founded 1081. The Norman castle, one of the prisons of Mary Queen of Scots, was destroyed in 1647. Tutbury produces plaster, gypsum, and fine cut glass. Pop. 2,000.

Tuthillite. Non-nitroglycerine permitted explosive in which the sensitiser is TNT (13-15 p.c.) mixed with ammonium nitrate (65.5-68.5 p.c.) to compensate for its lack of oxygen. Tuthillite is used for coal getting, or in dry pits as a general purpose explosive.

Tuticorin or **TUTTUKUDI.** Seaport of India, in the S. of Madras state, in the Tinnevely district, 443 m. S. by W. of Madras on the South Indian rly., and 149 m. from Colombo by sea. It was founded as a settlement by the Portuguese in 1540, captured by the Dutch in 1658 and by the British in 1782, restored and retaken several times, and came into British hands in 1825. The harbour is so shallow that steamers anchor 5 m. from the shore, but Hare Island affords protection to lighters and other craft. Next to Madras and Cochin, Tuticorin has the largest trade in S. India. It exports pulses, onions, chillies, livestock, cotton, Palmyra fibre, and cardamoms. Pop. 86,775.

Tuttle's Comet. Comet first seen in 1790 and shown to be periodic by C. W. Tuttle (1829-81) in 1858. It has a period of nearly 14 years.

Tutor (Lat., guardian, from *tueri*, to watch over). In Roman law, the guardian of an infant not under *patria potestas* (q.v.), and originally of a woman of any age,

not otherwise protected. The tutor was appointed by the testament of the father or husband, generally from among the nearest kindred, and could not refuse the duty without valid excuse. He represented his ward (*pupillus*) at law, administered his property, and provided for his education and maintenance.

At English universities, college tutors are fellows whose primary duty it is to advise the undergraduates assigned to their care, and to supervise their studies. At American universities they are junior members of the teaching staff. The word tutor is also applied to a private male teacher, especially to one resident in the house, and charged with the education of a boy or girl. In Scots law a tutor is a guardian of a boy under 14, or a girl under 12.

Tuva. Region of the R.S.F.S.R. It is bounded on the E., W., and N. by Siberia and on the S. by Outer Mongolia. Formerly ruled by hereditary tribal chiefs, it was incorporated in the R.S.F.S.R. in 1944, as the Tannu-Tuva republic, and became the Tuva region the following year. The Tuvians are a Turki people, whose chief occupation is cattle-raising, though the region has gold and asbestos deposits. The capital is Kysylchoto (in Russian Krasny) formerly called Khem-Belder. The area of Tuva is 64,000 sq. m.; pop. 65,000.

Tuxtla or **TUXTLA** **GUTIERREZ.** Town of Mexico, capital of the state of Chiapas. Situated 265 m. S.E. of Vera Cruz, it has tanning and indigo industries; mining and fruit growing are carried on in the neighbourhood. Pop. 15,883.

Túy (anc. Tudae). Town of Spain, in the prov. of Pontevedra. Situated 25 m. by rly. S. of Vigo, it is a frontier town on the Miño opposite Valença do Minho in Portugal, the towns being joined by an international iron bridge. The massive 12th century cathedral resembles a fortress. Fruit, vegetables, and silkworms are products of the fertile surrounding Vega del Oro. Alfonso III recaptured the town from the Moors in the 12th century. Pop. 13,600.

Tuyere (Fr., nozzle). In metallurgy, nozzle of a tube used to blow large volumes of hot or cold air into a furnace. This is done

either to oxidise some constituent of the charge and remove it as a gas or slag or to burn a fuel, mixed with the charge, to provide heat for smelting. Examples are the blast furnace, in which the charge is mixed with coke, and air is blown in at the bottom to burn it, and the converter, in which air is blown in beneath the surface of the molten matte, in copper smelting, or iron, in the manufacture of steel by the Bessemer process. In such processes the air must be introduced through a nozzle and its design is of great importance. The orifice is sometimes surrounded by a hollow steel wall, through which cooling water may be passed, but the tuyere hole is often made of refractory brickwork. Wear at the tuyere, due to the passage of large amounts of air, causes continual maintenance work and very often determines the ultimate life of the furnace. *Prox. twee-air. See Bessemer Process; Converter; Copper; Metallurgy; Steel.*

Tuz Tcholu or **TUZ GOL.** Salt lake of Asia Minor, the ancient Palus Tattaëa. Lying N.E. of Konieh, it has an area of about 700 sq. m., its length being 45 m. and its greatest width about 16 m.

Tvastri or **TVASHTRI.** In Hindu mythology, the god who shaped all things at his forge, the maker of Indra's thunderbolts, and the sharpener of the axe of Brahmanaspati. He is looked upon as the guardian deity of all craftsmen.

Tver. The region and city of R.S.F.S.R. formerly called Tver are in this work described under their new name of Kalinin, from Pres. Mikhail Kalinin.

Twain, MARK (1835-1910). Pen-name of Samuel Langhorne Clemens, American humorous author. Born at Florida, Missouri, Nov. 30, 1835, he claimed descent on his mother's side from the Lambtons of Durham, England, and on his father's side from men who, in Elizabeth's time, were pirates and slavers. His first job was in a printing works. In 1851 he became a steamboat pilot on the Mississippi, later taking his pen-name from the call of the leadsmen when reporting the soundings. After being a reporter on a newspaper in Virginia City, Nevada, he tried mining and journalism in San Francisco, and visited the Sandwich Islands.

Mark Twain

His first story, *The Celebrated Jumping Frog of Calaveras County*, appeared in *The Californian*, 1867. His first book, *Innocents Abroad*, 1869, the result of his first visit to Europe, established his reputation as a humorist. During 1869-71 he edited *The Buffalo Express*. Roughing It, 1872, based on his experiences in the Far West, was followed by *The Gilded Age*, 1873, written with C. D. Warner and later dramatised.

Then came *The Adventures of Tom Sawyer*, 1876, describing the lawless side of boyhood; *Life on the Mississippi*, 1883, full of vivid narrative; and *Huckleberry Finn*, 1885, a companion story to *Tom Sawyer*. Meanwhile, a second trip to Europe had produced *A Tramp Abroad*, 1880, and in 1882 appeared a juvenile romance, *The Prince and the Pauper*.

In 1884 Mark Twain became a partner in the publishing house of Charles L. Webster & Co., whose failure in 1894 involved him in liabilities which a five years' lecturing tour round the world enabled him fully to liquidate. Of his other works the most notable are *A Connecticut Yankee at the Court of King Arthur*, 1889, a rather bitter burlesque on the *Morte d'Arthur*, which was much later filmed with Will Rogers in the title rôle; *Personal Recollections of Joan of Arc*, 1896; *Following the Equator (or More Tramps Abroad)*, 1897; *How to Tell a Story*, 1897: an unfinished autobiography which ran serially in *The North American Review*, 1906-08; and an excursion into the Shakespeare-Bacon controversy, *Is Shakespeare Dead?*, 1909. In 1907 Oxford university conferred upon him the honorary degree of D.Litt. He died at Redding, Connecticut, April 21, 1910, two days after the appearance of Halley's comet, which had last appeared on the day of Twain's birth. His wife, Olivia L. Langdon, had died in 1904.

Mark Twain's humour depended on his acute sense of the incongruous, but under much of it was the pungent satire of a somewhat iconoclastic reformer. He loved a practical joke, but he hated shams. He never lost his hold on his public, and none of his contemporaries wielded a more dramatic pen or had a keener sense of nature in her various moods. Fredric March played Mark Twain in a film based on his life, 1944.

Bibliography. Works, 25 vols., 1910; *Speeches*, ed. W. D. Howells, 1910; *My Mark Twain*, W. D. Howells, 1910; *Biographical Studies*, H. Sedgwick, 1908; T. A.

Henderson, 1911; A. B. Paine, 1912; *My Father*, C. Clemens, 1931; Mark Twain, S. Leacock, 1932; *The Ordeal of Mark Twain*, V. W. Brooks, 1934.

Twayblade (*Listera ovata*). Perennial herb of the family Orchidaceae, native of Europe and Siberia. It has fleshy roots without tubers and two large, broadly elliptic leaves. The stem ends in a very long spray of small yellow-green flowers with a long, narrow lip ending in two lobes. A smaller species is known as the lesser twayblade (*L. cordata*).

Tweed. Soft, flexible, twilled woollen fabric. It is often made in two or more colours, the yarn being dyed before weaving. Tweed was first made of the famous Cheviot wool in the district along the river Tweed, in Scotland; Hawick, Gala-

from 1649 to his death, Aug. 11, 1697. He was made a marquess in 1694. His son John, the 2nd marquess (1645-1713), was lord chancellor of Scotland, and John, the 4th marquess (d. 1762), was secretary of state for Scotland. In 1787, on the failure of nearer heirs, George (1733-1804), a descendant of the 2nd marquess, succeeded to the title. His son George, the 8th marquess (1787-1876), was a soldier of distinction, and from him is descended the 11th marquess, William (b. Nov. 4, 1884). The marquess sits in the house of lords as Baron Tweeddale, a title dating from 1881. His seat is Yester House, and an eldest son is known as earl of Gifford.

Tweedmouth. Town and seaport of Northumberland, England. It stands on the right or S. bank of the Tweed, opposite Berwick.

Tweedmouth, Northumberland. Bridge over the Tweed, looking towards Berwick

shiels, Innerleithen, and Selkirk being the original tweed-making towns. The industry spread to Aberdeen, Ayr, Glasgow, and Paisley. Harris tweed is made in the Hebrides. See Weaving.

Tweed. River of Scotland and England. It rises in the hills of Peeblesshire, and flows across that county, Selkirkshire, and Roxburghshire. Beyond Kelso it forms the boundary between Berwickshire and Northumberland, and it continues to do so until within 2 m. of its mouth at Berwick. Its length is 97 m. Its chief tributaries are the Ettrick, Gala, Eden Water, Till, and Teviot. The Tweed is noted for salmon and trout fishing. See Kelso; Roxburgh; Seine Net. Consult *The Story of the Tweed*, Sir H. Maxwell, 1905.

Tweeddale. Former name of the Scottish co. Peeblesshire (q.v.).

Tweeddale, MARQUESS OF. Scottish title held since 1694 by the family of Hay. John Hay of Yester in E. Lothian was made a lord of parliament in 1478. From William (d. 1596), a later lord, who fought for Mary Queen of Scots, the title passed to John, made earl of Tweeddale in 1646. His son John, the 2nd earl, was a prominent politician, though not a consistent one,

It has a little shipping; other industries are fishing and engineering. On the parish church spire a salmon serves as weathercock. Tweedmouth is within the liberties of Berwick, with which it is connected by a fine stone bridge, finished in 1634, and a four-span ferro-concrete bridge, opened 1928. Pop. 5,574. See illus. p. 1117.

Tweedmouth, EDWARD MARJORIBANKS, 2ND BARON (1849-1909). British politician. Born July 5, 1849, he was the son of Dudley Marjoribanks, M.P. (1820-94), whose barony was conferred in 1881. Educated at Harrow and Christ Church, Oxford, Edward entered the house of commons in 1880 as Liberal M.P. for Berwick, and remained there until he succeeded to the peerage in 1894. In 1886 he was comptroller of the household; in 1892 parliamentary secretary to the Treasury; and in 1894-95 lord privy seal and chancellor of the duchy. From 1905 he was first lord of the Admiralty, but a letter he wrote to the German emperor in March, 1908, aroused some criticism, and, after *The Times* had made the fact known, he was transferred to the office of lord president. Tweedmouth died Sept. 15, 1909, his son,

Dudley Churchill (1874-1935), becoming the 3rd and last baron.

Tweedsmuir, JOHN BUCHAN, 1st BARON (1875-1940). British writer, politician, and administrator.

He was born at Perth, Aug. 26, 1875, the son of a clergyman, and educated at Glasgow university and Brasenose, Oxford. At Oxford, where he had a highly

successful academic career, he won the Newdigate prize and was president of the union. While still there he published his first books, *John Burnet of Barns*, 1898, and *A Lost Lady of Old Years*, 1899, swashbuckling historical romances of old Scotland, somewhat in the tradition of Stevenson. Called to the bar in 1901, he was in S. Africa during 1901-03 as secretary to Milner, an experience reflected in *Prester John*, 1910, and other novels. In 1915 he published what was to become his greatest popular success, *The Thirty-Nine Steps*, a spy story to which *Greenmantle*, 1916, and *Mr. Standfast*, 1919, were sequels that successfully recaptured the atmosphere of the first volume (see Hannay, Richard). Meanwhile Buchan had spent some time at British h.q. in France in charge of news services, but was soon transferred to England, as director of information under Lloyd George. He also wrote a 24-vol. war history.

After the First Great War Buchan produced many novels and biographies, the most notable of the latter being *Sir Walter Scott*, 1932, and *Oliver Cromwell*, 1934. Conservative M.P. for the Scottish universities during 1927-35, he was lord high commissioner to the Church of Scotland in 1933 and 1934, and in 1935, having been raised to the peerage, went to Canada as governor-general. He continued to write, his *Augustus*, 1937, attracting wide attention, and published a volume of reminiscences, *Memory Hold-the-Door*, in 1940. He died Feb. 11, 1940. A volume of personal appreciations, *John Buchan*, by his wife and friends, appeared in 1947. His title passed to his son John Norman Stuart Buchan (b. Nov. 25, 1911), who was well-known as an ornithologist.

John Rowland

Twelfth Day. Day of the feast of the Epiphany, also called Old Christmas Day. The night of Jan. 6, Twelfth Night, was formerly a time of merry-making. In the Middle Ages men representing the Three Kings or Magi used to take part in a ceremony in church on this day. Under the Stuart kings masques were performed on Twelfth Night at court and elsewhere. See Epiphany; Wassail.

Twelfth Night, OR WHAT YOU WILL. A romantic comedy by Shakespeare, who designed it perhaps for a performance at court on Twelfth Night, 1600. Set in an idealised Illyria, it has an Italian origin and is partly borrowed from the tale of Apollonius and Silla in Riche's *Farewell to Militarie Profession*. The main plot is complicated by episodes of mistaken identity and concerns the loves of Duke Orsino, Countess Olivia, and foreign twins, Sebastian and Viola, who have been separately rescued from shipwreck. A sub-plot shows the discomfiture of Olivia's killjoy steward Malvolio by Sir Toby Belch (a lesser Falstaff) and his rowdy cronies. With its passages of exquisite poetry in the dialogues between Orsino and Viola; some of Shakespeare's loveliest songs, rendered by the jester Feste; and comedy ranging from broad buffoonery to fine irony, *Twelfth Night* has always been a favourite play. The comic scenes dominate to the extent that there are 1,741 lines of prose and only 763 of blank verse in a total of 2,684 lines. A famous revival was that at the Savoy Theatre, 1912, in which Henry Ainley played Malvolio; another, with black-and-white decor, was at the New Theatre, 1932. Also outstanding in Malvolio's part were Tree and Donald Wolfitt; as Viola, Lily Brayton, Phyllis Neilson-Terry, Jean Forbes-Robertson, and Margaretta Scott excelled; Ion Swinley brought Orsino to life; and Robert Atkins enjoyed Sir Toby.

Twelve Patriarchs, TESTAMENTS OF THE. One of the non-canonical O.T. Apocrypha or Pseud-epigrapha (i.e. works written under an assumed name). The work consists of twelve pamphlets which purport to give the last utterances of the twelve sons of Jacob. Written originally in Hebrew by a Pharisee, probably between 109 and 106 B.C., it suffered interpolation later at the hands of a Christian writer.

Twelve Tables, THE. Oldest code of Roman law, according to tradition promulgated in 451 and 450 B.C. by a commission of ten

Decemviri (q.v.). The code, of which fragments are extant, was written in archaic Latin on copper tablets set up in the forum of Rome. It was in the main a summary recapitulation, under 12 heads, of the old criminal and civil law, but contained no constitutional enactments. The tables, venerated by the later Romans, are believed by some scholars to be a private compilation, perhaps of the 3rd century B.C. See Roman Law.

Twenty-Four Hour Clock.

Method of computing time on the sidereal period of 24 hrs., ignoring a.m. and p.m. The hours begin with zero at midnight and progress to 23; 23.59 being one min. before midnight. Thus, 1.30 p.m. is called 13.30 hrs. The system is widely used on the Continent for rly. time-tables, and in Sweden for broadcasting. It is also the international method of computing time at observatories, and is used by the armies, navies, and air forces of most countries, including the U.K.

On April 22, 1934, the B.B.C. began, with govt. approval, experimental broadcasting of programmes timed according to the 24-hr. clock. There was little public support for the innovation, which ceased to apply on Aug. 19. A 24-hr. clock obviates misunderstanding of printed time-tables and other public announcements, printed or broadcast. Ordinary clocks can readily be adapted by having the numerals 13 to 24 placed next to the existing 1 to 12. In countries where the 24-hr. clock is used on the rlys., etc., the 12-hr. clock remains in general use otherwise, and a certain amount of mental arithmetic is involved in translating times after noon from the one system to the other.

Twenty-four Parganas. District of W. Bengal, India. Pargana is a word for sub-district. In the Gangetic delta S. of Calcutta and E. of the Hooghli, and including much of the Sundarbans (q.v.), the dist. covers 3,696 sq. m., is administered from Alipore, and has a pop. of 3,536,386. Rights over the territory were granted in 1757 to the E. India co., and in 1759 personally to Clive, on whose death they reverted to the co. Until the partition of 1947 the dist. was in the Presidency div. of Bengal prov.

Twerton-on-Avon. Suburb on the W. of Bath, Somerset, England. It is 108 m. by rly. W. of London. Twerton was one of the first places in England famous for its woollen and weaving industries, and is still notable for cloth mills. It had an annual fair in the 13th century,

and weaving was begun here by monks in the 14th century. The ancient church, restored, has a Norman doorway. Fielding was living at Twerton when he wrote part of *Tom Jones*.

Twickenham. Mun. bor. of Middlesex, England. A favourite residential district of Greater London, and a popular Thames-side resort, it is 11½ m. S.W. of Waterloo by rly., and includes Hampton, Teddington, and Whiston. The parish church of S. Mary, rebuilt early in the 18th century, and several times restored, has a tower said to have been built by William of Wykeham. Alexander Pope (*q.v.*), who was buried here, is commemorated by a modern house on the site of his villa.

Other famous residents were Horace Walpole, at Strawberry Hill; Queen Anne, born at York House; Kitty Clive, Grattan, Mrs. Fitzherbert, Lady Mary Wortley Montagu, Fielding, Tennyson, and several members of the Orleans family. Twickenham Park has been built over, but Marble Hill Park remains to preserve the view from Richmond Hill. Twickenham Eyot, nearly opposite York House, is popularly known as Eel Pie Island. The manor once belonged to the Brethren of the Holy Trinity, Hounslow, and the monks of Christ Church, Canterbury. At Twickenham is the ground of the Rugby Union, where international matches are played. Pop. est. 108,000. Consult Memorials of Twickenham, R. S. Cobbett, 1872.

Twilight. Diffused illumination after the setting of the sun and before its rising. The phenomenon is due to the reflection of light from upper layers of the atmosphere, which are still lit after sunset at the earth's surface. The intensity of the reflected light falls off as the sun sinks farther below the horizon, since the direct light then reaches only the higher and more diffuse layers of the atmosphere. Two periods of twilight are recognized, astronomical and civil; the former is limited by a solar depression of 18°, and the latter by the insufficiency of light for outdoor work. In the tropics civil twilight is brief, half an hour to an hour, whereas above lat. 48° at the summer solstice, twilight lasts all night, and for many nights in succession as the pole is approached.

Twilight Arch. Strictly the boundary, seen towards the end of civil twilight, between the illuminated segment extending along the W. horizon and the dark sky above. Several other twilight arches are

recognized, however, *e.g.* the earlier western one which may be visible even before sunset, separating the tinted segment from the blue sky, and the boundary of the earth's shadow, just after sunset, which has been termed the first eastern twilight arch. Occasionally the early western arch persists through the development of purple light (*q.v.*).

Twilight of the Gods. Usual English translation of the German *Götterdämmerung* (*q.v.*).

Twilight Sleep. Name given to a method of relieving or preventing the pains of childbirth by the administration of scopolamine-morphine. It demands continuous skilled medical observation. The method is less used with advances in anaesthesia and pain-relieving drugs.

Twill. Cloth with a surface of parallel diagonal lines or ribs. The effect is produced by passing the weft threads over one and under two or more warp threads instead of over one and under the next as in plain weaving. In fancy twills the regularity of the lines is broken.

Twin. One of two young produced at a birth. Twin births occur on an average once in 83 pregnancies, but the proportion varies in different races, being about one in 60 in Ireland, and one in 110 in England. Triplets occur about once in 10,000 pregnancies. Individual women sometimes show a tendency to twin pregnancies, and hereditary factors also play a part. Identical twins are produced by the splitting of one fertilised ovum. See Pregnancy; Siamese Twins.

Twinkling. Rapid variation in brightness, apparent position, and sometimes colour, of the stars. It is due to irregularities in the earth's atmosphere. See Scintillation.

Two Gentlemen of Verona. *THE* Comedy by Shakespeare. It is a story of two pairs of lovers, Proteus and Julia, and Valentine and Silvia; the element of fun being introduced particularly in the characters of Launce and his dog Crab. Written about 1591, and first printed in the 1623 folio, it was based to some extent on *The Story of the Shepherdess Filismina*, in Jorge de Montemayor's romance, *La Diana Enamorada*, of which an English version appeared in 1598. It contains 2,060 lines, including 1,509 blank verse and 408 prose. Apart from the song, *Who is Silvia?*, the play is not popularly known. A notable revival was at Daly's Theatre in 1895, with Ada Rehan as Julia and Maxine Elliott as Silvia.

Two Hundred Families. Term sometimes used for the group of families (*Les Deux Cents*) which for many years controlled finance in France. With few exceptions they were families already in good financial standing at the beginning of the 19th cent. The centre of their power was the Bank of France, founded by Napoleon I in 1806, over which they exercised complete control by their predominance among the 18 regents which governed it. The Mallet family, for instance, was represented among the regents for more than a century. Baron Edouard de Rothschild, the Marquis de Vogüé, president of the Société des Agriculteurs de France, and François de Wendel (steel manufacturer, president of the Comité des Forges, senator, and owner of the Journal des Débats) were other regents in the 1930s. By their control of other banks and of corporations, rly. cos., chemical and metallurgical concerns, etc., the 200 spread their influence throughout French industry, commerce, and agriculture; and by the ramifications of their interests in foreign finance and industry they contributed to the weakness of France when faced with German aggression. By the pressure the Bank could exert, through *e.g.* refusing credits needed by the treasury, it was able to make and break cabinets.

Twopenny Tube. Popular name once given to the former Central London rly., London's second tube rly., which, when opened in 1900, ran from the Bank to Shepherd's Bush, the fare for that distance or for any intermediate stages being fixed at twopence. The fixed fare was abandoned after the amalgamation of the rly. with other tube rlys. opened in 1907, to form the London Electric Rly. Extended (by 1949) eastward to Hainault and Epping, westward to West Ruislip, the former "twopenny tube," still known as the Central line, is now administered by British Railways (London Transport executive).

Two-Step. American dance. A modified polka, adapted to American rag-time music, it was introduced into Europe at the end of the 19th century. There are many variants, such as the Boston two-step and the Military two-step; the step is also included in the Brazilian maxixe.

Two-stroke Engine. Engine with no mechanically operated valves. The piston serves as exhaust valve and also as admission valve for the fresh charge. The

action of this type is shown in diagrams, where E is the exhaust pipe communicating with ports on the left side of the cylinder, and G communicates with ports on the right side for supplying the explosive mixture, or, in oil engines, the charge of air, to the cylinder. During the working stroke these ports are sealed by the piston (Fig. 1), which first uncovers the exhaust ports near the end of the stroke (Fig. 2), allowing the pressure in the cylinder to drop nearly to atmospheric. Shortly afterwards it also uncovers the admission port (Fig. 3), allowing the fresh charge, which has previously been compressed to a pressure just above atmospheric, to enter the cylinder and drive out as much as possible of the exhaust gases. This is the most difficult part of the cycle, and the piston is shaped so that as little mixture as possible of the gases occurs, since the power attainable depends upon the weight of fresh charge in the cylinder when the compression stroke commences (Fig. 4).

The air (or mixture of gas and air) is drawn into the crankcase on the upstroke of the piston and com-

Tyburn. Scene at an execution; one of Hogarth's detailed pictures representing the noisy crowd of spectators thronging round the cart in which the criminal with his coffin is being driven to the gallows

Hogarth's Industry and Idleness, plate 11

first spring meeting. It is run over the Rowley mile by three-year-old colts and fillies, and is one of the five classic races. *See* Horse-racing.

Twyford. Name of several villages in England. One is 3 m. S. of Winchester, Hants, served by a rly. station, Shawford and Twyford. At Twyford House Franklin wrote part of his Autobiography. Another is in Berks,

gave its name to the Middlesex gallows, which stood near the junction of the Edgware and Bayswater Roads from the 12th century until 1783, when it was transferred to Newgate. In 1759 the permanent structure was removed and replaced by a movable gallows, the original site being occupied by the new turnpike toll-house. Marble Arch is close to the site. From 1699 to 1818 a person who secured the conviction of a felon was legally entitled to a certificate called a Tyburn ticket, which exempted him from parish and ward duties in the parish where the offence was committed. *Consult* Tyburn Tree, A. Marks, 1908; Tyburn Gallows, G. L. Gomme, 1909.

Tyi or Teye. Egyptian queen of the XVIIIth dynasty. A richly furnished Theban tomb yielded in 1905 the mummies of her parents, Yua and Thua, a Syrian immigrant and an Egyptian wife. Tyi wedded Amenhotep III.

Tyldesley. Urban dist. and town of Lancashire, England. It is 5 m. S. by W. of Bolton, and is served by rly. The principal industry is coal mining, and in the town are cotton mills. Pop. est. 18,500.

Tyldesley. Name of several Lancashire and England cricketers. Most celebrated was John Thomas (1873-1930), who was born Nov. 22, 1873, and scored 37,803 runs in first-class cricket, including 86 centuries. In ten years beginning 1899 he made 26 appearances in test matches against the Australians; and in 1910 he headed the English batting averages. He died Nov. 27, 1930. His brother Ernest was born Sept. 5, 1889, and played for the county during 1909-34. A model of consistency as a batsman, he made centuries in seven con-

Two-Stroke Engine. Diagrams showing sequence of strokes. *See* text

pressed sufficiently on the downstroke to drive it through the transfer port G when the piston reaches the lower position (Fig. 3). In larger engines a separate pump is used for this purpose. This type is uneconomical for gas and petrol engines, since if the scavenging is to be reasonably efficient, some of the fuel will escape mixed with the outgoing exhaust gases. This is not so with the oil engine, since air only is used for scavenging and the fuel is not injected until the end of the compression stroke. Other types have more efficient scavenging arrangements. *See* Double-acting Engine.

Two Thousand Guineas. English horse race. It was inaugurated in 1809, and is held normally at Newmarket on the Wed. of the

31 m. W. of London; this is the rly. junction for Henley. There is also a Twyford in Ashdown Forest, Sussex.

Twyford Abbey. Parish of Middlesex, England. It is on the S. bank of the Brent, between Alperion and Hanger Hill, 11½ m. W. of London. It takes its name from a sham Gothic structure, built 1807-09 on the site of an Elizabethan moated manor house; this house, which formerly stood in wooded grounds, was enlarged in 1904, and became an R.C. convalescent home. The manor once belonged to S. Paul's cathedral.

Tyburn. Name of a small stream in London now running underground from Hampstead through Regent's and Green Parks to the Thames at Westminster. It

secutive matches in 1926, played an innings of 256 not out in 1930, and was considered unlucky to have been picked only five times against Australia. Unrelated to them was Richard Tyldesley, celebrated in the 1920s for his stoutness and the remarkable slowness of his deliveries, which regularly took 100 wickets per season, gaining for him first place in the bowling averages for 1929, and an Australian tour in 1924-25.

Tyler. City of Texas, U.S.A., co. seat of Smith co. It is 105 m. E.S.E. of Dallas, and is served by the International and Great Northern and the St. Louis South-Western rlys. More than a third of the cultivated rose-bushes grown in the U.S.A. originate here, between six and seven million being dispatched annually. The first settlement was made in 1844, and in 1870 Tyler was incorporated. In 1894 Texas College for negroes was opened here. Pop. 28,279.

Tyler, JOHN (1790-1862). American statesman, born at Greenway, Va., March 29, 1790. He was member

John Tyler

of congress 1816-21, governor of Virginia 1825-27, and senator 1827-36. Elected vice-president of the U.S.A. in 1840 as one of the leading Whigs, he succeeded to the presidency next year upon the death of Harrison in office. Tyler's veto of the tariff bill of 1842 led to the resignation of most of his cabinet and a public repudiation of him by his party. During his term Texas was annexed, and the Ashburton-Webster treaty with Great Britain concluded. He died at Richmond, Jan. 18, 1862. *Consult* Letters and Times of the Tylers, L. G. Tyler, 1884-85.

Tyler, War (d. 1381). English rebel. He appears to have been a tiler at Dartford, Kent, and came into notice when the poll tax of 1381 was being collected. The story goes that a tax-collector insulted his daughter and was killed by him. This brought the discontent to a head and, under Wat Tyler and Jack Straw, men from Kent and Essex marched to London. At Mile End they met the boy king Richard II, from whom Tyler demanded that serfdom should be abolished. Receiving a favourable answer, he led his men on a plundering expedition among London mansions. On June 15 there was

another meeting at Smithfield with the king, whom Tyler insulted, to be immediately struck dead by the lord mayor. *See* Engl'sh History; Peasants' Revolt.

Tylers' and Bricklayers' Company. London city livery company. The craft it represents came into prominence in the 13th century, and the early members of the guild, which received its first charter in 1568, appear to have been employers rather than actual operatives. The office is at 6, Bedford Row, London, W.C.1.

Tylers' and Bricklayers' co. arms

Tyll Owlglass. Hero of a 16th century German book, *Till Eulenspiegel*, by a Brunswick monk, Thomas Murner (1475-1536). He is a jack of all trades, a mischief-maker, and a merry fellow. First translated into English by William Copland about 1560, as *The Merry Jest of a Man called Howlglass, and the Many Marvellous Things and Jestes which He Did in His Life*, the tale has been several times retold. *Till Eulenspiegel* is also the name of a symphonic poem by R. Strauss.

Tylor, SIR EDWARD BURNETT (1832-1917). British anthropologist, born at Camberwell, London, Oct. 2, 1832. Ill-health took him to America, where a Mexican tour with Henry Christy, 1856, resulted in a book, *Anahuac; or Mexico and the Mexicans*, 1861, followed in 1865 by *Early History of Mankind. Primitive Culture*, 1871 (*see* Animism), made Tylor the leading anthropologist of the age. After completing a popular manual on *Anthropology*, 1881, he became reader in that subject at Oxford, 1884, and first professor, 1895. He was made F.R.S. in 1871, knighted in 1912, and he died at Wellington, Somerset, Jan. 2, 1917.

Tympan (Lat. *tympanum*, kettle-drum). In printing, sheet of cloth, parchment, or other material placed between the platen or impression surface and the paper about to be printed. A hand press contains a frame holding an inner and an outer tympan; the outer holding the inner in place. In power presses the tympan covers the packing or make-ready between the platen and the printing surface. *See* Printing.

Tympani (Lat. *tympanum*, a drum). Italian name for orchestral kettledrums. They can be tuned to definite notes, which in early prac-

tice were generally the tonic and dominant of the key. Contemporary composers indicate any tuning they desire.

Tympanum (Gr. *tympanon*, drum). In anatomy, the membrane dividing the inner and outer ear (*q.v.*). In architecture it is the triangular space enclosed by the entablature and the sloping lines of the pediment. The name is also given to the space between the lintel and the arch of a doorway or window.

Tynan, KATHARINE (1861-1931). Irish poet and novelist. Educated at the Dominican convent, Drogheda, she published her first book of verses, *Louise de la Vallière*, 1885. Other volumes of her graceful and musical verse include *Ballads and Lyrics*, 1890; *The Wind in the Trees*, 1898; *Collected Poems*, 1901; *New Poems*, 1911; *Flower of Youth*, 1915. In 1893 she married H. A. Hinkson (1865-1919), barrister and author, lived much in London and at Southborough, Tunbridge Wells, and became a constant contributor of verses and fiction to periodicals. Among her novels are *The Handsome Brandons*, 1898; *A Midsummer Rose*, 1913; *John-a-Dreams*, 1916; *Second Wife*, 1920; *Wives*, 1924; *House in the Forest*, 1928. She published reminiscences of Irish and London literary life in *Twenty-Five Years' Reminiscences*, 1913; *The Middle Years*, 1916; *Years of the Shadows*, 1919. She died April 21, 1931.

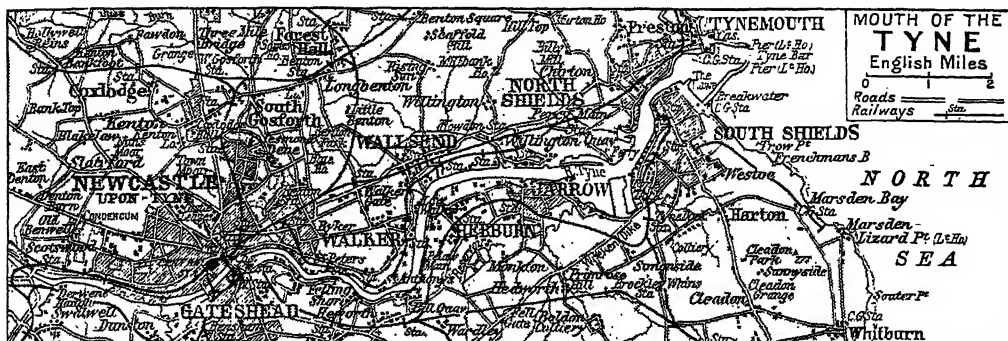

Tyndale, WILLIAM (c. 1492-1536). English translator of the Bible. A native probably of

William Tyndale, Bible translator

Gloucestershire, he was educated at Oxford and Cambridge universities, ordained priest in 1521, and became chaplain to Sir John Walsh at Little Sodbury. Removing to London, 1523, he preached at the church of S. Dunstan's-in-the-West and in the house of Humphrey Monmouth, a rich draper, began his work of translating the Scriptures in such a manner that, while the scholar could approve, the ploughboy might understand.

Forced to leave England in 1524, Tyndale travelled in Germany and Holland. He visited Luther at Wittenberg, began printing the N.T. at Cologne, 1525, continued the work at Worms, whence several copies reached England, and en-

Tyne. Map of the mouth of the English river which flows through the colliery district of Newcastle and North Durham, and is one of the busiest industrial waterways in the world

gaged at Antwerp in controversy with More. At the instigation of Henry VIII, who suspected him of sedition, he was strangled and burnt at the stake at Vilvorde, near Brussels, Oct. 6, 1536.

Tyndale's translation included the N.T., 1525; the Pentateuch, aided by Coverdale, about 1530; and Jonah, 1531. He is said to have left MS. of the O.T. as far as 2 Chron. In arrangement he followed Luther, but his translation, marked by a remarkable mastery of the English idiom, and one of the foundation-stones of the A.V., was mainly from the original texts. It has had an important influence on the development of English prose. A monument to Tyndale was erected at Nibley Knoll, Glos, in 1863. See Bible; consult Lives, R. Demaus, new ed. 1886; W. B. Cooper, 1924; J. F. Mozley, 1937.

Tyndall, JOHN (1820-93). British physicist. Born at Leighlin Bridge, co. Carlow, Ireland, Aug. 2, 1820, and educated at the local national school. he became an assistant in the ordnance survey of Ireland, 1839, and was transferred to the English survey, 1842. He accepted an offer to teach mathematics and surveying at Queenwood College, Hants, 1847; but the following year he went to the university of Marburg to study chemistry under Bunsen, and shortly afterwards began publishing the brilliant series of papers which brought him into the front rank of physicists. Notable among these was one on the Magneto-optic Properties of Crystals, 1850.

A lecture before the Royal Institution, 1853, on The Influence of

Material Aggregation upon the Manifestations of Force, established Tyndall as one of the most brilliant and original thinkers of his generation. Already F.R.S., he was at once chosen professor of natural philosophy at the Institution. In 1867 he succeeded Faraday as its superintendent, and carried out a series of researches on radiant heat in relation to gases and vapours which are among his most remarkable investigations. In 1866 he became scientific adviser to Trinity House, undertaking important researches on sound. He retired from the Institution, 1887, and died Dec. 4, 1893.

The phenomenon associated with his name, the Tyndall effect, refers to the scattering of a beam of light by small particles. The extent of the scattering varies inversely as the fourth power of the wavelength of the light, and explains the blue coloration of smoke, blue being at the short wavelength end of the spectrum.

Controversialist as well as thinker, Tyndall wrote Heat Considered as a Mode of Motion, 1863; Sound, 1867; Faraday as a Discoverer, 1868; Fragments of Science, 1871; Forms of Water, 1872. Consult Life and Work, A. S. Eve and C. H. Creasey, 1945.

Tyndareus. In Greek mythology, king of Sparta. His wife Leda became by Zeus mother of Castor and Pollux, and, in some legends, of Clytemnestra and Helen as well.

Tyne. River of N.E. England. The N. Tyne rises in the Cheviots near Carter Fell on the Scottish border, and flows S.E. and S. for 32 m.; the S. Tyne rises in the Pennines E. of Cross Fell in Cumberland and flows N. and then E. for 33 m. to join the N. Tyne near Hexham, whence the united stream flows 30 m. E. to the North Sea. From Newburn and Ryton it marks the boundary between Northumberland and Durham. The lower reach bordered by the Tyne ports, Tynemouth, N. and S. Shields, Jarrow, Wallsend, Hebburn, Walker, Gateshead, and Newcastle, is a busy industrial region. It was severely hit by depression in the shipbuilding industry after 1930. Tunnels under the Tyne for cyclists and pedestrians, connecting Howdon on the N. with Jarrow on the S., were completed in 1950; a third tunnel, for vehicles, was planned. See Newcastle-upon-Tyne; Tynemouth.

Tynemouth. Co. and mun. borough and seaport of Northumberland, England. Standing at the mouth of the Tyne, $8\frac{1}{2}$ m. from Newcastle, it has rly. stations and a ferry across the river to S. Shields. There are ruins of a Benedictine priory; near the latter the remains of the castle, the scene of fighting in the Civil War. The priory was a Norman foundation and attained considerable wealth and position. Modern buildings include the block in N. Shields erected for municipal

purposes. The port has a considerable shipping trade, for which there is a harbour at N. Shields.

Tynemouth arms

it was a centre for the salt and coal industries. In the 20th century it developed considerably as a holiday resort. It was made a borough in 1849, and includes N. Shields, Cullercoats, Preston, Percy Main, East Howdon, New York village, and Chirton, as well as Tynemouth proper. One member has been returned to parliament since 1832. Pop. 66,110.

Tynwald. Name for the old parliament of the Isle of Man. The Tynwald court today is composed of the two branches of the legislature when they meet together for executive business, which includes the control of the finances. Tynwald Hill is the hill where the laws of the island are promulgated after receiving the royal assent. See Keys, House of; Man, Isle of.

Type (Gr. *typos*, blow, mark of a blow). In theology, term for a prophetic symbol, or an impression or representation of some model, which is called the anti-type. A type is meant to strike the human senses with a supersensible idea, e.g. the paschal lamb in the O.T. is regarded as being meant to prefigure the sacrificial death of Christ.

Type. In chemistry, various suggested classifications of compounds. At one time popular, but now rarely used is Gerhardt's theory of type. This supposes that all compounds are derived from the following types of hydrogen :

Hydrogen Water Ammonia

by the replacement of hydrogen atoms by other elements or groups of atoms which play a part analogous to the atom of an element.

Type. In printing, piece of metal or wood containing a raised letter or figure, from which an impression is to be made. Type for books and newspapers is of metal, $\frac{1}{16}$ inch high, and rectangular in shape, the letter being in a form reversed from that of its appearance in print. Movable type is cast in founts or fonts of varying sizes and styles. The chief sizes in ordinary use in book and newspaper printing offices are as follows, each having a distinctive name or being distinguished according to the point system, a point being 0.0138 inch, i.e. 72 points to the inch :

Type. A single piece of type showing the parts. A. Face. B. Shoulder. C. Counter. D. Bevel. E. Pin mark. F. Body or shank. G. Nick. H. Feet. J. Groove

There are scores of type faces designed for text or display, each having CAPITALS, SMALL CAPITALS, lower case, *italic*, numerals, points (., : .), accented or other marks, signs, etc.

Each single letter is marked with one or more nicks on the front of its stem to guide the compositor and to distinguish one fount from

another. For large poster work wooden letters are used. See Black Letter; Linotype; Monotype; Printing.

Type-Founding or **TYPE-CASTING.** Casting of type for printing. Type is cast from type-metal by means of a mould to which is fitted a copper matrix made by a stamping machine from a steel punch or die cut by an expert craftsman. Early printers made their own punches and cast their own type (see Black Letter). Type-found- ing as a distinct industry began at the close of the 16th century, but did not approach uniformity and general excellence in England until the time of Caslon in the first half of the 18th century. Type-casting machinery has been much im- proved, and British type-founders in particular have made remark- able progress in the casting of letters for the production of works printed in Oriental and other foreign languages. See Galley; Printing.

Type Metal. Lead-base alloys used for type casting. They usually

contain 10 to 20 p.c. of antimony, and up to 10 p.c. of tin. Their characteristics are low melting point, ease of casting, and good resistance to wear.

Type-Setting or **COMPOSITION.** Arrangement of type-letters for printing. The work is done by hand or by machinery, either in single letters or in lines ("slugs") of type. See Compositor; Linotype; Monotype; Printing.

Typewriter. Machine for writing in characters resembling print. The first patent for a typewriter was granted to an engineer named Mills in England, Jan. 17, 1714; the first machine to be put to practical use, however, was invented by Charles Thurber in 1843. It was followed in 1856 by that of A. E. Beach for printing embossed

Tynwald. Church of S. John and, left, the ancient Tynwald Hill where the laws of the Isle of Man are annually promulgated on July 5

letters for the blind, and, about the same time, by an invention of Sir Charles Wheatstone. Then after several years of experiment Christopher Latham Sholes produced a successful machine which he described as a typewriter. E. Remington and Sons, of Ilion, New York, started making this machine in 1873 and the Remington became the first commercial typewriter. This machine had the type-bars pivoted about a horizontal ring, the arms of

Typewriter. The first commercial typewriter, made by Remington in 1873. Top. Christopher Latham Sholes' daughter using an experimental model made by the inventor in 1872

the type-bars being connected by vertical rods to the levers leading to the keyboard. A rubber cylinder moved the paper, and the impression of the type was supplied by an inked ribbon which unwound automatically from a spool. Sheets of thin paper coated on one side with a solid ink, and called carbon paper, were later used, interleaved with blank sheets, to obtain "carbon" copies of the text at the same time as the original was written through the typewriter ribbon. The pressing down and release of each key in turn moved the paper-carrying cylinder along one space by means of a spring. The roller was moved back and turned ready for the following line by hand. In the original machine each type-bar carried only one character, and the machine typed capital letters only. A later machine introduced in 1878 carried two characters on each type-bar, which in conjunction with a shift-key allowed the machine to type both

upper and lower case letters. The Remington machine was followed by others embodying various new ideas and improvements. The keyboard became standardised, with certain variations in different countries to suit the letter frequency in different languages, and various standard improvements were introduced, e.g. a back spacing key, which made it possible to reverse the carriage one space as necessary to retype a letter, two-colour ribbons, stencil-cutting switch, margin adjusters. Various methods of inking the type were used, among them inking pads before the fabric ribbon impregnated with solid ink was introduced. The type-wheels used on a number of early machines gave place to the arrangement of the type-bars in a "basket" or segment so that they all print by a hammer action at a central point. Some typewriters incorporate adding, subtracting, and tabulating mechanisms, others can be used for book-keeping work as well as general typing.

Noiseless typewriters, which make a little but not much noise,

are worked by pressure-printing; the type-bars are controlled by a toggle action and the printed impression is produced by the overthrow of a weighted cam. The portable typewriter, which can be easily carried on journeys, though somewhat slower in action, turns out work equal in appearance to that of a full-size machine.

Typhaceae. Family of marsh and aquatic herbs. Natives of temperate and tropical regions, they have creeping rootstocks, and long, narrow, grass-like leaves. The minute flowers are crowded into cylindrical or globular heads with the sexes separate. The family includes only two genera—*Typha* and *Sparganium* (Bur-reed). See Reed-mace.

Typhoid or ENTERIC FEVER.

Infectious disease caused by the bacillus typhosus. Typhoid fever occurs more or less throughout the world. At one time very prevalent in all large towns, it has been reduced to insignificant proportions where proper sanitation has been adopted. Unpolluted water is the essential preventive.

Contamination of the water supply by infected sewage is undoubtedly the commonest cause; but infection may also be conveyed by milk or food, and some outbreaks have been traced to infected

shellfish which feed on sewage matter. Typhoid carriers are a great menace, especially in institutions, where they may infect the food of others, if employed in kitchens. In the past typhoid has also taken heavy toll of life in armies in the field, but in both Great Wars its ravages were relatively small, a system of preventive inoculation being widely adopted by the belligerents.

The disease tends to be more prevalent in autumn than in other seasons, and is more likely to attack persons in youth or early adult life than the very young or the elderly. The period of incubation, *i.e.* the interval between infection and appearance of the symptoms, ranges from 8 to 14 days or more. Symptoms begin insidiously, and the patient may have been ill for a week or ten days before the disease is suspected. Early symptoms are headache, shivering attacks, loss of appetite, diarrhoea, bleeding from the nose, and pain in the abdomen. Temperature during the first week rises steadily. Towards the end of the week the spleen becomes enlarged, and there is an eruption of rose-coloured spots on the abdomen. During the second week the fever remains high and the symptoms become aggravated. Death may occur at this stage.

In the third week in a hopeful case the temperature gradually begins to decline, and in the fourth week convalescence usually begins. The disease may be accompanied by grave complications. Ulcers may form in the colon, and perforation of these is a frequent immediate cause of death. The heart muscle may also be affected.

TREATMENT. Absolute rest in bed, good nursing, and careful regulation of the diet are essential. With persistent high temperature, sponging of the body with cold water may be indicated. Chloromycetin may be administered. Solid food should be avoided.

Typhon or Typhoeus. In Greek mythology, a monstrous, fire-breathing giant with 100 heads. He was the son of Ge, the Earth, and was the father of the three-headed dog Cerberus, the Chimæra, and other monsters, and of some of the maleficent winds. Having revolted against Zeus, he was slain with a thunderbolt, buried under Mt. Etna, and seems to have personified the power manifested in earthquakes and volcanoes.

Typhoon (Chinese *tai fun*, strong wind). Tropical revolving storm associated with the China Sea, the Philippine archipelago (where it is called *baguio*), and Japan. Although occurring at any time of the year, typhoons are most frequent towards the end of the hot season, *i.e.* from July to Oct.; during 1893–1918, out of a total of 620 reported in the China Sea and the western N. Pacific, 387 occurred in these months. Like all cyclones typhoons originate over the hottest parts of the ocean, in regions where the trade winds are dying and merging into the humid equatorial calms of the doldrums. Essentially, these storms resemble the depressions of temperate lats., greatly intensified. The steep pressure gradients result in violent winds which whirl round the centre of the system; rainfall is torrential, sometimes accompanied by thunder and lightning; and advancing over the sea it produces enormous and destructive waves. Typhoons rarely penetrate far inland, but the islands lying in their paths, and the Chinese coasts, suffer severely. *See Cyclone; Hurricane; Okinawa; Wind.*

Typhoon. British fighter aircraft of the Second Great War. Designed and built by the Hawker company, the Typhoon had a span of 41 ft. 7 ins., a length of 31 ft. 11 ins., and was powered by one 2,200-h.p. Napier Sabre 24-cylinder sleeve-valve engine. It was the first Allied fighter to exceed 400 m.p.h. on service. Armament consisted of either twelve .303 Browning machine-guns or four 20-mm. cannon. Each wing had a rack for one 1,000-lb. bomb, two 500-lb. bombs, or four rocket projectors. The prototype first flew in Feb., 1940, but after the defeat of France production was stopped to enable the Hawker company to devote maximum production to Hurricanes. From May, 1941, the Typhoon served in most theatres of war, proving exceptionally useful as a ground attack fighter. Rocket-firing Typhoons of the 2nd tactical air force were used in W. Europe, 1944–45, as tank destroyers.

Typhus Fever (Gr. *typhos*, smoke, stupor). Acute infectious disease known also as hospital fever, spotted fever, gaol fever, and camp fever. The micro-organism responsible is of the Rickettsia group, and infection is conveyed by the body louse and possibly by the head louse, as well as by mites, fleas, and ticks. Rats and mice can be a reservoir of infection. Typhus is closely associated with

filth and overcrowding, and its prevalence in former years in prisons, hospitals, and other places where verminous persons were crowded together led to the above names being given to the disease. Typhus is highly contagious, and great epidemics have prevailed from time to time in many parts of the world. Improved sanitary conditions have led almost to the disappearance of the disease in England and Wales, but there was a serious outbreak in the Balkans early in the First Great War, and in the Second it occurred among refugees and in concentration camps.

The incubation period is about 12 days. The onset is usually abrupt, with chills or shivering, fever, headache, and pains in the back and legs. The temp. rises rapidly, the tongue is white, the face flushed, and vomiting severe. An eruption appears on the skin from the third to the fifth day. In severe cases the delirium becomes worse, coma supervenes, the action of the heart becomes feeble, and death occurs from exhaustion. The mortality varies in different epidemics from 12 to 20 p.c. Treatment is symptomatic. Cold sponging or cold packs are of value when the temp. is high. Mild aperients are necessary, and a light nourishing diet. D.D.T., by destroying the insects which carry typhus, is a preventative, as was demonstrated at Naples, Oct., 1943, when the whole population was treated and an epidemic prevented. *Consult Rats, Lice, and History, H. Zinsser, new edn., 1942.*

Typographic Etching. Process invented about 1873, to produce a metal block by means of an electro or cast of the actual lines of a drawing. Since 1890 the use of the process has been confined almost entirely to the production of maps, plans, etc.

Typography. Broadly, the art of printing from movable type or letters. But the term has become increasingly used in a special sense confining it to the design, selection, and arrangement of type rather than the actual operation of printing; in other words the art of so disposing type as to achieve the most effective and harmonious appearance in the printed pages of a book or other publication. A typographical expert possesses a wide and intimate knowledge of existing styles of type, and is concerned with the selection of the most appropriate styles and sizes of type for a given purpose, taking into consideration also such mat-

ters as widths of margins, spaces between lines, headings, initial letters, illustrations, tabulated material, etc. Good typography is a feature of the highest class of artistic book production. Consult *First Principles of Typography*, S. Morison, 1935; *Introduction to Typography*, O. Simon, 1945.

Týr (Old Norse *týr*, god). Scandinavian name of the old Teutonic god of war, called in Anglo-Saxon *Tiw*, and in Old High German *Ziu*. His name is cognate with Lat. *deus*, Sanskrit *devas*, god, and Greek *Zeus*. The son of Odin, he bound the demon wolf Fenrir, which bit off his hand. Týr was identified with the Roman Mars, whence the third day of the week, *Martis dies*, was called *Tiwes daeg* or Tuesday.

Tyrant (Gr. *tyrannos*). In Greek history, a name applied to a despot who ruled without constitutional sanction. In the 7th and 6th centuries B.C. oligarchies of nobles, which had replaced the old kings, ruled most of the city states of the Greek world, and were overthrown by able leaders of the unprivileged classes, wealthy or poor. These leaders, who seized the supreme power, and handed it on to their descendants, were not necessarily tyrants in the modern sense, which begins to be associated with the word in Sophocles and Plato. They were often vigorous rulers, who increased the power of the state, erected splendid buildings, and encouraged literature and the arts. Many of them employed foreign mercenaries. Becoming degenerate, they were swept away by revolutions, conspiracies, or foreign intervention. A later series of tyrants was set up in many Greek cities by the Macedonian kings. See Cypselus; Dion; Dionysius the Elder and Younger; Hiero I; Peisistratus; Periander; Phalaris; Polycrates.

Tyrconnel, RICHARD TALBOT, EARL OF (1630-91). Irish soldier. The son of Sir William Talbot, an

Earl of Tyrconnel,
Irish soldier
After S. Harding

Irish politician, he belonged to an R.C. family settled in Ireland for over 400 years. After fighting at Drogheda against Cromwell, he left the country and served the royal family. In 1660 he returned to England and was attached to James, duke of York, serving with the fleet. When James became king, Talbot, in the full confidence

of his master, was made commander-in-chief in Ireland, where he had held a command since 1681, and was created earl of Tyrconnel. James II created him duke of Tyrconnel in 1691, but the title was recognized only by the Jacobites. As lord deputy after 1687 he worked to secure Ireland for James, which he did by displacing as many Protestants as he could from both civil and military employment. He died at Limerick, Aug. 12, 1691.

Tyre. Alternative spelling of tire (*q.v.*), a hoop, band, or inflated rubber tube on the rim of a wheel.

Tyre, Syria. The modern city and harbour, built on the site of the ancient port, showing remains of the mole on the extreme left

Tyre (anc. *Tyrus*). English name for a city of ancient Phoenicia. It is first mentioned in the Amarna tablets of the 14th century B.C., when it formed part of the Egyptian empire. The city itself was built partly on the mainland (Palaetyrus, old Tyre), partly on an island, now a peninsula, on which was erected one of the strongest fortresses of antiquity. Its greatness dates from the 11th century B.C. and is reflected in the activities of Hiram, the friend of David and Solomon. It established colonies in Sicily, Sardinia, Spain, (Gades), Africa (Carthage), and sent fleets to trade with India.

In ancient times it was besieged by Shalmaneser and Sargon, kings of Assyria, Nebuchadnezzar, Alexander the Great, Antigonus of Syria, and always offered a desperate resistance. When finally it came under Roman rule with the rest of the country (64 B.C.), it was granted freedom and a constitution, and Severus made it a colony. Its extensive trade and manufacture of metal and glass wares, of woven stuffs, and especially of purple dyes, made it extremely prosperous. In 638 it fell into the hands of the Arabs; in the time of the Crusades it was

taken by Baldwin, king of Jerusalem, and became the seat of an archbishop, one holder being the historian William of Tyre. In 1291 it was recovered permanently by the Mahomedans.

The modern town, called Sur (rock), which is about 50 m. S. of Beirut, has some 5,000 inhabitants of very mixed stocks; it is the seat of a Greek archbishop. The harbour is choked up with sand and trade has been diverted to Beirut. There are interesting remains of an old church of crusading times. See Phoenicia.

Tyrol. See Tirol.

Tyrone. County of N. Ireland.

With 1,218 sq. m., it contains the Sperrin Mts. and other ranges, but in the east is a level tract. The rivers include the Derg and the Blackwater, while the Foyle divides the co. from Londonderry. Fea is one of several small loughs; on the E. boundary is Lough Neagh. Omagh is the co. town; other towns are Strabane, Dungannon, and Newtown Stewart, while Clogher, once the seat of a bishop, Dromore, and Fintona are also in the county. Oats, potatoes, and flax are grown, and cattle and poultry reared. Manufactures include linens, woollens, earthenware, chemicals, whisky, soap. Tyrone returns four members to the N. Ireland parliament; for the U.K. house of commons it votes partly in the co. constituency of Fermanagh and S. Tyrone and partly in that of Mid-Ulster. Pop. 127,586.

Tyrone, EARL OF. Irish title held by the families of O'Neill, Power, and Beresford. In 1542 it was conferred on Conn O'Neill, head of a famous Irish family. His grandson Hugh, 2nd earl, led the Irish in their rising against Elizabeth and James I. After having

Tyrone, N. Ireland. Map of this Ulster county

gained experience by serving with the English forces in Ireland, he revolted about 1593 and, aided by Spain, carried on hostilities until 1607, when he left the country. Having been attainted in 1614, he died in Spain, July 20, 1617. In 1673 Richard Power was made earl of Tyrone, but in 1704 the title became extinct. One of his descendants married Sir Marcus Beresford, who in 1746 was made earl of Tyrone. His son was made a peer of the U.K. in 1786, and in 1789 marquess of Waterford (*q.v.*). See Ireland.

Tyrrell, William George Tyrrell, Baron (1866-1947). British diplomatist. Son of a judge, he was born Aug. 17, 1866, and educated in Germany and at Balliol College, Oxford. Entering the foreign office, 1889, he was secretary to the imperial defence committee, 1903, and private secretary to Sir Edward Grey during 1907-15. Permanent under-secretary for foreign affairs, 1925, he played a prominent part in the negotiation of the Locarno treaties; and in 1928-34 was a highly successful British

Lord Tyrrell, British diplomatist

ambassador in Paris. On retirement he became president of the British board of film censors. Knighted 1913, he was raised to the peerage in 1929. He died March 14, 1947, leaving no heir.

Tyrrell, George (1861-1909). British theologian. Born in Dublin, Feb. 6, 1861, and educated at Rathmines, he was much influenced by Father Dolling, and in 1879 joined the R.C. communion. After being admitted to the Society of Jesus and attracting notice as a fervent Thomist, he taught in Malta, was ordained priest in 1891, and for two years engaged in mission work, which he gave up to write. Then began a period of controversy, aroused by a paper on Hell which Tyrrell contributed to *The Weekly Register*, Dec. 16, 1899. Tyrrell left the Society of Jesus in 1906, criticised the papal encyclical on Modernism, and died at Storington, July 15, 1909. See Modernism; consult also Father Tyrrell's *Modernism*, H. Egerton, 1909; *L'Affaire Tyrrell*, R. Gout, 1910; *Autobiography and Life of George Tyrrell*, M. D. Petre, 1912.

Tyrrell, or Tirel, Walter (fl. 1100). Reputed slayer of

George Tyrrell, British theologian

William Rufus. Lord of Poix, in Picardy, he was brought from France by William with whom he was on friendly terms. In 1091 he was at the court of the French king, but returned to England, and held the manor of Langham, Essex. He was present when William Rufus was killed, in the New Forest, Aug. 2, 1100, and was generally believed to have shot the fatal arrow. There is considerable doubt on the matter, and Tyrrell himself firmly denied the allegation.

Tyrrhenian Sea. Portion of the W. Mediterranean Sea. It lies between the W. coast of Italy and the islands of Corsica and Sardinia and is N. of Sicily. See Italy; Mediterranean Sea.

Tyrtæus (c. 650 B.C.). Greek lyric poet. Probably an Ionian by birth, he made his home in Sparta, where his martial songs in elegiac verse did much to inspire the Spartans in the second Messenian War. Only fragments of his verses have been preserved.

Tze-hsi (1834-1908). Dowager empress of China. Born in Peking, Nov. 17, 1834, she entered the seraglio of the emperor Hien-fung at the age of 15, and by her beauty and wit soon rose to be second to the empress Tze-an. On the death of Hien-fung, 1861, her son, Tung-chih (1856-75), came to the throne, but during his reign and that of his successor, Kwang-su, Tze-hsi wielded the imperial power. Assisted by Li Hung-chang she ruled wisely and successfully until the war with Japan in 1894-95 brought discontent. She re-established her authority by a *coup d'état*, and suppressed the opium traffic. She died Nov. 15, 1908, after one of the most remarkable female reigns in history.

Tze-hsi, Dowager Empress of China

THE history of this letter is for the most part the history of the letter V, which is said to have evolved from the Semitic *vau*, or hook (see the introductions to F and V). U is a much later variation, first clearly recognized in the Latin minuscule alphabet. Up to the end of the 2nd century A.D. Latin inscriptions in capital letters used the V for both vowel and consonant. But the minuscule, or cursive, form of the letter was rounded at the base and had a final descendant stroke: **U**. Both forms were used indiscriminately for U vowel and consonant. In course of time the V form was preferred for the beginning of a word, and the u form elsewhere; and as the consonant

occurred more commonly at the beginning of the word, later medieval writers gradually adopted the practice of using V for a consonant and u for a vowel, very much as in the distinction between I and J. Where the vowel also required a capital letter, a larger version of the rounded form above was used. Like the modern capital J, the familiar capital U of today was virtually a printer's invention. It was unknown in classical Roman times, and, again like capital J, lacks the balance and distinction of the Roman letters. Hence the endeavours on the part of many typographers to popularise the form historically more justifiable, derived directly from medieval MSS., with the final descendant stroke: **u**.

U Twenty-first letter and fifth vowel of the English and Latin alphabets, if it be regarded as distinct from V in the latter. It has various sounds, whether used alone or in combination with other vowels. It equals a long oo in *truth*, short oo in *bull*, pull, short u in *nut*, *iu* (*yu*) in *duke*, *funeral*, short i in *busy*, *business*, and short e in *bury*. *Ua* equals *wa* as in *assuage*, *language*, or long Italian *a* as in *guardian*. *Ue* may sound like *wæ* as in *conquest*, short e as in *quest*, *iu* (*yu*) in *cue*, *hue*, and is often mute at the end of words as in *antique*, *catalogue*, *fatigue*, *rogue*. *Ui* equals *wi* as in *anguish*, *languid*; short i as in *guilt*, *biscuit*; *iu* (*yu*) in *suit*, *nuisance*, and less emphatic *juice*; and almost oo as in *cruise*, *fruit*. *Uo* equals *wo* in *quote*, but not in *liquor*; and *uy* equals long i, the diphthong, not the Italian sound, in *bug*. See Alphabet; Phonetics; Pronunciation.

U. Title which precedes some names in Burma. Burmese politicians whose names have become familiar in Great Britain are indexed as though U were the first letter.

Uakari. Genus *Uacaria* of small American monkeys, distinguished by their short tails. There are three species, whose names—the bald, the red-faced, and the black-headed uakari—indicate their distinctive points. The two former have brilliant scarlet faces; but while the first has scant sandy hair, the other has deep chestnut. The third species has yellowish back and sides, reddish-brown loins, and black head and feet. Uakaris occur in companies in the tops of the trees in forests, living on fruit and flowers.

U Aung San (1914-47). Burmese politician. Born of peasant stock, he went to study law at Rangoon university. Engaged in revolutionary activities, he fled to Japan after the outbreak of the Second Great War, returning as head of the so-called Burma national army. He later dissociated

himself from the Japanese, formed an underground resistance movement, opened negotiations with the British, and gave valuable aid to the 14th army. The force U Aung San headed was the nucleus of the Anti-fascist People's Freedom League, from 1946 a powerful factor in Burmese politics. In a post-war interim govt. he was vice-president of the executive council, and having negotiated with C. R. Attlee an agreement in London, obtained a majority in the first Burmese constituent assembly, 1947. But on July 19 he was assassinated with six of his ministers in Rangoon, Thakin Nu taking his place.

Ubangi, OUBANGHI, OUBANGUI, OR WELLE (UELE). River of Africa. It rises as the Welle near the Sudan frontier of the Belgian Congo, and flows W. as far as Fort de Possel and thence almost due S. to its junction with the river Congo. The Ubangi and its N. tributary the Bomu form the boundary between the Belgian Congo and French Equatorial Africa. The river is impeded by rapids, but may be ascended as far as Zongo by small steamers, and above the rapids near Zongo, as far as the confluence of the Welle and the Bomu by small native boats. See Africa; Congo.

Ubangi-Shari. District of French Equatorial Africa. It lies N. of the Ubangi-Bomu river; W. of the Anglo-Egyptian Sudan; E. of Cameroons; and S. of Chad territory. Its main river is the Shari, which flows N.W. into Lake Chad, and on which stands the administrative centre of Fort Arochambault. Sleeping sickness is prevalent. Bangui, on the right bank of the Ubangi, is the capital. Until 1920 Ubangi-Shari-Chad constituted a single colony. Area, 238,767 sq. m. Pop. approx. 1,065,000.

Úbeda. Town of Spain, in the Andalusian prov. of Jaén. It stands on a plateau 2,000 ft. high,

on the Granada rly. 74 m. E. by N. of Córdoba. The surrounding fertile Loma de Úbeda has vineyards, olive plantations, and pastures for horses. There are portions of the old walls, a castle with many towers, and among churches the 16th century San Salvador, the Gothic San Pablo, and the Corinthian San Nicolás. The Palacio de las Cadenas contains municipal offices, and here is the Colegio de Escolapios. An annual fair is held. Pop. 23,900.

U-boat. Abbreviation of *Unterseeboot*, the German name for submarine. In both Great Wars such vessels had the prefix U, UA, UB, or UC, followed by a number. In the First Great War, the Germans had in service 810 submarines, of which 210 were lost in action or founded. The vessels ranged from 450 to 1,950 tons, and were responsible for sinking some 4,500 vessels totalling approx. 11,000,000 tons. A few cargo-carrying U-boats of 2,160 tons took freight to Germany from the U.S.A. until that country entered the war in 1917. Freight U-boats, of which the Deutschland was best known, had a range of 20,000 m. at a speed of 6 knots.

By the Versailles treaty, Germany was forbidden to construct U-boats, but between the wars kept abreast of submarine development by building in foreign countries. In 1935 she started at home and at the beginning of the Second Great War had 57 U-boats in service. By the end of the war 1,155 had been completed, the bulk of them by prefabrication. Of these, 778 were lost, approx. 500 being destroyed at sea by British and Imperial naval and air forces, and about 100 by R.A.F. attacks on U-boat pens and building yards. These craft ranged from 626 to 1,000 tons and destroyed 1,332 merchant ships totalling 7,596,645 tons. The fewer sinkings by U-boats in this war were due to institution of the Allied convoy

Paolo Uccello. The Rout of San Romano, a highly decorative battle-piece by this Florentine painter, now in the National Gallery, London

system at the outbreak of hostilities and the advance in anti-submarine measures. A few 1,600-ton U-boats acted as submarine supply ships and to carry freight between Germany and Japan. See Atlantic, Battle of; Navy; Second Great War; Submarine.

U-boat Pen. Shelter built by the Germans in the Second Great War to protect U-boats from air attack while in dock. Pens were constructed at most of the principal submarine bases in Germany and occupied Europe. Built of concrete reinforced with steel girders, they were 368 ft. long, 73 ft. wide, and 30 ft. high, and could each accommodate 10 ocean-going submarines or 30 smaller types. They were considered bomb-proof until Aug. 12, 1944, when those at Brest were penetrated by 12,000-lb. bombs dropped by the R.A.F. The Finkenwarder U-boat pens at Hamburg were destroyed by British occupation troops on Oct. 21, 1945.

Ucayali. River of Peru, S. America. The longest and greatest in volume of the main headstreams of the Amazon, it is formed by the union of the Apurimac and Urubamba, and flows N. to join the Marañón in the N.E. of Peru and form the Amazon. With the Apurimac the Ucayali has a length of 1,500 m. One source is at Lake Junin or Chinchaycocha, 100 m. N.E. from Lima. The Ucayali is a sluggish stream less than 1,000 ft. above sea level; the headstreams are over 10,000 ft. in elevation.

Uccello, PAOLO DI DONO (c. 1397-1475). Italian painter. Born in Florence, he was trained as a goldsmith, and became famous for his love of perspective. He assisted Ghiberti with the first of two doors for the Florentine baptistery, and after spending some time in Venice (where he

executed mosaics for the façade of S. Pietro), returned to his native city to carry out the equestrian fresco of Sir John Hawkwood in the cathedral. Other masterpieces were designs for the cathedral windows, and battle pieces for the Medici palace. One of his last works was an altarpiece for the confraternity of Corpus Christi at Urbino. Although few, the works of Uccello are of the highest importance in Florentine painting of the period. One of his three extant battle pieces is in the National Gallery, London; the others are in the Uffizi Gallery and the Louvre, the latter possessing also his portraits of Giotto, Donatello, Brunelleschi, and himself. *Pron.* Oochello.

Uckfield. Town of Sussex, England. It is about 9 m. N.E. of Lewes and 5 m. S. of Ashdown Forest on the main London-Eastbourne road, and has a rly. station. In the 17th century there was an ironfoundry industry, but trade now is in farm produce and implements. The church has a 15th century tower. Pop. 3,557.

Udaipur. City and former state of India, now part of Rajasthan, of which its ruler became maharajpramukh. The state, also known as Mewar, lies S. of Ajmer. The N. contains the wildest por-

tion of the Aravali Hills. Maize, bajra, gram, tobacco are grown; sheep and goats are reared. Area, 13,170 sq. m. Pop. 1,926,698.

The city is one of the most picturesque in India, with a granite and marble palace. It was founded in 1568, and contains the Jagannath temple (c. 1640), in the Indo-Aryan style. The Udaipur-Chitorgarh rly. was opened in 1898. Pop. 59,648.

Udall OR UVEDALE, JOHN (c. 1560-92). English Puritan. Educated at Christ's and Trinity Colleges, Cambridge, he became the incumbent at Kingston-upon-Thames, but was deprived in 1588 for writing tracts against the bishops. He then became a preacher at Newcastle, and in 1590 was tried unfairly and condemned to death for complicity in the Marprelate tracts. After two years in prison he was pardoned, but died immediately on release. In 1593 appeared his Hebrew Grammar and Dictionary.

Udall, NICHOLAS (1506-56). English schoolmaster and playwright. A native of Hampshire, he was educated at Winchester and Corpus Christi College, Oxford, and was a friend of John Leland. Successively headmaster of Eton, vicar of Braintree, prebendary of Windsor, rector of Calbourne, I.O.W., playwright to Queen Mary, and headmaster of Westminster, he wrote short plays for performance at court or by his scholars. Udall assisted in the translation of Erasmus's paraphrase of the N.T. and wrote Ralph Roister Doister, the earliest known English comedy, in rhyming doggerel. He was buried in S. Margaret's, Westminster.

Uddevalla. Seaport of Sweden. Situated 48 m. N. of Gothenburg, at the head of Byfjord, it is a rly. junction, and has a school of navigation. Sugar refineries, woodpulp mills, granite quarries, shipyards, and textile mills are found here. Pop. 21,437.

Udaipur, India. The Jagnewas palace, built on an island.

Udine. Prov. of Italy. It slopes from the Carnic Alps to the Gulf of Venice, and is drained by the Tagliamento and its tribs. Hemp, flax, silk, wine, and hides are the principal products. It lies in the fertile plain of Friuli (q.v.). Area 2,765 sq. m. Pop. 810,000.

Udine. City of Italy, capital of the prov. of Udine. It is 84 m. by rly. N.E. of Venice, on the Roja

Udine, Italy. Clock tower in the principal square, resembling that at Venice

Canal, and in the midst of a fertile, cultivated plain. The Romanesque cathedral, a fine archiepiscopal palace, the Palazzo Bartolini, with a museum of antiquities, and a large library are the chief buildings of interest. In the Second Great War the cathedral roof was burnt and the church of S. Francis gutted by bombs. Silks, velvets, leather, paper, and sugar are the principal products; flax and hemp the chief articles of trade. The city was the capital of Friuli in the 13th century, and passed to Venice in 1420. In the First Great War Udine was an important base of the Italian army on the Isonzo front. Captured by the Austrians, Oct. 29, 1917, it was reoccupied by the Italians, Nov. 3, 1918. Udine was entered May 1, 1945, by the British 6th armoured div. after the surrender of the Germans in Italy in the Second Great War. Pop. 63,098.

Ueberweg, FRIEDRICH (1826-71). German philosopher. Born at Leichlingen in the Rhineland, Jan. 22, 1826, he was educated at

the universities of Göttingen, Berlin, and Bonn, and after a period passed as a tutor in philosophy was made professor at Königsberg. He died June 9, 1871. Ueberweg was a representative of idealistic realism, according to which the contents of the perceptive faculty are subjective signs of real events. Perception is directed towards an objective outside itself, not towards the sensations, which we first refer to an object. His most important works are *System of Logic*, Eng. trans. 1871; *History of Philosophy*, Eng. trans. 1872.

Ufa. River of Russia. Rising in the Ural Mts. in the S. of the region of Sverdlovsk, it flows first N.W. and later S.W. into the Bashkiria A.S.S.R., and after a course of c. 500 m. joins the Bielaia 2 m. above the town of Ufa.

Ufa. Chief town of the Bashkiria autonomous republic, R.S.F.S.R. An industrial and manufacturing centre in the S.W. of the Ural region, it stands near the confluence of the Ufa and the Bielaia, and is a rly. junction. It is known to Russians as the second Baku because of its extensive production of oil, and its reserves in 1938 were estimated at 2,700 million tons. Its industries also include copper, smelting, rope-making, brewing, and fruit liqueur distilling. In 1574, when Kazan had fallen, the Russians advanced through the then Finnie-Bashkirian state and founded Ufa. Pop. 245,863. See Bashkir.

Uffington. Village of Berkshire, England. It lies at the foot of the downs, 4 m. S. of Faringdon, and has a rly. station on the main line to the West. It was the birthplace of Thomas Hughes, who described it in *Tom Brown's Schooldays*. The fine E.E. church has a set of 11 consecration crosses; but its spire was "beat down by a tempest" in 1740. Above Uffington rises White Horse Hill (856 ft.) with the oldest chalk figure of a white horse in England; near is Uffington Castle, an ancient earthwork. Pop. 453. See White Horse.

Uffizi Gallery. Art gallery in Florence. Designed originally by Giorgio Vasari as government offices (*uffizi*) for the dukes of Tuscany, and completed in 1574 under Duke Francesco I, it became the home of the Medici art treasures. Under succeeding Medici princes and the later house of Lorraine the collection was gradually enlarged. In 1860 it passed into the hands of the Italian

government. Among the world-famous masterpieces in the gallery are Botticelli's *Venus Rising from the Sea* and *Adoration of the Magi*, Sodoma's *S. Sebastian*, Filippino Lippi's *Adoration of the Magi*, Michelangelo's *Holy Family*, Fra Angelico's *Coronation of the Virgin*, Sebastiano del Piombo's *Fornarina*, and Titian's *Flora*. All the paintings were moved out of Florence during the Second Great War. The gallery was badly damaged throughout by blast from explosions during German demolitions. See Pitti Palace.

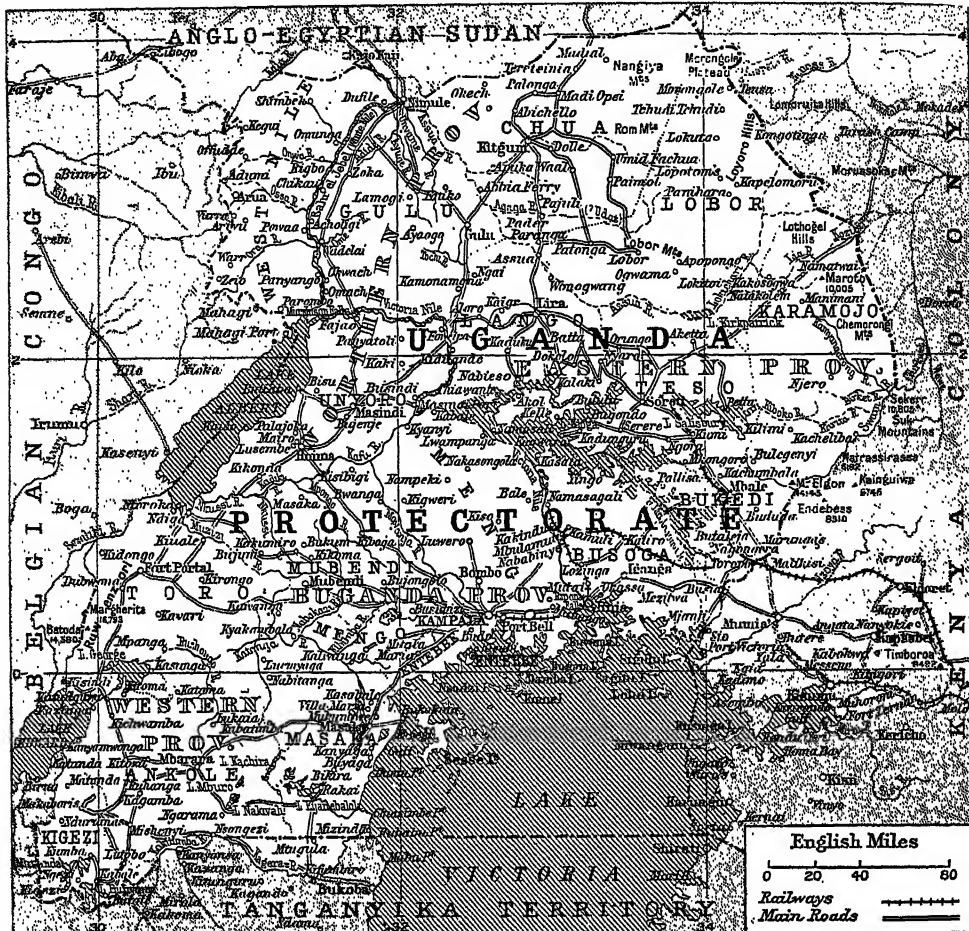

Uganda. British protectorate in Central Africa. It has frontiers with the Anglo-Egyptian Sudan, Kenya Colony, Tanganyika, and the Belgian Congo. Of its area of 93,981 sq. m., 13,680 sq. m. are water comprising parts of Lakes Victoria, Edward, and Albert, and the whole of Lakes George, Kioga, and Salisbury.

Uganda comprises the N. portion of the great African plateau between the two great African rift valleys and has an average elevation of 4,000 ft.; it drains almost entirely to the Mountain Nile (Bahr-el-Jebel). The Victoria Nile and the Kioga lake system occupy a central depression in the plateau.

There are mt. ranges in the S.W., culminating in the extinct volcano, Mt. Elgon, 14,097 ft.

The Ruwenzori range, rising to a height of 16,800 ft., consists of a non-volcanic chain of peaks extending for about 70 m. As the slopes at 9,000-12,000 ft. experience a rainfall of 200 ins. a yr., they are usually veiled in mist and cloud, and are covered by a luxurious rain forest with enormous specimens of giant groundsel, lobelia, and heather. Owing to the heavy snowfall and the protection by cloud from the equatorial sun, there are large glaciers which descend almost to the vegetation line. At Entebbe (3,860 ft.), on Lake Victoria, the monthly mean temps. in Jan. and July are 71° F. and 69° F. respectively; rainfall is greatest in spring, the April total being 10 ins. out of a yearly 58 ins.

The soil is fertile, but methods of cultivation have led to erosion. The chief crops are cotton, tobacco, rye, coffee, tea, groundnuts, and sugar, in addition to foods for native consumption, sweet potatoes, wheat, maize, millet, and bananas. Mineral production has not been on a large scale, but tin is mined, quartz, manganese, iron, copper, and phosphates are being developed. Nearly every African animal, bird, or reptile

Uganda. Map of the extensive British protectorate of Central Africa, traversed by the upper courses of the Nile

occurs within Uganda's bounds. Ivory was long its principal export.

Total population (1948 census) is 4,550,000 of whom some 30,000 are Asiatic, 3,000 European. The Africans are of many tribes, the largest group being the Buganda (from whom the protectorate is named), c. 1,000,000; pygmies live in the Semliki valley. The early history of Uganda is unknown, but from 1877 it was the scene of many inter-tribal wars. The English tried to establish order before April 1, 1894, by agreement with Germany; they established a protectorate, a step much criticised but highly successful in its results.

A British governor is assisted by an executive and a legislative council, three members of which must be Africans. Buganda, the most important prov., is under the direct rule of the Kabaka and his govt. and a native assembly. The natives own the land.

Entebbe is the administrative, and Kampala the chief commercial, centre. Near Kampala is Makerere university college, one of the chief educational institutes for natives in Africa. Primary education was in the hands of missionaries until 1925, since when it has received increasing support from the govt. The roads are excellent and there is rly. communication between Kampala and Mombasa, with branch lines serving the lakes, on which there are steamer services. For the hydro-electric scheme near the head of the Nile, designed to provide Uganda with power for industrial development, see Owen Falls Dam. See also Africa; East Africa, Conquest of.

Ugolino della Gherardesca (d. 1289). Italian soldier. Member of an ancient Pisan family, in 1274 he attempted to found a principality. On his failure he escaped to Florence, but eventually forced his entry into Pisa and established himself there. In 1288 he was overthrown and, together with his sons, Gaddo and Uguccione, and two nephews, was cast into prison and starved to death. The story is told by Dante in the *Inferno*, Canto 33.

Ugrian. Term denoting a subdivision of the yellow race. Derived from a regional or ethnic name on the Ural slopes, it may be limited to the Ostyak, Voguls, and Magyars, or may include the Samoyeds.

Uhlán (Turk. *oghlan*, a youth). Word used by the Tartars for a certain type of soldier. It was adopted

by the Poles for mounted men armed with the lance. Later the Prussians gave the name to regts. of cavalry, these being armed with the lance and used for scouting.

Uhländ, JOHANN LUDWIG (1787-1862). German poet. He was born April 26, 1787, at Tübingen, and studied law at the university there. In 1812 he received a legal appointment at Stuttgart, but resigned it after two or three years. He published *Poems* in 1815, and added many fresh pieces to the new editions which were constantly demanded. He wrote many excellent romantic ballads, and won a leading position among German lyrists. His ballad *The Luck of Edenhall* is familiar in Longfellow's translation. He was professor of literature at Tübingen, 1829-33, and in 1848 was a prominent Liberal member of the German National Assembly. His writings include, besides early plays, *Walther von der Vogelweide*, 1822; *On the Thor Myth*, 1836; *Old High and Low German Folk Songs*, 1844-45; *Writings on the History of Tradition and Legend*, 8 vols., 1865-73. Uhländ died at Tübingen, Nov. 13, 1862. His *Songs and Ballads* were translated by W. W. Skeat, 1864.

Ludwig Uhländ,
German poet
After Morff

Uigur or **UGHUR**. Ancient mounted nomads of Turkic stock in E. Turkistan. Reputed to be descended from the Hiungnu, they established a kingdom, under which Nestorian missionaries in the 7th century introduced their script, based upon primitive Aramaean, which the Mongols afterwards imitated. The Uigurs have been absorbed by the surrounding Mongols, Chinese, and Tartars.

Uinta. Range of mts. in the N.E. part of Utah, U.S.A. It connects the E. and W. ranges of the Rocky Mts. and reaches in Gilbert Peak an alt. of 13,688 ft. See *Rocky Mts.*

Uist, NORTH. Island of the Outer Hebrides, in the Scottish co. of Inverness. Lying S.W. of Harris, it is about 18 m. long and of average width about $\frac{1}{2}$ m. Its E. coast is indented by sea-lochs which almost divide the island into several islets. Eaval in the S.E. reaches 1,138 ft. At the head of Loch Maddy, a well protected natural harbour, stands Lochmaddy, the chief village. Notable

among ancient remains are those of the old church of the Holy Trinity at Carinish. Pop. approx. 3,200. *Pron.* Wist.

Uist, SOUTH. Island of the Outer Hebrides, in the Scottish co. of Inverness. It lies 7 m. S. of N. Uist, Benbecula being between the two. Its greatest length is 22 m. and greatest breadth 8 m. Flat in the N. and W., it is elsewhere mountainous, high points being Ben More (2,035 ft.) and Hecla (1,988 ft.). Lochboisdale, lying on a deep sea-loch to the S.E., is the chief place and has a pier. Small farming, crofting, and some sheep raising are carried on. Pop. approx. 4,800.

Uitenhage. Town and dist. of the Cape Province, South Africa. The town is 21 m. by rly. N.W. of Port Elizabeth, lying in the valley of the Zwartkops river. It is an agricultural centre, and on irrigated land there are large fruit and flower nurseries. Textile factories, rly. workshops, and wool-washing concerns give other employment. Uitenhage was founded in 1804. Pop. 26,267. *Pron.* approx. Out-en-ha-gha.

Uitlander (Dutch, foreigner). Term applied in the Transvaal during the 19th cent. to white men other than Boers. On the formation of the South African Republic, the burghers refused civil rights to all aliens. The word is sometimes translated into English as Outlander. See *Jameson Raid*; *South African War*; *Transvaal*.

Ujiji. Town and lake port of Tanganyika Territory. Formerly the terminus of the great caravan route to Lake Tanganyika, it is on the E. side of the lake, 4 m. S. of Kigoma, the terminus of the Tanganyika rly. It was an important slave centre, especially under Tippoo Tib. Ujiji was first visited by Burton and Speke in 1858, and here Stanley found Livingstone in 1871. Occupied by the Germans in 1900, it was captured by the Belgians in 1916, and handed over to the British in 1921. Pop. 25,000.

Ujjain. Town of Madhya Bharat, India, once capital of Gwalior state and of the ancient state of Malwa. It stands on the right bank of the river Sipra, 138 m. by rly. N.N.W. from Khandwa. It is surrounded by old walls with towers and contains Hindu temples, Mahomedan mosques, and, outside the walls, an old observatory from which the initial meridian of longitude of the Hindu astronomers was taken. Cotton spinning is carried on. The ruins of the ancient city lie 1 m. N. Pop. 72,729.

Ukase (Russ. *ukaz*, ordinance or edict). Edict issued by the Russian government. In pre-Revolution days a ukase emanated either from the tsar or from the senate. Whether legislative or administrative in import, it had the binding effect of law until annulled by a later ukase, and the collection of these edicts formerly made up the legal code of Russia. The term was revived by the Soviet authorities in 1938.

Ukraine. European republic of the U.S.S.R. Historically the land of the Little Russians, Ukrainians, or Ruthenes, it is said to be traceable as a state with its capital at the holy city of Kiev in the 9th century. This state passed under Lithuanian and Polish authority, and by the treaty of Andrusowo, 1667, that part E. of the Dnieper was ceded to Russia; which absorbed the rest in 1793 at the second partition of Poland. In 1917 a Ukrainian people's republic was founded; this was joined at the end of the First Great War by Austrian Ukraine (Galicia); and in 1920 a Soviet republic was proclaimed through the combined territory, recognized in the treaty of Riga by Russia and Poland. Throughout this period there was fierce and confused fighting between tsarist Russians, Bolsheviks, Germans, and Poles.

When on July 6, 1923, the constitution of the U.S.S.R. was adopted, Ukraine became the second largest republic in the union (later exceeded in area by Kazakh S.S.R.). A western portion which had been conquered by Poland in 1919-20 was regained by the U.S.S.R. in Sept., 1939, and incorporated on Nov. 1. In 1940 Rumania ceded N. Bukovina and her Bessarabian provs., confirmed in the peace treaty of 1947; and in 1945 the parts of Ruthenia formerly within Czecho-Slovakia and Poland were taken over, the Rumanian portion in 1947. Distribution of these territories between Ukraine and Moldavia S.S.R. (the second had been until 1940 a dependency of the first), was left to these two republics. In 1946 Ukraine covered about 225,000 sq. m. and its pop. was close on 40 millions.

The republic is bounded S. by the Sea of Azov and Black Sea; S.W. by Moldavia S.S.R., Rumania, Hungary, and Czecho-Slovakia; W. by Poland; N. by White Russia S.S.R.; E. by the R.S.F.S.R. Its great river is the Dnieper, others being the Bug,

Donetz, and Dniester. There were 25 regions or provinces in 1946. Kiev is the capital, and like Kharkov had more than 800,000 inhabitants in 1939, when they were the third and fourth cities of Russia. Odessa and Dnepropetrovsk claim more than half a million each.

In both agriculture and industry Ukraine is outstanding. In view of the devastation brought about by invaders and defenders alike in the Second Great War (see Russo-German Campaigns), post-war figures of production are misleading. But some of the richest land in Europe yields wheat, rye, barley, oats, buckwheat, sugar-beet, potatoes, cotton, and flax; before the war nine-tenths of Russia's exported cereals came from Ukraine. More than half the cultivated land is arable, collective farms being nearly ten times as numerous as state farms. Horses, cattle, sheep, pigs, and goats are reared. Forests cover 13,000 sq. m.

Half Russia's reserves of bituminous and anthracite coal are in the Donetz basin, and this coal combined with iron ore from around Krivoi Rog has given rise to a vast industry in steel, pig-iron, and foundry and furnace products. Manganese, aluminium, oil, salt, and gypsum occur. Chemicals and machinery are made. Hydro-electric installations on the Dnieper serve thousands of communities. There are 9,000 m. of rlys.

Kharkov, Kiev, Odessa, and Uzhgorod (Ungvar) have universities, and there are training colleges and schools for those who speak Ukrainian, Moldavian, Polish, and Yiddish, as well as Russian. Greek Orthodox and R.C. churches attract the biggest congregations. It is claimed that Russian literature of the 11th-13th centuries was Ukrainian, and certainly there was a nationalist school of writers by the 16th century. Later names are Ivan Kotlyarevsky (1769-1838) and Taras Shevchenko (1814-61). Karol Szymanowski (1883-1937) is the principal Ukrainian composer, though regarded as a Polish artist. See Dnieper; Dnieper Dam; Dniester; Donetz Basin; Galicia; Kharkov; Kiev; Russia; Ruthenia.

Bibliography. U. and Its People, H. P. Vowles, 1939; The U.: a History, W. E. D. Allen, 1940; The U.: a Russian Land, P. Brégy and S. Obolensky, 1940; The Ukraine, W. H. Chamberlin, 1945.

Ukulele or **UKELELE**. Musical instrument of the guitar family. It has a long finger board and four strings which are plucked in chords to provide a simple tinkling accompaniment to popular songs. Originating in Portugal, it entered the world of popular entertainment in the U.S.A. by way of the dance band and vaudeville, in the early 20th century after the banjo had outworn its first welcome; and was later adopted as a solo instrument by occasional music-hall artists in America and Great Britain, besides having a certain vogue among amateur performers.

Ukulele. Musical instrument of Portuguese origin

occasional music-hall artists in America and Great Britain, besides having a certain vogue among amateur performers.

Ulan Bator or **URGA**. Chief town of Outer Mongolia, China. It is about 730 m. N.W. of Peiping and 170 m. S. of Kyakhta in the U.S.S.R., and stands on a tributary of the Tola. There is considerable trade in the products of cattle, sheep, and horses. A holy city, Ulan Bator is the residence of the Jetsun Dampa Hutuktu, who ranks as third Buddha in the Lamaist hierarchy. Hither the Dalai Lama withdrew from Tibet

Ulan Ude or **VERKHNE UDINSK**. Chief town of the Buriat-Mongol (q.v.) republic, U.S.S.R. It stands S.E. of Lake Baikal and is connected by the Trans-Siberian rly. with Irkutsk, about 160 m. direct W. on the other side of the lake.

Ulcer. Breach on the surface of the skin or mucous membrane which does not tend to heal quickly. It discharges its contents quickly, whereas an abscess does not. An ulcer may be due to a simple localised infection, or to constitutional disease such as syphilis or tuberculosis, or may arise in the course of malignant disease, or may be due to sluggishness of the circulation in the veins. Chronic ulcers require local treatment. Rest is not always prescribed. See Duodenum; Gastric Ulcer.

Uleåborg. Swedish name for the district and seaport of Finland, called in Finnish Oulu (q.v.).

Ulex. Small genus of spiny shrubs of the family Leguminosae. They are natives of W. Europe and N.W. Africa. As seedlings they have a few normal leaves divided into three leaflets; but later leaves are all metamorphosed into needle-pointed spines. The larger spines are aborted shoots, as many show by bearing flowers. See Furze.

Uliasutai. Town of Outer Mongolia, China. It stands S. of the Khangai range, at the junction of

Ullswater. A pleasure steamer arriving at Pooley Bridge on this lake of Cumberland and Westmorland. See facing page

after the Younghusband expedition. The Hutuktu proclaimed his independence of China when the republic was set up in 1911, but in 1915 he accepted autonomy in recognition of Chinese suzerainty. A Mongol burial ground probably of the 2nd cent. B.C. was unearthed in 1925. In the Mongol quarter live several thousand monks; the Chinese town is a few miles away. There is a university with 600 students and a partly Russian teaching staff. Pop. approx. 100,000.

the Uliasutai and Bogdo rivers, this site making it a mart and the centre of a trade in cattle.

Ullage. That part of the volume of a vessel not filled with liquid. Measurement of the contents of a calibrated tank may be made directly by finding the depth of liquid (dipping) or indirectly by finding the amount of free space (ullaging) and subtracting this from the capacity of the tank. Ullaging is usual in rail cars, tankers, and wherever obstructions

make dipping impossible. The reference point from which the depth to the top of the liquid is measured must be rigidly fixed.

Ullapool. Town of Ross and Cromarty, Scotland. Established in 1788 by the British Fisheries Association, it is 36 m. N.W. of Dingwall, and has a good harbour on Loch Broom and several attractive whitewashed houses. The district attracts geologists, anglers, and holiday-makers.

Ullswater. Lake in the counties of Cumberland and Westmorland, England. Lying 4 m. S.W. of Penrith, this is the second largest of the English lakes, with a total length of 7½ m., average width of ½ m., and depth of 477 ft. The lake is divided into three reaches, of which the southern is set in some of the most beautiful of the Lake scenery. See Lake District.

Ullswater, JAMES WILLIAM LOWTHER, 1ST VISCOUNT (1855-1949). British politician. Born

1st Viscount
Ullswater,
British politician

April 1, 1855, he went to Eton and Trinity College, Cambridge. Entering politics in 1883 as Conservative M.P. for Rutland, he represented Penrith continuously from 1886,

and was Speaker of the house of commons from 1905, until raised to the peerage in 1921. Lowther was one of the most distinguished of all Speakers, acquitting himself with dignity during the suffragette period. He presided over the electoral reform conference of 1916, the committee on proportional representation 1918, and the lords and commons committee on electoral reform 1929. He wrote *A Speaker's Commentaries*, 1925. Dying March 27, 1949, he was succeeded by his great-grandson Nicholas (b. 1942).

Ulm. Town of Germany, in Württemberg-Baden. At the confluence of the Iller and the Blau with the Danube, 46 m. direct and 58 m. by rly. S.E. of Stuttgart, it is joined with New Ulm in Bavaria by two bridges across the Danube, which here becomes navigable. During the Second Great War, before it was captured by the U.S. 7th and French 1st armies on April 24, 1945, it was destroyed by heavy Allied bombing except for the Protestant cathedral, founded in 1377, which, however, was badly

Ulm, Germany. Approach to the 14th century Gothic cathedral, as it was seen by U.S. troops, after the capture of the town in 1945

damaged. Famous for its great size and its high tower, which, finished in 1890 with other work of restoration, is at 528 ft. the loftiest ecclesiastical structure in Europe, it had fine stained glass and carving. The 16th century town hall had remains of ancient frescoes. Brass-founding, bleaching, brewing, and leather working were long established industries; and hats, wire rope, cement, and paints were made. A town since 1027 and later the chief place in Swabia, Ulm was a free imperial city in the 14th and 15th cents., was annexed to Bavaria in 1803, and to Württemberg in 1809. After the Second Great War it fell in the U.S. zone of occupation. Pop. 64,000.

Ulm, CAMPAIGN OF. French success over the Austrians in 1805. The adhesion of Francis I to the third coalition involved Napoleon in war with Austria simultaneously with England and Russia. The Austrian forces under Mack, instead of awaiting the arrival of the Russians, had taken up a position between Ulm and Memmingen, and in Sept. Napoleon formed the plan of cutting Mack off from his allies and Vienna. To this end he passed all his armies, aggregating 190,000 men, swiftly through Hanover and the smaller German states, and reached the Danube in rear of Mack, who was taken by surprise. Napoleon succeeded in hemming in Mack with

60,000 men at Ulm, the investment being completed on Oct. 14 and the surrender on Oct. 20—one day before Trafalgar.

Ulmaceae. Botanical name for the elm family, which contains trees and shrubs, natives chiefly of the northern regions. They have rough, alternate leaves, and greenish flowers in loose clusters. The family is divided into two suborders, Celtideae and Ulmeae. The former includes the genus *Celtis*, containing the nettle tree (*q.v.*), the latter *Ulmus* and *Planera* or Water Elm. The elms are mostly very large trees with rough bark; the timber is esteemed for its resistance to the action of water. The inner bark of the European *U. campestris* has tonic and diuretic properties, and is used as a medicine for skin diseases; that of the N. American *U. fulva* is used as a demulcent, internally and externally. When ground it makes a poultice similar to linseed-meal.

Ulna. Internal of the two long bones of the forearm. In its upper part it articulates with the humerus, or bone of the upper arm, and radius, or outer bone of the forearm. In the lower part it articulates with the radius and with a fibro-cartilage which separates it from the wrist-joint. The upper part terminates in a projection known as the olecranon, which forms the point of the elbow. The curved surface which articulates with the humerus is known as the great sigmoid cavity, terminating above in the olecranon and below in a projection, the coronoid process. On the outer side of the base of the coronoid process is the small sigmoid cavity which receives the head of the radius.

Ulnar Nerve. One of the main nerves of the arm. It arises from the brachial plexus in the outer wall of the armpit, and passes down on the inner side of the arm, being felt as the "funny bone" just inside the internal condyle of the humerus. The nerve terminates below the wrist, where it divides into numerous branches for the supply of the skin and muscles of the hand.

Ulphilas OR WULFILA (c. 311-383). Gothic evangelist and translator. Said to have been the son of Cappadocian captives, he was born in Gothic territory N. of the Danube and was sent as a youth to Constantinople, where he learnt Latin and Greek. Early in life he became a lector or reader of the Scriptures, and in 341 he was consecrated bishop of the West Goths by Eusebius of Nicomedia. For

Ulster. Map of the ancient northern province of Ireland, within which are the Six Counties forming Northern Ireland

seven years he laboured successfully as a missionary N. of the Danube, preaching the Arian doctrines, to which he adhered all his life. In 348 a persecution of the Christians compelled him to migrate with his flock, and with the consent of the Emperor Constantine they settled in Lower Moesia, near Nikopolis. Here Ulphilas continued his work as missionary for 33 years.

His translation of the Bible, of which there are extant large portions of the four Gospels, the whole of S. Paul's second Epistle to the Corinthians, and fragments of other books, is almost the only written document of the Gothic language, and the oldest existing work in a Teutonic tongue. It is contained in six different manuscripts all dating from the first half of the 6th century, of which the most important is the Codex Argenteus, preserved in the library of the university of Uppsala.

Ulster. Most N. of the four historic provs. of Ireland. It consisted of the cos. of Donegal, Londonderry, Antrim, Tyrone, Cavan, Fermanagh, Monaghan, Armagh, and Down; area, 8,613 sq. m. Six Ulster counties, i.e. all save Donegal, Cavan, and Monaghan, form the country known since 1920 as Northern Ireland, which, as a partly self-governing unit within the U.K., is described separately in this work.

The early history of the province of Ulster is largely one of tribal wars, but it appears to have been a kingdom, and in the 12th century was conquered by the English. It

was divided into shires about 1580, and its plantation by English and Scottish settlers was promoted under Elizabeth and James I. Afterwards land was given to many of Cromwell's soldiers, and in these ways a large number of Scottish and English settlers were introduced. The largest city is Belfast. Much flax is grown, and the making of linen is a staple industry. The area around Belfast is industrial; agriculture is followed in other parts of the prov.

Early in the 12th century the English king created an earldom of Ulster. This was held by the family of Lacy, and later by that of de Burgh, from whom it passed by marriage to Lionel, duke of Clarence.

The presence in Ulster of two distinct races, the Irish and the descendants of settlers from Scotland and England, together with religious antagonisms, presented a formidable difficulty when the demand for Irish home rule became insistent. Details of the events arising from these difficulties will be found under Ireland. Each of the cos. making up the province is described separately.

Ulster Constabulary, ROYAL. Irish police force. On the establishment of the govt. of Northern Ireland (q.v.) in 1921, the Royal Irish Constabulary (which had been formed in 1867) was disbanded, and the R.U.C. formed to police the six northern counties, many former members of the R.I.C. agreeing to serve as a nucleus. Chief of the force—which totals some 2,900—is an inspector-

general under whom are a deputy inspector-general, a commissioner of police in charge of the force in Belfast, and six county inspectors. The h.q. is in Belfast. The counties are sub-divided into districts, each with a district inspector, and into sub-districts each with a sergeant. Police barracks in each sub-district provide living accommodation for single men. See Police.

Ulster King of Arms. Chief heraldic officer, 1552-1943, in Ireland. The office, instituted by Edward VI in substitution for the dignity of Ireland king of arms instituted by Richard II, was terminated March 31, 1943. Its functions in Eire were taken over by the Irish Genealogical Office, Dublin Castle, and in N. Ireland by Norroy and Ulster king of arms.

Ulster Rifles, ROYAL. Regiment of the British army. Raised in 1793 as the 83rd and 86th Foot, the regiment was

Royal Ulster Rifles badge

recruited mainly from N. Ireland, and was drafted to the W. Indies, where it won its first battle honour, San Domingo. In 1801 it was with Abercromby at the capture of Cairo; next it served in the Second Maharratta War in India, and was at the capture of the Cape of Good Hope, 1806. From Africa the regiment moved to Spain, where it joined the Light division and gained 12 honours in the Peninsular War. During the Indian Mutiny, 1857, the 2nd battalion particularly distinguished itself.

In 1881 the 83rd and 86th Foot became the 1st and 2nd battalions of the Royal Irish Rifles, and as such served throughout the S. African War. Twenty-two battalions were raised in the First Great War and gained the battle honours: Mons; Marne, 1914; Ypres, 1914, '15, '17, '18; Neuve Chapelle; Somme, 1916, '18; Albert, 1916; Courtrai; Struma; Suva; Jerusalem. The regiment provided the nine infantry battalions of the Ulster division. After the formation of the Irish Free State in 1922 the unit took its present title. In the Second Great War it became lorry-borne infantry, battalions serving in all the major campaigns. The regimental depot is at Omagh, Tyrone.

Ultima Thule. Term signifying the extreme limit. See Thule.

Ultimatum (Lat. *ulimus*, last). Final terms or conditions presented after inconclusive negotia-

tions by one party in a dispute to another, usually with a time-limit for acceptance or rejection. An ultimatum may be given in order to put an end to delaying tactics on the part of an opponent, or may offer terms impossible of acceptance, and so lead to war. The entries of various belligerents into both Great Wars followed a series of ultimatums.

Ultor (Lat., avenger). In Roman mythology, an epithet of Mars, the god of war. The temple built at Rome by Augustus after the defeat of Caesar's murderers was dedicated to Mars Ultor.

Ultrabasic Rocks. In geology, a classification group of igneous rocks which are poor in silica and alkali content, but rich in magnesia, lime, and iron oxides. They include types like peridotite, serpentine, and dunite, which are characterised by such minerals as olivine, pyroxene, amphibole, etc., to the exclusion of quartz and feldspars. Chromite, iron, platinum, and diamonds are locally associated with these rocks. See Igneous Rocks; Rock.

Ultra-Centrifuge. Device for separating particles of different sizes or densities, or the constituents of mixtures of gases or liquids with different densities. The system under test is contained within a cylinder rotated at a high speed, e.g. by compressed air, and centrifugal force will tend to cause the more dense particles to move outwards. The device has been used with some success to separate isotopes.

Ultra-High Frequency. Term which refers to electro-magnetic radiation of the order of 1,000 Mc/s., i.e. 10^8 cycles per sec., when the wavelength will be in the centimetre region.

Ultramarine (Lat. *ultra*, beyond; *mare*, sea). Blue pigment originally obtained by grinding up lapis lazuli. This method made cost of the pigment very high, and it is now artificially prepared by heating together clay, sodium carbonate, and sulphur. It was first produced commercially in 1828. Exact composition of the native mineral is not known.

Ultra-Microscope. Device for viewing small particles which are not visible under the ordinary microscope. A powerful beam of light is focused in the liquid under examination, and any suspended particles present will appear as bright points, acting as scattering elements to the light. This phenomenon is known as the Tyndall effect.

Ultramontane (Lat. *ultra*, beyond; *montanus*, pertaining to mountains). In general, term applicable to things on the farther side of mts., and in practice referring to the Alps; it is thus a term relative to the geographical position of those using it. In common usage Ultramontane designates that element in the R.C. Church which lays special stress on the absolute supremacy of the pope in matters of faith and ecclesiastical discipline, opposing the idea of national churches, such as the Gallican, which are conceived as partially independent of the Holy See. The term became familiar to the British public at the time of the Vatican council, 1869-1870, when controversy arose between Gladstone and Manning on the subject of papal authority. The extreme ultramontane view, which would have extended infallibility even to the utterances of the pope as a private individual, was rejected by that council. In 19th century France, Germany, and Austria the Ultramontanes formed strong groups in party politics. See Kulturkampf; Vatican Council.

Ultrasonics. Branch of physics concerned with the generation and effects of waves of a special class. These waves are propagated in air, liquids, and solids; they differ from ordinary sound waves in having frequencies too high for the human ear. Their range of frequencies extends from 20,000 to 2,000,000 cycles per sec. They are not electro-magnetic waves, but are made up of successive compressions and rarefactions; their speed in air is like that of sound.

Methods of generating such waves include one using the piezo-electric crystal driven by a valve oscillator; another working on the magnetostriction principle. In the piezo-electric generator very high frequencies can be reached, but the power available is comparatively small. The magnetostriction method is more promising. It permits a relatively high power output to be obtained, but the frequency range is very limited and the generator becomes very hot. Many physicists hold that neither of these methods can be developed sufficiently to exploit ultrasonic waves to the full. Other methods have therefore been investigated.

Ultrasonic waves can be used for many purposes. Results obtained in the dairy industry show that ultrasonic treatment is one of the most effective methods of milk

sterilisation. No other method kills all bacteria, and most have some effect on the quality of the milk.

Another application is the testing of such things as castings or aeroplane propellers for internal defects. In the past it was necessary to break up a percentage of each batch made. This was expensive and not conclusive, for there might always be faults in those not tested. X-ray examination was a step forward, since it allowed every article to be examined without the need to destroy any. The apparatus is, however, costly and not easy to use. Ultrasonics provide a much cheaper and simpler, but equally effective means, which works similarly to radar. A pulse of ultrasonic vibrations is sent through the article and is normally reflected back from the far side to a receiver. The time which the pulse should take for its double journey through the material is readily calculated. If there is a hidden flaw the pulse is reflected back from this, and makes the journey more quickly. Similarly hidden faults in the concrete runways of aerodromes, or those ahead of the working face in mines can be detected. A further advance, also on radar lines, is the focusing of ultrasonic waves into a beam by a parabolic reflector. In this way a short range navigating device has been evolved.

Ultrasonic waves applied to liquids have thrown new light on molecular structure. At some frequencies the phenomenon of cavitation has been observed. Remarkable results have also been achieved in the removal of dirt from fabrics. Without the use of soap, fabrics impregnated with dirt are thoroughly cleaned by immersing them in hot water agitated by ultrasonic vibrations. The particles of dirt are literally shaken out of the material, though if the frequency is too high the material itself may be shaken to pieces.

Ultra-Violet Radiation. Term applied to light radiations of a wavelength shorter than those of the visible range of the spectrum. In Ångström units (Å) they range approximately from 3,900 Å, the limit of visible light at the violet end of the spectrum, to 1,000 Å, the beginning of the X-rays. Ultra-violet rays obey the same laws of reflection, refraction, etc., as does ordinary light, and can be focused by a concave mirror or a lens. The whole range affects photographic plates, and the ultra-violet part of the solar spectrum

has beneficial and tanning effects on the skin, though this is probably due to a very small range of wavelengths. Such rays may be artificially produced by mercury vapour lamps and tungsten arcs. Ultra-violet radiation has been used to restore to pasteurised milk the vitamin A destroyed by the process of pasteurisation. See Ray Therapy.

Ultra Vires (Lat., beyond the powers). Legal phrase used in connexion with the law of corporations. In Great Britain and the U.S.A. all corporations (this word includes limited companies) are constituted by a document—for a limited company the memorandum of association—which defines its powers. A corporation has only the powers actually set out in this document, and any powers necessarily incident thereto. If the directors of a corporation do, in the corporation's name, any act, or enter into any contract not within these powers, they are acting *ultra vires*, and the corporation is not bound thereby.

Ulundi. Village of Zululand, S. Africa, now in Natal. It is 115 m. N. of Durban, and was the headquarters of Cetwayo and other Zulu kings, the word meaning high place. Here on July 4, 1879, the Zulus were decisively defeated by a British force under Lord Chelmsford. The force, consisting of about 4,200 Europeans and 1,000 natives, received the attack of about 20,000 Zulus. Met with a tremendous fusillade, the enemy eventually broke in confusion. The Zulus lost 1,500, the British casualties being about 100.

Ulverston. Urban district, market town, and administrative centre of the Furness district of Lancashire, England. Situated on Morecambe Bay, near the mouth of the Leven, 26 m. N.W. of Lancaster, it has a rly. station. The parish church of S. Mary was founded early in the 12th century, but the present structure is of Tudor date. The town makes clothing, chemicals, electrical accessories, and has tanning and light engineering works. Before the rise of Barrow it was the chief town in Furness, its fair and market dating from the 13th century. Market day, Thurs. Pop. 26,910.

Ulyanov. Surname of the Bolshevik leader who rose to fame as Lenin (*q.v.*).

Ulyanovsk. A town of the R.S.F.S.R., in the region of the same name. Formerly Simbirsk, birthplace of Lenin, whose real name was Ulyanov, it was renamed

in his honour. It is built on a hill, alt. 560 ft., on the right bank of the Volga; lies 110 m. S. by W. of Kazan; and has rly. communication with Ufa. Impressive buildings are the cathedral dedicated to S. Nicolas in 1712, and the convent of the Redeemer, 1648 (the year of the town's foundation). Ulyanovsk trades in grain and potash, engages in river fishing, and has saw-mills, brickyards and distilleries. Pop. of town, 102,106.

Ulysses. Latin form of the name of the Greek adventurer Odysseus (*q.v.*). He is equally familiar in this form in English literature. He appears as a leading character in Shakespeare's *Troilus and Cressida*, and gives the title to a poetic drama by Stephen Phillips, produced in 1902 at His Majesty's Theatre, London, and to a fine poem by Tennyson in which the wanderer is speaking as an old man. James Joyce's book is separately noticed.

Ulysses. Novel by James Joyce (*q.v.*). It has been described as the revelation of all life in a single day. The action covers the period from early morning of June 16 to about 3 a.m. of June 17, 1904. Into this is packed a picture of the variegated Dublin life which serves as a background for the chief characters, the poet Stephen Dedalus, and Leopold Bloom, an Irish Jew. The construction is based on the *Odyssey* of Homer. The partly autobiographical figure of Dedalus (Telemachus) represents the fatherless son, whereas Bloom (Ulysses) stands for the sonless father. Begun before the First Great War and completed 1920, the book was published in Paris and London, 1922. Its frankness and free use of obscene words caused it to remain unprinted for many years in Great Britain and the U.S.A., but it appeared in unexpurgated form in 1934. Of 732 pages, *Ulysses* is the supreme example of the "stream of consciousness" style of writing, and had a profound effect upon contemporary British, French, and American writers. Consult *Ulysses*, S. Gilbert, 1930; *Fabulous Voyager*, R. M. Kain, 1947.

Uma. In Hindu mythology, one of the names under which the wife of Siva is worshipped. See *Devi*.

Uman. Town of Ukraine S.S.R. It is in the region of Kiev and about 115 m. S. of that city, being on a tributary of the Bug, and the terminus of a branch rly. Pop. approx. 50,000.

Umballa. Another spelling of Ambala (*q.v.*), in Punjab, India.

Umbel (Lat. *umbella*, a screen). Form of inflorescence in which all the footstalks of a cluster of flowers radiate from a common point at the top of the flower stem. See *Coriander*; *Inflorescence*; *Sanicle*.

Umbelliferae. An extensive family of herbs. Chiefly natives of Europe, N. and W. Asia, N. Africa, and N. America, they have jointed stems, the lengths between the nodes being usually hollow. The alternate leaves are occasionally undivided, but mostly much dissected, the leaf-stalk dilated at the base and clasping the stem. The flowers are small, usually white, but some species are yellow, pink, or blue; they are associated in umbels and these often form compound umbels. The fruit consists of two flattened carpels which have five or nine ridges on their outer face, and are often traversed by canals filled with pungent oils, which cause many species to be useful in medicine, cookery, etc. Some species are poisonous, e.g. hemlock (*Conium*), cowbane (*Cicuta*), and waterdropwort (*Oenanthe*).

Umbra (Lat. *umbra*, shadow). Mineral pigment, a hydrated ferric and manganese oxide mixed with variable proportions of earthy matter. It is brown in colour, and is found in Cyprus and other localities. The pigment is used both raw and burnt or calcined. In the latter form it has a redder, warmer colour than the former.

Umberto. For the two kings of Italy who bore this name see under *Humbert*.

Umbilical Cord (Lat. *umbilicus*, navel). Cord, containing two arteries and a vein, which unites the infant in the womb with the placenta or mass of tissue adherent to the womb. The embryo absorbs fluids and nutriment from the mother's blood, borne to and from the placenta by the vessels of the umbilical cord.

Umbra (Lat., shadow). In astronomy, word used in two senses: (1) The darkest portion of the

shadow cast by the earth on the moon or the moon on the earth. It is surrounded by the penumbra. (2) Dark central region of a sunspot.

Umbrella (Lat. *umbra*, shade). Instrument carried for protection against rain or sun; when used for the latter purpose it is commonly termed a sunshade or parasol. It is made of silk, cotton, paper, etc., stretched on a steel or wooden radiating, folding frame, supported on a rod. Umbrellas were known

in England in the 17th century, but their use does not appear to have been general until the latter part of the 18th century. Jonas Hanway (*q.v.*) was one of the first to make a habit of carrying one. By the invention of the "Paragon" ribs, Samuel Fox in 1852 improved upon the old umbrellas with wooden ribs, and did much to stimulate the trade of umbrella making, important centres of which are London, Manchester, Paris, Lyons, and Angers.

In the East, umbrellas were used as symbols of royalty and power from early times. In ancient Egypt and Nineveh sculptured remains show them carried in procession, and they are found pictured on Greek vases. Anglo-Saxon MSS. show them carried by attendants over persons of rank. The Mahratta princes of India were known as Lords of the Umbrella, and in Burma white umbrellas were reserved for the use of the king and the sacred white elephant; coloured ones, graduated according to their tint, belonged to corresponding grades in rank.

Umbrella Tree (*Magnolia tripetala*). Small tree of the family Magnoliaceae, native of N. America. Its oval-lance-shaped leaves are one to two ft. long, crowded at the summit of the flowering branches in an umbrella-like circle. The large white flowers are slightly scented.

Umbria. A region of central Italy. Covering the provs. of Perugia and Terni, it has an area of 3,271 sq. m., and pop. est. 780,000. Medieval castles and bridges abound, Umbria losing less than any other of the Italian depts. fought over in the Second Great War. Ancient Umbria extended more to the E. than the modern prov., and touched the Adriatic

Umbrella of 750 B.C., from an Assyrian bas-relief. Top, Nigerian state umbrella

coast. The people were akin to the Oscans and Latins. They were defeated by Rome in 308 B.C., and finally conquered at the battle of Sentinum in 295 B.C. See Eugubine Tables; Foligno; Perugia; Rome; Terni.

Umea. River and port of N. Sweden. The river rises in the

Kjölen Mts. and flows through several lake expansions S.E. to the Gulf of Bothnia after a course of about 250 m. The small port of Umeå, capital of the co. of Vesterbotten, is 12 m. from the mouth of the river. It is on a branch rly., and exports timber, wood-pulp, and tar. Pop. 14,092.

Umlaut (Ger. *um*, round; *laut*, sound). Term invented by the German philologist, J. Grimm, for the modification, especially characteristic of the Teutonic family, of an accented vowel by the vowel *i* or semi-vowel *j*, which originally stood in the succeeding syllable. It is expressed in German writing and print by the symbol " (commonly called an *umlaut*) above the vowel of the affected syllable or by the insertion after that vowel of the vowel *e*. Examples are Ger. *Männer*, *Mäuse* (pl. of *Mann*, *Maus*) and English men, mice. See Philology. *Pron.* oomlowt.

Umpire. Person appointed to arbitrate or decide between two opposing parties. If several arbitrators disagree, an umpire is called in to settle the dispute. The term is used in various sports, notably in cricket. A cricket match requires two umpires not appointed by the teams, one standing at the wicket at the bowler's end, the other being square to the striker. The word was originally *nompere*, the change being similar to that in *apron* (*q.v.*). It is derived from Old Fr. *non*, not; and *per*, peer, equal. See Arbitration; Referee.

Umtali. Mining and agricultural centre in the British portion of Manicaland, S. Rhodesia. It is 171 m. by rly. S.E. of Salisbury. Here are the workshops of the Beira-Mashonaland rly. Gold, silver, lead, and copper are mined. With a magnificent climate and situation, alt. 3,750 ft., Umtali grows cereals and tobacco. There are European and native hospitals. Pop. (white) 3,300.

Una. Heroine of the first book of Spenser's Faerie Queene. She is the personification of truth, and having sought at the court of Gloriana (Queen Elizabeth) a champion to slay the dragon which keeps her parents prisoner, secures the aid of the Red Cross Knight. They set forth together, but get separated by the magic of Archimago, after which Una for a time is accompanied by a lion. See Faerie Queene.

Unalaska. Second in size and chief in importance of the Aleutian Islands (*q.v.*), Alaska. A mountainous and barren island, it measures about 76 m. in length and varies in breadth from 10 m. to 24 m. It has deeply indented coasts and contains the volcano of Makushin, 5,635 ft. high. Iliuliuk or Unalaska, a port of entry on the N. coast, is the chief settlement. Here also is the U.S. naval base, Dutch Harbour.

Unanimism. French literary movement initiated in 1909 by Jules Romains (*q.v.*). It advocated world brotherhood, under the influence of Whitman and Verhaeren. The central doctrine of the *Unanimes* was the subordination to the group of the individual, whose true development was held to lie in merging his own with the larger interest. In its socialistic tendencies the movement was opposed to traditionalism; in its clarity and directness, it was a reaction against symbolism. Blank verse was the chosen medium. Georges Duhamel (*q.v.*) was one of the early Unanimes.

Unao. District and town of the Uttar union, India, in the Lucknow division. The dist. is separated from that of Cawnpore by the Ganges and adjoins the Lucknow dist. on the N.E. The annual rainfall is 35 ins. Wheat, barley, and sugar-cane are the chief crops. The town, a rly. and road junction between Cawnpore and Lucknow, contains many Hindu temples and mosques. Area, 1,762 sq. m. Pop., dist., 959,542; town, 12,700.

Uncial (Lat. *uncia*, an inch). Ancient style of writing in capital letters. Derived from an expression of S. Jerome's, the term denotes the rounder and less regular

characters resulting from the adaptation of stone-incised capitals to vellum writing. See Alphabet; Capitals; Palaeography.

Unconformity. Diagram 1. Angular unconformity. 2. Erosional unconformity. a, older beds which have been eroded; b, surface of unconformity; c, younger beds

Uncle Remus. Book by the American writer Joel Chandler Harris (*q.v.*), consisting of stories about Br'er Rabbit and Br'er Fox, as related by an imaginary negro, Uncle Remus. Harris himself came to be called by the same name.

Uncle Sam. Nickname used to personify the government or people of the U.S.A. It appears to have arisen in the war against Great Britain, 1812-14, and may have been a jocular misinterpretation of the letters U.S. See Brother Jonathan.

Uncle Toby. Character in Sterne's *Tristram Shandy* (*q.v.*). Uncle of the narrator of the story, and the embodiment of simple, kindly common sense, he is an old soldier, fond of fighting his battles over again. His favourite tune was Lilliburlero, which he whistled under his breath in moments of stress.

Uncle Tom's Cabin. Story dealing with slavery in America by Harriet Beecher Stowe (*q.v.*). After appearing serially in the anti-slavery journal, *The National Era*, the story was published in vol. form in 1852, and had extraordinary success. Although the book occupies an important position in the history of the abolitionist movement, it has little literary value, the characterisation being crude and the style undistinguished. Besides Uncle Tom the characters include the slave-driver Legree and the white girl Eva, with her slave attendant Topsy.

Uncommercial Traveller. THE. Miscellaneous descriptive papers and sketches by Dickens, contributed to *All the Year Round* and first collected under this title in 1860, and later added to up to 1869. The title presents the author as travelling for the great house of Human Interest, Brothers.

Unconformity. In geology, a break accompanied by erosion in the deposition of strata. Angular unconformities are formed when rocks of an old series have been

tilted or folded, eroded to a smooth or undulating surface, and then had a younger group of beds deposited on their truncated edges.

Erosional unconformities are the result of more simple earth movements by which the older beds have not been tilted, but simply raised and eroded; so that when the younger overlying deposits are laid down on them the stratification planes are parallel despite the break that occurs between the two groups. The plane of unconformity may be an old land surface or a plane of marine denudation. See Sedimentary Rocks.

Unconscious. Psychological term for regions of the mind normally inaccessible to consciousness. Until the end of the 18th century, mind was generally equated with consciousness, though it was realized that something must happen to those memories, feelings, and desires which are not within the focus of attention at any given moment. Later these were all regarded as sub-conscious. Freud first postulated that many impulses, and some memories, feelings, etc., are not only sub-conscious, but never do or can become known to the ego in their original form unless they are brought to the surface by hypnosis or free association. He therefore divided the subconscious into the pre-conscious, whose contents are subject to voluntary recall, and the unconscious, which is barred from attention by the super-ego. He went on to show that although their existence is denied by their owner, they frequently exercise a lifelong influence upon his behaviour and beliefs.

Briefly, a child is born with an equipment of inherited instinctive urges which demand satisfaction. Some, like hunger, must be frankly admitted. Others, like the desire to kill people who annoy him, and many manifestations of the sexual instinct, begin to arouse guilt, shame, and anxiety which increases as the child accepts a degree of moral training. When these feelings become acute the mind represses, or drives into the unconscious, everything which roused them. After this no more direct knowledge is possible, for the super-ego continues to keep them out of consciousness. But whenever an external situation must be faced

which resembles that which caused the original repression, the exiled material strives to return to the conscious mind. Symbols, errors and omissions, the material of dreams, works of art in which free rein is given to the imagination, may all express unconscious wishes and conflicts. People with a large accumulation of repressed anxiety will feel exaggerated dread of small dangers which normal minds can meet with equanimity. Sometimes these fears amount to phobias.

The contents of the unconscious are not organized like those of the conscious mind. They seem—to use a spatial metaphor—to lie side by side without modifying one another. The only link between them is that, where a series of repressions takes place at various moments in life on account of the same type of prohibition, all will be aroused by a fresh stimulus of the same general nature. The unconscious exhibits no mechanisms of its own except this persevering though intermittent struggle against frustration and oblivion. As it cannot be attended to, the material which becomes unconscious is not amenable to reason, which might free the conscious personality from its influence.

Amber Blanco White

Unconsciousness. Insensibility to the surroundings. Unconsciousness, apart from sleep, may be due to simple fainting; injury to or disease of the brain, such as concussion or apoplexy; epilepsy, diabetes, uraemia, and other constitutional conditions; hysteria; or poisoning by various narcotics. In all cases of sudden unconsciousness, the patient should be kept in the recumbent posture, with the head low if the face is pale and the breathing shallow, or high if the face is congested and the breathing stertorous. Clothing round the neck and chest should be loosened, and artificial respiration should be adopted if breathing shows signs of failure. Further treatment depends upon the underlying cause mentioned above.

Undercooling. Phenomenon in physics also known as Supercooling (*q.v.*).

Underground Dwellings. The natural and artificial cavities in the earth used for residence, refuge, storage, and burial. The primal cave-dwelling, often retained in later phases of civilization, survives in special circumstances in the modern world, e.g. in caves used as air-raid shelters during the Second Great War. In Neolithic times men began to sink the foundations of

structures for domestic and industrial purposes. The practice was perpetuated by the early Germanic tribes. Such semi-subterranean dwellings survive in N. Asia, among the Eskimos and the Pacific coast Indians, as well as in Central and South Africa. The megalithic builders, whose massive stone monuments were devised primarily for the tendance of the dead, developed also a laborious practice of rock-cutting.

In the Balearic Islands there are underground villages, faced with massive blocks. In S. Palestine a non-Semitic people excavated limestone labyrinths, one with 60 chambers, another with a chamber 400 ft. long, 80 ft. high. At Edrei, the city of Og, king of Bashan, a vast subterranean city was in a later age carved out of lava, with streets, shops, houses, market-place, and a pillared hall roofed with a jasper monolith. There are many other widely scattered examples. See Archaeology; Cave Dwellings.

Underground Movement. Term sometimes used for the organized resistance to the Germans which developed in German-occupied countries during the Second Great War. See Resistance Movement; V Campaign.

Underground Railroad. Popular designation of the system organized by the abolitionists in the Northern states of America to assist fugitive slaves from the Southern states to reach Canada, where they automatically became free men. The favourite routes were through Ohio and Pennsylvania, sympathisers in these parts helping the fugitives on their way by giving them shelter, food, and money. Occasional heavy penalties inflicted on those who thus broke the fugitive slave laws failed to break up the system.

Underground Railway. In London this term was originally applicable only to the Metropolitan and Metropolitan District rlys., which in the days of steam trains were popularly called the "underground." But it was later extended to include the system of tube rlys. known as the London Electric rly., and with the incorporation of the two systems under one management and the electrification of the older lines the distinction between "underground" and "tube" disappeared. The equivalent U.S. term is subway.

Underpinning. In building, the substitution of new for old foundations. As applied to ordinary buildings the process generally consists of cutting away the old

foundations in sections of a few feet at a time—after shoring up the wall immediately above the part excavated—making a wider and deeper foundation of concrete or masonry, and bonding it in with the original wall. See Building.

Understanding. Philosophical term sometimes considered synonymous with reason (*q.v.*), but usually distinguished from it. Understanding is discursive, proceeding by means of reason and argument, gathering up a number of ideas and bringing them under one common idea. Reason is intuitive, and immediately grasps both premise and conclusion, and at once seizes the truth of facts. Understanding works within the sphere of experience; reason is connected with the supersensuous.

Under the Greenwood Tree. Second novel by Hardy, first published in 1872. The most completely happy of the Wessex novels, it takes a pastoral theme, borrowing its title from Amiens' song praising rustic life in *As You Like It*. Woven into the love story are descriptions of Christmas festivities, and the conversations in dialect are unsurpassed.

Underwood. Growth from a stool or stock of such woods as grow rapidly. It does not form timber; but the wood is useful for faggots. In law underwood is a crop, and the tenant of the land where it grows is entitled to cut it at such times as are customary; but he may not cut it at other times. If he does, he is committing legal waste, and is liable to an action for waste. Underwoods was the name given by Stevenson to a set of short poems, mostly written at Bournemouth.

Underwriter. Originally one who insured ships and their cargoes against loss and damage, but now most underwriters undertake many kinds of risk. The name is due to the fact that underwriters write their names under the wording of the policy. The term is also used for those who underwrite, i.e. insure, appeals to the public for capital, whether made by states, municipalities, or business houses. The underwriter, in return for a commission varying with the risk, agrees to take up all that the public does not subscribe for. Risks of almost every other kind can be insured with underwriters. The association of underwriters in London is known as Lloyds (*q.v.*).

Undine (Lat. *unda*, a wave). Name for the class of Water-nymphs in the Cabalistic system of Paracelsus. An undine possessed

no soul, but acquired one, and at the same time took on the ordinary conditions of humanity, by bearing a child to a mortal. Baron de la Motte Fouqué's story of Undine, 1811, Eng. trans. E. Gosse, 1912, is based on this legend.

Undset, SIGRID (1882-1949). Norwegian novelist. She was born of a Norwegian father and Danish mother at Kalundborg, Denmark, May 20, 1882. Until 1909 she was in commerce, but published a successful first novel, *Fru Marta Oulie*, in 1907. Jenny in 1912 established her fame. Later stories, some appearing in English trans., included the striking trilogy of life in the Middle Ages, *Kristin Lavransdatter* (1920-22)—the main reason for her being awarded in 1928 the Nobel prize for literature—and *Olav Audunsson* (1925-27). She wrote a discursive autobiography, *Men, Women, and Places*, 1939, and died June 10, 1949.

Undue Influence. English law term. According to the court of chancery it is influence exerted by way of pressure on a person not capable of resisting it, in order to benefit the person exercising the pressure. The court will set aside any gift or will so obtained. Certain persons are, by reason of their position, more readily suspected than others. Thus, a solicitor who obtains a gift, etc., from a client, or a doctor from a patient, or a priest from a penitent, or a guardian from his ward, especially if the donor is old or in feeble health or not strongminded, is in such a position. But whenever it can be shown that the relations between donor and donee are such that the donor leans upon the donee, or is under his thumb, the court will regard with great suspicion any transaction between them.

By the Corrupt Practices Act, the term is applied to any intimidation, threat, force, or restraint, in order to induce any person to vote or not to vote, or to punish him for having voted a certain way, or for having refrained from voting. Undue influence, in this sense, being obviously an interference with the freedom of the electorate, is a ground on which an election petition may be presented to unseat a M.P. on whose behalf it has been exercised.

Undulant Fever. Vague illness characterised by prolonged fever with a tendency to long relapses and accompanied by malaise, neuralgia, and painful swellings of the joints. It is also sometimes called Malta fever, Mediterranean fever, or abortus fever.

It was common in Malta until the milk of the local goats was boiled by the British garrisons, the organism being conveyed in goats' milk. Other subdivisions of the germ are conveyed by cattle, in which it causes abortion.

Mortality rate in humans is low except when the disease manifests itself in the rare malignant form. But chronic types can leave the patient grey and thin and liable to acute relapse. Treatment consists in general nursing and dieting and in relieving the symptoms as they arise; specific therapy is not established.

Unemployment. Term for that condition in which a person dependent on his earnings for his living has no work to do. The U.K. publishes statistics of unemployment, but these include only those who have registered themselves as unemployed at an employment exchange or appointment office of the ministry of Labour. There are at all times some thousands of others seeking employment. Registered unemployed in the U.K. on Sept. 13, 1948, numbered 321,000, or about 1.5 p.c. of the total registered employed pop. Total registered unemployed in 1939 were 1,305,000; 1938, 1,912,000; 1935, 1,888,000; 1932, 2,776,000. The International Labour Office estimated in 1933 that in the 19 European countries about which it had information there were about 13.6 million persons out of work, or about 1 in 5; in addition, some millions of peasant farmers were without much of their customary income. For most of the years from 1923 to 1938 many industries in the U.K. had more than 10 p.c. of registered unemployment; in 1932 the average figure was 22.5 p.c., and in some industries was more than 40 p.c.

Unemployment was at times a problem long before the industrial revolution. From the 1850s it became a serious social and political evil. Great depressions of trade (such as those of 1858, 1868, 1879, 1893) were followed by revivals, more or less marked; but from 1850 to 1910 some 10 p.c. of workers were on the average unemployed. The First Great War was followed by a world slump in 1921-22 when more than 20 p.c. were unemployed in Great Britain; during the next decade unemployment ranged between 10 and 15 p.c. The world depression of 1931-33 put the figure higher than it had ever been since records were kept.

Unemployment has been attributed, among other things, to (a) restrictionist policies, that is, the attempt of industrialists and traders to obtain the maximum profit through high profits on few goods; (b) mistaken forecasts of demand and of other producers' output, and consequent ill-judged investment; (c) "over-production," that is, so much investment in machinery and raw materials, etc., that capacity to produce grows more rapidly than ability to buy; (d) "under-consumption," that is, a distribution of the national income leaving too little to the mass of the public to enable them to buy the goods that the factories produce; (e) the inability of the political and economic organization of distribution to keep pace with improvements in technology; (f) low prices paid to primary producers—who in the world as a whole outnumber those engaged in manufacture and trade; (g) recurrent poor harvests and bumper harvests, equally ruinous through faulty marketing; (h) sweated labour abroad, particularly in India, the Far East, and Africa; (i) excessive speculation, induced by undue optimism, followed by loss of confidence; (j) lack of mobility and adaptability of workpeople, plant, and machinery; (k) tariffs and other barriers to world trade.

It has come to be widely believed that, given sufficient powers, and with the help of adequate statistics, a govt. can prevent booms and slumps, and organize for full employment, that is, restrict unemployment to short-term dislocations caused by economic change. *See* Depressed Areas; Labour; Trading Estates.

U.N.E.S.C.O. Initials of United Nations Educational, Scientific, and Cultural Organization, a subsidiary body of the United Nations set up at a conference in London, held at the invitation of the British govt. Nov. 1-15, 1945, and attended by 44 of the United Nations including all the major powers except Russia. Its objects are to promote mutual understanding between peoples through interchange of teachers and students and exchange of information about educational methods and facilities. Julian Huxley (*q.v.*), elected first director-general, 1946, was succeeded 1948 by Torres Bodet, foreign minister of Mexico. The organization has a permanent office at 19 rue Kléber, Paris.

Unfederated Malay States. The states of Johore, Kedah,

Kelantan, Perlis, and Trengganu, formerly independent powers, but now included in the federation of Malaya, are dealt with separately in this work.

Unfinished Symphony. Popular name for Schubert's symphony No. 8 in B minor. After two movements, allegro and andante, had been written at Vienna in 1822, the work was abandoned, though it marks the beginning of Schubert's mature period which culminated in the great C major symphony. Nine bars of a scherzo were written in full score, together with sketches for its completion. Schubert never heard this music, which was first played in Vienna, 1865, and in England at the Crystal Palace, 1867, becoming a favourite.

Other unfinished symphonies are a third by Elgar, designed on a large scale; and Borodin's No. 3 in A minor, which, consisting of two movements, was orchestrated by Glazounov.

Unfunded Debt. Alternative name for Floating Debt (*q.v.*).

Ungava. Dist. of Canada, formerly a territory of the dominion and now part of Quebec. It is the northern part of the Labrador peninsula and its area is 351,780 sq. m. The climate is too cold for most agricultural pursuits, but it has rich mineral deposits, including iron, lead, and copper, and quantities of fur-bearing animals, martens, foxes, etc. A good deal of the land in the E. is covered with forests. Ungava was originally part of Rupert's Land, and as such belonged to the Hudson's Bay co. The territory gave the title to an adventure story by R. M. Ballantyne. In 1869 Ungava was purchased by the dominion, and in 1895 the territory of Ungava was created out of it. In 1912 this was added to the province of Quebec under the Quebec Boundaries Extension Act.

Ungava Bay. Bay of Canada, in the N. of the Labrador peninsula. It extends S. from Hudson Strait and receives the waters of the Leaf, Koksoak, Whale, and George rivers. It is about 175 m. wide and extends inland for about the same distance. In the N.W. is the island of Aukpatok.

Ungulata (Lat. *ungula*, a hoof). Subdivision of the mammals which includes all the hoofed forms, such as the cattle, sheep, antelopes, giraffes, deer, camels, llamas, pigs, hippopotami, rhinoceros, horses, hyrax, and elephants. In these the limbs have completely lost the power of grasping, and the feet are

adapted for movement only, the toes being protected by an external casing of horny substance known as a hoof. The number of toes is usually reduced, as in the rhinoceros, which has three, and the horse, which has only one. From this feature, the ungulates are divided into two groups. The Perissodactyla, or odd-toed ungulates, include the horse; while the Artiodactyla, or even-toed ungulates, include the cattle, deer, sheep, etc. It is among the ungulates that the function of ruminating or chewing the cud is developed. See Horse.

Ungvar. Magyar name of town described under its Ruthenian name Uzhgorod.

Uniate (Russ. *uniyat*, from Lat. *unus*, one). Oriental churches which have been brought into communion with the Church of Rome, but retain their ancient rites, liturgies, and customs. Their clergy are allowed to be married; they communicate in both kinds, and they use leavened bread in the Eucharist. They originated in Poland in 1596, when part of the Lithuanian Church submitted to the pope, but in the 18th and 19th centuries, under Russian pressure, many of their congregations rejoined the Greek Church. This Ruthenian Church, as it was called, was by far the largest of the Uniate Churches, numbering between three and four million adherents. The Rumanian Uniate Church, chiefly in Transylvania, numbers about 1,000,000. The Maronites (*q.v.*), Catholic Armenians, and Christians of S. Thomas are next in importance. The other Uniate Churches are very small.

Uniaxial Crystal. A crystal having only one axis of symmetry. Light rays are propagated through crystals in different ways. On this basis crystalline minerals, for example, are classified as isotropic or anisotropic, and the latter into uniaxial and biaxial minerals. Uniaxial minerals consist of those which fall into the tetragonal and hexagonal groups, based on crystallographic symmetry. Uniaxial crystals behave in characteristic ways when viewed under the petrologic microscope by transmitted polarised light. The principle is much used for identifying minerals. See Crystallography.

Unicorn (Lat. *unum*, one; *cornu*, horn). Fabulous quadruped, resembling a horse, with a single long, forward slanting horn on its forehead. Ctesias mentions it as inhabiting India, but at a later

date it was placed in Africa. It is probably derived mainly from the rhinoceros, perhaps also from the

Unicorn in heraldry

oryx, depicted on ancient monuments in profile, but its spirally twisted horn is the tusk of the narwhal (*q.v.*). The unicorn, it was believed, was fierce and swift, but could be immediately tamed by a virgin. Cups of its supposed horn, really rhinoceros horn, were thought to make poison harmless. Represented with cloven hoofs and a tufted tail, it is used as a device and supporter in heraldry. The supporters of the royal arms of Scotland are two unicorns argent, crined and gorged or. See Persia.

Uniform (Lat. *una forma*, one pattern). Dress of one pattern or colour distinguishing those belonging to one service, organization, or business concern. British military uniforms date from the 17th century, when most regts. were raised by colonels, who chose the particular garb the units wore. The few regts. enlisted for the direct service of the sovereign wore the royal livery of scarlet. Red became the uniform of all regts. during the Commonwealth, the facings (revers, cuffs) being in the colours of officers who had originally raised them. After the Restoration, the household troops wore red uniforms with royal blue facings.

Throughout the 18th and 19th centuries British military uniforms became increasingly decorative and unserviceable. Many elaborate features were borrowed from foreign countries: hussars wore Hungarian dress with a useless pelisse, lancers the square Polish cap, dragoons the French cuirass or breastplate. Towards the close of the 19th century, all royal regts. wore blue facings; all non-royal English and Welsh regts., white facings; Scottish regts., yellow; and Irish, green. In 1900, regts. reverted to the facings they had worn on full dress in 1881. Elaborate uniforms continued to be worn on the battlefield until the S. African War, when khaki tunics and trousers were introduced. Thereafter dress uniform was abolished by the army except for ceremonial occasions.

In April, 1939, khaki Battle Dress (*q.v.*) was introduced as the service uniform of all branches of

the army and was adopted in blue or blue grey by the R.N. and R.A.F. It also became the uniform of civil defence, fire service, merchant navy, etc. Variations of battle dress were ultimately adopted by most foreign countries. By 1949, the only regimental distinction in the service uniform of British regts. and corps was the colour of the beret: infantry, blue; R.A.C., black; rifle regts., green; airborne, maroon. In 1946, the kilt was restored to Highland regts. Guards and household cavalry reverted to full dress scarlet and gold for ceremonial duty in 1948. (*Consult Uniforms of the British Army, J. Laver, 1948.*)

Under the Tudors a green livery was worn in the British navy, and in Stuart times red. The present blue uniform was adopted in 1840 and has altered only in minor details. Naval officers' full dress blue uniform with white slashes dates from the reign of George III. The blue-grey R.A.F. uniform was introduced in 1918 and the open-necked tunic for other ranks in 1938; this was the first service in which all ranks wore collars and ties.

With the development of the European dictatorships, political uniforms were introduced, e.g. the Fascist black shirt, the Nazi brown, the Falangist blue, and the Communist red. This last had been the uniform of Garibaldi's followers in the liberation of Italy. Politicians who favoured the establishment of a dictatorship in Great Britain followed Continental models and clothed their supporters distinctively. By the Public Order Act of 1936, however, wearing political uniforms in the U.K. was forbidden.

Distinctive uniforms are worn by the boy scouts, girl guides, Salvation Army, Church Army, and Y.M.C.A. officials attached to service establishments. Most public schools require pupils to wear uniform dress; amongst these are the blue gown of Christ's Hospital, Eton short jacket, and Harrow straw hat. Most large industrial firms require their employees in contact with the public to wear a uniform, as do the post office, railways, and road transport undertakings.

Uniformity. Condition of similarity or agreement. The word is applied in history to a condition in which all persons profess the same religious opinions. In England the Acts of Uniformity, four in number, were statutes passed to secure general uniformity in the doctrines, services, and observances of the

Church of England. The first accompanied the issue of the first book of common prayer in 1549, requiring the clergy to conform to the new prayer book. The second, which accompanied the issue of the second prayer book in 1552, departed from the first by imposing pains and penalties upon the laity as well as upon the clergy who did not conform.

The third came after the accession of Elizabeth, with the issue of the third prayer book in 1559. In the interval, under Mary, the clergy had reverted to the Roman use; the new Act applied only to the clergy, and appears to have caused not more than 200 resignations—probably because it was understood that the authorities would be lax in the permission of evasions. The fourth Act of Uniformity followed the Stuart restoration (1660) and accompanied the revision of the Liturgy in 1662. It ordered the use of the revised liturgy in every church and chapel, the regular ordination according to the Anglican rite of all incumbents before S. Bartholomew's day following, and a formal declaration from all of their entire acceptance of the service book. The result was the resignation of over 1,200 incumbents. See Nonconformity; Prayer Book; Toleration.

Unigenitus (Lat. *unus*, one; *genitus*, begotten). Name given to the papal bull issued to suppress the Jansenist heresy, 1713. After many years of controversy and attempts on the part of the church to convert the Jansenists from their errors, Clement XI issued the bull which condemned 101 propositions of heretical doctrine taken from the works of Pasquier Quesnel (*q.v.*). The French high ecclesiastics and universities declared against the bull and in 1717 formed a party known as the Appellants, from their declared purpose of appealing to a general council. See Jansenism.

Union. In local government, the combination under boards of guardians of two or more contiguous parishes for poor law purposes. Unions were first formed under Gilbert's Act, 1782. The term was popularly applied to a Union workhouse. Boards of guardians were abolished in 1930. See Poor Law.

Union. City of New Jersey, U.S.A., in Hudson co. It stands on the Hudson river, adjoining West Hoboken, and is served by rly. Embroidery and silk goods are the chief manufactures. Here in 1936 was built a cinema where patrons

can see films while seated in their cars. Formerly a part of N. Bergen, from which it was detached in 1861, Union was incorporated as a town in 1864. Pop. 56,173.

Union, Acts of. In British constitutional history, name for the two statutes by which the kingdoms of Scotland and Ireland were united to that of England, in 1707 and 1801 respectively.

The question of the succession having made the matter urgent, in spite of strong opposition on both sides a joint Anglo-Scottish commission drew up a treaty, which was ratified by the English parliament in July, 1706, and by the Scottish parliament in Jan., 1707. It became law on May 1. Scotland obtained guarantees for commercial liberty, the establishment of the Church, and her own law and administration. The United Kingdom of Great Britain was thus formed. (See Scotland.)

The Union with Ireland, due in part to the rebellion of 1798, and the fact that Grattan's parliament represented only a small minority, was effected through the promise of R.C. emancipation, and through compensation to the Irish oligarchy, aided by extensive corruption. The Act was passed by the British parliament, July 2, 1800, and by the Irish parliament, Aug. 1, and came into effect on the first day of the new century. See Ireland.

Union-Castle Line. British steamship company. The line was formed in 1900, being an amalgamation of two existing concerns. The older was the Union Steam Collier Co., founded in 1853 and made

into a limited company in 1856. The second was the Castle line, started in 1862 to carry goods between Liverpool and Calcutta. These two lines divided the work of carrying the S. African mails from 1876, and in 1900 they were united as the Union-Castle Mail Steamship Co. H.q. are at 3-4, Fenchurch Street, London, E.C.3. Many of the ships are named after a castle.

Union Cloth. Admixture of materials. Union linens are linen in one direction, generally in the warp, and cotton in the other. Union worsted coatings have a cotton warp and worsted weft. Union flannel is a similar mixture. The name is a notice that the articles are not pure linen, worsted, or flannel.

Union Club. London non-political, social club, founded c. 1800, reconstituted 1821. It had many Irish members. From 1824 to 1924 its premises were in Cockspur St., Trafalgar Sq., then until 1951 at 10, Carlton House Terrace. In 1950 it acquired the premises formerly occupied by the Thatched House Club, 86, St. James's St. Famous members of the Union club were C. J. Fox, Sheridan, Wellington, Peel, Cecil Rhodes, and Lord Kinnaird.

Union Day. A general holiday in South Africa, May 31, the day on which the union of the states was established in 1910.

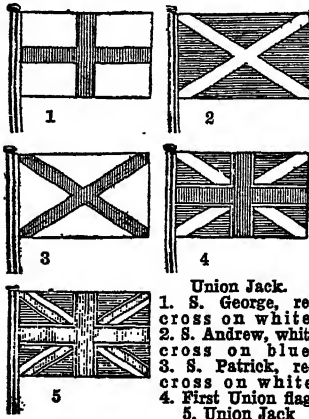

Unionidae or FRESH-WATER MUSSELS. Family of bivalve molluscs. In Great Britain four species occur: *Unio tumidus* and *U. pictorum*, common in the rivers of S. England; the pearl mussel, *U. margaritifera*, which occurs in the mountain streams of Scotland and Ireland; and *Anodonta cygnea*, the swan mussel.

Union Islands or TOKELAU. British island group in the Pacific. Lying between 8° and 10° S. lat. and 171° and 173° W. long., the islands belong to New Zealand and are administered from W. Samoa. Until 1926 they were part of the Gilbert and Ellice Islands colony. Copra is the chief product. Area, 4 sq. m. Pop. 1,388.

Unionist. Name of a political party of the U.K., mainly between 1885 and 1922, and latterly virtually synonymous with the Conservative party. Originally the Unionists were Liberals who, under Lord Hartington (later duke of Devonshire) and Joseph Chamberlain, left their party rather than accept Gladstone's proposals for Irish home rule. They set up their own organization and for a time acted as a separate party, the Liberal Unionists, both in and out of parliament. In 1895 some Liberal Unionists were included in Salisbury's govt., and thereafter the coalition of Conservatives and Liberal Unionists became known as the Unionist party. As such they fought the elections of 1906 and 1910. The party organizations, however, remained distinct until 1912. The Unionist leaders joined the coalition govts. of Asquith and Lloyd George, and fought the 1918 election as Coalition Unionists, obtaining the largest representation of any party. After the signing of the Irish treaty, the Unionist party brought about the downfall of Lloyd George, but thereafter the name was dropped, and the older name of Conserva-

tive revived. See Conservative; Home Rule; Liberal Unionist.

Union Jack. British national flag. It is composed of the banner of S. George, white with a red cross, for England; the banner of S. Andrew, blue with a white saltire or diagonal cross, for Scotland; and the banner of S. Patrick, white with a red diagonal cross, for Ireland. The first Union flag showed the blending of the banners of England and Scotland at the union of the crowns in 1603, and was confirmed by the Act of the Union in 1707. This blending was done by placing the cross of S. George fimbriated argent, i.e. with a narrow border of white, over the Scottish saltire. At the Union with Ireland in 1801 the banner of S. Patrick, the red saltire fimbriated like the cross of S. George, was combined with the white saltire of S. Andrew; but not to give undue

preference, the two saltires were "counter-charged" so that in the first and third quarters the white saltire, and in the second and fourth the red saltire is uppermost.

Properly called the Great Union, the Union Jack is flown on the jack-staff at the bow of a ship. It is illegal to use the Union flag or any ensign for advertising purposes; neither may these be defaced by advertising emblems or lettering. Union Jacks and ensigns flown from ships or buildings should be struck at sunset. No ensign should be flown unless with the Union flag in the jack; the only exception is that a ship in distress at sea may fly the flag upside down to attract attention. See Flags colour plate; Jack.

Union Jack Club. British institution for sailors, soldiers, and airmen. Soon after the close of the S. African War steps were taken to establish a national memorial to

Union Jack Club, London. Club buildings in Waterloo Road, opened by Edward VII in 1907

soldiers who fell in that war, and the scheme of a club where service men could meet was taken in hand. A site was selected in Waterloo Road, London, close to Waterloo Station, and here the club premises were opened on July 1, 1907, by Edward VII. Extensions were made in 1910, 1922, 1928, and 1939. Membership is limited to all service men below the rank of officer. Here they can deposit their kit, obtain good meals and a comfortable bedroom there are over (1,000), and avail themselves of a library and writing-room, baths, barber's shop, club store at which everything for ordinary use can be purchased, and all the usual amenities of club life. The benefits of the Union Jack Club to men passing through London in both Great Wars were incalculable.

Union of Soviet Socialist Republics. Official style of the national entity founded by treaty of union, Dec. 30, 1922, between four Soviet republics—those of Russia, Ukraine, White Russia, and Transcaucasia. The country described in this Encyclopedia as Russia consisted in 1948 of 16 republics. That of Transcaucasia was split into Armenia, Azerbaijan, and Georgia in 1936. In 1925 the Turkmen and Uzbek, in 1929 the Tadzhik, and in 1936 the Kazakh and Kirghiz autonomous republics were brought into being, making eleven. In 1940 the Karelo-Finnish, Moldavian, Estonian, Latvian, and Lithuanian republics were incorporated. See separate articles on each country; Lenin; Stalin.

Uniontown. City of Pennsylvania, U.S.A., the co. seat of Fayette co. It is 70 m. by rly. S.S.E. of Pittsburgh, and is served by the Baltimore and Ohio and the

Pennsylvania rlys. Ironfounding and the manufacture of lumber products, iron and steel ware, and glass are carried on. Coal and iron are worked in the neighbourhood. Incorporated in 1796, Uniontown became a city in 1915. Pop. 21,819.

Unipolar. Term used by electrical engineers. Strictly speaking, it is a contradiction in terms, as it implies only one pole, which is an impossibility. It is convenient, however, to apply the word to such devices as a unipolar dynamo.

Unison. In music, the simultaneous sounding by different voices or instruments of two or more notes of exactly the same pitch. Passages are often described as in unison when really they are in octaves as, for example, in the "doubling" of orchestral instruments, or in congregational singing.

Unit. Standard quantity, by the multiplication or division of which any other quantity of the same kind is measured. Absolute units are based on arbitrary units of mass, length, and time. The expression is sometimes applied to the C.G.S. or centimetre, gramme, second system of units in physics. See Absolute Units; Astronomical Unit; Units.

Unitarianism. System of theology. It is a belief that God exists in one Person. Some writers maintain that Unitarianism was coeval with the Apostolic Church. Described as succeeding to Arianism, Arminianism, and Socinianism, it has undergone many changes in modern times. Unitarian congregations first arose in Poland and Hungary, and independently in England. Persecution, the martyrdom of men like Servetus in Switzerland, Biddle and Legate in England, and David in Transylvania, as well as repression in Italy and elsewhere, gave it impetus. After the Reformation many Presbyterians, Independents, and Baptists were drawn to it, and Milton, Locke, and Newton are said to have favoured it. Among later leaders, James Priestley (1773-1804) and James Martineau (1805-1900) in England, and Theodore Parker (1810-60) and W. E. Channing (1780-1842) in America, are conspicuous.

With no creed, and opposed to dogma, Unitarianism in Great Britain has been defined as a belief in the unity of God; in the humanity of Jesus, who is regarded as the supreme religious and moral teacher of the world; in progressive revelation; and in the immortal hope for all man-

kind. While believing in the fatherhood of God and the brotherhood of man, Unitarians deny the doctrine of the Trinity, the verbal infallibility of the Bible, and eternal torment. They claim to be open to all the revelations of science and evolution, and to all the laws of change. Their ministers and congregations are free and independent.

Though in the 18th century many congregations of Presbyterian, Independent, and Baptist origin moved towards a Unitarian doctrinal position, the first church bearing the name Unitarian was opened in 1774 by Theophilus Lindsey (1723-1808) in Essex Street, London. The British and Foreign Unitarian Association was founded in 1825, the same year as the American Unitarian Association, and in 1928 came the general assembly of Unitarian and Free Christian Churches. Until 1944 the headquarters of the assembly were on the site of Lindsey's chapel, but that building was completely destroyed by a flying bomb, and temporary headquarters were established at University Hall, 14, Gordon Square, W.C.1. The Unitarian College in Manchester, Manchester College at Oxford, and the Presbyterian College at Carmarthen train students for the ministry. Most of the churches have Sunday schools. In the British Isles are 334 places of worship. The denomination supports a weekly paper, *The Inquirer*; a monthly, *The Unitarian*; and a journal *Faith and Freedom*.

IN THE U.S.A. Just as English Unitarianism originated as a Liberal movement within orthodox Presbyterianism, so American Unitarianism began as a breakaway from the traditional Calvinism of New England Congregationalism. When this schism occurred early in the 19th century Unitarian members were in the majority in many churches, and therefore, according to Congregational polity, retained the property. Thus today one often finds a Unitarian church bearing the name of First Congregational Church (Unitarian) while the orthodox section worships in a later building called Second Congregational Church (Trinitarian). Unitarian churches in the Middle and Far West are mostly of independent and later origin, and many have discarded any theistic belief. Of about 300 Unitarian churches in the U.S.A. nearly half are in Massachusetts, the h.q. of the denomination being

in Boston, where an international Council was started in 1900. Members total fewer than 75,000, but their influence on religious thought in America has been out of proportion to their numbers. Subscribers, besides Parker and Channing, included Emerson and four presidents—J. Adams, J. Q. Adams, Fillmore, and Taft. Unitarian views are also held by the Hicksite Quakers.

United Africa Company. Largest individual unit of the Lever Brothers and Unilever group of companies. It is probably the biggest trading company in the world, operating principally in E., W., and N. Africa and the Middle East. It trades chiefly in palm kernels, palm oil, groundnuts, cotton, hides, skins, dates, and rubber. These commodities are normally sold in the open market in competition with other sellers. After amalgamation with the Niger company, the African and Eastern corporation, and others, the co. embarked on manufacturing operations, e.g. making plywood in W. Africa. From the point of view of Unilever, this co. is the principal source of supply of raw materials needed in soap and margarine, and the agency through which Africans are supplied with goods. The co. helped in the inception of the groundnuts scheme financed by the British government in 1948.

United Church of South India. Amalgamation of the Anglican, Methodist, Congregational, and Presbyterian churches in southern India, inaugurated in Madras, Sept. 27, 1947. The church has 14 dioceses, though one of these, comprising Ceylon, remains wholly within the Anglican communion. At its inauguration the church had 8 European and 6 Indian bishops. The Lambeth conference of 1948 warmly welcomed the new church, while expressing some concern at certain features of its constitution, notably the status of bishops appointed after the inauguration of the church.

United Deccan. Name given to a short-lived union of small Indian states. It originated in a meeting in Bombay on Aug. 26, 1947, of the rulers of states in the old group of Kolhapur and Deccan who wished to join the dominion

of India just brought into being. States represented were Aundh, Bhor, Kurundwad, Miraj senior and junior, Phaltan, Ramdurg, and Sangli. On March 8, 1948, the states were merged in Bombay.

United Free Church of Scotland. Presbyterian church which existed from 1900 to 1929. It came into being with the amalgamation of the Free Church of Scotland—result of the Disruption of 1843, when a number of leading ministers and laymen left the Established Church of Scotland—and the United Presbyterian Church formed in 1847. No doctrinal difference existed between the Free Church and the United Presbyterians, and their organization had much in common. But a small section of the Free Church—commonly known as the Wee Frees—held out, and when the union of the two bodies was accomplished in 1900 they held aloof, and claimed that they were now the Free Church of Scotland, and entitled to its property (see Free Church of Scotland). In 1929 the United Free Church rejoined the Church of Scotland (q.v.).

United Irishmen. Society of disaffected Irishmen first formed in Dublin in 1790 by Hamilton Rowan and Wolfe Tone. It was a product of the French Revolution. In Ireland there was much discontent among the Roman Catholics on account of their political disabilities, and among the peasantry generally on account of the impoverished state of agriculture. The necessity for parliamentary reforms provided common ground for a combination of Protestants and R.C.s in the new society—hence the name—but with the victorious progress of the French armies a programme of Irish independence emerged.

In 1796 Tone persuaded the French to send a fleet under Hoche, which failed at Bantry Bay, as did several internal risings. Early in 1798 Lord Edward Fitzgerald made arrangements for a secret rising in Dublin, but the leaders in Dublin were arrested in March, and in May Lord Edward himself was mortally wounded in resisting arrest. Then the counties of Wicklow and Wexford broke into open rebellion. Their headquarters at Vinegar Hill were stormed by Lake on June 26, and with this battle organized resistance collapsed. The last hopes of the rebels were dashed when in Oct. a small French expedition surrendered near Lough Swilly, and Tone was taken prisoner. See Ireland; Vinegar Hill.

THE UNITED KINGDOM: HISTORY FROM 1707

A. F. POLLARD, Litt.D., KENNETH ADAM, and Others

This sketch traces the history of the United Kingdom from 1707, continuing the history of England and Scotland, and from 1800 to 1922 that of Ireland. See biographies of rulers from Anne to George VI; prime ministers and other statesmen from Walpole; also soldiers and sailors. See also British Empire; Europe; First Great War; Second Great War; articles on battles, e.g. Alamein; Somme; Waterloo; movements, e.g. Chartism; Home Rule; and on political parties

The Act of Union between England and Scotland was a stepping-stone towards imperial development, partly because it was in effect an Act for the disruption of England's ancient enemy. Only the Lowlands were united in heart and mind to England in 1707. Scottish national unity, which had been largely maintained by antagonism to England, broke down with the disappearance of the Borders, and Scotland was divided into parties which came to blows in the Jacobite rebellions of 1715 and 1745. France in her future wars with England could look for help only to a diminishing section of the Scottish people instead of to a national Scottish government, and the crowns of the two realms passed in 1714 to the Whig and Hanoverian candidate.

Anne's Successor

There was, indeed, a feeble protest in 1708 in the form of an attempted invasion of Scotland by the Old Pretender, which was frustrated by Byng and his fleet off the Firth of Forth; but this did not disturb the prosecution of the war of the Spanish succession by the Whigs. Marlborough continued to win victories, but little progress was made in the war to wrest Spain from Louis XIV's grandson, Philip V.

The Tories had left the coalition ministry in 1708, and began to accuse the Whigs, especially Marlborough, of continuing the war in their own interests. The prosecution of Sacheverell in 1710 turned Anglican feeling against the government, and Queen Anne was alienated through the influence of Mrs. Masham. Harley (afterwards earl of Oxford) and St. John (afterwards Viscount Bolingbroke) succeeded in ousting Marlborough and Godolphin, and in forming a purely Tory administration, which soon set to work to end the war by negotiations. These were prolonged by the difficulty of securing agreement among the Allies, and England concluded the separate peace of Utrecht in 1713.

From the problem of the Spanish succession the British government turned to that of their own. St. John wanted the Stuarts back in preference to the Hanoverians,

but Harley could not make up his mind, and most of the Tories shied at the staunch Roman Catholicism of the Old Pretender. A few days before Anne died, St. John succeeded in supplanting Harley, but he had no time to reorganize his

United Kingdom. Arms borne by the sovereign

distracted party, or concert measures for the restoration of the Stuarts. The Whigs easily seized the reins of power, and introduced the Hanoverian dynasty.

They did not long remain united. Hitherto they had been the party of war in defence of the Revolution of 1688, and of the Protestant succession against Louis XIV as champion of the Stuarts and Roman Catholicism. The treaty of Utrecht had settled that issue, but the two chief Whig ministers, Stanhope and Sunderland, were still bent in 1714 on playing an active, if not an aggressive, part in European politics. An excuse was provided by the energy of Spain under Alberoni, an ambition defeated by the British naval victory off Cape Passaro in 1718. A peace movement was led by Walpole and Townshend, and gradually the Whigs accepted their later rôle of non-intervention. The South Sea Bubble burst in 1721, and Walpole was called to inaugurate a period of peace, retrenchment, and repose.

In the longest administration of our history, he left a permanent mark by his non-intervention in European wars, development of commercial activity, tolerant administration, and constitutional construction. His tolerance did not

extend to the rivals who disputed his predominance, and one after another his colleagues were driven from office. Gradually these discontented Whigs joined hands with the reviving Tories to form an opposition which brought Walpole down.

War broke out again in 1739 over commercial disputes with Spain, which was determined to keep as closely shut as possible the door into the Spanish dominions in America, while English traders were bent on forcing it open. But this war between England and Spain soon merged in the general European War of the Austrian Succession, which followed on the death in 1740 of the emperor Charles VI without male issue. Walpole, who had resisted the war, tried to limit England's participation; but even his naval measures were unsuccessful, and in 1742 he was defeated, and resigned.

He was succeeded by an unstable coalition until Pelham (1744-54) became prime minister, and the war brought little comfort to the country which had demanded it. For a moment in 1745 it seemed to have opened the door to a Stuart restoration, and Charles Edward advanced as far into England as Derby. He was crushed by the duke of Cumberland at Culloden in 1746; but the French overran the Austrian Netherlands, penetrated farther into Holland than Louis XIV had done, and in India captured Madras. But British sea power was sufficient to rob France of all the fruits of her victories, and restore the *status quo* at the peace of Aix-la-Chapelle, 1748. That, however, was merely a truce; and in 1756 the Seven Years War began.

The Work of Chatham

Pitt, who came into office in 1757, perceived the political values of the struggle, and confined himself in Europe to maintaining naval supremacy, and giving Frederick the Great sufficient help to stave off his enemies. France concentrated her energies on a continental war waged mainly for the benefit of Austria. There were twelve times as many British as French colonists in America; the Spaniards were, indeed, more numerous than either, but Spain did not come into the war until 1761, two years after Quebec had fallen, and had long

ceased to be an efficient ally. Sea power, moreover, was bound to decide a struggle between combatants who relied upon transmarine reinforcements, and a succession of naval victories gave the oceans into British keeping, and turned French dominions overseas into beleaguered garrisons. Louisbourg and Cape Breton fell in 1758, Quebec and Guadeloupe in 1759, Montreal next year, and Grenada, St. Vincent, and Tobago, and the Spanish Havana and Manila in 1762, while French dominion in India was shattered by Clive's victory at Plassey and Cooté's at Wandewash. Some of these conquests, notably Cuba and the Philippines, were restored by the peace of Paris, 1763.

George III as King

George III had ascended the throne in 1760, glorying in the name of Briton, and meaning to play the part of patriot king; and the Tories, weaned from their allegiance to the distant and drunken Pretender, were prepared to rally round the throne in its efforts to break the ring of Whig dictators. Pitt himself had smoothed their path by preaching the gospel of efficiency and the virtues of coalition; but the Whigs had done more by dissolving into factions and subordinating principles to interests. There was no longer a Whig party and hardly a Whig principle. Fifty years of power had corrupted its possessors, and reduced them to a circus of seekers and holders of office. George III would have been powerless against a united party or a responsible house of commons; but he made his own party in the house, and his own confidants in the cabinet, until, by undermining one ministry after another, he at length secured in North a prime minister who confessed himself the agent of the king.

To George III more than to any other individual belongs the responsibility for the War of American Independence; but it is idle to ascribe to any one person the deep-rooted causes which provoked that disruption of the British Empire, for there had always been disruptive forces at work.

The Revolution of 1688 had in effect made the executive of Great Britain responsible to a British legislature; but it had not made the executives in the colonies responsible for colonial legislatures; and the Whigs denied to American colonists what they claimed for the British people. Hitherto a breach had been avoided by the laxity of Walpole, the dependence of the

colonies, and the indifference of England. But the Seven Years War had changed all that. The arm of Downing Street was strengthened and prolonged, and it was no longer disposed to leave to colonial arbitrament what had been won by the British navy. There was the vast hinterland of the West, which the British parliament was not inclined to abandon as unearned increment to the colonies; there was also the cost of the war to be met.

On their side the colonists felt that there was now less need for dependence on British protection; and they claimed that, whatever their share in the common expense, it must be granted by their colonial legislatures. They also drew the distinction, as old as parliament itself, between external taxation imposed on foreign trade and internal taxation levied on lands and goods. But the old distinction had been obliterated at home by the control secured by parliament over both forms of taxation, and the British government denied distinction. Furthermore, taxation in Great Britain had ceased to be the grant of divers "states" and become the act of parliament whose sovereignty had been established since the colonies were founded, and had never been recognized by them.

Loss of American Colonies

The issue was joined with hesitation. Pitt (Chatham) and Burke protested, and Rockingham repealed the taxes of Grenville. But reactionary forces were in the ascendant; Grafton succeeded to Chatham, and North to Grafton; extremes on one side provoked extremes on the other. Ten years after the Stamp Act, agitation broke out into open hostilities at the battle of Lexington, and on July 4, 1776, the 13 colonies adopted their Declaration of Independence. In the ensuing struggle the disorganization and mutual distrust of the colonists might have given George III the victory, had not France and other European countries intervened to wipe off the scores of the Seven Years War.

A transient loss of the command of the sea was redeemed by Rodney's victory over De Grasse in 1782; but the moment had been enough to enable the colonists to compel the surrender of Cornwallis at Yorktown; and the war happily ended in England's successful defence against her foes in Europe and India, and in her failure to reduce her American colonies. A corollary of that failure was the end of the king's attempts at per-

sonal government. His agent, North, resigned in 1782, and the Rockingham Whigs were called in to make the peace of Versailles in 1783. But the country was as tired of the Whig oligarchs as it was of George III; and when on Rockingham's death an unprincipled coalition of North and Fox imposed a government on both king and country, George was soon able to dismiss it and put the younger Pitt in office. But he only beat the oligarchs at the price of giving himself a master in a premier dependent upon the constituencies; and the surprising general election of 1784 was a triumph for the minister rather than for the monarch.

The Younger Pitt

Pitt began as an independent Whig with Liberal tendencies. He favoured financial reform, established freer trade with France, sought to establish it with Ireland, reduced tariffs, introduced bills to reform the parliamentary system, and advocated the abolition of the slave trade. The French Revolution made him, if not a Tory, at least a Conservative. At first he welcomed the Revolution, though with less enthusiasm than Fox. Pitt never, indeed, committed the folly of endeavouring to establish a reactionary government in France by the force of foreign bayonets; and he was driven into war, not so much by the crimes of the Jacobins and the consequent agitation in England, as by their insistence on releasing the navigation of the Schelde from the fetters which English and Dutch commercial jealousy had imposed since 1648.

In the struggle that lasted from 1793 to 1815 Great Britain played the leading and lasting part because in that country, despite reaction, there was a more popular foundation for government than on the Continent. But she was enabled to hold out only because she confined her energies for the most part to the war on sea. Her inefficient and insignificant contingents were soon swept out of the Low Countries; her landings in France and Flanders nearly all failed; and she did not intervene in the Peninsula until a popular rising had prepared the way.

Even these efforts would have been impossible without the command of the sea, and French aggression in Europe was partly dictated by the need for fleets to counteract this disability. Howe had destroyed the French Atlantic fleet in 1794; the Spanish fleet, which the French had commandeered, was annihilated at Cape St. Vincent in Feb., and the Dutch off Cam-

perdown in Oct., 1797; Nelson sank the Mediterranean fleet at the battle of the Nile in 1798, and destroyed the Danish at Copenhagen in 1801; at Trafalgar in 1805 he disposed of the French and Spanish vessels which Napoleon had collected, and in 1807 a new Danish fleet was seized at Copenhagen. Masters of the seas, the British were able to seize whatever colonies they chose belonging to France and her allies.

Only command of the sea saved Ireland for the British Empire and prevented the French from rendering to the Irish rebellion of 1798 the service they had rendered to the American insurgents in 1778-81. That success had helped to precipitate England's recognition of Irish legislative independence in 1782. The rebellion which followed 16 years later was the outcome of one of the worst governments in Europe, and Pitt thought that Union, coupled with R.C. emancipation, would at least be an improvement. George III's scruples foiled his hopes of emancipation, and he had to purchase the consent of a corrupt Irish parliament to the Union of 1800.

Coalitions Against Napoleon

Meanwhile the Continental allies wearied sooner than the British of a struggle which brought them relatively little advantage. The first coalition, financed by Pitt, broke up in 1795, his second in 1801; and Pitt resigned either because he could not carry Irish R.C. emancipation, or because he preferred to leave to another the unpalatable task of making the temporary peace of Amiens. The renewal of war in the following year recalled him to a brief term of office, darkened by Napoleon's crowning victory of Austerlitz, glorified by Trafalgar, and ended by Pitt's death on Jan. 23, 1806. He was succeeded by a coalition called the ministry of All the Talents; but Fox died eight months later and subsequent govts. grew more and more Tory.

In 1808 the war took a fresh turn with the Spanish insurrection against Napoleon and Wellington's expedition to the Peninsula. But it was slow progress. Napoleon had little difficulty in crushing Austria in 1809, but in 1812 the disaster of the Moscow expedition made Spain a secondary sphere of operations. First Prussia and then Austria threw in their lot with Russia, and at Leipzig in 1813 Napoleon's armies in Germany were annihilated. Napoleon

abdicated and was exiled to Elba. He returned later to take advantage of the allies, who had almost come to blows among themselves; but they closed their ranks, and Wellington defeated Napoleon at Waterloo on June 18, 1815. The pick of the British troops had been sent to fight the U.S.A. in a fratricidal war which broke out over the British blockade, provoked by Napoleon's Berlin and Milan decrees, and was happily brought to an end by the treaty of Ghent in 1814.

The Congress of Vienna

The congress of Vienna, established peace on the principle of a balance of power, and sought to enforce it by an informal confederation of Europe. The idea of this balance was that there should be five or six great states with power reasonably distributed among them so that no single one should be able to dominate Europe as France had done for 20 years. Great Britain, however, would tolerate no balance of power on the sea nor in any other continent, and clung tenaciously and successfully to her gains in three-quarters of the globe. Nor was there unity of spirit in the confederation of Europe. The three autocracies, Russia, Prussia, and Austria, subscribed in 1815 a document known as the pact of the Holy Alliance, which was to guarantee legitimate monarchs as a band of brothers against revolutionists and usurpers. Great Britain refused, on Castlereagh's advice, to sign; dissociated itself from the efforts of its allies to repress popular insurrection in Italy and Spain; and, led by Canning, in 1823 joined with President Monroe in threatening armed resistance if the Holy Alliance attempted to recover for Spain her revolted South American colonies. Finally, at Navarino, in 1827, Russia, France, and England helped insurgent Greece to break the Turkish yoke.

The repressive system of the restoration had failed to crush the germs of liberal nationalism sown broadcast over Europe by the French Revolution and Napoleon's armies; and the growing spirit of foreign peoples encouraged the revival of Liberalism in Great Britain. The years succeeding the war were unhappy, and the nation descended from the glory of Waterloo to the squalid massacre of Peterloo. No democratic franchise helped to mitigate the burdens bequeathed by the war or apportion the profits produced

by the industrial revolution; and high prices were perpetuated by deliberate legislation like the Corn Laws. Political despotism, secured to the landed classes by the unreformed parliamentary system, was used to deny to others the means of social redress; and the combination of artisans or agricultural labourers was made a crime punished by transportation. They were even denied the education which might have enabled them to appreciate the value of the machinery they broke. Instead the Habeas Corpus Act was suspended, the Six Acts were passed to protect the *status quo*, and discontent, denied legitimate expression through the franchise, was driven to find vent in riots and conspiracies.

In 1822 the more liberal Peel succeeded Sidmouth as Home secretary, and Canning took Castlereagh's place at the foreign office; while in 1823 Huskisson became president of the board of trade, modified the Navigation Acts, and removed some of the restrictions on the working classes. In 1825 a Catholic Relief Bill, though rejected in the lords, was passed by the commons, and in 1827 Canning succeeded Liverpool as prime minister. He died a few months later, and in 1828 Wellington became premier with Peel, Huskisson, and Palmerston as secretaries of state. The Tory government was assuming an almost progressive hue, and in 1828-29 the Test and Corporation Acts were repealed and R.C. emancipation carried, partly as a result of O'Connell's agitation in Ireland. In 1830 William IV, who posed as a Whig, came to the throne, and Wellington, who had declared against parliamentary reform, was replaced by Grey.

The Reform Act, 1832

The government bill having been emasculated in committee, parliament was dissolved and the Reformers returned with a great majority; the bill was passed by the commons with a majority of 109, but thrown out by the lords. A third Reform Bill was destroyed in committee by the lords, and ministers resigned. Wellington failed to form an administration, and the country was saved from revolution by the return of Grey to office with the king's authority to create the peers necessary to pass the bill.

The first reformed parliament, which met in 1833, disappointed expectations. Slavery was, indeed, abolished in British dominions by

an Act of that year, the Poor Law was reformed in 1834, and municipal corporations in 1835. These measures did not satisfy the Radicals, who began to lose faith in the Whigs, and in 1838 the Chartist movement was founded. At the same time the lukewarm reformers turned Conservative, and Peel, who had made two ineffective attempts to form a government, succeeded in driving Melbourne from office in 1841 and obtaining a majority at the ensuing general election. Simultaneously Cobden started the Anti-Corn Law agitation, and free trade became the dominant issue in politics.

Peel was reluctantly convinced, partly by famine in Ireland, of the need of repeal, which he carried in 1846, thereby breaking up his party and putting an end to his own political career. Russell became prime minister and passed a succession of measures, culminating in the repeal of the Navigation Acts in 1849, and Gladstone's abolition of protective duties in 1853, which completed the freeing of trade. The motives of the Cobdenites were somewhat mixed; they wanted cheap food partly at least because they wanted cheap labour, and even Bright was singularly indifferent to the conditions under which the workers laboured. As a protest against these conditions the Chartist movement came to a head in 1848. It died away, but five out of the six points of the Charter have since been carried.

Imperial Expansion

The best work of Russell's administration was done in the development of colonial self-government. The first half of the 19th century had been a period of great imperial expansion. Most acquisitions were treated as crown colonies and governed from Downing Street; but representative institutions had been established wherever there was an adequate white population. The growth of the overseas dominions involved an increasing obligation to maintain their communications; and while naval supremacy was enough to protect sea-routes, it could not relieve Great Britain of anxiety with regard to the land approaches to India, where British expansion was accompanied by a Russian advance across Siberia and in Central Asia. The frontiers of the two empires were continually approximating, and the farther the British boundary was pushed the greater grew the alarm for its security. To bolster up the decadent Turkish empire became a cardinal

point in British foreign policy. This in its turn involved a nearer risk of war with Russia than the danger to the Indian frontier.

The same language was used in England about Russia in the 'fifties as about Germany 60 years later, and in 1854 the Crimean War broke out. Napoleon III's restoration of the French empire in 1852 was condoned in consideration of his services as an ally against Russia, but both countries had cause to regret in later days their Crimean crusade. The conduct of the war reflected little credit upon the Allies, and a peace was made in 1856, not a clause of which stood the test of time.

India and the Crown

The war was concluded before the Indian Mutiny broke out in 1857, and after harrowing sieges of Delhi, Lucknow, and Cawnpore, it was suppressed in 1858. It was clear that a change in the government of India was essential. The East India company had grown from a trading concern into the owner of an empire. Pitt's India bill of 1784 had given the crown a joint control with the company, and an Act of 1833 had vested the supreme direction of the government in a governor-general and council. Now in 1858 a new India Act transferred all the territories and powers of the company to the crown; and a secretaryship of state for India was established, corresponding to the secretaryship for the colonies which had been separated from the War office in 1854. The imperialisation of India was completed by Disraeli's Act of 1876 conferring on Queen Victoria the title of empress of India. A less glittering but more substantial step towards imperial organization was taken when the Dominion of Canada Act was passed in 1867.

Meanwhile domestic politics stagnated under the soporific influence of Palmerston, who limited his turbulence to foreign affairs. Derby, with Disraeli as his chancellor of the exchequer, had ousted Russell in 1852, but speedily fell before a coalition of Whigs and Peelites under Aberdeen. The latter succumbed to the mismanagement of the Crimean War in 1855 and Palmerston succeeded. He, too, fell in 1858; Derby's second attempt was hardly more permanent than his first; Palmerston came back and his ministry survived until his death in 1865.

His disappearance removed one of the two rival leaders, and Russell re-entered to resume the work of domestic reform. Gladstone was

his moving spirit, as Disraeli was Derby's; but the ministry's Reform bill was defeated by a secession called by Bright the Cave of Adullam, and Russell resigned. Derby essayed a third administration, but resigned after 20 months. He had described as a leap in the dark the Reform bill of 1867, which Disraeli carried through parliament, but had taken it, as he expressed it, to "dish the Whigs." Disraeli became prime minister in Feb., 1868, but was defeated in the elections of the autumn, and Gladstone formed his first cabinet.

Its reforming activity far surpassed that of its predecessors. The Irish Church was disestablished and partly disendowed in 1869. In 1870 the first of the great Irish Land Acts was passed, and Forster's Act set up public compulsory education by means of popularly elected school boards. In 1872 the Ballot Act established secret voting at parliamentary (other than university) elections; the judicial system was remodelled by the Judicature Act of 1873; and the purchase of commissions in the army was abolished by order in council. Public opinion approved of the neutrality maintained by the government during the Franco-Prussian War, but was more critical of the submission to arbitration of the dispute with the U.S.A. over the Alabama. Other Acts abolished religious tests at Oxford and Cambridge, and enabled Anglican clergy to divest themselves of their orders. Finally, Cardwell cured the army for the time of the paralysis which beset it.

Disraeli's Imperialism

The government, defeated over its Irish University Bill in 1873, remained in office until in Jan., 1874, a dissolution was followed by a Conservative victory at the polls. Disraeli came for the second time into office as prime minister and for the first time into power; and his advent diverted public attention from domestic problems to foreign and imperial policy. He represented one stream of public opinion as Gladstone stood for the other; and Disraeli's administration saw the first outburst of modern British imperialism. His first achievement was the purchase in 1875 of shares in the Suez Canal.

The construction of this canal by de Lesseps in 1869 had profoundly altered the strategic situation of the British Empire by providing a sea-route to India three weeks shorter than that round the Cape. The purchase of these shares led by reluctant steps to an increasing

amount of British intervention in Egypt, until the whole of its territories and a good deal more passed under British control. Similar interests involved the government in Afghan wars to counter the advance of Russia, and encouraged a pro-Turkish policy which hampered the liberation of S.E. Europe, brought the nation to the verge of war with Russia in 1877-78, and facilitated the establishment of German influence in the Balkans as a counterpoise to Russia's.

The Transvaal and Egypt

Disraeli's indifference to Turkish atrocities had, however, alienated large sections of British opinion, and the "peace with honour" which he brought back from the congress of Berlin in 1878 was a feeble set-off against the indignation which Gladstone evoked by his pamphlets and his Midlothian campaigns. The general election of 1880 returned the Liberals to power with a large majority, and Gladstone, who had retired from leadership in 1874, was found to be the only possible premier. His second administration, 1880-85, had a chequered career, partly due to troubles it inherited and partly to its own divisions and mistakes. The Transvaal Boers revolted and were regranted their independence after winning the battle of Majuba, but British prestige was restored in Afghanistan by Roberts's march to Kandahar.

In Egypt the dual control of England and France, established in 1876, created friction and discontent; and France withdrew, leaving her partner to deal with the formidable native revolt raised by Arabi Pasha in 1882. Alexandria was bombarded and Arabi's revolt crushed, but a more serious religious movement broke out in the Sudan under the Mahdi. Gordon went to Khartum to see what could be done by moral suasion; he was there besieged by the Mahdi's forces and killed in the capture of the place in 1885, while an expedition under Wolsley was coming to his relief. Ireland was even more troublesome. The mild Home Rule movement which Butt had led in the 'seventies was supplanted by the more aggressive policy of Parnell, which sought by obstruction to render the transaction of business in parliament impossible, and well-nigh paralysed the arm of the law in Ireland. The chief domestic measure of the government was the Franchise and Redistribution Act of 1884-85, which gave the vote to some two million agricultural labourers, and

extinguished a number of small boroughs.

In 1885 Gladstone's government was defeated on the budget, and Salisbury took office without a parliamentary majority, pending the result of the general election to be held under the new Franchise Act in the autumn. The new voters gave the Liberals a majority of more than 80 over the Conservatives; but there were 86 Home Rulers, and Salisbury continued in office to see what they would do when parliament met in 1886. His government was defeated on Jan. 27, and Gladstone formed a ministry pledged to some form of Home Rule. Hartington and Goschen refused to join it; Chamberlain resigned before the bill was produced; and Bright announced his opposition.

Nearly 100 Liberal members followed their example and became known as Liberal Unionists. With their help the Home Rule bill was defeated by 30 votes; Gladstone dissolved in July, and Salisbury returned to power with a majority of 116 Conservatives and Liberal Unionists. His six years' administration was marked by the revived coercion of Ireland combined with Liberal Unionist measures for England. Free education was established and county councils were set up, while abroad large parts of Africa were partitioned in 1890 between England and Germany, which also received Heligoland.

End of the 19th Century

Gladstone remained bent on his Irish policy, but at the general election of 1892 he obtained the exiguous majority of 40. He took office for the fourth time and carried a second Home Rule bill through the commons in 1893; but it was rejected by the lords, and his colleagues in the cabinet refused to assent to a dissolution, and differed from Gladstone over the naval estimates. Consequently he resigned in 1894, when Lord Rosebery was chosen premier in preference to his older colleague Harcourt. The government hung on with a majority of a dozen until July, 1895. Then it was defeated on a division, and resigned. Salisbury resumed office, dissolved, and secured a majority of 152 at the general election.

Henow included the chief Liberal Unionists, Hartington, Chamberlain, and Goschen in his government, and his path was further smoothed by dissensions between the Rosebery and Harcourt factions of the opposition. The Jameson Raid was a premature and ill-

advised indication of the direction in which the new government was likely to move; but the reconquest of the Sudan was brilliantly carried out by Kitchener in 1896-98, and an awkward dispute with the U.S.A. over the boundary between Venezuela and British Guiana was satisfactorily settled. An excellent Irish Local Government Act was passed in 1898, imperial penny postage was established, Weihaiwei was impulsively annexed, and parliamentary sanction was given by the Commonwealth of Australia Act of 1900 to the federation of the six Australian states.

But the disputes with the Transvaal were not well handled, and a war broke out in 1899, which lasted three years and added nothing to Britain's reputation.

A. F. Pollard

Men and materials for the S. African War were drained out of the country for nearly three years before the inevitable victory over the Boers added the Transvaal and Orange Free State to the British empire. In the midst of it a general election returned the Unionist party to power with a smaller majority. The death of Queen Victoria in 1901 wrote finis to an epoch. To the mental and material triumphs of the Victorian age succeeded the Edwardian decade whose freedom and gaiety served to disguise the drift to European catastrophe.

An "entente" permitting a free hand for France in Morocco and for the U.K. in Egypt promised better relations between the two countries, but public interest focused rather on Chamberlain's dream of an imperial customs union and the campaign for tariff reform which led him to leave the govt.; also on Balfour's Education Act of 1902, which caused a Nonconformist passive resistance movement in protest against the obligation to contribute as ratepayers to church schools. Balfour succeeded Salisbury as premier in 1902 and remained until the end of 1905, his govt. becoming increasingly unpopular and ineffectual. Its policy of supplying cheap Chinese labour for the Transvaal gold mines played a considerable part in the election of 1906, which brought the largest turnover of votes for 80 years and put the Liberals in power with the huge majority of 350, under Sir H. Campbell-Bannerman. The Liberals were supported by 51 Labour members, now represented in any strength for the first time.

The house of lords soon showed itself determined to prevent Lib-

eral reforms from reaching the statute book. But solid achievements were recorded. The Boers were entrusted with responsible self-government, which paved the way for the Union of S. Africa in 1910. The army was reorganized, old age pensions were introduced, and trade boards set up to regulate sweated industries. On the other hand, three attempts to deal with education petered out, an instalment of Irish home rule was abandoned, and a licensing bill which would have closed 30,000 public houses in 14 years suffered a similar fate. The hostility of the upper house reached new heights when Lloyd George, chancellor of the exchequer in Asquith's ministry (Asquith had succeeded Campbell-Bannerman in 1908), brought in the so-called "people's budget" of 1909, which included land taxes. Inflamed by Lloyd George's speeches at Limehouse and elsewhere, the lords decided to reject the budget and "damn the consequences."

Stormy Years

Constitutional battle was now joined. An election early in 1910 reduced the Liberal majority, but Asquith proceeded with a bill denying the right of the lords to veto any money bill and reducing the veto to a suspensive one. Edward VII died with the issue still clouded. After an abortive conference between representatives of the two parties, a second election was held before the year's end, but this produced little change. Asquith announced that the new king, George V, would exercise his prerogative to create enough new peers to secure the passing of the bill. The Act ultimately went through the house of lords in 1911, by a majority of 17. The first use to be made of it was to pass measures for Irish home rule and Welsh church disestablishment.

Meanwhile militancy at home continued with the threat of armed resistance in Ulster if home rule was implemented; with the growth of "direct action" in industrial disputes, many strikes and lock-outs culminating in the national railway strike of 1911 and the great coal strike of 1912; and with the disturbances by "suffragettes" which reached alarming proportions. Abroad the same spirit waxed strong. The Agadir incident (1911) brought the U.K. and Germany to the brink of conflict. Popular clamour for dreadnoughts to counter German naval building intensified the armaments race still further.

War, when it came in 1914, began in the east, but with Germany's invasion of Belgium the "scrap of paper" which bound Great Britain to the Continent was invoked, and domestic differences were sunk at once in a national effort which brought a million men voluntarily to the colours in five months. However, trench warfare in Europe put a heavy strain first on enthusiasm, then on endurance. An attempt to sidetrack the western front at Gallipoli failed, and this, together with a revealed shortage of shells, hastened the formation of a coalition govt., under Asquith. During 1915 the country learned to accept high prices, and the trade unions to accept dilution of labour and the employment of women in industry.

With total conscription early in 1916, the U.K. was organized on a war footing.

The year 1916 brought the horror of the first air raids and the boon of "summer time." Intrigues in and out of parliament coincided during the winter with a general feeling of stalemate to oust Asquith and install Lloyd George as premier. This rift between old colleagues marked the beginning of the Liberal party's decline, but the running of the war was smoothed and accelerated. New ministries were given to business men. The U-boat attempt to starve the British Isles was met in 1917 and 1918 by Q-ships, armed merchantmen, the convoy system, and rationing. The entry of the U.S.A. into the war in 1917 and the Russian revolution tended to obscure such important domestic events as the giving of the vote to women (over 30) and the setting up of Whitley councils to resolve industrial disputes. In 1918 the war objective was narrowed to the western front. Internal dissensions marred the last months before victory, and the extension of conscription to Ireland gave Sinn Féin its chance. When Armistice was called in November, an exhausted community was gripped by an influenza epidemic which took toll of thousands of lives.

Lloyd George's 2nd Coalition

The "coupon" election of 1918 returned Lloyd George's coalition to power, but the tactics employed embittered political life and fomented industrial discord. The only substantial achievement of 1919 was the Addison housing scheme which provided badly needed working-class suburbs. Otherwise a succession of strikes, of which the most serious was on

the railways, involved the equivalent of 100,000 men every day of the year. As the flush of victory, during which demobilised servicemen had been absorbed into industry, faded, unemployment rose to one-and-a-half million and stayed there. A miners' strike failed, and wages fell generally. At the Peace Conferences, nationalism, insistent on territorial adjustments and unreal reparations, ran rife; the wisdom of the British representatives was not conspicuously greater than that of their allies. Ireland, India, and Egypt took steps towards freedom, though not before blood had been spilled. Bloodshed in Ireland was rife, where what was in effect a guerrilla civil war raged until the treaty of 1922 brought into being the Irish Free State. Thenceforward the United Kingdom was not the U.K. of Great Britain and Ireland, but only of Great Britain and Northern Ireland; and Northern Ireland had her own parliament in Belfast.

Return to Conservatism

In 1922 the coalition government fell after a revolt by Unionist "back benchers," and the Conservative leader, Bonar Law, for long the lieutenant of Lloyd George, entered upon a few months of power before his death in 1923. His one-word policy, "tranquillity," was adopted by his successor, Baldwin. But in 1923 Baldwin went to the country on tariffs, which proved still unpopular. Liberals and the Labour party combined against him, and were in the majority, with Labour the second strongest party in the house. Baldwin resigned, and the first Labour govt. was formed by Ramsay MacDonald. The latter also placed himself at the foreign office, and the acceptance at a London conference of the Dawes Plan for the settlement of German reparations by the principal belligerents of the war was a personal triumph. But Russian relations proved more intractable, and the "Zinoviev letter" helped to put the minority government out after only a few months.

Baldwin's second government, swept into power, faced a serious threat to parliamentary authority when the T.U.C. called a general strike in 1926 in support of the miners. The national stoppage lasted nine days, but the mines were idle for six months. The cost to the nation was incalculable. Two quiet years were followed in 1929 by the first election in which all adults were entitled to vote, and

Labour became the largest party in the house. Dependent on Liberal neutrality, however, the new government found legislation difficult, and a solution to unemployment, swollen by 1931 to 2½ million, impossible. The economic weakness of the U.K., exposed by the May report of 1931, led to "a flight from the pound," and in the emergency a national government was formed. Though this failed to keep the country on the gold standard, it received overwhelming support at the polls. In the next few years progress towards recovery was marked by the final abandonment of free trade and the introduction of government marketing schemes for agriculture, termed "socialism of the right." MacDonald retired in favour of Baldwin in 1935, and the "Samuelite" Liberals left the ministry, which though predominantly Conservative, clung to the "national" label, even after the election of 1935 confirmed the Conservative majority.

The Darkening Prospect

Before the year was out the Italian invasion of Abyssinia and the attempt to impose sanctions on the aggressor had recalled the country to anxious contemplation of a steadily darkening international horizon. In 1936 Mussolini triumphed in Africa, in the face of a League of Nations equally powerless to arrest Hitler in the Rhineland or the intervention of both dictators in the Spanish Civil War. The government's policy of "non-intervention" was strongly criticised, as was its slowness in re-arming.

The death of George V in 1936 was quickly followed by the abdication of Edward VIII in order to marry the woman of his choice, an incident which might well have shaken the prestige of the British crown had it not been handled with consummate tact by Baldwin, in conjunction with the governments of the various dominions in the Commonwealth. Baldwin was succeeded by Neville Chamberlain, son of Joseph, who developed a foreign policy of appeasement, which led to the prolonged crisis over German demands on Czechoslovakia in 1938, and his three meetings with Hitler, culminating in the Munich agreement. His optimism, following that agreement, in seeing it as a sign of "peace for our time" was short-lived. Preparations for war were advanced, and Hitler's betrayal of the agreement in March, 1939, was the end of appeasement. The

1939 budget allocated £580 millions to service requirements, including civil defence. Hitler's entry into Prague and Mussolini's invasion of Albania caused British pledges to be given to Poland, Greece, and Rumania. The keynote of the new foreign policy was resistance to aggression; its logical result was conscription, introduced for the first time in history while the U.K. was nominally at peace. The British pledge to Poland was implemented two days after the German invasion of Sept. 1, 1939. For the second time in 25 years the U.K. declared war on Germany and a war cabinet was set up immediately.

Kenneth Adam

During the first quiescent months of the war the govt. remained virtually a Conservative govt. The Labour opposition, though wholeheartedly supporting the war effort, made it clear that they would not serve under Chamberlain. The apparently complacent inactivity of the govt. and the shock of the Allied defeat in the Norway campaign of April, 1940, caused much dissatisfaction, and it became obvious that Chamberlain's ministry had suffered a serious diminution of confidence in parliament and in the country, and that a government on a broader base was essential to counter the full impact of war and lay the foundation of victory. Labour indicated its willingness to join a coalition administration under Winston Churchill, and on Chamberlain's resignation in May, 1940, Churchill became premier.

Churchill as Premier

The change was appropriately timed, for it was made on the very day that Hitler's "blitzkrieg" was turned upon Belgium, the Netherlands, and France. Under Churchill the national will to victory was at once rekindled. His coalition of Conservatives, Labour, and Liberals remained in power and almost unassailable until victory over Germany was achieved five years later. In Churchill was revealed a man as powerful in leading the national spirit as in expressing it, and the country set itself determinedly to wage total war, accepting its inevitable suppression of innumerable cherished personal rights and hard-won freedoms. That spirit was about to be tested to the limit. For before the end of the month the armies of the Netherlands and Belgium had surrendered and the defeated B.E.F. was saved only by the "miracle" of Dunkirk. Eighteen

days later the armistice was signed between Germany and France. The United Kingdom, with the British Commonwealth and Empire, stood alone at the most perilous moment of her history, facing an enemy who occupied as a conqueror the W. coast of Europe from Norway to the Pyrenees, an enemy swollen with success and ready to strike again. It is understandable that not only the enemies of the U.K. but many of her friends thought that a long chapter of glorious history was about to end in unmitigated defeat.

The "Finest Hour"

But the people of the U.K., led by Churchill, refused to see it that way. They entered what Churchill, in one of many inspired phrases, hoped would be "their finest hour" with nothing but firm faith in ultimate victory, and awaited the onslaught calmly. The country became an armed camp—the emphasis in the earliest weeks being on the camp rather than the arms, which were all too few. Among the most remarkable manifestations of the time was the enthusiastic rush of a million volunteers to join the Local Defence Volunteers, later the Home Guard. Large areas of the country were militarised and forbidden to civilians. Plans were made to meet the probability of armed invasion.

But in Aug. and Sept., 1940, the course of history was deflected from the strict line of probability by the defeat of the German Luftwaffe by squadrons of the R.A.F. ("the few") in the air battle of Britain, one of the decisive battles of all time. The German plan of invasion was frustrated, and that particular peril passed. Nevertheless large-scale death and destruction in warfare came again to Great Britain, after a lapse of centuries, with the German air raids on the civil population. These were first made on an intensive scale from Sept., 1940, until June, 1941, and continued intermittently throughout the war, until they reached a climax in assaults by flying bomb and rocket bomb in 1944-45. Most large centres of population suffered, notably London, but also Merseyside, Clydeside, Belfast, Manchester, Sheffield, Bristol, Coventry, Birmingham, ports such as Plymouth, Hull, and Southampton, many seaside towns, and such cathedral cities as Exeter, Norwich, Canterbury, and York. Moreover, innumerable smaller towns, villages, and hamlets had

to bear with equal fortitude the ravages of war, e.g. Petworth, Sussex, where a bomb falling on a school wiped out almost a whole generation of the town's children. In addition the Dover area was within range of constant hostile shell-fire. Nowhere was there any flinching of morale. Civilians became painfully accustomed to the noise of battle as planes and A.A. guns fought the menace. A highly organized system of civil defence was of incalculable value in sustaining high standards of courage and efficiency in the face of the prolonged danger.

Meanwhile the U.K. acquired a new importance as the rallying ground for the fighting forces and governments of those countries which had been occupied by Germany. Poles, Czechs, Dutch, Belgians, Norwegians, the Free French, and forces of the British dominions and colonies were presently, when the action of Japan had made that country as well as Germany the enemy of both the U.K. and the U.S.A., joined by the U.S. troops in such numbers as to form in many areas an army of friendly occupation. The intensive air bombing of German industry and communications was carried out from the U.K. bases. From the shores of the U.K. that great army of liberation known as the Allied Expeditionary Force was gradually assembled, and from the shores of the U.K. it set forth in June, 1944, to liberate Europe and achieve complete victory.

Socialists in Power

With the end of the war in Europe in May, 1945, the coalition broke up. Churchill continued as prime minister of a so-called "caretaker" govt., mainly Conservative, pending a general election, which followed in July. Labour was returned with a majority over all other parties, and so for the first time attained government with power. The Labour party had won on a programme in which high place was given to proposals for nationalising the country's chief assets and industries, and they soon set about the fulfilment of the programme. The bank of England, the coal industry, the supply of electricity and gas, and the railways were all nationalised within the next three years, and in 1949 a further Act was passed for the nationalisation of the iron and steel industry at a later date. To ensure its passage a special session of parliament was called to pass a new Parliament Act, reducing the period for which the house of lords

could delay the passing of any bill. In addition a comprehensive scheme of social insurance was introduced, including a national free health service for all. The government also maintained a tight hold upon most of the industrial and trade controls of wartime.

Economic Exhaustion

These measures were met by sustained high taxation, and were thus sound enough by internal book-keeping. But the war had left the U.K. in very real danger of bankruptcy. Overseas assets had been so drawn upon as to leave relatively negligible reserves. While the war lasted, the effects of the U.S.A. Lease-Lend system had served to disguise the truth, but when the U.S. declared Lease-Lend at an end immediately after the victory over Japan in Aug., 1945, it was obvious that the U.K. could not for long continue to pay for imports not only of food but of the raw materials necessary for any real revival of her industry and her export trade. A loan to the U.K. of \$3,750,000,000 was therefore granted by the U.S.A. for the purchase (mainly in the U.S.) of necessary food and materials to tide the country over a difficult period. This was originally calculated to last until 1951, but with the rise in U.S. prices and a period of "convertibility" it was almost spent by mid-1947, by which time the exports of the U.K., though satisfactorily higher in total value than before the war, were still a long way from being sufficient to balance imports.

Further time in which to foster the drive for increased exports was given through the launching by the U.S.A. in 1948 of the European Recovery Programme (q.v. in N.V.). Nevertheless, the economic situation of the U.K. remained precarious, the export of British goods being hampered by the high price of such goods in the dollar area, and late in 1949 the govt. therefore introduced a measure of devaluation of the £ sterling in relation to the dollar.

Hostility to the European Recovery Programme by the U.S.S.R. and those countries under her immediate influence served to heighten in the eyes of western Europe and the U.S.A. the menace of Communism and the possibility of a further extension of Russian dominance. Steps towards military union were therefore taken by the U.K. in concert with certain other countries of W. Europe, as an important part of a general programme of Western Union

(q.v.), and these were in 1949 merged in the North Atlantic Treaty (q.v. in N.V.).

In June, 1950, confronted with military aggression by the Communists of N. Korea against S. Korea, the U.N. authorised military assistance to the latter. With naval and air forces the U.K. gave immediate practical support to the U.N. decision, and later sent an army detachment. But the fact of Communist aggression, and its initial success, revealed the urgent and paramount necessity of increased expenditure on rearmament and defence.

Meanwhile, a halt had been called to nationalisation plans as a result of a general election in 1950. Labour remained in office but with a majority over all other parties so small (between 10 and 15) as to preclude further experiment.

Thus the middle of the century found the U.K. under heavy material and economic handicaps with the added anxiety of the possibility of a third war; yet in every respect other than the material retaining her former position as a leader in the comity of nations, and sustained by the hope that in company with the other nations of the Commonwealth she might yet help to constitute the most powerful balancing force in the shaping of the world's future.

United Methodist Church. Former religious denomination constituted 1907 from the amalgamation of three Methodist churches: the Methodist New Connexion, founded 1797 by seceders from the Wesleyan Methodists following a dispute over

greater powers for the laity; the United Methodist Free Church, formed 1857 by the union of the Wesleyan Methodist Association and the Wesleyan Methodist Reformers (sects formed 1835 and

1849 respectively); and the Bible Christian Church (*q.v.*), founded 1815. In 1928 the United Methodist Church became part of the reunited Methodist Church. See Methodism.

vote. The regular session of the assembly opens on the third Tuesday of Sept. each year, but special sessions may be convened by the secretary-general at the request of the security council or of a majority of the members.

The general assembly may discuss, and make recommendations on, any international question within the scope of the United Nations, with the one exception that, if a dispute or international situation is being dealt with by the security council, the assembly cannot intervene unless requested to do so. Essentially a deliberative organ, with powers to supervise, review, and criticise, the general assembly adopts its own rules of procedure and elects its own president and vice-presidents for each session. Most of its work is done in committees. There are six main committees, dealing respectively with (1) political and security matters, (2) economic and financial matters, (3) social, humanitarian, and cultural matters, (4) the trusteeship system and matters relating to non-self-governing territories, (5) the budget of the organization, and (6) legal and constitutional questions. In addition, procedural, standing, and *ad hoc* committees are appointed as required. All committees report to the full assembly, which is responsible for ultimate decisions.

THE SECURITY COUNCIL. This body is charged with the primary responsibility of maintaining international peace and security. It consists of 11 members of the United Nations, each of whom has one representative. China, France, Russia, the U.K., and the U.S.A., in virtue of their special position as great powers, are permanent members of this council. The remaining six non-permanent members are elected by the general assembly. Each sits for a term of two years and is not eligible for immediate re-election. Unlike the council of the League of Nations, the security council functions continuously. As watchdog over the peace of the world, its first duty is to deal promptly and effectively with any dispute or situation which is likely to endanger the maintenance of international peace and security.

Major political issues referred to the security council have concerned Persia, Indonesia, Syria and Lebanon, Spain, Greece, the British complaint against Albania regarding the mining of the Corfu Channel, the conflict between India and Pakistan over Kashmir, and the Berlin dispute between

THE UNITED NATIONS FROM 1945

Leslie E. Aldous, Head of Information Dept., U.N. Association

This article describes the origins, development, and principal organs, together with their functions, of the body set up by 50 nations in 1945. See also Atlantic Charter; Covenant; Dumbarton Oaks; Food and Agriculture Organization; International Court of Justice; International Labour Organization; International Law; League of Nations; Moscow Declaration; San Francisco Conference; U.N.E.S.C.O.; U.N.R.R.A.; Veto

The United Nations is the organization of states created in April, 1945, which replaced the League of Nations. The first step towards the creation of the United Nations was taken on Aug. 14, 1941, when President Roosevelt and Winston Churchill, after a conference aboard a British warship in mid-Atlantic, issued a joint statement of principles and policies which came to be called the Atlantic charter and foreshadowed a peace affording to all peoples a guarantee against aggression and the establishment of a permanent system of general security. On Jan. 1, 1942, 26 Allied nations signed a declaration subscribing to the programme set out in the Atlantic charter.

Four of the great powers—China, the U.K., the U.S.A., and the U.S.S.R.—assumed prime responsibility for planning the new international authority. By the Moscow declaration of Oct. 30, 1943, they recognized "the necessity of establishing at the earliest practicable date a general international organization, based on the principle of the sovereign equality of all peace-loving states, and open to membership by all such states for the maintenance of international peace and security."

Meeting of Fifty Nations

Exploratory discussions, begun immediately after the conference at which this declaration was drawn up, resulted in agreement on certain basic points. Representatives of the four powers conferred at Dumbarton Oaks, Aug.-Oct., 1944, to work out detailed proposals, and in due course invitations were issued to a conference on international organization at San Francisco, held April-June, 1945, which drew up the charter of the United Nations, signed on June 26 by the representatives of 50 nations taking part in the conference. Admissions to the organization during 1946-48 raised the membership to 58 nations; and

the inviting powers on May 4 invited France (who had declined to be an inviting power) on a basis of equality.

The charter, the obligations of which are accepted by all states members of the United Nations, is a much longer and more detailed document than the covenant of the League of Nations. It consists of a preamble and 111 articles, as compared with the covenant's preamble and 26 articles. Six principal organs of the United Nations were established under the charter—a general assembly, a security council, an economic and social council, a trusteeship council, an international court of justice, and a secretariat. During Aug.-Dec., 1945, a preparatory commission met in London to draw up detailed plans for the functioning of these organs, and the general assembly held its inaugural meetings in the Central Hall, Westminster, London, Jan. 10-Feb. 13, 1946. The chief business of this session was to bring the other principal organs into being. Before it adjourned, both the security council and the economic and social council had been appointed, and had started work; a bench of 15 judges of different nationalities had been elected for the international court of justice; and Trygve Lie (Norway) had been chosen as first secretary-general of the United Nations with authority to recruit the necessary staff. The election of the trusteeship council was deferred until the second part of the session, which took place in New York, Oct. 23-Dec. 16, 1946.

THE GENERAL ASSEMBLY. This is a body in which all the members, big and small, meet on equal terms. Each member may have five delegates but has only one

Russia on the one hand, the U.K., the U.S.A. and France on the other.

In virtually all these cases the voting procedure in the security council was found, in practice, to be an obstacle to effective action. This voting procedure had been in the formative stages of the United Nations the subject of prolonged controversy. It was one of the points on which the great powers had been unable to reach agreement at Dumbarton Oaks. Subsequently, after the Yalta Conference of Feb. 4-12, 1945, Roosevelt, Stalin, and Churchill agreed to recommend that decisions on matters of procedure should be made by a majority of any seven of the eleven members of the security council; but decisions requiring action must have among the seven affirmative votes those of all five permanent members. This meant, in effect, that any great power could, if it so desired, exercise a veto on action. Not all the great powers—Great Britain, for example—considered this procedure in the best interests of the new organization; but for the sake of unity, they agreed to unite in urging its acceptance at San Francisco. There they were vigorously opposed by the smaller states. However, after Russia had made it plain that she regarded as vital the veto—or, as she preferred to call it, the principle of great power unity—the San Francisco conference reluctantly accepted the suggested voting procedure as the price of getting a charter. It was, nevertheless, understood that the great powers would exercise moderation in the use of the veto.

Russian Use of Veto

No sooner did the security council start to function, however, than Russia began systematically to invoke the veto in almost every problem which came before that body. Sometimes, as in the Greek question, the effect was to prevent the council from sending a commission of inquiry to the spot; sometimes, as in the Syrian-Lebanese question or the Corfu Channel dispute, the council found itself debarred from formally recommending a solution which seemed just to the majority. Russia also used the veto to prevent the admission to the United Nations of prospective members of whose applications she disapproved. During the first three years of U.N. she used the veto 28 times.

A few months of these delaying tactics in the security council made the majority of United Nations members restive. The general as-

sembly, when it resumed its first session in New York on Oct. 23, 1946, struck a warning note and strongly urged the security council to mend its ways. A year later, on the proposal of G. C. Marshall, the U.S. secretary of state, the general assembly instituted an interim assembly—popularly called the little assembly—to remain in being and bridge the gap between regular sessions of the full assembly. In the event of a single great power misusing the veto in the security council it would be possible for any seven members, as a matter of procedure, to remove the item from the council's agenda. Then the whole matter could come before the assembly, where there is no veto. Thus more use could be made of the assembly as a peace machine. In the meantime, the little assembly was instructed to study the question of "liberalising" the veto in the security council.

THE ECONOMIC AND SOCIAL COUNCIL. This is the body responsible for the constructive side of peace-making. Although some of the most enduring work of the League of Nations was achieved in the sphere of promoting international cooperation, the covenant regarded the various social, humanitarian, and technical activities of the League as sideshows. According to the United Nations conception, peace is not merely an absence of war. Peace is positive and dynamic—an opportunity for all nations to work together in every way possible to make this world a better place for men, women, and children everywhere; hence the immediate setting up of this council.

The economic and social council consists of 18 members elected by the general assembly. The term of office is three years, but retiring members are eligible for immediate re-election. There are no permanent seats reserved for great powers on this council; but in practice certain important countries can be certain of securing election. On all the international economic, financial, social, cultural, educational, scientific, and health matters with which it is concerned, the council may make or initiate studies and may make recommendations to the general assembly. It may call international conferences and prepare draft conventions. It has its own commissions, dealing respectively with (1) economic matters and employment, (2) transport and communications, (3) statistical matters,

(4) human rights, (5) social questions, (6) status of women, (7) narcotic drugs, (8) fiscal matters, and (9) population questions. Regional economic commissions have been established for Europe and for Asia and the Far East. A position of considerable importance is occupied by the "specialised agencies" which, by means of agreements, are gradually being brought into proper relationship with the United Nations. Each is responsible for spadework and planning in its own branch of international cooperation, and recruits its own membership.

Survival from the League

The international labour organization is one of these specialised agencies. Founded in 1919, it is the only part of the League of Nations structure which has survived in roughly its old form and without change of name. It considers labour conditions, industrial relations, employment, social security, and other aspects of international social policy. The food and agriculture organization (F.A.O.), born as a result of the Hot Springs conference of 1943, has as goal the raising of levels of nutrition and the standards of living of the peoples of all countries.

None of the specialised agencies has greater potentialities than the United Nations educational, scientific, and cultural organization (U.N.E.S.C.O., *q.v.*).

Other specialised agencies, either in being or planned, are the international civil aviation organization, the international monetary fund, the international bank for reconstruction and development, the universal postal union, the international telecommunications union, the world health organization, the international refugee organization, the international trade organization, and the United Nations maritime organization.

TRUSTEESHIP COUNCIL. The charter established a trusteeship system for the administration and supervision of territories placed under it by individual agreement. The system applies to territories held under League of Nations mandate; territories detached from Axis states as a result of the Second Great War; and territories voluntarily placed under the system by the states responsible for their administration. Each trusteeship agreement has to be approved by the United Nations. The trusteeship council is the body which, under the authority of the general assembly, exercises the trusteeship functions of the United

Nations. All members administering trust territories sit upon it, as do such permanent members of the security council as are not administering trust territories; the general assembly elects as many other members as may be necessary to balance the number of those who administer trust territories with the number of those that do not.

THE INTERNATIONAL COURT OF JUSTICE. This body is described under its own heading.

THE SECRETARIAT. This is an international civil service, under the control of a chief administrative officer, the secretary-general. At the first assembly it was decided to establish the h.q. of the United Nations at New York. Much of the work, however, is decentralised, and the buildings at Geneva, taken over with the other assets of the League of Nations, are used as a European centre.

United Presbyterian Church. Former separate branch of the Presbyterian Church in Scotland. It was formed in 1847 by the union of the Secession Church (*q.v.*) and the Relief Church, founded in 1750. It united in 1900 with the Free Church of Scotland (*q.v.*) to form the United Free Church of Scotland (*q.v.*) See Presbyterianism.

United Provinces. Former province of India, in 1950 made a state and renamed Uttar Pradesh or Uttar union. Its main divisions are Agra, known until 1901 as the North-Western provinces, and Oudh; and is bounded by Tibet and Nepal on the N., Punjab and Rajasthan on the W., Madhya Bharat, Madhya union, and Vindhya union on the S., and Bihar on the E. It comprises the plains of the Upper Ganges, the Jumna, and their tributaries, and adjacent hill tracts N. toward the Himalayas and S. toward the scarp of the Deccan; it includes a considerable section of the great Indo-Gangetic plain, which is divided into the Great Doab and the lower plains. The Great Doab between the Ganges and the Jumna is a stoneless, flat bed of alluvium, well irrigated and of great fertility, which produces wheat, barley, sugar-cane, cotton, millet, indigo, and opium. The lower plains produce rice.

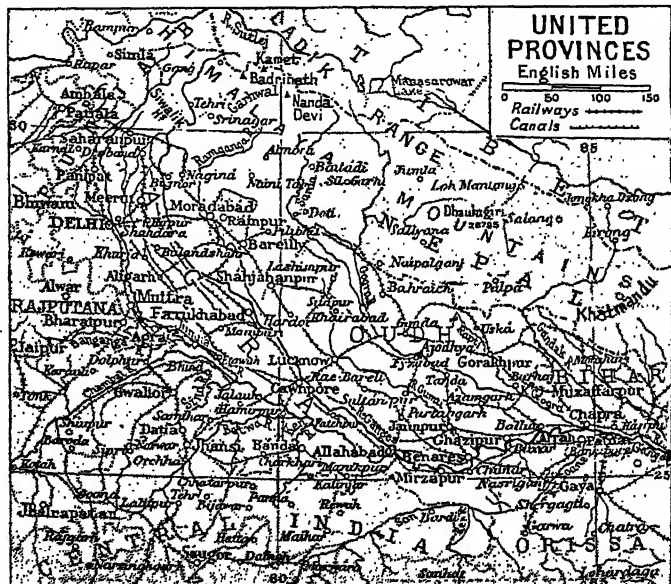

The N. mountainous area contains the Siwalik Hills and the Garhwal section of the Himalayas where are Nanda Devi, Kamet, and Badrinath peaks, all of which exceed 25,000 ft. The Ramganga, Sarda, Gogra, and Rapti flow from the Himalayas, and the Gumti from the Oudh plain, into the

Ganges from the N.; the Chambal, Sind, Betwa, and Ken reach the Jumna from the S.

In this most densely populated state of India, five-sixths of the people are Hindus; most speak Hindi, which in 1947 replaced English as the official language. There are many towns: sacred places like Benares, Muttra, and Ajodhya, ancient and modern capital cities such as Lucknow and Agra, modern manufacturing towns like Cawnpore, centres of river traffic like Allahabad, strategic towns such as Bareilly and Meerut. There are universities at Allahabad, Lucknow, Benares, and Aligarh.

Oudh was added in 1856. From 1877 the prov. was in the charge of lieut.-govs., until 1921, when it became a governorship. On the transfer of power in 1947 Mrs. Sarojini Naidu (*q.v.*) became gov., the first woman to hold such a post. Area 106,247 sq. m. Pop. (1950 est.) 61,620,000.

United Services Institution, ROYAL. British naval, military, and air force institution, founded in 1830. Housed in a building in Whitehall, adjoining the Banqueting Hall, it provides for officers of the fighting services a resort at which professional subjects can be discussed through the medium of

United Provinces, or Uttar union. Map of this state of north-central India

Before the 12th century the area covered by the Uttar union comprised many petty principalities; coherence came with the Mohamedan conquest when Mahomed Ghori, during 1176-93, occupied the whole area as far as Benares.

After the death of Aurungzebe in 1707, the district lapsed into total anarchy, Rohilkhand and Oudh achieving independence, and the Doab being only nominally under the control of Delhi. British power was first exerted in 1763 to repel the nawab of Oudh, who had invaded Bengal. By 1803 various territories in Oudh became British as the Ceded and Conquered Provinces, administered from Bengal. In 1816 N. dists. were taken from the Gurkhas, and 20 years later these areas became the North-Western provinces.

lectures, or studied with the help of a service library and a quarterly journal. The United Services Museum has a collection of naval and military trophies, relics, models, medals, pictures, prints, uniforms, badges, etc.

United Society for Christian Literature. Religious organization in Great Britain. It stimulates publication of literature devoted to Christian purposes, mainly in cooperation with missionary societies, and has produced books in more than 340 languages. The oldest interdenominational body of its kind, it comprises the Religious Tract Society, 1799; Christian Literature Society for India and Africa, 1858; and Christian Literature Society (Scotland) for China, 1884. Its London h.q. is at 4, Bouverie St., E.C.4.

THE UNITED STATES OF AMERICA

S. K. RATCLIFFE, Peterson Lecturer, N.Y.C., etc., and Others

See the articles on the mountains and rivers of the U.S.A., e.g. *Appalachians*; *Mississippi*; *Missouri*; *Rockies*; also those on the states and cities. See also *American Civil War*; *American Independence, War of*; and biographies of *Lincoln*; *F. D. Roosevelt*; *Washington*, and other leaders. For later history see N.V.

The United States of America occupies the whole of the S. part of the N. American continent, excepting Mexico.

It extends from the Atlantic to the Pacific Ocean, and from the Canadian frontier to the Gulf of Mexico, the extreme measurements being from E. to W., 2,700 m., and N. to S., 1,600 m. The territory covers 2,977,128 sq. m.

The physical form of the country is roughly made up of two great mountain ranges, the Appalachians and the Rockies, neither for the most part very high, and of vast plains between them. East of the Appalachian range, however, are the Atlantic coast lowlands, a great part not more than 200 ft. above sea level, and consequently including much marshland, of which Dismal Swamp, in Virginia and N. Carolina, is the best known example. On and near the N. Atlantic coast are the most thickly populated regions, and those with the longest history of white settlement.

Development Westward

For a long time the Appalachians were a barrier to the westward extension of settlers; it was only when they were crossed and the valley of the Mississippi, with its fertile lands stretching for hundreds of miles, was colonised that the real development of the U.S.A. began.

E. of the Rocky Mts., which form the main watershed of the country, lie the Bad Lands (*q.v.*) and the prairie belt. The Coast Range, with the parallel inland range formed by the Cascade Mts. and Sierra Nevada, is separated from the W. coast by the narrow Pacific Slope, a fertile region with a genial climate. The broad zone between the Rocky Mts. and the Sierra Nevada consists of a high plateau, broken by depressions. It contains the Great Basin, chiefly in Utah and Nevada, a large area of internal drainage.

The Missouri-Mississippi is the most striking physical feature of the country. About 4,000 m. in length, it has a basin surpassed in

area only by that of the Amazon. In Louisiana it turns the surrounding country into a vast swamp. It also washes away to the sea millions of tons of soil every year. The Mississippi river system is by far the most important in the U.S.A.; many of the rivers included in it have a navigable length of hundreds of miles. Few of the rivers discharging into the Atlantic are navigable for any great distance; they include the Hudson, Delaware, Susquehanna, Potomac, Roanoke, and Savannah. Of the rivers draining towards the Pacific the biggest are the Columbia, Sacramento, and Colorado. In lakes the country is rich. In the N.E., close to the Canadian border, are the Great Lakes (*q.v.*), bodies of fresh water of vast size. Between Lake Erie and Ontario, on the river Niagara, are the Niagara Falls, of which the most impressive part is in Canada. The chief lake of the Great Basin is Great Salt Lake. In addition there are many lakes of smaller size, especially in the New England states, New York, and Minnesota.

CLIMATE AND VEGETATION.

The climates vary in different regions, owing to the size of the country. In its N. regions winters are long and severe; its S. extremities lie near the tropics. But the greater part of the country is in the temperate zone, though the summers are much hotter and the winters colder than in W. Europe, e.g. in New York the temp. has varied between 102° F. and -13° F. Sudden changes of weather are frequent, and storms are of great violence. The prevailing winds of the N.W. are from the Pacific Ocean; they give the W. coast a mild and fairly uniform climate. Rainfall is abundant on this and most other coasts; inland it is mostly of smaller quantity; over the barren lands very little falls at any time of year. In Florida and Texas there are regions where tropical vegetation flourishes; in California and the states along the Gulf of Mexico and the Atlantic, as far as Virginia, subtropical plants are found.

The trees and shrubs are immensely varied. Many of the native species are unknown in Europe, but most European species

have been introduced. In the Appalachians the forests are magnificent, and flowering plants grow to perfection. On the prairies there are not many trees save willows and cotton-wood growing by the streams. The planting in this area of screens of trees as windbreaks, and to help to stop soil erosion, has been a feature of U.S. planning since 1933. The W. plains are characterised by the prolific growth of sage-brush. Forests of fir and pine abound in the Rocky mts. in which bears may still be found, though in much smaller number than formerly. The bison is nearly extinct, and the fur-bearing animals are greatly reduced in numbers. The alligator haunts the south-eastern rivers, and the rattlesnake is a pest in many parts. The N.W. rivers abound in salmon.

Marvels of Nature

In Yellowstone Park, a national reserve of territory in Wyoming, there are kept, as far as possible at liberty, many animals that used to roam the country at large, and were in danger of becoming extinct. Here are numerous geysers and hot springs, and there is a Grand Canyon, or gorge, of glorious beauty, though in grandeur it cannot compare with the Grand Canyon of the Colorado river in Arizona. Another marvel of nature, the Yosemite Valley, in California, unites the sublime with the beautiful in its cliffs and crags and waterfalls. As a general rule, the E. is the mixed farming region; the centre the maize (corn) and wheat growing belt; between the Mississippi and the Rockies the grass land area where cattle are raised in enormous numbers; while the S.E. is a cotton and tobacco-growing area.

Proceeding from E. to W., and grouping the 48 states of the Union (*see table*) under convenient headings, those which constitute New England are Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. Next come three Atlantic states, New York, New Jersey, and Pennsylvania, all highly industrialised. The S. states are Delaware, Maryland, Virginia, W. Virginia, N. Carolina, S. Carolina, Georgia, Florida, Kentucky, Ten-

nessee, Mississippi, Alabama, Louisiana. In these, industries progressed slowly for a long time, but in the 20th century they have been making up for lost time; Florida in particular developed shipbuilding and aircraft making during the Second Great War. The middle west includes Ohio, Indiana, Illinois, Missouri, Iowa. The N. central states are Michigan, Wisconsin, Minnesota, N. Dakota, S. Dakota. Arkansas, Oklahoma, Kansas, Texas, and New Mexico have some southern but more western characteristics; Nebraska, Wyoming, Montana, Colorado, Arizona, Utah, Idaho, Nevada are western. The Pacific states are Washington, Oregon, California.

The smallest of the states is Rhode Island, little larger than the English co. of Durham. The largest is Texas, twice the size of the U.K. The territory of Alaska, which belongs to the U.S.A., covers 591,000 sq. m., almost all barren and mountainous. The U.S. government administrators also Hawaii, Puerto Rico, Guam, all the Pacific islands formerly under Japanese mandate, and some of the West Indian and Samoan islands. The Panama Canal zone is under its authority.

Distribution of Cities

Cities are well distributed throughout the country; there are more than a dozen towns with over half a million inhabitants, and smaller ones have multiplied exceedingly since the 20th century began. In the New England states the chief centres of population are Boston, with three-quarters of a million people; Providence, Worcester, New Haven. In the next group come New York, the commercial capital, with seven and a half million inhabitants; Philadelphia, third city in the Union (1,931,334), Pittsburg, Buffalo, Newark, and Jersey City. Of the S. cities the chief are Baltimore, New Orleans, Washington, Louisville, Atlanta, Birmingham, Richmond, and Memphis.

The cities of the middle W. are headed by Chicago, the second city of the U.S.A. (3,396,803); St. Louis, Cleveland, Cincinnati, Kansas City (Mo.), Indianapolis, Columbus, Toledo. In the N. central states are the twin cities of St. Paul and Minneapolis, Detroit, fourth city (1,623,452), and Milwaukee. In the W. and S.W., cities are less frequent and smaller; chief among them are Denver, Omaha, San Antonio, Salt Lake City. In the Pacific states, conditions have produced

<i>District of Columbia</i>	61	938,458		1791

many large towns: Los Angeles, San Francisco, Seattle, Portland, Oakland, Spokane. The city of Washington, the capital, where the president resides, congress meets, and the gov't. offices are, has a pop. of 663,091 and is in a special area, about half the size of the Isle of Wight, created to contain it; this is called the District of Columbia (D.C.).

POPULATION. The est. pop. of the U.S.A. in 1947 was 142,673,000. Est. pop. of the various states in 1945 is shown in the accompanying table. Anglo-Saxon stock still appears to predominate, although a greater total of people are of other stocks, German, Scandinavian, and S.E. Europe having contributed very largely to the American nation. Among foreign-born and first generation U.S.-born, Germans (5,236,612), Italians

(4,594,780), Canadians (2,910,951), Poles (2,905,859), Russians (2,610,244), Irish and Eireann (2,410,951), English (1,975,975), Swedes (1,301,390), Austrians (1,261,246), and Mexicans (1,076,653) were in 1940 the most numerous. In certain cities there are 'quarters' where English is scarcely heard. New York City includes persons of at least 70 national origins. Yet the process of transforming all these various elements into Americans—the biggest single influence in which is the public (elementary) school—goes on steadily. In the second generation they become indistinguishable from those whose families have been American for generations. Only the French Canadians, of whom there is a considerable element in New England and near New Orleans, resist absorption.

American (Red) Indians, the people who inhabited the land when the first white men arrived, never numbered more than a few million, and were sparsely scattered, living for the most part a nomadic life as hunters, except in what is now New Mexico and Arizona, where they had settled communities. Treated by the white settlers even as late as the 1880s as little better than vermin, and like vermin better dead, they appeared in the last years of the 19th century likely to disappear; but a more enlightened approach to the remnants left of their civilization, the strict setting aside of reservations of land for them, and laws forbidding the sale of alcohol in their reservations have effected a change, and their number in 1940 was 333,969 compared with 244,437 in 1900. Although military service was not compulsory for them, many served in the armed forces during the Second Great War.

The Negro in S. and N.

The negroes, descendants of Africans imported as slaves, numbered about 1,200,000, or nearly 25 p.c. of the pop., when the slave trade stopped in 1807; in 1940 they numbered 12,865,518, or nearly 11 p.c. of the pop. Their birth rate is about 24 per thousand, while the white birth rate is about 18.5, so that, although their expectation of life is 50 years instead of 60, following the drastic cut in white immigration in the 1930s there is a tendency for the proportion of negro to white to rise again. Three-quarters of the negroes live in the southern states, where in some areas they constitute 50 p.c. or more of the pop. In the S. they live in separate districts, and are restricted to their own schools (inferior to those of the whites), churches, theatres, and special seats in public conveyances. It was to raise the status of these negroes, and of the poor whites in the S., deprived by state laws or intimidation of most of the rights which the constitution confers on all U.S. citizens, that President Truman insisted on states rights in his 1948 election campaign; and it was this stand by the president that led to the "Dixiecrat" revolt against the Democratic party in the states of Ala., La., Miss., and S.C. There is a progressive spread of negro pop. northwards, where there is still, though less, discrimination—e.g. a negro is usually paid less, even when he does the same work as a white man—but,

though in explosive centres of mixed pop. such as Detroit, there may be "race riots," lynching does not occur, and there is no discrimination in theatres, trains, etc.

GOVERNMENT AND CONSTITUTION. The country, a federal republic of 48 sovereign states, is bound together by the pact of 1787, put in force in 1789. It has a written constitution; each state has a similar fundamental law.

The federal govt., from its seat at Washington, deals with only such matters as the states have delegated to it, and each state retains complete authority over all unenumerated categories. The govt. looks after foreign relations, customs, army and navy and dependencies, and controls interstate trade, post office, currency, bankruptcy, and patents. The tendency is for an extension of federal authority, and the average citizen comes steadily more in contact with it. The ordinary civil and criminal law is a state matter, but income tax, suits between residents of different states, and the majority of banks are under the control of Washington.

The principle of the separation of powers underlies both federal and state constitutions. Executive officials, like the president and state governors, being elective and as truly representative of the people as members of congress or the state legislatures, have definite powers, with which the lawmakers cannot interfere. On the other hand, the legislatures are under no obligation to pass measures the executive desires. A lack of teamwork frequently results. Laws get on the statute-books which the executives neglect to enforce; the president or a governor finds his favourite policy foiled by want of the legislation or the appropriations it requires. Clashes are frequent, and the executive veto power, obsolescent in England, is active in the U.S.A., although a legislature can usually override it by a two-thirds vote.

Four-Yearly Presidency

The president and vice-president are elected every four years and are irremovable, except by impeachment, a process only once, and then unsuccessfully, tried. They are selected by a college of electors, which has in theory unlimited powers of choice; practically, as the electors are themselves elected under pledge to support definite candidates, they are elected by the direct vote of the people. Presidents can be re-elected; until the presidency of F. D. Roosevelt, it

was an accepted convention that no man stood for a third term.

The vice-president presides over the senate, and, in case the president dies, fills out his term. Unless that occurs, his position was dignified but as a rule not very important, though some presidents, e.g. Harding, have given the vice-president a seat in the cabinet. Six vice-presidents have succeeded to the White House.

Cabinet and Congress

The president is commander-in-chief of the army and navy, and until it comes to treaty-making is supreme in foreign affairs. He cannot initiate legislation, but by his message to congress he can awaken the country to the need of particular reforms; and he can, within ten days of its passage, veto any bill. Moreover, as the official head of the administration, he can decide upon the zeal with which different classes of law are enforced. In time of war or other grave crises, he is expected to assert himself as head of the nation, and the prestige of his office makes him almost an autocrat.

Cabinet members cannot sit or speak in either house of congress, and are merely the president's personal assistants. Subject to the assent of the senate, usually quite perfunctory, he can select whom he pleases and can dismiss them without facing a political crisis. Concurrence by the senate is requisite in all important appointments, such as to embassies or the federal bench, and concerning lesser offices the president is expected to consult the local senators concerned. This at once extends and checks presidential power, and provides a link between the executive and the legislature. His power of patronage arms the president with a lever to enable him to get his favourite measures through congress, and it also keeps him—for he is normally head of his party as well as of the national government—in touch with the people's representatives.

By his foreign policy the president can bring the country to the brink of war, but congress alone can declare it and grant money for it. The president cannot conclude a treaty except "by and with the advice and consent of the senate," and that by a two-thirds majority of the senators present. Negotiations and the formal ratification of a treaty, after it has been approved by the senate, are entirely in the president's hands; but the senate is

United States of America. Map showing the network of railways which traverse the continent and connect the industrial centres with all parts of North America

always jealous of its right to reject, amend, or add reservations to treaties before they are executed; moreover, if financial questions are involved, the approval of the house of representatives is invariably considered necessary.

The senate, representing the states as sovereign entities, has 96 members—two from each state, regardless of its size or pop.; the house consists of 435 members, or congressmen, distributed among the states proportionately to pop. Senators sit for six years. One-third are elected every second year; the life of the senate is thus never interrupted. Congressmen are elected for two years, a general election being held every presidential year and again two years later.

Despite the presence of many distinguished men in the lower house, the longer term and greater power of the senate attract to it the majority of U.S. politicians corresponding to the British "front bench men." A man having served as a congressman will often seek, and secure, election as a senator. Senators may express their views with a violence unknown to the British parl. system, and much of the complexity of U.S. politics is due to the importance attached to the personal, as distinct from the party, opinions of leading senators. The senate is much better adapted to serious debate

than the house of representatives with its vast hall, but as its rules do not include the "closure," the opposition at the close of a session often fights a measure by a "filibuster," i.e. by talking it out.

Powers of Committees

Numerous committees are set up, each of which decides the fate of all bills before it. In the senate the committee on foreign relations, in the house the committees on ways and means, appropriations, and rules are among the most important. Debates on the ordinary measures are brief but full dress discussions on foreign affairs in the senate, and on taxation and appropriations in the house, are detailed and interesting. The immense power of the speaker of the house, always the representative and virtually the leader of the majority, springs as much from his right to nominate committees and their chairmen as from his control of bills, once they are returned to the house. It is an unwritten rule of these committees that the chairman is the member having uninterrupted seniority of membership in the senate or the house.

To these committees the recommendations of the executive come. The navy dept., for instance, prepares a shipbuilding programme: the secretary of the navy and his experts come before the committee on naval affairs and urge its desirability; the committee then de-

cides what is to be done, reducing and altering the plan according to its own ideas, to the grant it can get from the committee on appropriations, and to the general political situation.

In other ways, nevertheless, congress is far less powerful than the British parliament. Its authority is strictly limited by the constitution. That document lays down certain definite principles which every statute must observe. Repeal of a federal statute requires a two-thirds majority in both houses and the assent of three-quarters of the state legislatures. All the states have two-chamber legislatures except Nebraska, which in 1934 in an amendment to the state constitution adopted a single chamber legislature.

Should any act of congress or the state legislatures infringe the constitution, the supreme court of the U.S.A. does not hesitate to declare it *ultra vires* and void. Composed of judges nominated by the president with the concurrence of the senate and irremovable save by impeachment, the supreme court is a body of the highest prestige. It is in theory above political strife, but a renewed bench of judges has sometimes accepted a law similar to one declared unconstitutional by an earlier court.

To work institutions of the complexity just described and to make

it possible for a democracy of more than 140,000,000 in a territory of nearly 3,000,000 sq. m. to carry on, extra-constitutional organizations of great efficiency are needed. These the two principal parties, the Republican and the Democratic, provide. Each maintains a network of committees, which covers the entire country and deals indifferently with federal, state, and municipal issues. It focuses opinion on each question as it arises, and by mobilising public opinion puts pressure on the party office holders, and thus serves to keep them in line with the views of the organization.

The system is seen in its most elaborate form at the great national conventions, at which each party chooses its presidential candidate every four years. Delegates from each state, selected by the rank and file of the voters of the party concerned, meet and decide on the men and the "platform" they will support. To enable these assemblages of over 1,000 men to reach a decision much direction is necessary; compromises between rival interests must be reached, and there is room, and indeed a necessity, for much wire-pulling. The "machine" may seem to exert almost autocratic power, but it is always susceptible to the trend of popular feeling, and never forgets that the convention may at any time be "stampeded" against its wishes in favour of some individual or policy which has caught the public ear.

But, when all is over, the party candidates and policy have been determined and party managers have a shrewd idea of how far and in what direction their followers will permit them to go. The executive officials complete as is their authority within their own spheres, are usually careful to conform to the understanding arrived at, and are thus able to count on the cooperation of the legislators of their own party in carrying out the programmes on which they embark. A compromise has, in fact, been established between the executive and, legislative branches of the government, in spite of the constitutional "separation of powers," and if it breaks down, the party national committee remains in being until the next national convention meets, to advise or admonish as the case may require.

EDUCATION AND RELIGION. The public control and regulation of education are the concern not of

the federal govt. but of the states, each of which alone has the power of educational legislation and administration within its own borders. At Washington there is a section of the federal security agency entitled the office of education, but its functions are confined to the collection and publication of statistics and the diffusion of useful information respecting the organization and management of schools, methods of teaching, etc. There is consequently a great diversity in educational systems and conditions in different parts of the country. Thus, while every state has enacted a compulsory school attendance law, the number of days in the year when children are required to attend is much lower in some of the southern states than in New England.

The public school (or common school) in the U.S.A. corresponds to the English council school, being a school, whether elementary or secondary, that is under public management. A school of the type of the English public school is called in the U.S.A. a private school. The U.S. preparatory school is not one where young boys are prepared for an American equivalent of an English public school, but is roughly equivalent to the English public school itself. A parochial school is one organized and maintained by a religious body, most frequently R.C. The classes in U.S. elementary schools are called grades, and are taught by grade teachers.

Higher Education

The U.S.A. has some 700 universities and degree-granting colleges, some for men, some for women, and some for men and women. Many of them are state institutions, established by the state, supported by state funds, and controlled by the state legislature; and a number are not of a standard which would warrant the title university outside the U.S.A. There are some 250 professional schools, again some for men, some for women, and some for men and women. Institutions of higher education include also junior colleges and teachers' colleges.

Illiteracy is not common except in the S.: more than a third of all Ky. children do not finish their elementary schooling, and in all the S. states the percentage of conscripts rejected during the Second Great War on account of illiteracy was high.

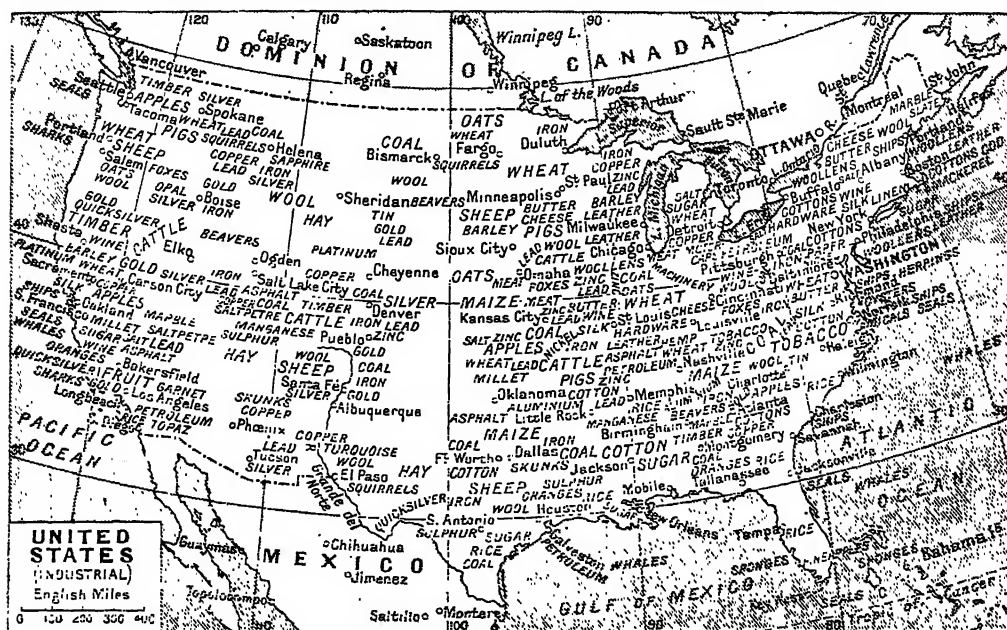

That the vast majority do read a great deal is proved by the huge

sale of newspapers, magazines, and many kinds of books.

Of the religious communities the R.C. has the largest number of adherents (20,000,000), although the population is overwhelmingly Protestant. But the Protestants are divided into a great many sects, of which the Baptists (8 million), and the Methodists (7 million) are the largest, Lutherans, Presbyterians, Protestant Episcopal Church, and Disciples of Christ coming next in order.

MINERAL RESOURCES. Development of the U.S.A.'s mineral resources began only about the middle of the 19th century; but, despite their vastness, intensive and unrestricted exploitation and the immense demands made by the two Great Wars have eaten into her metals to an alarming degree, so that she has become a great importer of these products. The most widely distributed mineral is coal, found in 30 of the states, and over an area of some 335,000 sq. m. The most productive coal mines are in Penn., with Ohio next, followed by Ill. and W. Va. Most of the coal is bituminous; anthracite is found only in Penn.

Next in importance comes iron; this is very widely distributed, but the largest deposits have been those close enough to the surface to be simply shovelled up in the "ranges" (districts) in Michigan and Wisconsin near Lake Superior, where, however, the ore is expected to be exhausted by 1975. In both coal and iron mining the use of machinery is intensive. Production of iron ore in 1946 was 40 million tons, valued at \$1,103 million (£276 million). Copper as well as iron has been mined in the Lake Superior region in immense quantities; it is found also in Ariz., Mont., Utah, and Calif.; in 1946 535,000 tons were produced, valued at \$172 million (£43 million); but it has been estimated that the mines will be exhausted by 1960. Next in value of annual production comes aluminium, of which 365,000 tons valued at \$116 million (£29 million) were produced in 1946. Production of lead, of which the U.S.A. was once the world's most prolific source, at 282,000 tons in 1946 was only about half the production in 1925. Quicksilver is profitably mined, chiefly in Calif. Silver worth \$17 million (£4,250,000) and gold worth \$51 million (£14,750,000) were produced in 1946, the first chiefly from Col., Utah, Mont., Nev., and Ida., the second from Calif., Col., Nev., S. Dak., and Alaska.

United States of America. Map showing the distribution of natural products and the consequent industrial and agricultural centres, some of which are still in course of development

The U.S.A. remains by far the world's largest producer of petroleum (q.v.); it has been estimated, however, that known sources will be exhausted before 1970. Natural gas, consumed in 1946 to the value of \$885 million (£221 million), is a cognate product.

Sapphires (Mont.), turquoises, garnets, rubies, and other precious stones are found.

AGRICULTURE. The farming pop. in 1947 was estimated at 27,550,000 (compared with 31,614,269 in 1900). Farming remains, however, the largest single industry in the Union, giving employment in 1940 to 17.6 p.c. of workers (compared with 53 p.c. in 1870). Conditions changed materially between the years before the First Great War and the years following the Second. In the early part of the 20th cent. the happy-go-lucky era when a man who had exhausted the fertility of one farm moved on to another stretch of virgin territory was already virtually at an end; but the attitude of mind based on the assumption that such migration was possible remained, and it was not until the 1930s that the American people as a whole realized how much the fertility of their most fertile land was decreasing, and that, there being no more land to be brought easily under cultivation, it was necessary to conserve what they had and put into it humus and fertilisers.

Two areas in particular felt this change: the Middle West and the S.E. During a succession of dry years from 1935 to 1942, the violent winds that sweep across the vast plains of the Middle West, uninterrupted by any west-east hill range, caught up and carried away the soil of 40,000,000 acres, and badly damaged the land in half the remainder of the 400,000,000 acres under cultivation there. Before white settlement the soil had been held down by the roots of coarse grasses and weeds; the white rangers' cattle and sheep grazed this herbage almost to extinction; its roots were dug out and destroyed, and for years the soil, without fertilisers or intensive culture, yielded crops of wheat and Indian corn. The continued cropping with one product seriously reduced fertility; the complete absence of crops, e.g. clover, with roots which would hold the soil together allowed it to become dust. The planting of banks of trees to break the wind, and the introduction of clover and other run-rooted crops to get fibre back into the soil, followed the disastrous drought of 1935-42; but millions of acres were beyond repair.

Much of the soil in the cotton-growing areas of the S.E. has also suffered from erosion. Cotton bushes are planted in rows, and the soil between is cleared of weeds (the roots of which would hold it

together). Much of the cotton country is hilly. When the rains come, and they are heavy in this area, the soil is washed away.

In the longest settled states, in the N.E., where mixed farming on the European model has always obtained, there is no such serious problem of erosion.

Changes in Cotton Culture

The acreage under cotton fell from about 45,000,000 in 1929 to less than 18,000,000 in 1946, chiefly because of the displacement of cotton by synthetic fibres. This change, and the introduction of machinery, in particular for picking (the machine can pick 30,000 lb. in 24 hrs., a man 120 lb. in 8 hrs.), have produced a revolution in the cotton area where, it has been estimated, 5,000,000 fewer workers will be required in 1955 than were needed ten yrs. earlier. Some of the cotton lands come within the area controlled by the Tennessee Valley Authority; and there, and in other areas with state and federal encouragement, terracing has been introduced, orchard growing, livestock rearing, and general farming are being developed, and lands no longer suitable for agriculture are being re-afforested. These changes are contributing to an improvement in living conditions in the area, and helping to absorb some of those displaced by changes in cotton culture.

The proportion of owner-farmers to tenant farmers fluctuates, an increase in tenant farming indicating bad times when the owner-farmer either fails to keep up mortgage payments or is forced to sell in order to procure necessities. The vulnerability of the farmers in bad times is being gradually reduced by the turning away from monoculture to general farming, which provides more of a family's necessities from the farm itself. In 1945, 3,301,361 farmers owned the farms they worked, 1,858,421 were tenants, 660,502 part owners, while 38,885 farms were worked by managers. The worst rural slums in the world are to be found in the cotton-growing areas, where many of the farms are worked by negro and white tenant farmers and sharecroppers. In this area the tenant farmer as a rule pays no rent; he provides tools, a team, and labour, and gives his landlord a share of his harvest—usually half. His home is rarely better than a ramshackle hut, with no running water or other amenity; his income is perhaps one bale of cotton, worth about £25. The sharecropper contributes nothing but his labour. His home may be a hovel constructed of packing cases and corrugated iron; and his children constitute a large part of the illiterates of the S., for since he cannot clothe them they cannot attend school. In 1940 a third of all farms in Kentucky were valued at less than £75.

Of the crops widely grown maize is the heaviest, the total in 1946 being 3,288 million bushels from 88,718,000 acres, compared with an average of 2,608 million bushels from 91,698,000 acres during 1935-44. It is grown chiefly in the middle Missouri-Mississippi valley, Iowa producing most. Wheat comes next in acreage—1,155.7 million bushels from 67,201,000 acres in 1946, compared with an average of 843.7 million bushels from 55,404,000 acres during 1935-44. This indicates how U.S. wheat production was increased to help make good the shortages caused by war devastation in Europe and by drought elsewhere. Most wheat comes from the Middle West, to the N. of and overlapping the maize belt, Kansas giving the heaviest yield (216,667,000 bushels in 1947). Oats, nearly 1,510 million bushels from 43,648,000 acres, was the second largest crop in 1946; most of it is used for stock feeding on the farms. Other important crops are rye, barley, soya beans (an increasing crop), flax seed, rice, potatoes, sugar cane, sugar beet.

Cotton production in 1946 was 8,724,000 bales of 500 lb. gross, Texas with 1,750,000 bales providing most. Tobacco output was 2,247.7 million lb. in 1946, compared with an average of 1,479.6 million lbs. during 1935-44; N. Carolina, with 896 million lb., had the heaviest crop.

The total value of live-stock in 1946 was estimated at \$8,922,763,000 (approx. £2,230,690,000). Horses, mules, milk cows, sheep, and pigs all showed a reduction in numbers in 1947 compared with 1946; cattle showed a slight increase. Farm and factory butter production amounted to 1,706 million lb., cheese production to 1,115 million lb., condensed and evaporated milk to 4,107 million lb.

INDUSTRY. While the great coal mining districts of Penn. remain the chief centre of heavy industry of the U.S.A., the creation of sources of electric power by the construction of great dams on the Columbia (Bonneville and Grand Coulee) in the west and on the Tennessee and its tribs. in the east, coupled with production need during the Second Great War, led to the development of industry in areas formerly devoted to agriculture or forestry. The Kaiser shipyards at Vancouver, the Boeing aeroplane works at Renton and Seattle, and the plutonium plant at Hanford, which produced the core of the first atomic bombs, are outstanding examples of such new plants planned by Washington.

Principal Manufactures

Production of synthetic rubber went up from 8,383 tons in 1941 to 820,373 in 1945, reduced in 1946 to 740,026 tons when natural rubber began once more to be available. Output of steel, centred in Pittsburgh, in 1946 was estimated at 59 million tons. Motor vehicles in normal times top all other products in total value; the great metropolis of this industry is Detroit. Meat packing, petroleum refining, cotton weaving, woollen manufacture, tobacco manufacture, and the production of animal feeding stuffs are other important industries. Electric power used in 1946 totalled 269,772 million kWh., nearly a third of it hydro-electric.

Of the forests suitable for exploitation the federal govt. owns about 89 million acres, state and lesser public authorities 27 million acres, 345 million acres are privately owned. Annual consumption of timber is at an average of 13,660 million cu. ft.: annual growth is estimated at 13,370 cu.

ft. Vast areas are swept by fires every year—20.7 million acres being lost in 1946. Some replanting is carried out: 520,000 acres in 1940, last pre-war year for the U.S.A., 150,000 acres in 1946.

COMMUNICATIONS. The first rly. was started in the U.S.A. in 1828; by 1830 there were 23 m. of rly. Atlantic and Pacific were linked when the Union Pacific railroad met the Central Pacific in 1869; mileage in 1870 was 52,922. Maximum mileage was 266,381 in 1916, reduced to 240,156 by 1945. Except E. of the Great Lakes in the area of longest settlement, rly. communication from E. to W. is much better than from N. to S., owing to the fact that the rlys. were for the most part constructed in pioneering days when the urge to the westward caused them to be built. More than 45,000 locomotives were in use in 1946, and railway workers numbered nearly 1½ million.

The great length of journeys in the U.S.A. has stimulated internal air transport, which provides regular services between all large centres of pop. Domestic airlines operating 696 aeroplanes flew 207,347,325 m. in 1947; 8,095,833 passenger journeys were made; international lines with 163 aircraft flew 55,852,717 m. Total number of airports in use was 5,431, of which 319 were designed for long distance aircraft.

Rivers and canals are important, particularly for transport of goods. The Mississippi and its great trib. the Ohio have long been highways into the interior; the canal system connecting the Great Lakes with New York has an immense traffic; the T.V.A. has made the Tennessee navigable, turning into busy river ports townships formerly almost dead. Sea going vessels owned in the U.S.A. increased from 1,379 of 1,000 tons or over of deadweight tonnage 11,681,700 in 1939 to 4,888 of 50,780,000 in 1946, giving the U.S.A. the greatest merchant marine on the world.

HISTORY. Not for nearly a century after Columbus's discovery of the W. Indian islands was any systematic colonisation of them, or of the mainland discovered later, attempted. In 1565 the Spaniards started a settlement in Florida, but not until the 17th century did emigration from England begin. It was conducted under the auspices of a company chartered in 1606, to which powers to colonise and trade in what is now Virginia and the neighbouring states were given. Settlers

founded Jamestown in 1607, and with other settlements this was formed a little later into the colony of Virginia, a proprietary province. These emigrants were for the most part people of good family, who remained loyal to the Stuarts when the struggle came, and gave their society an aristocratic tinge.

Meanwhile the Plymouth Company was making settlements along the north-east seaboard. Emigrants landed at Plymouth Rock in 1620, and in 1629 the colony of Massachusetts Bay was established. The troubles in England led to the arrival in America of persons, most of them of Puritan sympathies, who were dissatisfied with the conditions at home, and these settlers founded the colonies of Connecticut, Rhode Island, New Hampshire, Vermont, and Maine. The colonists had their own religious quarrels, frequently very bitter, but external pressure united most of them in 1643 in a confederacy called the United Colonies of New England, a name given to this district. Later Pennsylvania was settled by Penn and his followers, and N. Carolina, S. Carolina, and Georgia came into existence.

In the New England colonies democratic institutions existed from the beginning; in Virginia they were introduced about the time the Puritans landed. Yet the colonists remained generally content to be under the English government, with outbreaks now and then against what they considered to be stupidity or oppression. In 1664 the Dutch settlement of New Holland in and around New Amsterdam (now New York) passed under English rule; the wedge between the two English sections was thus removed.

Resistance to British Taxes

During the 18th century the struggles between Great Britain and France, which made Canada British, involved the American colonists in continuous warfare. At the end of the struggle they were left more to themselves, and began to think of their interests apart from those of the mother country. Therefore, when the British government, being in need of money, attempted to tax them, they protested, and even resisted violently. To the Boston riots (*q.v.*) parliament replied by punitive measures, some of which altered the charter of Massachusetts. George III was chiefly responsible for the attempt to coerce the American colonies; a

large body of opinion was hostile to it, but he found subservient ministers, and had a majority in the house of commons.

By 1774 the colonists were behaving as an independent people, but they had not yet reached the stage of repudiating British authority altogether. All they wanted

United States of America. Map of the original seaboard states which declared their independence July 4, 1776

was to protect themselves against what seemed to them to be attacks upon their liberty and unconstitutional efforts to take away their rights. The story of the war that followed is related in the article, American Independence: the War of 1775-83. In 1776 the colonists declared that they no longer recognized the royal authority, and in the declaration of independence proclaimed themselves free and independent states.

In 1778 the French government openly recognized the new nation, and made an alliance with it, at once sending ships and men to take part in the war. It was not until 1781, however, that the capture of Lord Cornwallis's army brought the end of what U.S. citizens called the war of the revolution in sight: in the next year peace was made. Now came the difficulty of framing a constitution and the even greater difficulty of finding money with which to carry on the government of the new republic. Thanks largely to Alexander Hamilton, a federal form of union was adopted: the constitution framed under his influence has remained in force ever since. In 1789 General Washington took office as first president, and the new congress set to work. The first political contests occurred between the Federalists, who were for firmly exerting the authority of the

central government over the states, and those who would have interpreted the constitution more liberally. The latter called themselves Democratic Republicans, and so the Democratic party came into being.

During the Napoleonic Wars, Britain aroused the resentment of the Americans by several acts which were considered high-handed, such as searching ships for contraband, and pressing men who claimed American citizenship into the naval service. Under the leadership of Henry Clay, an agitation was got up for going to war with England, and in 1812 war was declared. To the surprise of the world, the American navy showed itself superior to the British in both gunnery and seamanship. On land, however, the British were more successful, and the war dragged on until the end of 1814. Among its other consequences was the extinction of the Federalist party, which had been opposed to it and to the government which was carrying it on. This led to accusations of lack of patriotism; henceforward the central administration was admitted by everybody to be entitled to exercise very wide powers and the right of the states to individual action was limited. This intensification of national feeling made it easy for President Monroe to put forth in 1823 his famous doctrine that no European power should acquire territory in the American continent.

Tariff issues broke up the national harmony, and the state right party became more insistent, some states maintaining that a tariff which did not suit their interests was unconstitutional, and claiming the right to secede at will from the Union.

War with Mexico, 1846-48, arose out of the support given by the Americans to Texas, which was striving to free itself from Mexican rule. The U.S. troops won a series of victories, and as the result of the war the far west was added to the Union, N. California, as well as New Mexico and Texas, being given up by Mexico.

Just after this gold was discovered in California, and the rush to the diggings began, 1849, the effects of which made a noticeable difference in the development of the country.

The question whether slavery should or should not be permitted in the new territories taken from Mexico caused a fresh alinement of political parties. The Democrats

now made it one of their chief aims to perpetuate slavery; against them were arrayed the Republicans—at first called National Republicans—and so fierce were the emotions on the one side of those who were anxious to prevent the spread of slavery and on the other those whose way of living depended on slave labour, that there was talk even then of civil war. From this time the north showed active sympathy with the slaves, helping them to escape from their southern masters and openly working for the abolition of slavery. Feeling became bitter, and in the south separation was talked of as certain.

Thus matters stood when, in 1860, the Republican Abraham Lincoln was elected president. He announced in his inaugural address that he had no right and no intention to interfere with the institution of slavery where it already existed, but he also declared that no state could lawfully leave the Union. This raised again the question which had been so long debated as to whether the federal government had authority over states which declared themselves unwilling any longer to acknowledge it as supreme. Lincoln avowed his determination to coerce the south into remaining within the Union; the southern states, which formed themselves into a confederation, believed themselves strong enough to prevail in war, which broke out in the spring of 1861 (*see American Civil War, 1861-65*). The primary issue was not slavery; it was the old quarrel between the Federalists and the upholders of state right. Yet the result was to free the slaves, for, as a war measure, Lincoln, in 1862, proclaimed all the slaves in the rebel states free. This only inflamed the southerners, or Confederates, to greater efforts, and for two years the balance was even. Then the north, contrary to the world's expectations, began to gain ground steadily. It had command of the sea, and established a blockade of the S. ports. The S. rlys. had been badly damaged; it became more and more difficult for the south to feed its troops and move them about. At last, in 1865, the Confederate forces surrendered, and Lincoln's aim was accomplished: he had prevented the Union from being broken up.

But the Civil War left the southern states devastated as no great stretch of country had been since the Thirty Years War. President Lincoln, with great

wisdom, advocated allowing the vote to any southerner who would swear allegiance to the United States; and the readmission to the Union of any southern state in which 10 p.c. of the population thus enfranchised could set up a govt. He wanted the negroes to be freed and educated, without immediate enfranchisement. But he was assassinated before he could carry through his policy, and though his successor, Andrew Johnson, sought to follow Lincoln's lead, he was not strong enough to sway congress in that direction. Instead, congress decreed that any southerner who, after taking an oath of allegiance to the constitution, had taken up arms against it, was debarred from voting. This meant that, with few exceptions, the educated men of the S. were ineligible to vote. The negroes, on the other hand, were at once enfranchised by the Civil Rights Act of 1866, strengthened by the 14th amendment to the constitution (1868), which declared all freedmen to be citizens of the U.S.A. with the same civil rights as white persons. The negroes and the poor whites—equally untrained in political judgement—were the arbiters of the fate of the S. through more than five years during which their votes were manipulated by corrupt politicians from the N., popularly known as "carpet-baggers." The conditions that arose from the abandonment of Lincoln's wise policy did more to perpetuate the hatred of the S. for the N. than all the disasters of the war itself. Not until the Amnesty Act of 1872 were the south's natural leaders allowed to re-emerge. Complete amnesty was not granted till 1898, after the outbreak of war with Spain.

Problem of the Freed Negro

As the S. began to recover politically, the practical disfranchisement of the negroes began. The 15th amendment (1870) decreed that no man might be debarred from voting on account of race, colour, or former condition of servitude; but the southern states got round this by introducing literacy and other qualifications of voting. The abolition of slavery revealed another problem: that of the negro himself and his position in a country where he was in a substantial minority (*v.s. Population*).

Up to the time of the Civil War, the U.S.A. was mainly an agricultural country. But necessities of war led to the development of

industry on a considerable scale. Before the Civil War, customs duties were not much more than a revenue tariff. The Morrill and supplementary Acts raised them considerably during the war, and they were maintained at a high level after it, first to protect the Union's "infant industries" and afterwards as a part of U.S. policy of detachment. The Civil War also led to the laying down of many miles of rlys. for the transport of troops, munitions, and food, and these, when peace came, were rapidly pushed westward. The native Red Indians, like the herds of bison that had roamed for centuries over the great plains, were pushed westward, too. The bison rapidly became extinct. The Indians were concentrated into reservations allotted to them by the govt. The land thus cleared was devoted to cattle-raising, an industry given great impetus by the introduction in 1869 of refrigeration.

The cattle-ranchers moved farther westward and were followed by agricultural settlers. The Homestead Act, 1862, offered 160 acres of land free to any citizen or prospective citizen who would settle on it and work it for 5 yrs. During 1860-80 more than 65 million acres were taken up by native born citizens and immigrants from Europe, mostly Irish, German, or Swedish. The discovery of gold and silver in the far west encouraged emigration westward; the discovery of coal and iron close together in Ala., and of oil in Tex. and Okla., led to the development of industry in the agricultural S.

As the free land filled, immigrants from Europe began to settle in increasing numbers in the industrial towns of the E., where their presence created problems in administration and assimilation undreamt of when newcomers speaking no English were scattered workers on the soil. Rapid industrial development, and absence of all traditional ideas and restrictions, led to the concentration of immense power in the hands of "big business." Trusts were formed; their menace to the small business and the ordinary man was early recognized by congress which attempted in the Interstate Commerce Act, 1887, and the Sherman Anti-Trust Act, 1890, to put a brake on them. (*See Trusts*.)

For a hundred years after the declaration of independence the U.S.A. looked inwards to her own development, a preoccupation undisturbed by molestation from out-

side. But towards the end of the century she was forced to look over the wall. In 1898 feeling against Spain's tyrannous treatment of the people of Cuba came to a head with the blowing up of the U.S.S. Maine in Havana harbour, which the American public was convinced was a hostile act and not an accident as the Spanish govt. alleged. War was declared against Spain. It lasted only four months. The Americans were completely victorious, and annexed Puerto Rico, Guam, and the Philippines. Their experience in this war, however, convinced them of the value of rapid sea communication between their E. and W. coasts, and led the U.S.A. to complete the Panama Canal (*q.v.*). She also acquired Alaska from Russia by purchase in 1867; a share in the Samoan Is. (with Great Britain and Germany), 1889; and in 1898 annexed the Hawaiian Is.

Anglo-American relations were badly strained on more than one occasion during the second half of the 19th century. In 1861, two southern envoys had been arrested by Federal agents while on board the British ship *Trent*. In response to British protests, the Federal govt. apologised, and released the southerners. In 1862, the Alabama and other southern cruisers, built in England, had been allowed by the carelessness of the British govt. (which adopted an attitude of neutrality during the Civil War) to put to sea, where they almost destroyed the Federal merchant navy; the resulting dispute was settled by arbitration in 1871. A third cause of friction arose when in 1895 the U.S.A. endeavoured to persuade Great Britain to agree to the settlement by arbitration of her dispute with Venezuela over the boundary between that country and British Guiana. After an exchange of sharp notes between Washington and London, Great Britain in the end agreed to arbitration—and secured most of the territory that had been in dispute. Great Britain's attitude during the Spanish-American war resulted in a great improvement in Anglo-American relations. In 1909, a long standing dispute between Great Britain and the United States over the Newfoundland fisheries was referred to the Permanent Court of Arbitration at The Hague, and decided in 1910 in a way that satisfied both.

The outbreak of war in Europe in 1914 found the U.S.A. both totally unprepared for warlike activities on a large scale, and

determined to take no part in the conflict. She immediately proclaimed her neutrality, and maintained it for nearly three years, despite the disorganization of her trade caused by the effective Allied blockade of Europe, neutral and belligerent alike. She disliked the capture by the British navy of American vessels taking goods to European ports; but she also disliked the acts of destruction committed in her factories and elsewhere by German agents trying to interfere with the flow of American munitions to the Allies.

Declaration of War, 1917

The sinking in May, 1915, of the *Lusitania*, with the loss of 128 American lives, roused intense anti-German feeling in the country; but President Wilson was still able to maintain his policy that a nation may be "too proud to fight." The German submarine campaign against mercantile vessels grew intenser and more ruthless, however, and this, coupled with the interception of a German dispatch promising Mexico territories incorporated in the U.S.A. since 1848 if she would join in the war, led the U.S.A. to join the Allies, and to declare war on April 6, 1917. The part played by U.S. forces in the First Great War is described under that head.

* Irene Clephane

Fighting in the First Great War came to an end on Nov. 11, 1918. During the ensuing winter President Woodrow Wilson was the first man in the world. His decision to attend the peace conference was by no means popular in his own country, but it was hailed with enthusiasm in Europe. From the crowds in London and Paris he received a welcome of honour and gratitude such as no public man before him could have known. He was the elected head of a great republic whose might had made certain the Allied triumph. He seemed to embody the hopes of all the peoples.

Wilson's power, however, was severely limited. The Democratic party of which he was the head had just lost an election. He had little direct knowledge of Europe's deep-seated national problems. He was soon to find himself baffled in dealing with the statesmen of the old world, especially Clemenceau and Lloyd George. Being devoted above all to a single great purpose, the establishment of an inclusive League of Nations, he made one demand which proved to be a grave strategic mistake. This was that the covenant of the League

should be linked with the peace. When the Versailles treaty was signed, in June, 1919, the president was conscious of profound disappointment, and he foresaw that the League and the terms of peace would provoke a bitter party contest at home. His end was tragic. He undertook a western tour in defence of the Versailles settlement, and in Sept., 1919, suffered a paralytic stroke which left him helpless. On March 4, 1921, he ceased to be president. He died on Feb. 3, 1924.

In the election of 1920 the Democratic party and Wilson's policy were alike foredoomed. The new president was Warren G. Harding, senator from Ohio, an amiable mid-westerner who had been chosen by the bosses on account of a deadlock between rival candidates. His great majority revealed a fierce revulsion from Wilsonian ideas, and it swept the isolationists into power. The necessary two-thirds majority in favour of the treaty could not be mustered in the Senate. Wilson had refused to admit reservations to the covenant, and as a consequence the U.S.A. stood outside the League.

In the sphere of international politics Harding's short term was notable for one event only—the Washington conference of 1921–22 on the limitation of naval armaments. It resulted in an agreement which fixed at 5–5–3 the ratio of warships between the U.K., the U.S.A., and Japan. This meant parity for the two great powers. Harding died Aug. 2, 1923. He was succeeded by the vice-president, Calvin Coolidge, who occupied the White House until March, 1929. Coolidge was a Massachusetts politician—dour and reserved, offering in his manner a complete contrast to the open-handed friendliness which the world had come to look upon as typically American.

During the Coolidge term of 5½ years his country was as far as possible detached from world affairs. Between Great Britain and the U.S.A. there was one vexatious question—war debts and reparations—upon which opinion in the two countries was sharply at variance. The British view, roughly stated, was that the two problems were intermingled and that the American account could not be separated from the other inter-allied debts. The American public was slow in understanding that huge debts between govts. could not be discharged when imports were barred by high tariff walls. In 1923 Stanley Baldwin, going to Washington on behalf of

the Bonar Law cabinet, negotiated a settlement which was subjected to serious criticism. It could be maintained only until 1931.

The U.S.A. during the 1920s was deeply concerned over the problem of immigration. A law for drastic curtailment was passed in 1924. The republic's wide-open door was thus partially closed. Henceforward immigrants were admitted on a strict quota system, so designed as to give preference to the northern European peoples. There was no change of policy as regards the League of Nations; but Coolidge and his secretary of state sought an alternative through formal outlawry of war. In 1928 the Briand-Kellogg pact was signed in Paris. Fifteen govts. agreed to renounce war as an instrument of policy. No method of enforcement was considered. No sanctions or penalties were attached to violation of the pledge.

Herbert Hoover, the next president, had been secretary of commerce in the Harding and Coolidge cabinets. With that exception his career had lain wholly outside politics. A mining prospector by profession, with experience in Europe and the Far East, he became world famous as an organizer of war and post-war relief, a sphere of public service unknown before 1914. It became important by reason of the generosity of the American people, and Hoover, as head of the American relief administration, had command of immense funds. It is reasonable to assume that he would have been successful as a business president; but three-fourths of his four-year term were darkened by an unparalleled economic blizzard.

"Prosperity" Coolidge

Coolidge was the "prosperity president." When he entered the White House the U.S.A. was moving into a period of industrial expansion and commercial prosperity such as no country had ever before experienced. American productive capacity was an impressive phenomenon; prices were high, money was plentiful, a building boom made work without end, and the urban population enjoyed a standard of living never before attained. Similar conditions, it is true, did not prevail in the farming regions. On the contrary, before the end of the 1920s there were ominous warnings of increasing agrarian distress. But the tone was set by the cities, and that tone was an unbounded optimism until after Coolidge had passed into retirement. The signals of an impending break were ignored

by the politicians, and in 1928 Hoover ran on the slogan, "Four more years of prosperity." There was a widespread belief, encouraged by national leaders and even by many economists, that the U.S.A. with its enviable resources and unique command of industrial technique, had conquered poverty.

A terrific awakening was in store. The special feature of the Coolidge epoch was a wild expansion of credit and speculation, together with lavish foreign loans, which went mainly into the reconstruction of Germany and the financing of reparations. The Dawes plan of 1924 was designed to safeguard German finance and the reparations account; but it did not avail to check the cataract of American credit. Speculation raged without restraint. The banks went into speculative business in all directions. Stock-exchange prices were announced over the air. Stocks rose to fantastic heights. The fever attacked nearly all classes of society. Instalment buying was carried to the limit and beyond. There were no adequate warnings from the great financial houses, and in consequence when disaster befell, the country was totally unprepared. Faith in the magic of prosperity was almost unimpaired when, in Oct., 1929, the crash of the New York stock exchange heralded the worst and longest depression in history.

The Hoover govt. struggled in vain against the advancing desolation. The president himself was unrealistic. For more than a year he strove to persuade the nation that the depression would be short-lived, and he made the mistake of repeating that prosperity was just around the corner. This attitude he was forced to abandon in 1931, when his administration acknowledged the necessity of large federal grants in relief of the farmers and of the city and state govts. The closing stage of his term was unrelieved gloom. Unemployment rose until the total was estimated at not less than 15,000,000. Banks were closing by the thousand. Farmers everywhere were loaded with debt. The nation was desperately in need of a new impetus, an inspiring leader. That was F. D. Roosevelt's opportunity.

Elected in Nov., 1932, Roosevelt was inaugurated on March 4, 1933, when the U.S.A. was in the lowest depth of the depression. Every bank was closed. It was almost impossible for money to be transferred from city to city. The grim economic situation was

matched by an eclipse of the national spirit. For the first time in the history of the United States there were millions of men and women who found themselves driven to doubt the soundness of the national system and the American way of life.

History of Prohibition

Before continuing the general history of the U.S.A., it is necessary to consider that remarkable social experiment, national prohibition. For more than half a century the prohibition movement had been advancing by way of local option and state laws, until in 1918 the 18th amendment to the constitution made the sale of intoxicating liquor illegal throughout the republic. This step was backed by a formidable force of organized public opinion. The trade was discredited; the saloon was everywhere reprobated. Magistrates and medical authorities, educationists and social workers were united against it. The great employers were for any policy that encouraged abstinence among the workers. The Protestant churches were solidly identified with the crusade. Drys were victorious in so many of the states that by the end of the First Great War prohibition had come to seem inevitable. But no sooner was the amendment ratified than the difficulty of enforcement began to be realized, and in a few years its sheer impossibility was shockingly evident. The federal govt. and the states were faced with the challenge of lawlessness and violence on a stupendous scale, and with a dilemma which was not to be evaded. Prohibition could not be made effective. The costly and elaborate organization built up to enforce it provoked a defiance of the law such as no modern country had ever known. An enormous percentage of the people, including millions commonly thought of as law-abiding, fell into the practice of home distilling and dealt habitually with the bootlegger; drinking among young people increased to an alarming extent. The illicit trade in liquor became a gangster industry of enormous range and unmitigated evil. Successive Republican presidents had declined to denounce the 18th amendment. Roosevelt declared for repeal, and a newly elected congress followed him without delay. The 21st amendment, 1933, reversed the 18th, and national prohibition ended after 14 stormy years.

Roosevelt seized the reins of government with extraordinary

vigour. He was well prepared for his high office. Having foreseen the electoral victory, he had gathered together in advance a group of able advisers who worked out a broad plan of economic recovery. His first task was to restore public confidence in the banks, and the early success of his action in that field gained for him a fund of good will which was of the greatest help when he turned to the programme of the policy that was known as the New Deal.

F. D. Roosevelt and Congress

Roosevelt's authority over both houses of congress was, to begin with, absolute. On account of the deplorable conditions prevailing, party conflict had perforce to be suspended. His first year was marked by a speed and range of legislation, passed virtually by consent, never exceeded in any democratic country. This activity in Washington evoked a great popular response. Signs of recovery were soon in evidence, and the hopes of the nation revived. But the road ahead was not by any means clear. The first two acts of congress upon which Roosevelt relied, in launching the New Deal for industry and agriculture, were judged by the supreme court to be unconstitutional. The govt. had therefore to proceed by way of amended laws. The new agricultural policy was highly controversial, for it involved the severe restriction of crops and even the destruction of livestock. Subsidies and stable prices, however, brought results, although at a tremendous cost. The vigour and daring of the new administration were exhibited most impressively in the expansion of hydro-electric power under federal govt. control (*see e.g.* Grand Coulee Dam; Tennessee Valley Authority). The social reforms of the New Deal were long overdue, and as the country returned to prosperity they were accepted by all parties. This was especially true in regard to the Social Security Act, which covered unemployment and sickness insurance. An important Labour Act established minimum standards and the right of collective bargaining. For the first time in the U.S.A. the principle of full national responsibility for unemployment and destitution was acknowledged. This involved elaborate schemes of relief and public works over the whole country. The Roosevelt govt. adopted, almost without reserve, the theory that the only way out of a great depression was by spending for recovery. Hence the heads

of the new depts.—men whose integrity was never impugned—were given command of public funds on a scale never before known.

Before the end of his first term the privileged classes had turned against Roosevelt and the business world was denouncing him as the enemy. No vital American president can hope to escape obloquy, and Roosevelt became the object of class enmity to an unprecedented degree. His opponents were outspoken and without mercy, and they continued so to the end. But the millions remained steadfast in support: for them the president embodied the true American spirit and was their powerful friend in whom they did well to trust. This became manifest in the second election (1936) when Roosevelt had an unequalled triumph, winning 46 of the 48 states.

The menace of Nazi Germany was realized by him at an early date. He was quick also to see the danger to world peace in Mussolini's East African empire, in the Spanish civil war, and the Japanese invasion of China. The American people, however, absorbed in their own affairs, were overwhelmingly isolationist. There was a deep and general conviction that the U.S.A. must not again be drawn into the conflicts of the Old World. The settled policy was non-intervention. Neutrality Acts of 1935 and 1937 forbade the export of arms, and even of other goods, to any belligerent. In Oct., 1937, twelve months before the Munich compromise, Roosevelt ventured to deliver a challenging speech in which he urged positive cooperation by the great powers for the "quarantining" of any aggressor. The public response was hostile in the extreme. No move of any kind from Washington was possible. When war broke out in 1939 a third Neutrality Act, passed in Nov., permitted belligerents to buy war materials on a cash-and-carry basis, i.e. goods must be paid for in dollars and carried in the buyers' ships; it was passed only after prolonged debate. Not until the defeat of France, in June, 1940, did a general awakening begin.

The president then found himself able to call for immediate aid to the Allies. All available arms were poured into the U.K., and 50 old destroyers were turned over to the R.N. in return for a 99-year lease as bases of eight British sites on the Atlantic. By standing for election in 1940 Roosevelt broke the tradition against a third presidential term. His personal

prestige was immense, and he found it possible to make a ringing declaration that America must become the arsenal of democracy. The Allies, he said, were in desperate need of guns and tanks, of planes and ships. These they were to get from America in abundant measure, with munitions of all kinds. In Jan., 1941, he sent to congress the remarkable plan that was made effective in the Lend-Lease Act, a project of mutual aid in war wholly original in conception and magnificent in range and generosity. The best immediate defence of the United States, said the president, was "the success of Britain in defending itself," and the essential purpose of Lend-Lease was "the elimination of the dollar sign." No nation, he added, could have peace with the Nazis except at the price of total surrender and that was unthinkable.

"All Aid Short of War"

Lend-Lease was launched at the close of the bleak winter (1940-41) when Hitler had conquered half Europe. American war production had already begun to rise. Under the impetus of the new economic alliance it exhibited an immense power and rapidity of expansion, although there were elements of isolationism among some of the most powerful industrialists. The U.S.A. was still officially neutral. No leader, however powerful, would dare to propose any change. In the 1940 election Roosevelt had been impelled, like his Republican opponent Wendell Willkie, to give a positive pledge against the sending of American troops into a foreign war. The watchword by this time had become, "All aid to the Allies short of war," and the sentiment behind it was not weakened by the German invasion of Russia. On the contrary, that great gamble of Hitler's was seen as lightening the pressure upon the Western Allies, for the American people in general did not welcome the prospect of a war alliance with the Soviet Union. The president himself was still clinging to the hope that aid short of war, if given without limit, would be sufficient, thus leaving the U.S.A. in a position to use the weight of its whole influence in a world settlement. Nevertheless, the decisions and actions of 1941 carried the U.S.A. far beyond the bounds of any definable form of neutrality. The navies were cooperating in the Atlantic. American warships were ordered to shoot at submarines on sight. The U.S.A. established protective bases in Greenland and Iceland.

With the Japanese assault on Pearl Harbour, Dec. 7, 1941, the U.S.A. was immediately at war with both Japan and Germany. All doubts and hesitations had been blown away; Roosevelt was now head of a united nation. But the major part of America's fleet in the Pacific Ocean had been destroyed. War mobilisation took on a terrific momentum. The stupendous American industrial machine was geared to the full demands of total war. Existing plants were adapted and enlarged. New manufacturing centres sprang up in a few months or weeks. Small towns and rural areas were speedily transformed. Aeroplane plants and training fields were multiplied. New shipyards were built, with Henry Kaiser and other industrialists applying mass-production to seagoing vessels as well as to road and air transport. Perhaps the most striking aspect of this amazing development was the easy turning over of domestic manufacture to war purposes. The U.S.A. had long led the world in labour-saving devices and every sort of gadget for home and office and personal use. In the course of a few months the civilian market was deprived of refrigerators and washing machines, telephones and radio sets, typewriters and fountain pens. The new army and air forces were trained and equipped with unexampled rapidity. It was not long before American soldiers and airmen were appearing in all the theatres of war. Before the end came in 1945 the uniformed forces of the U.S.A. reached a total of more than 11,000,000.

Inter-Allied Conferences

Roosevelt's record as president and c-in-c. made him a unique world figure. His control of the fighting services and direction of the American war machine were maintained with unflagging energy. It was impossible for any of his associates to think of him as a cripple. Roosevelt and Churchill met for the first time at sea in Aug., 1941, when the Atlantic Charter was agreed upon. Later they conferred in Washington and at Quebec. In 1943, when the tide of war had turned, they agreed at Casablanca upon unconditional surrender as the only possible end to the fighting. In the same year came Roosevelt's first conference with Stalin, at Teheran, and in Feb., 1945, the conference at Yalta in the Crimea, his last attendance at a meeting of the "big three." The end of the war in Europe was then known to be

imminent, but the hand of death was upon the American president. He died suddenly at Warm Springs, Georgia, on April 12, one month before the German surrender.

After F. D. Roosevelt

The twelve years of Franklin Roosevelt's presidency were a momentous epoch of American history, a great transition in the life of the republic and in the status of the U.S.A. as a world power. By the 1930s the technological revolution in the U.S.A. was far advanced. The vast processes of war production caused a heightening of tempo and compressed within the shortest time great changes, economic and social, which under peace conditions would have needed many years. The consolidated might of North America had become the most impressive phenomenon of the world, and the victory over Japan made the U.S.A. supreme in the Pacific. The American republic and Soviet Russia now confronted one another, seemingly sharing between them the destinies of mankind. Nor could there be a more profoundly significant fact than this, that one of the greatest of American presidents had passed away almost at the moment when, by the release of atomic energy, the mind of man had brought within its control the fundamental energy of the universe.

Roosevelt's successor was Harry S. Truman of Missouri who, elected vice-president in 1944, had almost the whole of the fourth Democratic term to serve out. He was a stranger to the American people, known in Washington as a regular member of the party and a modest supporter of the Roosevelt policies. The cabinet was changed almost entirely, and the new president made one interesting experiment by appointing to the dept. of state the chief of staff, Gen. George Marshall. The measures incidental to an immense changeover from war to peace conditions were rapidly carried through, while the evidences appeared to show that the country generally was undergoing a revulsion from Roosevelt and his social aims. In the congressional elections of 1946 the Republican party, after 14 years in opposition, made substantial gains. It was therefore taken for granted that the long reign of the Democrats was over.

In 1948 the Democrats could not avoid the nomination of Truman as presidential candidate. The Republican choice was Governor Dewey of New York, who had been defeated by Roosevelt in 1944.

The Dewey organization was the most thorough application of streamlined methods to a political campaign that had so far been achieved, and the entry of a third party under Henry Wallace, Roosevelt's vice-president 1941-44, who claimed to have inherited the mantle of the New Deal, was believed to ensure a large reduction of the Democratic poll. A Republican victory was on all sides assumed to be inevitable. Truman's election, therefore, was an immense surprise, the greatest in the annals of the American parties. It was due mainly to three factors: the president's own energy, personal appeal, and fighting spirit; the support of organized labour, resentful of the Taft-Hartley Act, which had reduced the privileges of the labour unions; and a widespread fear among the wage-earners that a Republican congress and administration would endanger the gains of the Roosevelt New Deal. For later history see N.V.

LITERATURE. Although any complete estimate of literature in the U.S.A. means a record of three centuries, even today there can be detected in it the characteristics of a young people. Despite roots in the old world, drawing on a common inheritance from the great masters, Americans write as men of a new civilization which they must make themselves for their own needs. Obviously such influences impart a stern tone of resolute democracy, mainly directed towards the common welfare, and, in its beginnings, not much interested in art or style. Governor Berkeley of Virginia (d. 1677) actually thanked God there were neither free schools nor printing, and hoped there might be none "these hundred years."

Books were written, however, before the close of the 16th century, of which the *Journal of William Bradford* and *Edward Winslow* was probably the first, closely followed by Governor John Winthrop's classic but tedious *History of New England*, and the Rev. Nathaniel Ward's theological outpourings.

Printing began with the crude Bay Psalm Book (1640) and the once-popular poem, *The Day of Doom*, by Michael Wigglesworth, who would admit "reprobate infants" to "the easiest room in Hell." With the three generations of Mathers—Richard, Increase, and the famous Cotton—the stern sway of extreme Puritanism lost its hold upon the thought and literature of New England. Cotton, curiously enough, was more extravagant than his father or even his grandfather, combining sacerdotal pedantry with ecstatic pietism. Of his 400 publications, the chief were *Bonefacius*, or *Essays to do Good*, which taught Franklin "charity by system"; the standard *Church History of New England—Magnalia Christi Americana*—and the beautiful elegy on his persecuted father, entitled *Parentator* (1724).

Writers on Religion

The 18th century opened with social and political developments which, for a time, crowded out the activities of literature, while New England itself lost the lead in population as well as thought. However, to this period belongs the great Jonathan Edwards, whose *Treatise on Original Sin* has been esteemed the most strictly logical exposition extant of extreme Calvinism, while his *Freedom of the Will* has been described as "the sole fundamental contri-

bution, outside the sphere of politics, which America has made to the world's thought."

His contemporary, Benjamin Franklin, a man of extraordinary versatility, provides a startling contrast. If Edwards retained the "God-intoxication or inward sweet delight in God" of earlier divines, the great father of American journalism was a complete materialist. He started the first American magazine—*The General Magazine and Historical Chronicle* for all the British Plantations in America—in 1741; and issued his *Poor Richard's Almanac* for 25 years. Caring nothing for art, and little for his own soul or humanity's, his immortal *Autobiography* is yet one of the world's classics. Revealing himself, he told the secret of a mighty race.

Then, too, appeared that "lively book about people who were very much alive," the *History and Present State of Virginia* (1705), by Robert Beverley; the sprightly works of Colonel Byrd (first published in 1841); and the scholarly *Chronological History of New England*, by Thomas Prince (1687-1758).

Though John Woolman (1720-72), the Quaker, was at different times a farmer, a clerk, and a tailor, he devoted himself to home missions and anti-slavery, and his "other-worldly" *Journal* has made its way into many an English home.

Among literary men who sowed the seeds of Independence were the shrewd John Dickinson, so well versed in English law; and Thomas Paine, who went to America in 1774. His masterly *Common Sense* was a trumpet call to all patriots, and *The Crisis* (1776-82) provided a constant challenge to free thought.

There was subtler genius and a more attractive personality in Thomas Jefferson, idealist, who drafted the Declaration of Independence; and if George Washington is scarcely regarded as a literary man, his *Letters* are intimate self-revelations, and the *Farewell Address* has sonorous dignity.

Young America, it would seem, was too much intent upon state-building for the gentler arts; and if the facile Philip Freneau and the Hudibrastic John Trumbull stand out among the verse writers, neither can claim to be called a poet. The nature-reading of J. Hector St. John de Crèvecoeur's idyllic *Letters of an American Farmer* (1782) has, indeed, more pretensions to real culture.

The first American play professionally performed in New York (1787) was *The Contrast*, by Royal Tyler, the well-read jurist; and the daring fiction, *Alcuyn*, of Charles Brockden Brown, America's first professional man of letters, came out ten years later. The preparatory eras of literature in America close with the well-known *Grammar of Lindley Murray*, and the immortal *Dictionary of Noah Webster*, who also wrote quaintly on every imaginable subject. Apart from his other works, over 70,000,000 copies of his manual on spelling have been sold.

Emergence of U.S. School

Of America's great names in literature from Washington Irving to Walt Whitman and Henry James enough has been said elsewhere. In their hands are seen the gradual emergence from old-world models to a new and strong independent English-spoken art. The poets and novelists, the humorists and historians, are as familiar as the favourite English authors of the same period, and Emerson has never lost his hold on English thought.

There was, perhaps, a more clearly American note in the lesser men, though William Bryant is usually called the "Wordsworth of America," and is second only to Longfellow in popularity as a poet. Certainly the Marjorie Dawe and the witty verses of Thomas Bailey Aldrich are unmistakably "new English"; Sidney Lanier, a second Edgar Allan Poe, is no less obviously a Southerner of the South.

No less un-English (to English perceptions) are Emerson's somewhat precocious disciple, Margaret Fuller; the American Burke, Daniel Webster; George Ticknor, historian of Spanish literature; the great *History of the United States* in 6 vols. (1882-84) by George Bancroft; and the distinguished *Personal Memoirs of Ulysses Grant*. Essayists like Channing, the Unitarian; Theodore Parker, transcendentalist; the moral Whipple; the flowery George Curtis; and even the learning of William Winter (1836-1917) have more of a "foreign" sound to English ears.

It is only, however, roughly speaking, in the 20th century that we come seriously to study American writers as apart from English, to watch for tendencies, and to discuss revolts in language and style. Every year bears witness to a vigorous originality.

an enthusiasm for real scholarship, and an alert, racy, shrewdness of outlook that have contributed much to the awakening of the old world.

In the first decades of the 20th century some of the best and most characteristic American writing seemed to be finding its natural outlet in the short story. The romantic impulses of Irving, Poe, and Hawthorne had yielded to a stronger and more numerous following of Bret Harte's brilliant manipulation of realistic drama set within vivid local colour. There was a spate of short stories for which the backgrounds were provided by every facet of the variegated American scene, from New England to California and Tennessee. The tendency was obviously stimulated by the partiality of Americans for their newspapers and magazines, which accustomed them to preferring their literature "made snappy," that is to say, concise, epigrammatic, laconic.

Humour and "Wisecracks"

The same stimulus ordered the exploitation of an even more characteristic American line, that unique gift of revealing the humour, and indeed the wit, of the exaggerated turn of phrase and the adoption of a reckless *enfant terrible* attitude towards the pomposities of literary tradition. These qualities had been seen in the shrewd nonsense of Artemus Ward and Mark Twain: in the same school were John Hay, with his Jim Bludso, and Joel Chandler Harris, with his Brer Rabbit. The kindly genius of O. Henry fanned it to a glowing blaze, and the same clever quaintness was later seen in the subtle short stories of Damon Runyon, and in the humours of James Thurber and Robert Benchley. More than a hint of its decadence is seen in the conscientious and elaborate "wisecracks" of American comedy scripts for film and radio, and in the grimaces of popular newspaper columnists. Nevertheless, it is sometimes said that American slang is the true poetry of a great nation, and the "wisecrack" no less than the epigram may have claims to be considered as a form of literary art.

A third characteristic, long persistent, has been the somewhat naïve sentimentalism cherished as the obverse side of the hardest-headed commercialism the world has ever known. Sentimentality in literature is by no means peculiar to America, of course, but

nowhere else did it have so long a run nor threaten to mar the work of so many good writers. If Louisa M. Alcott's *Little Women* has long been a nursery classic and Harriet Beecher Stowe's *Uncle Tom's Cabin* achieved immortality, the more mawkish qualities in such works reached their climax in Elizabeth Wetherell's *Queechy* and *The Wide, Wide World*, in the peculiar heart-throbs of Ella Wheeler Wilcox, and in the suave uplift of Ralph Waldo Trine. There is much to disarm the highbrow in the freshness of Kate Douglas Wiggin's *Rebecca of Sunnybrook Farm* or Alice Hegan Rice's *Mrs. Wiggs of the Cabbage Patch*. But fortunately the cinema industry came to the rescue in time, enabling those who favoured sentimentality to enjoy it henceforward in unprecedented measure without necessarily demanding it in their books, thereby enabling American literature to escape more swiftly than it might otherwise have done from a peculiar defect of its own early virtues.

The period between the two Great Wars saw American literature stepping at last into its own rights with the successful emergence of a new school of realists, led by Sinclair Lewis, first American winner of the Nobel prize for literature, and Theodore Dreiser, whose *American Tragedy* (1925) set the seal on the rebellious realism of several earlier works. Though Lewis owed much of his narrative style, and his manner of surveying the social scene, to such English masters of objective realism as Wells and Bennett, his subject-matter was essentially American, and it was he who first consciously set out, in *Main Street*, *Babbitt*, and other novels, to present America not only to itself but to the rest of the world as a phenomenon unlike any other.

But the leading influence in the development of the new school of writers in the 1920s was H. L. Mencken, who, as editor of *The American Mercury*, set new standards of literary and social criticism, leading a revolt against both the academic and the "moronic" in literature. Himself the author of a scholarly work on *The American Language*, he was called with some justice "the most powerful personal influence on a whole generation of educated people." Certainly he created a wider audience for such realistic writers as Lewis, Dreiser, Willa Cather, James Branch Cabell, Sherwood Ander-

son, Ernest Hemingway, and the poets Robert Frost and Carl Sandburg (who also wrote a long biographical study of Lincoln). Mencken's influence waned only after its work was accomplished, and a younger school of realists, harsh and iconoclastic but strong and courageous, had found not only a ready audience but new themes in the tragedy of economic depression in the 1930s. They included John Steinbeck, John Dos Passos, Erskine Caldwell (*Tobacco Road*), William Saroyan, and William M'Phree. Meanwhile Upton Sinclair had for over two decades pursued his own *genre* of crusading realism. John P. Marquand developed the ironic undertones of realism in such studies of the Boston scene as *The Late George Apley*. Archibald MacLeish, Edna St. Vincent Millay, and Jesse Stuart were the poets of the later realism; Eugene O'Neill (another Nobel prize winner), Maxwell Anderson, and Robert E. Sherwood were its principal dramatists. All were intent upon exhaustive dissection of the contemporary American scene.

Reaction against realism was simultaneously represented by such writers as Thornton Wilder, author of *The Bridge of San Luis Rey* and the thoughtful plays, *Our Town* and *The Skin of Our Teeth*, all expressing a preoccupation with art form, and Pearl S. Buck, author of *The Good Earth*. Another reaction against what was slick, terse, and sometimes crude was seen in the vogue for the almost audaciously long historical novel. Works of fiction like Hervey Allen's *Anthony Adverse* and Margaret Mitchell's *Gone With the Wind*, painstakingly accurate in historical detail, leisurely in character drawing, sprawling in texture, and perhaps "escapist" in intention, appeared to indicate yet another direction in which American writers were prepared to excel.

* Gordon Stowell

United States Army Air Force. Former air organization of the U.S. army. Established in 1912 as a branch of military engineers, it became a separate corps in 1918. In the Second Great War, the U.S.A.A.F. had a maximum strength of 80,083 aircraft, and personnel numbered 2,400,000. It was divided into eight major commands: strategic, tactical, air defence, proving ground, air material, air transport, training commands, and air university; the last a research and advanced training organization. The strategic com-

mand was subdivided into operational forces, of which the 8th U.S.A.A.F. was stationed in Great Britain during 1942-45, and carried out the bulk of the daylight raids on Germany.

Altogether the U.S.A.A.F. flew 2,354,124 sorties: 1,692,468 in Europe and Africa, and 661,656 in Asia and the Pacific. A Superfortress bomber of the 20th U.S.A.A.F. dropped on Hiroshima the first atomic bomb used in warfare. During 1942-45 about 22,500 aircraft were lost in operations against Germany and Japan, while some 40,000 enemy aircraft were destroyed in action.

Under the National Security Act of July 26, 1947, the U.S.A.A.F. was separated from the army and, as the United States Air Force, became an autonomous service.

Units. Quantities in terms of which measurements are expressed. For scientific purposes the centimetre-gram-second (c.g.s.) system was built up during the 19th century, based on the three fundamental units of length, mass, and time. The first two are arbitrary and maintained by direct comparison with physical standards kept at Paris. The third is defined as $1/86,164 \cdot 100$ of a sidereal day. Other units, such as dyne, erg, etc., (*q.v.*), are built up by combinations of these.

For electrical and magnetic quantities a fourth fundamental unit is required, and two separate systems have been devised: the electrostatic system, based on the electrostatic unit (e.s.u.) of permittivity (*q.v.*); and the electromagnetic system, based on the electro-magnetic unit (e.m.u.) of permeability (*q.v.*). These are related by a factor equal to the speed of light (in cm per sec), *i.e.* very nearly 3×10^{10} .

In practice a number of the c.g.s. units prove to be inconveniently small; a few inconveniently large. A system of practical units has therefore been adopted, based on the metre and kilogram instead of the centimetre and gram, and hence called the m.k.s. system. *See* table.

For the measurement of some physical quantities, convenience or historical accident has led to the introduction of other units, not strictly fundamental, into the system; *e.g.* the degree of temperature (Fahrenheit or centigrade), the calorie, and the angular measures (radian, degree, revolution). For special units of length used for very small or very large distances, *see* Ångström Unit; Micron; Astronomical Unit; Parsec.

For engineering in English-speaking countries a series of units evolved in the early 19th century is retained. It is based on the foot, the pound weight (a unit of force), and the second, and includes the foot-pound (a unit of work), the horse-power (equal to 550 ft-lb per sec), the slug (equal to $\frac{1}{g}$ lb or 32.1725 lb as a unit of mass), and the poundal (the force which will give 1 lb mass an acceleration of 1 ft per sec²). The corresponding unit of heat is the British Thermal Unit (B.Th.U.), the amount of heat required to raise 1 lb water through 1° F.; 1 therm = 100,000 B.Th.U. Electric power is sold by the Board of Trade Unit (B.T.U.) or kelvin, a unit of energy equal to one kilowatt-hour or 3,600,000 joule.

Finally, there are various systems of units which cannot be directly related to the fundamental units, usually because they are based on the physiological peculiarities of the human senses: *e.g.* the candle, lumen, lux, phot, etc. used for measuring light (*see* Illumination), and the bel (*q.v.*) and phon used for measuring sound. *See also* Weights and Measures; Metro System; and articles on the individual units.

Universal (Lat. *universalis*, belonging to the whole). In logic, a general term or concept, opposed to the particular, variously interpreted at different times. Like the Platonic ideas, universals were regarded as archetypal forms, which were in existence before things (*ante res*); like the Aristotelian entelechies (actualities), as inherent in things

(*post res*). The universals are five: genus, species, difference, property, accident. Disputes as to the nature of the universals led to the struggle between nominalist and realist. *See* Logic; Syllogism.

Universalists. Name given to those who believe that all men, however wicked, will ultimately be saved. This view was held, with some limitations, by the followers of Origen (*q.v.*). The first sect to make it a distinctive feature was founded in London in the 18th century by a Unitarian named James Rely. The present centre is in Cavendish Road, Clapham.

The American Universalists (500 churches) were founded at Gloucester, Mass., 1779, by John Murray, who had been associated with Rely in London, and held their first convention at Boston in 1785. The sect has become subdivided at various times, notably by the secession of the Restorationists in 1840. These maintained that the wicked would pass through temporary punishment after death.

Universal Language. Means of communicating ideas to all the inhabitants of the civilized world by universally understood sounds or written signs. *See* Basic English; Esperanto; Ido; Volapuk.

Universal Shell. Properly a shell case, a field gun projectile of the First Great War, which could be filled with either shrapnel or H.E., so simplifying battery equipment.

Universe. The whole of creation regarded collectively. Philosophically, it may be defined as everything that exists or appears to exist, known and unknown, material and non-material. To man the meaning, and indeed the nature, of the universe remains a mystery, and, as many think, an insoluble mystery.

So far as the stellar universe is concerned, modern astronomical observations indicate that space is not filled uniformly with matter, but that certain types of condensation occur. The fundamental unit of the cosmos seems to be the star, of which the sun is a typical example. Whether planetary systems such as that circling the sun are normal features of a star's constitution is not yet known, but they are in any case quite insignificant on the cosmic scale. Apart from such minor condensations as double and multiple stars and star clusters, the next unit is the galaxy, of which our own Milky Way system is probably typical. The average galaxy contains several thousand million stars, which cluster thickly near its centre, and vast

Quantity	m.k.s.	c.g.s.
Force	newton	10^5 dyne
Energy	joule	10^7 erg
Power	watt	10^7 erg per sec
		e.s.u. e.m.u.
Charge	coulomb	3×10^9 10^{-1}
Current	ampere	3×10^9 10^{-1}
Resistance	ohm	$\frac{1}{9} \times 10^{-11}$ 10^9
Potential (e.m.f.)	volt	$\frac{1}{3} \times 10^{-8}$ 10^8
Capacity	farad	9×10^{11} 10^{-9}
Inductance	henry	$\frac{1}{9} \times 10^{-11}$ 10^9
Magnetic flux	weber	$\frac{1}{3} \times 10^{-1}$ 10^8

amounts of uncondensed interstellar matter. Most galaxies are in rotation and are thereby flattened. It is this flattening in our own system, observed from within, which produces the observed appearance of the Milky Way. Galaxies tend to occur in groups or clusters, but they do not appear to thin out towards the extreme limit of penetration of our biggest telescopes. The more distant ones, however, seem to be travelling away from us and from each other, and this has given rise to the theory that the universe is steadily expanding. See Nebula; Relativity; Stars.

University (Lat. *universitas*). National institution for advanced teaching and study, recognized for that purpose by a charter from the state. A university is empowered by its charter to confer degrees upon its students, after they have conformed to the regulations laid down in the statutes. These regulations determine the conditions of length of residence, attendance on lectures, and the requisite examinations to be passed before degrees are conferred.

Most universities are teaching universities, i.e. they contain a staff of teachers, styled professors, lecturers, or readers, appointed each for a special subject, to give instruction, and to direct the studies of students. Such students as are admitted to the university must have passed an entrance examination, and are then said to be matriculated. From the time of matriculation to that of taking the degree, the student is called an undergraduate; after conferment of the degree, a graduate. Degrees are usually of bachelor, master, and doctor. They can be taken in various groups of subjects, known as faculties. Examinations normally complete the courses of study followed under the instruction and direction of professors.

Historically it is to be noted that the original term for a university was *studium generale*, a place in which were established facilities for teaching and learning, open to all comers, and not restricted to a special community of a town, or of a monastery. To the medieval universities of Italy, and to that of Paris, students went from various European countries, and found it convenient to group themselves into nations, according to the country or province from which they came. Thus a *studium generale* contained many groups, not altogether without analogy to trade and craft guilds.

In the latter part of the 14th century *universitas* came to be used in the sense of a university. In other words, the first use of *universitas* was for voluntary groups, and it developed gradually into the idea of the whole institution, as recognized by the emperor or the pope, when its position was guaranteed by an imperial charter or papal bull. This seal of authority not only gave unity to the community of teachers and scholars as a whole, but also became a symbol of the unity of the whole learned world, because universities thus chartered were alone enabled to confer on their graduates degrees (certifying studies and training in teaching) which carried with them the right of teaching not only in their own university or their own country, but also in any *studium generale*.

This right was particularly helpful to the spread of knowledge, because medieval teachers and scholars communicated everywhere, both orally and by writing, through the medium of the Latin language and not through the vernacular. They naturally valued highly the facility of moving about from university to university at home and abroad. Roughly speaking, this use of Latin, as the language of teaching and learning, broke up with the decline of the Renaissance. We may date the beginning of the downfall of Latin for England with the Restoration of 1660.

Not only has Latin fallen entirely out of use as a spoken language, but in some modern universities movements have arisen to minimise the study of ancient languages for degrees, if not to remove them as necessary subjects for all degrees. The modern civic universities are inclined to lay great stress on the subjects underlying the special industries of their localities. Hence, in some ways and to some extent there has been a reversal of the old idea that the university developed in the student a power of entering into the knowledge and learning common to all the universities.

On the other hand the modern university lays more and more stress on the "university spirit." This means a constant watchfulness to aid and promote the advancement of learning and discovery of knowledge, to provide the stimulus of intellectual inquiry in every subject, and to raise the tone and level in all professional training. Particularly it aims at encouraging in teachers and taught a right and effective attitude towards methods of research. The

most famous British and foreign universities have separate entries in this Encyclopedia. See also Gowns colour plate; Sorbonne. Consult Universities of Europe in the Middle Ages, Rashdall, 1895.

University College. The oldest college of Oxford university. Doubtful tradition ascribes its origin to Alfred the Great. In 1872 the millennium of its establishment was celebrated, and there is reason to believe that a society of some kind was in existence before 1249,

University College arms

when William of Durham left money for the purpose of founding a college. The buildings, which front the High Street, date partly from the 17th century, including the chapel, hall, and old library, and partly from the 19th. The most famous name in the college records, although he was "sent down" after only a year's residence there, is Shelley, to whom there is a striking monument by Onslow Ford. Lord Herbert of Chêrbury, Dr. John Radcliffe, Sir Edwin Arnold, Viscount Cecil of Chelwood, and Clement Attlee were "Univ" men, and among fellows were Lords Stowell and Eldon. Sir Michael Sadler was master 1923-34, and Sir William (later Lord) Beveridge, 1937-45.

The universities of London and Durham have each a University College, both the oldest in those universities. In London, University College, the buildings of which are in Gower Street, was opened as the university of London in 1828. In 1836 a change was made, the university becoming a distinct institution, but a connexion, which still exists, was kept between the two. The college head is the provost, and it has its own staff of professors. University College, Durham, dates from 1837, and there are University colleges at Exeter, Hull, Leicester, Nottingham, and Southampton.

University College Hospital. London hospital. Situated in Gower Street, London, it was founded in 1833, and rebuilt and enlarged, 1897-1905, by the munificence of Sir J. Blundell Maple. Addition of the Hospital for Tropical Diseases and St. Pancras Hospital in 1948 brought the number of beds to approx. 1,100. Here Liston on Dec. 21, 1846, performed the first operation under anaesthetic in Great Britain, using ether for

the purpose. An excellent medical school is attached to the hospital.

University Settlement. Place of residence for university men in the poorer parts of a great town. These settlements were started with a view to the cooperation of young university men in the work of ameliorating the lot of the poor by personal service in social and educational directions. Toynbee Hall (*q.v.*) was the pioneer institution of the movement. There are over 400 settlements in the U.S.A. alone. See Settlement, Social.

Unknown Warrior. Name given to the remains of one man, chosen as a representative of those who fell in the First Great War. The idea originated in Great Britain, and took the form of selecting from a war cemetery in France the body of a soldier, whose identity was unknown, to be buried in Westminster Abbey as a symbol of the nation's homage to the fallen. The body was exhumed in 1920 and brought to London, where on Armistice Day, Nov. 11, in the presence of the king, and with heads of the services acting as pall bearers, it was interred in the abbey in soil brought from France.

Canada also interred an unknown warrior, and in 1921 the body of an unknown American soldier was removed from France and buried in the national cemetery at Arlington, Washington, on Nov. 11. France's unknown warrior is buried under the Arc de Triomphe in Paris, where a flame burns perpetually in his honour; Italy's in the church of Santa Maria degli Angeli, Rome; and Portugal's in Batalha Abbey.

After the Second Great War, America arranged for similar honour to be paid to the body of an American soldier of that war. It was to be chosen from one of 5,600 such bodies conveyed from France to America in 1947.

Unleavened Bread. Flat cakes or biscuits (Heb. *mazzoth*), made without yeast, and eaten ritually by the Jews. According to the Mosaic law (Ex. 12), the feast of unleavened bread, during which all leaven is removed from the house, is celebrated for seven days after the Passover, at which feast also unleavened bread is eaten. In the R.C. and Monophysite churches unleavened bread is used in the Eucharist. See Leaven; Passover.

Unna or UNA. River of Yugoslavia. It rises in the Dinaric Alps, flows N.W., N., and N.E., in part forming the boundary between

Bosnia and Croatia, and joins the Save some distance below Sissek after a course of 140 m.

U.N.R.R.A. Word formed from the initials of United Nations Relief and Rehabilitation Administration, an organization proposed by the U.S.A. and set up Nov. 9, 1943, in Washington by representatives of 44 nations. Its object was to give immediate aid after liberation to those in need (estimated at 70 millions) in those parts of Europe which the Germans had occupied and exploited. At its first session the organization recommended that each member govt. whose home territory had not been occupied should contribute 1 p.c. of the national income for the year ending June 30, 1943, and that other member govts. should contribute if able to do so. Herbert H. Lehman (*q.v.*) was director general from Nov., 1943, to March, 1946, when he was succeeded by Fiorello LaGuardia until Dec. 31, the official end of U.N.R.R.A. Maj.-Gen. Lowell Rooks of the U.S. army took charge of the winding up of the organization, completed June 30, 1947; its functions in respect of food aid passed to the Food and Agricultural Organization (*q.v.*), of resettlement to a new U.N. international refugee organization. Other functions were taken over by the world health organization and the international children's fund.

During its existence the organization gave the total quantities shown in the table of food, clothing, medical supplies, and materials for rehabilitation. The U.K. contributed £155 million; Australia £12 million; N.Z. £2.6 million; S. Africa £275,000; Canada 77 million dollars; the U.S.A. 2,500,000,000 dollars. Of the 7-8 million Displaced Persons (*q.v.*) in Germany and German occupied territories, U.N.R.R.A. assisted in repatriating some 7 million.

U.N.R.R.A. Aid in Tons

Italy	9,928,700
Greece	2,667,500
Yugoslavia ..	2,424,700

San Marino ..	200

U.N.R.R.A. aid undoubtedly saved many thousands from death by starvation, particularly in Greece and Yugoslavia. *Consult* International Economic Organization, H.M.S.O., 1947.

Unsaturated Compounds. Term used in chemistry for carbon compounds in which the carbon atoms are united by two or three bonds. They are able to combine directly with hydrogen to form saturated compounds, *i.e.*, the carbon atoms are joined by single valencies. There is a series of unsaturated acids known as the oleic series. See Oleic Acid.

Unst. Most northerly of the Shetland Islands and therefore of the British Isles. Unst is 28 m. N. by E. of Lerwick. It lies almost N. and S., being 12 m. long and averaging 4 m. in breadth. Balta Sound and Uyea Sound furnish anchorage for vessels of medium draught. Fishing and knitting are the principal occupations. The island is wildly picturesque and is visited by plovers and rare moths. See Shetland Isles.

Unter den Linden (Ger., under the limes). Thoroughfare of Berlin, Germany. Running from the Brandenburg Gate to the monument of Frederick II, it is 198 ft. wide and about two-thirds of a mile long. It was bordered by a double avenue of trees, mostly limes with a few chestnuts, but these fell victims to Hitler's planning, and the street was finally wrecked by Allied bombing during the Second Great War. See Berlin illus. p. 1105.

Unterwalden. Canton of Switzerland. It lies S. of the lake of Lucerne, and comprises the two half-cantons Nidwalden (106 sq. m.) and Obwalden (190 sq. m.). Nid, or lower, Walden adjoins Lake Lucerne; Ob, or upper, Walden is higher. The canton is drained by the two rivers Aa and contains lakes Sarnen and Lungern. Horticulture and cattle rearing are the chief industries, and fruit and dairy products the main exports. The two half cantons have separate administrations, Sarnen (Ob) and Stans (Nid) being the two capitals. The people are German-speaking Roman Catholics. One of the four forest cantons, Unterwalden joined the confederation of 1291. Pop., Obwalden, 20,340; Nidwalden, 17,348.

Unto This Last. Four essays on the first principles of political economy by Ruskin. They were published as a volume in 1862 after having appeared in *The Cornhill Magazine*. The work is an attack on the idea that wealth is an end

Untouchable. Term applied to certain castes according to Hindu religion. The subject is dealt with under Depressed Classes.

Unwin, MARY (1724-96). Close friend of the poet Cowper. Born at Ely, she became in 1744 the wife of Morley Unwin (1703-67), and was friendly with Cowper from 1765. With him she moved two years later to Olney, and there and at Weston acted as his devoted attendant until her death on Dec. 17, 1796. She inspired the famous lines *To Mary*, and other verses.

Unwin, SIR STANLEY (b. 1884). British publisher. Born Dec. 19, 1884, he was educated at Abbotsholme and Haubinda.

Sir Stanley Unwin,
British publisher

Entering publishing, he became chairman and governing director of George Allen and Unwin, and a director of various other publishing

firms. He was a prominent member of the publishers' association of Great Britain, of which he was president 1933-35, and was president of the international publishers' congress 1936-38 and from 1946. He helped to prevent the application of purchase tax to books in the U.K. and was a frequent contributor to the press on the baneful effect on the book trade of the shortage of paper during and after the Second Great War. He several times revised and reissued his best-known book, *The Truth about Publishing*, which first appeared in 1929. He was knighted 1946.

Unwritten Law. Popular term for an assumed right to execute summary vengeance on behalf of a female relative, by killing her violator or seducer. Although occasionally allowed by American courts, the principle has never been recognized in law.

Unyoro or **BUNYORO**. Native kingdom of Uganda. It is bounded by Lake Albert, the Victoria Nile, and the Kafu and Nkussi rivers. E. of the scarp overlooking the lake is a plateau with conical hills rising about 1,000 ft. above the plateau level of about 3,500 ft. Palajoki, 4,876 ft., in the S.W. is the highest point. The N.W. corner is an animal reserve in which hunting is prohibited. Holmo was the headquarters, 1900-12, and was succeeded by Masindi, whence motor roads go to Butiaba and

Port Masindi. N.E. of the capital lie grass-covered rolling plains. The kingdom was annexed in 1896.

Upas Tree (*Antiaris toxicaria*). Tree of the family Moraceae, a native of Java. When the bark of

Upas Tree. Leaves and fruits of the Javan tree, the sap of which is used for poisoning arrows

the tree is incised, a milky juice exudes that is extremely virulent and is used for poisoning arrows. Its principle is known as antiarin, and is allied to strychnine. On the basis of this single fact a mass of legend was built up, as, for example, the story that nothing could live within a considerable radius—10 or 12 m.—of it, so virulent was its effluvia. Gladstone referred to the Irish problem as his upas tree.

Upavon. Village of Wiltshire, England. It stands on Salisbury Plain, near the Avon, 8 m. S.E. of Devizes, and was once a market town. Near here is a R.A.F. research and training establishment.

Upholders or **UPHOLSTERS**. London city livery company. Granted arms in 1465 and admitted later to the Skinners' fraternity, it was given a charter in 1626. Upholders seem at first to have been engaged in the peltry trade, then to have been fripperers or dealers in second-hand clothes, furniture warehousemen, furniture dealers, pawnbrokers, and undertakers. The office is at 61, Victoria Street, S.W.1.

Upholders'
Company arms

Upholland. Urban district of Lancs, England. It is 4 m. W. of Wigan, and has a little coal mining and quarrying, but brickmaking is more important. A Benedictine priory was founded here in 1319 by Robert de Holland, whose family takes its name from this place. There is a grammar school. Pop. est. 6,250.

Uppington. Town of the Cape Province, S. Africa. It is situated on the Orange river, 2,600 ft. above sea level and 258 m. by rly. N.W. of De Aar. It is the centre of an agricultural district and of tungsten mining. Uppington became important during the First Great War. It was held by the rebels during the S. African rebellion, and later in 1914 was connected by rly. with Prieska. The line was then carried across the Orange to the German frontier at Kalkfontein to facilitate the conquest of German S.W. Africa. Pop. approx. 11,000.

Upminster. Parish of Essex, England. Part of the urban dist. of Hornchurch, it has become a suburb 15 m. E. by N. of London, being the terminus of underground rly. and bus routes. Part of the church dates from the 13th century, interesting brasses are shown, and there are two avenues of yews. Great Tomkyns is a 15th century house, and the golf club uses a gabled hall of Elizabeth's reign. Pop. 3,732.

Upper Nile Province. Province of the Anglo-Egyptian Sudan. It contains the dists. of Abwong, Malakal, Renk, Zeraf Nuer, Lau Nuer, and Sobat Nuer, and comprises a wide area between the Bahr-el-Jebel (Mountain Nile) and Abyssinia in the S., and a narrow strip on both sides of the White Nile in the N. between the provs. of Blue Nile and Kordofan. The administrative centre, formerly Kodok, was later changed to Malakal. Area, 92,270 sq. m. Pop. 711,500.

Upper Senegal-Niger. Name until 1920 of a colony of French W. Africa now known in English as French Sudan. See Sudan.

Upper Volta. Territory of French W. Africa. Formed from part of Upper Senegal-Niger in 1919, it was partly transferred to the Niger colony in 1926, abolished 1933, and reconstituted 1947. It is subject to the gov.-gen. of French W. Africa but locally administered from Ouagadougou, the capital. With the Black Volta river as S.W. boundary, it lies between the river Niger and the N. boundaries of Ashanti, Togoland, and Dahomé. See West Africa, French.

Uppingham. Market town of Rutland, England. It is 98 m. N.N.W. of London, and 7 m. S. of Oakham, being served by rly. Apart from the school (*v.i.*), the chief building is the church of SS. Peter and Paul. There is a trade in agricultural produce. Pop. 1,703.

Uppingham School. English public school. It was founded in 1584 by Robert Johnson, and was

for nearly 300 years a country grammar school. In 1853 Edward Thring was appointed headmaster, and under him it became a great public school. New buildings were erected, and it has now museum, laboratories, swimming bath, etc. The chapel dates from 1891. Divided into upper, middle, and lower divisions, Uppingham has accommodation for 450 boys.

Uppsala. Co. or län of Sweden. It lies W. of the co. of Stockholm, between Lake Mälaren and the Baltic Sea. About half the area of 2,056 sq. m. is forested. In the N. are the celebrated iron mines of Dannemora. Pop. est. 148,277.

Uppsala. City of Sweden, capital of the co. of the same name. It is situated in a fertile plain on both sides of the navigable river Fyris near Lake Mälaren, 41 m. by rly. W.N.W. of Stockholm. The ancient and historic city on the right bank of the river is chiefly renowned

Uppsala arms

for its university, which was founded in 1477, and, after a chequered career, was munificently endowed by Gustavus Adolphus; the Gustavianum is its oldest building. A handsome Renaissance building was added in 1886-87, and the university has also an observatory. The botanic garden has palm houses and an orangery. The orangery of an older garden houses a collection of northern antiquities. The university library, which received the collections of Gustavus Adolphus, contains the Codex Argenteus of Ulphilas. Near the city is an academy of agriculture.

Uppsala cathedral dates from 1230, and within it is the gorgeous burial chapel of Gustavus Vasa, who built the half finished castle, the Slott, on a hill S. of the city, which now contains the provincial archives. Linnaeus, who resided in

the city, is commemorated in the cathedral. Uppsala is the metropolitan see of the Lutheran or state church of Sweden. Pop. 48,725.

Upset Price.

In sales by auction, lowest price at which a vendor is willing to sell his property. It thus forms a start for any bidding that may take place, and it was long customary to name the upset price in advertisements of the sale. See Auctioneering.

Upton. Town of Worcestershire, England. It stands on the Severn, 8 m. due S. of Worcester, and has picturesque Tudor architecture. A 14th century tower is all that remains of a church ruined in the Civil War; the building

which replaced it in the 18th century has a spire rising 183 ft. Upton has associations with John Dee, the astrologer, Mrs. Siddons, and Fielding's Tom Jones, who came to the White Lion inn. It is connected by rly. with Tewkesbury. Pop. 1,968.

Uppsala, Sweden. The 13th-century Gothic cathedral, in which Linnaeus is commemorated

UR: A SUMERIAN CITY REVEALED

Sir Leonard Woolley, Director of Excavations at Ur

A perusal of other articles in this work, e.g. Archaeology; Assyria; Babylonia, is suggested. See also Abraham; Chaldaea; Persia; Tigris, etc.

The ruins of Ur, called by the Arabs al Mugheir, or the mound of pitch, were identified as the site of Ur by the results of excavations conducted for the British Museum by Taylor in 1855. Further excavations were undertaken by the British Museum in 1918, and by the joint expedition of the British Museum and of the museum of the university of Pennsylvania from 1922 onwards.

The earliest remains, consisting chiefly of painted pottery and stone implements, represent the first occupants of the lower valley of the Euphrates, probably not Sumerian but Semitic-speaking

Akkadians from the North. The Sumerian civilization first comes to light with the royal and other graves dating to about 3,500 B.C., but by that time it was fully developed and must have had behind it many centuries of growth. There has been found a great wealth of vessels and orna-

ments, weapons and tools, in gold, silver, copper, and in a variety of stones, and much inlay in shell and lapis lazuli, all bearing witness to an art of a high order, and to a technical skill in dealing with metal and other materials which is unsurpassed in later periods of Mesopotamian history. The large use of precious metal shows that the civilisation was a prosperous one.

Since the raw materials are all imported, trade must have been extensive and important; this, and the conquests of the Sumerian army (whose formation and armament is illustrated on a remarkable mosaic standard found in one of the graves), spread the influence of Sumerian civilization over a very wide area. The kings of the Sumerian city states seem to have been deified in their lifetime at this period as well as later, and their deaths were celebrated by human sacrifice on a large scale, but apart from this little is known of the religion of the time.

In 3,500 B.C. Ur was probably a vassal of the king of the city of Erech; about 3,100 B.C. Mes-annipadda, king of Ur, made himself master of all Sumer and its dependencies and founded the first dynasty of Ur. At al 'Ubaid, four

Uppsala, Sweden. The main building of the university, erected 1886-87

miles from the capital, there has been discovered a temple of the goddess Nin-khursag built by his son A-anni-padda, which was adorned with reliefs in copper and mosaic, with statues of lions in copper, and with wooden columns overlaid with copper, or with incrustation in red and black stone and mother-of-pearl.

The first dynasty lasted for five generations and then Ur was conquered by rival states and for a long time remained a subordinate city. Remains of this period are scanty, but they suffice to show that the religious importance of the place as the centre for the worship of the moon-god Nannar was maintained, and at least one of its overlords, the great Sargon of Akkad, installed his daughter as high priestess of the god at Ur.

The Third Dynasty of Ur

For a brief while the hegemony of Sumer was regained by the second dynasty of Ur, but of this nothing is known, and the city comes again into prominence only with Ur-Nammu (Ur-Engur), who being governor of Ur revolted against his master, Utu-khegal, and founded the third dynasty. There ensued the time of the greatest prosperity of Ur. Ur-Nammu and his son Dungi virtually rebuilt their capital on a very magnificent scale, reorganized and enlarged the irrigation system, encouraged trade and, by their military conquests, extended their dominions to the Persian uplands on the east, and to the shores of the Mediterranean on the west.

Many of the best preserved monuments of Ur date either from this period or from that immediately following it, when, after the destruction of the city by the Elamites, the suzerains of Isin and Larsa were careful to restore the buildings of the third dynasty kings on their original lines. The Ziggurat, or staged tower, a sister structure to the Tower of Babel at Babylon, today one of the most striking ruins in Iraq, is the work of Ur-Nammu. Four other temples, a royal palace, and the walls of the inner city also represent the labours of his house and give a very fair idea of the appearance of the religious centre of the city in the great age.

Most of these buildings, either in their original form, or as restored by the Larsa kings, were standing when Abraham lived at Ur between 2,000 and 1,900 B.C. A number of private houses have been excavated and illustrate the domestic conditions of the Abrahamic times. The

houses, brick-built, were two storeys high and might contain on an average twelve or fourteen rooms forming a square round a paved court open to the sky. In type almost identical with the better-class houses of modern Baghdad, they were eminently comfortable and bear witness to a high standard of living among the urban population. Curious features are the presence, in some of the houses, of small chapels for domestic worship and the custom of burying the members of the family under the floor either of the chapel or of some other room. Since by 3,500 B.C. the main principles of architecture were already understood by the Sumerian builder and even in the tombs the vault, the arch, and perhaps the dome were used, the designers of the third dynasty temples had full technical knowledge and their work must have presented an appearance surprisingly modern. The art of sculpture, too, was far advanced, and from the fragments that survive today it is clear that the statues of the gods are worthy of the splendid buildings which housed them.

About 1,900 B.C. Hammurabi of Babylon conquered Ur; some thirty years later an ill-judged revolt brought the armies of Babylon again on the scene and the old city was laid waste. Though destined never again to be a capital of empire, Ur long retained its importance as a religious centre, and subsequent kings of Babylon repaired from time to time the damage done by the soldiery and the gradual decay of the brick buildings. In the fourteenth century B.C. king Kuri-Galzu undertook a thorough restoration of the city's monuments, and again in the 11th century B.C. we find evidence of much building activity.

Religious Significance

Even under the Assyrians the claims of the ancient Sumerian capital could not be disregarded, and the local governor, Sinbalatsu-ikbi, was commissioned to repair or rebuild a number of temples. It is probable that the motive of the kings was usually a political one, an attempt to conciliate southern feeling by attention to the southern gods. About 600 B.C. Nebuchadnezzar was particularly energetic in the work of restoration, and most of the temple ruins contain, in the upper parts of their walls, bricks stamped with his name. There can be little doubt that in this he was making a bid

for support in his struggle with neighbouring Assyria.

His grandson Nabonidus also did much work at Ur and amongst other things restored the Ziggurat, completing in blue glazed bricks the shrine which crowned its summit, and he consecrated as high priestess of Nannar his daughter, Belshalti-Nannar, the sister of Belshazzar. But the defeat of the latter in the field by Cyrus the Great and the overthrow of the Babylonian empire involved the downfall of Ur. The Persian conqueror satisfied his hatred of Nabonidus by the destruction of the buildings erected by him, and though he did repair certain temples the city could not recover.

Its political importance had long since gone. It is probable that the Euphrates had already shifted its course and by putting out of commission the canal system ruined Ur's agricultural prosperity. Soon the adoption by the Persians of the Zoroastrian creed made the religious associations which had preserved it hitherto a cause of offence. The old temples were dismantled and burnt, the population drifted elsewhere and their houses sank into decay. By 300 B.C. Ur was a heap of ruins.

Uraba. Gulf of the Caribbean Sea. On the coast of Colombia, it forms the S. portion of the Gulf of Darien, and receives the Atrato. It penetrates inland some 50 m.

Uraemia. Form of toxæmia, or blood poisoning. Due to the retention of urea in the body, it may develop in the course of nephritis or Bright's disease. Early symptoms are foul breath, coated tongue, headache, palpitation, and sometimes cramp. Treatment consists in active purgation and promoting sweating.

Uraeus. Ancient Egyptian serpent-symbol. Representing the African hooded cobra, Naja haje, it surmounted the forehead of royal persons. This emblem migrated to Phœnicia and Mexico, and survives in the sub-continent of India. See Serpent Worship.

Ural. River of S.E. Russia. Rising on the E. slope of the Ural Mts., R.S.F.S.R., it flows generally S. to Orsk, then W., and from Uralsk runs S. through Kazakh S.S.R. to discharge itself by three arms into the Caspian Sea at Guriev. It is c. 1,500 m. long, and for the most part too shallow to be navigable. During part of its course E. of Chkalov, it forms the boundary between Europe and Asia. The lower course is noteworthy for fishing.

Gold forms the head-dress; gold, lapis lazuli, and carnelian the necklaces, earrings, and other adornments

UR: GOLDEN CROWN AND JEWELRY OF A SUMERIAN QUEEN OF 3000 B.C.

1. Ur and the temple Ziggurat seen from the air. 2. Dagger in gold and lapis lazuli about 3,500 B.C. 3. Reconstruction of a Sumerian queen's headdress, about 3,000 B.C. from a stone tomb at Ur. 4. Reconstruction of private house of the time of Abraham, about 2,150 B.C. 5. Head of lion in copper and inlaid bitumen, about 3,100 B.C. 6. Relief of god Inigig in copper, reconstructed from fragments found at Tell el-Obeid.

Courtesy of Joint Expedition to Ur

Ural (Russ. *Zemnoi Poias*, girdle of the world). Mountain range in Russia. It extends some 1,600 m. from the Arctic Ocean to the Caspian Sea, and is usually regarded as the boundary between Europe and Asia. The range is the W. edge of a broad belt of folding, most of which is buried under Tertiary deposits in W. Siberia. The Urals are usually divided into three sections, N., middle, and S., the highest points being in the N., where two peaks, *Sablia* and *Tel-Pos*, both reach over 5,000 ft. In the S. the range becomes a plateau, under 1,500 ft. high. The mts. are a climatic barrier, annual rainfall on the E. side varying between 8 and 16 ins. and on the W. side exceeding 20 ins.

Mining of salt, iron, and copper began in the 16th century, and extensive gold deposits were found in 1745. Other minerals worked include manganese, platinum (of which the Urals before the First Great War furnished over 90 p.c. of the world's supply), uranium, tellurium, chromium, and silver. Under the Soviet regime the area was much developed, and during the Second Great War, after the loss of the Ukraine, it became the main seat of Russia's war industries. Its industrialisation, begun under the first five-year plan, was later accelerated, many new towns and new industries being planned and created. Heavy engineering, including making machinery, is of first importance, but there are also china, glass, cement, and brick works, while leather and textile factories are in operation.

Much of the lower slopes of the Urals is covered with deciduous forests, which provide timber for furniture-making and other industries. In the wilder parts animals such as fox, wolf, and ermine are hunted for their skins. On the steppes to the S.E. camels are bred. The *Sverdlovsk* region of the R.S.F.S.R. extends on both sides of the Urals, among the principal towns being *Sverdlovsk*, *Irbit*, *Perm*, and *Molotov*.

Ural-Altaic. Term denoting a family of agglutinating languages. It is an attempt to embody E. European with Asiatic elements. The simpler term *Altaic* is often preferred, comprising the W.-Altaic sub-families, *Samoyedic* and *Finno-Ugric*, including *Hungarian*; and the E.-Altaic sub-families, *Turkic*, *Mongolic*, and *Tungusic*. In these languages, unlike inflexional Indo-European, the root is unchangeable, suffixes being added, the vowels of which are assimilated

to the chief root-vowel by vocalic harmony. See *Altaic*; *Turanian*; *Ugrian*.

Uralite. In mineralogy, an amphibole resembling actinolite, formed by the secondary alteration of pyroxene. The original mineral often retains its form but is changed to an aggregate of slender amphibole fibres. Originally recorded in a rock from the *Ural Mts.*, uralitisation often occurs in altered pyroxene rocks.

Uralsk. Town of *Kazakh S.S.R.* Founded in 1775, it stands on the *Ural* river, 160 m. W.S.W. of *Chkalov*. It is the terminus of the *Ryazan-Uralsk* rly., and a centre for grain and cattle from the *Kirghiz* steppe. There are flour mills and leather works, as well as iron and woollen industries. Pop. 66,201.

Urania. One of the nine muses in Greek mythology. Daughter of *Uranus*, she presided over astronomy, and is usually represented as a draped figure bearing a globe in her right hand, a staff in her left.

Uraninite. Alternative name of the mineral *pitchblende* (*q.v.*).

Uranium. One of the chemical elements. Its symbol is *U*; atomic no., 92; atomic weight, 238.07; specific gravity, 18.69; m.p., 1689°C.

The element is named after the planet *Uranus* and was discovered by *Klaproth* in 1789. It occurs in *pitchblende*, which is essentially U_3O_8 but contains in addition thorium, the rare earths, lead, calcium, and bismuth. It is known to exist in *Cornwall*, the *Belgian Congo*, the *Ural mts.*, *S. Africa* (*Blyvooruitzicht*), *S. Australia* (*Flinders Range*), and *Canada* (the *Great Bear Lake*), the last being probably the richest source. The other principal ore of uranium is *carnotite* or *potassium uranyl vanadate*, $K_2(UO_2)(VO_4)_2 \cdot 3H_2O$, which is the main source of radium (*q.v.*) in the *United States*. Until recently the main interest in uranium ores lay in the radium in them and the extraction of this metal for medical purposes was the chief concern, the uranium being merely a by-product. With the advent of the modern technique of splitting uranium atoms as a source of atomic power its production has become of the greatest importance.

The principal steps in the extraction of the metal are to leach the roasted ore with sulphuric acid. Sodium nitrate is then added to oxidise the uranium, which passes into solution together with copper, iron, manganese, and calcium.

Sodium carbonate precipitates the first three of these, and the uranium is converted into soluble sodium uranyl carbonate. The uranium is finally obtained as sodium uranate (uranium yellow) which may vary in colour from yellow to orange. The metal itself is prepared by reduction of the oxide in a calcium chloride flux with calcium under argon in a bomb; or the fused double alkali fluoride may be electrolysed. Freshly prepared uranium resembles steel in appearance, but although the metal stains in air the corrosion does not penetrate. The metal combines readily with oxygen, nitrogen, and the halogens giving U_3O_8 , U_3N_4 , and UX_4 respectively.

Several oxides are known, each giving rise to a series of salts in which uranium may show valencies of 2, 3, 4, 5, and 6.

Industrial uses of uranium are limited, one of the most important being the addition of uranium yellow to ceramics. As little as 0.006 p.c. gives a good yellow colour, and the addition of further amounts will deepen the colour through olive green to black. All uranium compounds are radioactive, *i.e.* they spontaneously and continuously emit alpha and beta particles, being transformed in the process into other elements, finally ending with lead. The identification of the alpha and beta particles with a doubly charged helium atom and the electron respectively led to speculation whether alpha particles might not be used for bombarding other atoms (*see Atom*), and hence for effecting transformations.

Natural uranium consists of three isotopes of masses 234, 235, and 238 of which the first is present in only very small amounts and the latter two in the ratio of 1:140. The isotope of mass 235 was at first of importance from the point of view of atomic fission (*see Atomic Bomb*). Neutrons (*q.v.*) are used for this purpose. U^{238} does not undergo fission on bombardment with neutrons, but a neutron is absorbed, giving rise to a new element *neptunium* (*Np*) and by similar processes *plutonium* (*Pu*), *americium* (*Am*), and *curium* (*Cm*) are produced. These are known as *trans-uranic* elements and it is unlikely that useful quantities will be found in nature. *See Cyclotron*.

Uranus (Gr., heaven). In Greek mythology, the first king of the gods. He was the son of *Ge*, the Earth, and by her was the father of *Oceanus*, *Hyperion*, *Themis*,

(Cronos, and other gods and giants. These children he confined in Tartarus, and eventually, instigated by Ge, they rose in revolt against him, headed by Cronos, who mutilated him with a sickle. From his blood the Gigantes and the Furies were born, and from the foam that arose where the mutilated parts fell into the sea sprang the goddess Aphrodite. *Pron. Yoor-a-nus.*

Uranus. Second outermost planet of the solar system. It was discovered March 13, 1781 by Sir William Herschel, who also detected on Jan. 11, 1787, two of the Uranian satellites, Oberon and Titania. The mean distance of the planet from the sun is 1,785,800,000 m., its period of revolution round the sun 84 years, its diameter 32,400 m. Though 64 times as big as the earth it is only fifteen times as heavy. Its period of rotation on its own axis is $10\frac{1}{2}$ hrs., as determined spectroscopically and from variations in total brightness and surface spots.

Three further satellites have been discovered: Ariel and Umbriel by Lassell in 1851, and another by Kuiper in 1948. The satellites revolve in a plane nearly at right angles to the orbit of the planet, and have a retrograde motion. The spectrum of the planet indicates that the atmosphere contains methane, the intensity of the absorption bands corresponding to a terrestrial atmosphere 4 m. thick. From irregularities in the orbit of Uranus, the remarkable mathematical and consequent telescopic discovery of Neptune (*q.v.*) was made. *See Astronomy; Planet.*

Urban. Name of eight popes, of whom all save two are noticed separately. Of Urban I nothing is known except that he reigned 222-230, and was long honoured as a martyr. Urban VII (1521-90) died within a week of his election, Sept. 22, 1590.

Urban II (d. 1099). Pope 1088-99. A native of Champagne, of noble family, Otto or Ode studied at Reims under Bruno, founder of the Carthusians, and later entered the abbey of Cluny, where he became prior. As one of Gregory VII's most trusted helpers, he was made cardinal and bishop of Ostia, and in 1088 was elected pope at a council held at Terracina. Rome was then in the hands of the anti-pope Clement III, who, with the support of the emperor, Henry IV, alternated with Urban II in the actual occupation of S. Peter's. The greater part of Urban's ponti-

ficate was passed in exile, but he strove to maintain the policy of his great predecessor, Gregory VII. He excommunicated Philip I of France. In 1095 Urban crossed the Alps, re-entered his native country, and projected the first crusade, which he proclaimed at the council of Clermont. He died July 29, 1099.

Urban III (d. 1187). Pope 1185-87. Born at Milan, of noble family, his name was Uberto Crivelli, and he was made a cardinal and archbishop of Milan by Pope Lucius III. On his election to the papacy he maintained the dispute between the pope and the emperor, Frederick Barbarossa, over the claim of the papacy to estates in Tuscany. He refused to crown Henry, Frederick's son and the husband of Constance of Sicily, or to accept the emperor's nominee as bishop of Treves. Frederick responded by putting a stop to all communication between the papal court and German ecclesiastics. Urban was stopped from excommunicating him only by the refusal of the Veronese to allow the sentence to be promulgated from their city. The pope died at Ferrara, Oct. 20, 1187.

Urban IV (d. 1264). Pope 1261-64. Son of a French cobbler of Troyes, Jacques Pantaléon studied in Paris and became successively canon of Laon, archdeacon of Liège, bishop of Verdun, 1253, and patriarch of Jerusalem, 1255. Innocent IV employed him in various missions, and in 1261 he was elected pope at Viterbo. Urban's policy led ultimately to the final overthrow of the enemy of the papacy, the Hohenstaufen dynasty. He secured French intervention in Italy in the person of Charles of Anjou, by the offer of the Sicilian crown, but Italy had to be won back from Manfred, prince of Tarentum. Urban's diplomacy kept off Manfred, but the pope did not see the accomplishment of his schemes, for he died at Perugia, Oct. 2, 1264. Urban established the feast of Corpus Christi.

Urban V (1309-70). Pope 1362-70. Guillaume Grimoard, a native of Languedoc, entered the Benedictine order, in which he rose to be abbot of S. Victor at Marseilles. During his absence as legate to Naples, he was elected to succeed Innocent VI and was crowned at Avignon, Nov. 6, 1362. In 1367 he moved to Rome, but in Nov., 1370, at the entreaties of the French cardinals, he returned to Avignon, dying there Dec. 19.

Urban VI (1318-89). Pope 1378-89. A Neapolitan, Bartolommeo Prignano became archbishop of Bari in 1377, and on the death of Gregory XI was elected pope, April 8, 1378. A tactless disciplinarian, he alienated the college of cardinals, who in July 1378 met at Anagni, declared Urban's election null, and elected a French cardinal as Clement VII in his place. This was the origin of the Great Schism. Urban was on his way to seize the throne of Naples vacated by the death of Charles, whom he had himself crowned, when, thrown from his mule, he succumbed to his injuries, Oct. 15, 1389.

Urban VIII (1568-1644). Pope, 1623-44. Maffeo Barberini, a Florentine, was educated in Rome and

Urban VIII,
Pope 1623-44

Pisa, made cardinal in 1606, and elected pope in 1623. During the Thirty Years War he sided with France. In Rome he built the magnificent Barberini palace of stones from the Colosseum, and took bronze from the Pantheon to make the tawdry baldachin at S. Peter's, an act which elicited one of Pasquino's bitterest gibes, *quod non fecerunt barbari fecerunt Barberini* (what the barbarians left undone, the Barberini did). He founded the Propaganda College for missionaries, 1627; issued, 1631, the Breviary as used until Pius X; and culminated decrees against the Jansenists. He died July 29, 1644.

Urban District. In England, Wales, and Ireland, a unit of local government. These districts were created by an Act of 1894 from populous areas which were not municipalities. Each has an elected council, presided over by a chairman.

Councillors are elected for three years, and one-third retire every year on April 15, unless the county council has made an order providing for all to retire every three years and new elections to be held. A chairman is elected at the annual meeting, which appoints clerk, treasurer, surveyor, medical officer of health, sanitary inspector, and other officers. There must be an annual meeting on or immediately after April 15, and at least three other meetings in each year. The council may appoint and act through committees. It acts as

the sanitary authority and highways authority for unclassified roads, and exercises many other powers under various Acts of parliament. Further powers may also be delegated to it by the c.c. In 1948 there were 572 urban districts in England and Wales.

Urbi et Orbi. Latin phrase meaning To the city and the world. It is used in papal bulls to signify that they are addressed first to Rome and afterwards to the whole world, and thus are of universal authority and application.

Urbino. City of Italy, in the prov. of Pesaro. It is 25 m. by road S.W. of Pesaro, on a hill amid the E. ridges of the Apennines, between the rivers Metauro and Foglia. The house wherein Raphael was born is now a museum of fine arts. The cathedral, 1801, has interesting paintings, and the churches of Santo Spirito and San Domenico contain artistic treasures, as does also the 15th century ducal palace. Urbino university dates from 1671. The famous library is now in Rome. Silks, majolica, oil, and cheese are the main products. Pop. est. 20,500.

As Urbinum, the city was prominent in Roman times; Federigoda Montefeltro was created duke of Urbino in 1474, and made the city a centre of science and art. It was a papal possession, 1626-1860. The city wall, virtually complete, had a narrow escape in the Second Great War, as it was mined by the retreating Germans. Allied troops entered the city in their wake, Aug. 29, 1944, and British engineers removed all the mines, except those at the S.W. corner. Thus only some 200 yards of the wall was destroyed.

Urdmurtsk. Autonomous republic of the U.S.S.R. It is bounded on the N. and W. by the region of Kirov, on the E. by the region of Sverdlovsk, and on the S. by the Tatar A.S.S.R. Its capital is Izhevsk, and the republic is a flourishing centre of timber and cereal production.

Urdu (Turkish, camp). A language of the sub-continent of India. It arose from the Muslim invasion after the 11th century. It is in fact the Persianised product

of Hindi, which, of the Indo-European family of languages, began to be the common speech of India in the 2nd century B.C., and assumed literary form in the 8th A.D. From the Delhi and Meerut districts, Urdu spread over most of N. India. The poets Sanda and Mirtaqi wrote in Urdu early in the 18th century: Muhammad Nazir was an outstanding successor to them; and in modern times Sir Mohammed Iqbal gained fame for his Urdu verse, appreciated all over India. The novel became another medium for the expression of Urdu literary talent, especially with Pandit Ratanath Sarshar. Although the accident of

Urbino, Italy. The modern cathedral, with statue of Raphael; top, right, house in the market place where the artist was born

political controversy tended to make this language an exclusively Muslim possession in opposition to Hindi, Sarshar's work shows that it had a wider appeal.

Urdu script is Arabic in style and is written from right to left, whereas Hindi, in the Devanagari or Sanskrit alphabet, is written from left to right. Hindustani, the *lingua franca* of about 120 million people, may be written in Urdu or Hindi script. Under British rule "Roman Urdu" was used in the army, but efforts to extend its use were not successful.

Ure. River of Yorks, England, a headstream of the Yorkshire Ouse. It rises in the Pennines in

the N. Riding and flows E. and S.E. through Yoredale or Wensleydale, past Askrigg, where there is the oldest bridge in the county, past Jervaulx abbey, Masham, Ripon, and Boroughbridge, to join the Swale, the two forming the Ouse.

Urea (NH_2CONH_2). Chemical compound occurring in the form of colourless tetrahedral crystals, and familiar to chemical students as the first organic substance to be synthesised from purely inorganic raw materials (Wöhler, 1828). It has since been synthesised from ammonia and carbon dioxide for a variety of industrial purposes including pharmaceutical chemicals, fertilisers, and plastics. Condensation products of urea, and of its near derivatives thiourea and melamine, are the most important members of the urea formaldehyde plastics or aminoplastics. The m.p. of urea is 132.7°C .

Urethane. Colourless crystalline substance, known also as ethyl carbamate. It is prepared by heating urea nitrate with alcohol, or by the action of ammonia on chloroformic ester. Urethane is used in medicine as an hypnotic, and in combination with quinine as a sclerosing agent in treatment of varicose veins.

Urethra. Channel through which urine is voided from the bladder. In the male it is 6 to 8 ins. in length, and in the female approximately $1\frac{1}{2}$ ins.

Urey, HAROLD CLAYTON (b. 1893). American chemist. He was born April 29, 1893, studied at the universities of Montana and California, and, after doing chemical research in industry, served on the staff of Johns Hopkins, Montana, and Columbia universities. In 1934 he was awarded the Nobel prize for chemistry for his work on the chemical aspects of the quantum theory. Professor of chemistry at Columbia at the outbreak of the Second Great War, Urey was put in charge of the atomic bomb project in 1940. In 1945 he became professor of chemistry at Chicago.

Urfa. Town of Asiatic Turkey. It is 78 m. S.W. of Diarbekir, and has considerable trade in cotton and wheat. It occupies the site of the ancient Edessa (q.v.). Pop. 36,635. It gives its name to a vilayet with a pop. of 267,561.

Urga. Sacred city of the Mongols, otherwise Ulan Bator (q.v.).

Urganj or **URGENJ.** Town of Turkmen S.S.R. It is about 85 m. N.W. of Khiva, on an affluent of the Amu-Daria or Oxus, and is the commercial centre of a large district. Historically it is known

Cronos, and other gods and giants. These children he confined in Tartarus, and eventually, instigated by Jê, they rose in revolt against him, headed by Cronos, who mutilated him with a sickle. From his blood the Gigantes and the Furies were born, and from the foam that arose where the mutilated parts fell into the sea sprang the goddess Aphrodite. *Pron. Yoor-a-nus.*

Uranus. Second outermost planet of the solar system. It was discovered March 13, 1781 by Sir William Herschel, who also detected on Jan. 11, 1787, two of the Uranian satellites, Oberon and Titania. The mean distance of the planet from the sun is 1,785,800,000 m., its period of revolution round the sun 84 years, its diameter 32,400 m. Though 64 times as big as the earth it is only fifteen times as heavy. Its period of rotation on its own axis is $10\frac{1}{2}$ hrs., as determined spectroscopically and from variations in total brightness and surface spots.

Three further satellites have been discovered: Ariel and Umbriel by Lassell in 1851, and another by Kuiper in 1948. The satellites revolve in a plane nearly at right angles to the orbit of the planet, and have a retrograde motion. The spectrum of the planet indicates that the atmosphere contains methane, the intensity of the absorption bands corresponding to a terrestrial atmosphere 4 m. thick. From irregularities in the orbit of Uranus, the remarkable mathematical and consequent telescopic discovery of Neptune (*q.v.*) was made. *See* Astronomy; Planet.

Urban. Name of eight popes, of whom all save two are noticed separately. Of Urban I nothing is known except that he reigned 222-230, and was long honoured as a martyr. Urban VII (1521-90) died within a week of his election, Sept. 22, 1590.

Urban II (d. 1099). Pope 1088-99. A native of Champagne, of noble family, Otto or Ode studied at Reims under Bruno, founder of the Carthusians, and later entered the abbey of Cluny, where he became prior. As one of Gregory VII's most trusted helpers, he was made cardinal and bishop of Ostia, and in 1088 was elected pope at a council held at Terracina. Rome was then in the hands of the anti-pope Clement III, who, with the support of the emperor, Henry IV, alternated with Urban II in the actual occupation of S. Peter's. The greater part of Urban's ponti-

ficate was passed in exile, but he strove to maintain the policy of his great predecessor, Gregory VII. He excommunicated Philip I of France. In 1095 Urban crossed the Alps, re-entered his native country, and projected the first crusade, which he proclaimed at the council of Clermont. He died July 29, 1099.

Urban III (d. 1187). Pope 1185-87. Born at Milan, of noble family, his name was Uberto Crivelli, and he was made a cardinal and archbishop of Milan by Pope Lucius III. On his election to the papacy he maintained the dispute between the pope and the emperor, Frederick Barbarossa, over the claim of the papacy to estates in Tuscany. He refused to crown Henry, Frederick's son and the husband of Constance of Sicily, or to accept the emperor's nominee as bishop of Treves. Frederick responded by putting a stop to all communication between the papal court and German ecclesiastics. Urban was stopped from excommunicating him only by the refusal of the Veronese to allow the sentence to be promulgated from their city. The pope died at Ferrara, Oct. 20, 1187.

Urban IV (d. 1264). Pope 1261-64. Son of a French cobbler of Troyes, Jacques Pantaléon studied in Paris and became successively canon of Laon, archdeacon of Liège, bishop of Verdun, 1253, and patriarch of Jerusalem, 1255. Innocent IV employed him in various missions, and in 1261 he was elected pope at Viterbo. Urban's policy led ultimately to the final overthrow of the enemy of the papacy, the Hohenstaufen dynasty. He secured French intervention in Italy in the person of Charles of Anjou, by the offer of the Sicilian crown, but Italy had to be won back from Manfred, prince of Tarentum. Urban's diplomacy kept off Manfred, but the pope did not see the accomplishment of his schemes, for he died at Perugia, Oct. 2, 1264. Urban established the feast of Corpus Christi.

Urban V (1309-70). Pope 1362-70. Guillaume Grimoard, a native of Languedoc, entered the Benedictine order, in which he rose to be abbot of S. Victor at Marseilles. During his absence as legate to Naples, he was elected to succeed Innocent VI and was crowned at Avignon, Nov. 6, 1362. In 1367 he moved to Rome, but in Nov., 1370, at the entreaties of the French cardinals, he returned to Avignon, dying there Dec. 19.

Urban VI (1318-89). Pope 1378-89. A Neapolitan, Bartolommeo Prignano became archbishop of Bari in 1377, and on the death of Gregory XI was elected pope, April 8, 1378. A tactless disciplinarian, he alienated the college of cardinals, who in July 1378 met at Anagni, declared Urban's election null, and elected a French cardinal as Clement VII in his place. This was the origin of the Great Schism. Urban was on his way to seize the throne of Naples vacated by the death of Charles, whom he had himself crowned, when, thrown from his mule, he succumbed to his injuries, Oct. 15, 1389.

Urban VIII (1568-1644). Pope, 1623-44. Maffeo Barberini, a Florentine, was educated in Rome and

Urban VIII,
Pope 1623-44

Pisa, made cardinal in 1606, and elected pope in 1623. During the Thirty Years War he sided with France. In Rome he built the magnificent Barberini palace of stones from the Colosseum, and took bronze from the Pantheon to make the tawdry baldachin at S. Peter's, an act which elicited one of Pasquino's bitterest gibes, *quod non fecerunt barbari fecerunt Barberini* (what the barbarians left undone, the Barberini did). He founded the Propaganda College for missionaries, 1627; issued, 1631, the Breviary as used until Pius X; and fulminated decrees against the Jansenists. He died July 29, 1644.

Urban District. In England, Wales, and Ireland, a unit of local government. These districts were created by an Act of 1894 from populous areas which were not municipalities. Each has an elected council, presided over by a chairman.

Councillors are elected for three years, and one-third retire every year on April 15, unless the county council has made an order providing for all to retire every three years and new elections to be held. A chairman is elected at the annual meeting, which appoints clerk, treasurer, surveyor, medical officer of health, sanitary inspector, and other officers. There must be an annual meeting on or immediately after April 15, and at least three other meetings in each year. The council may appoint and act through committees. It acts as

the sanitary authority and highways authority for unclassified roads, and exercises many other powers under various Acts of parliament. Further powers may also be delegated to it by the c.c. In 1948 there were 572 urban districts in England and Wales.

Urbi et Orbi. Latin phrase meaning To the city and the world. It is used in papal bulls to signify that they are addressed first to Rome and afterwards to the whole world, and thus are of universal authority and application.

Urbino. City of Italy, in the prov. of Pesaro. It is 25 m. by road S.W. of Pesaro, on a hill amid the E. ridges of the Apennines, between the rivers Metauro and Foglia. The house wherein Raphael was born is now a museum of fine arts. The cathedral, 1801, has interesting paintings, and the churches of Santo Spirito and San Domenico contain artistic treasures, as does also the 15th century ducal palace. Urbino university dates from 1671. The famous library is now in Rome. Silks, majolica, oil, and cheese are the main products. Pop. est. 20,500.

As Urbinum, the city was prominent in Roman times; Federigoda Montefeltro was created duke of Urbino in 1474, and made the city a centre of science and art. It was a papal possession, 1626-1860. The city wall, virtually complete, had a narrow escape in the Second Great War, as it was mined by the retreating Germans. Allied troops entered the city in their wake,

Aug. 29, 1944, and British engineers removed all the mines, except those at the S.W. corner. Thus only some 200 yards of the wall was destroyed.

Urdmurtsk. Autonomous republic of the U.S.S.R. It is bounded on the N. and W. by the region of Kirov, on the E. by the region of Sverdlovsk, and on the S. by the Tatar A.S.S.R. Its capital is Izhevsk, and the republic is a flourishing centre of timber and cereal production.

Urdu (Turkish, camp). A language of the sub-continent of India. It arose from the Muslim invasion after the 11th century. It is in fact the Persianised product

of Hindi, which, of the Indo-European family of languages, began to be the common speech of India in the 2nd century B.C., and assumed literary form in the 8th A.D. From the Delhi and Meerut districts, Urdu spread over most of N. India. The poets Sanda and Mirtaqi wrote in Urdu early in the 18th century: Muhammad Nazir was an outstanding successor to them; and in modern times Sir Mohammed Iqbal gained fame for his Urdu verse, appreciated all over India. The novel became another medium for the expression of Urdu literary talent, especially with Pandit Ratanath Sarshar. Although the accident of

Urbino, Italy. The modern cathedral, with statue of Raphael; top, right, house in the market place where the artist was born

political controversy tended to make this language an exclusively Muslim possession in opposition to Hindi, Sarshar's work shows that it had a wider appeal.

Urdu script is Arabic in style and is written from right to left, whereas Hindi, in the Devanagari or Sanskrit alphabet, is written from left to right. Hindustani, the *lingua franca* of about 120 million people, may be written in Urdu or Hindi script. Under British rule "Roman Urdu" was used in the army, but efforts to extend its use were not successful.

Ure. River of Yorks, England, a headstream of the Yorkshire Ouse. It rises in the Pennines in

the N. Riding and flows E. and S.E. through Yoredale or Wensleydale, past Askrigg, where there is the oldest bridge in the county, past Jervaulx abbey, Masham, Ripon, and Boroughbridge, to join the Swale, the two forming the Ouse.

Urea (NH_2CONH_2). Chemical compound occurring in the form of colourless tetrahedral crystals, and familiar to chemical students as the first organic substance to be synthesised from purely inorganic raw materials (Wöhler, 1828). It has since been synthesised from ammonia and carbon dioxide for a variety of industrial purposes including pharmaceutical chemicals, fertilisers, and plastics. Condensation products of urea, and of its near derivatives thiourea and melamine, are the most important members of the urea formaldehyde plastics or aminoplastics. The m.p. of urea is 132.7°C .

Urethane. Colourless crystalline substance, known also as ethyl carbamate. It is prepared by heating urea nitrate with alcohol, or by the action of ammonia on chloroformic ester. Urethane is used in medicine as an hypnotic, and in combination with quinine as a sclerosing agent in treatment of varicose veins.

Urethra. Channel through which urine is voided from the bladder. In the male it is 6 to 8 ins. in length, and in the female approximately $1\frac{1}{2}$ ins.

Urey, HAROLD CLAYTON (b. 1893). American chemist. He was born April 29, 1893, studied at the universities of Montana and California, and, after doing chemical research in industry, served on the staff of Johns Hopkins, Montana, and Columbia universities. In 1934 he was awarded the Nobel prize for chemistry for his work on the chemical aspects of the quantum theory. Professor of chemistry at Columbia at the outbreak of the Second Great War, Urey was put in charge of the atomic bomb project in 1940. In 1945 he became professor of chemistry at Chicago.

Urfa. Town of Asiatic Turkey. It is 78 m. S.W. of Diarbekir, and has considerable trade in cotton and wheat. It occupies the site of the ancient Edessa (q.v.). Pop. 36,635. It gives its name to a vilayet with a pop. of 267,561.

Urga. Sacred city of the Mongols, otherwise Ulan Bator (q.v.).

Urganj or **URGENJ.** Town of Turkmen S.S.R. It is about 85 m. N.W. of Khiva, on an affluent of the Amu-Daria or Oxus, and is the commercial centre of a large district. Historically it is known

as a principal place in the Khiva Khanate, often itself called Urganj. Jenghiz Khan in 1220 was one of many tribal leaders to storm the place, which was strategically more valuable before the Amu-Daria changed course. As Orgunje it is mentioned in the famous descriptive passage which closes Arnold's *Sohrab and Rustum*.

Uri. Canton of Switzerland. It comprises 415 sq. m. in the valley of the Reuss, with outliers of the Bernese Alps on the W., the Glarus Alps on the E., and the St. Gotthard group to S. It is elevated, sparsely peopled, and almost solely dependent upon the pastoral industry and its dairy products. Altdorf, scene of Tell's exploits, is the capital, and Andermatt is in this canton. The inhabitants are German-speaking Roman Catholics. One of the four forest cantons, Uri joined the Swiss confederacy of 1291. Pop. 27,302.

Uriah. Hittite soldier, whose fate is told in 2 Sam. 11. David, having committed adultery with Bathsheba, wife of Uriah, ordered his captains to place the latter "in the forefront of the hottest battle," where he was slain by the people of Rabbah. This drew upon David the rebuke of Nathan, and his child by Bathsheba died at seven days old.

Urial (*Ovis vignei*). Species of wild sheep, found in the Punjab, Tibet, Afghanistan, and Baluchis-

Urial. Big-horned, wild sheep of central Asia that dwells in flocks in the valleys and on the hills

tan. It stands about 3 ft. high, and has greyish brown hair on the upper parts, with whitish underparts. The horns measure about 27 ins. along the curve. Urials are found both in the valleys and on the hills, usually in flocks.

Uric Acid. Crystalline substance found normally in small quantities in urine as the acid am-

monium salt, and in the blood and calculi of gouty patients as the acid sodium salt. It is the chief constituent of the excreta of birds and reptiles. Uric acid was discovered in 1776 by Scheele in urinary calculi. It may give rise to stone by reason of its insolubility.

Uriconian Series. In geology, a group of ancient Pre-Cambrian lavas, volcanic tuffs, and minor intrusions which form the Church Stretton hills and the Wrekin, Shropshire. They underlie the sediments of the Longmynd, and are tentatively correlated with similar rocks in the Malvern Hills and Pembrokeshire. They are named after the ancient Roman city of Uriconium (*v.i.*). See Pre-Cambrian; Tuff; Volcano; Wrekin.

Uriconium or **VIBROCONIUM.** A Roman British town, tribal capital of the Cornovii, on the site of Wroxeter, Shropshire. It was probably established as a military fort by Claudius with the XIV legion about A.D. 47; when the legion withdrew in 70 a municipal centre quickly developed. Within its walled enclosure of 170 acres were a market place 394 ft. by 265 ft., public baths, and fine houses of Italian design. The junction of the Watling Street and of roads from Caerleon and Chester, Uriconium attained much opulence. Excavations in 1912-14 and 1923-27 revealed: rows of colonnaded

shops, a temple, furnaces for bronze working, etc. See Britain; Wroxeter.

Urim and Thummim. Sacred objects which the ancient Hebrews employed as oracles or media for learning the will of God. They were probably two small stones, representing "yes" and "no," one of which was shaken out of some receptacle. On difficult occasions, as in 1 Sam. 14, an agreement was previously made as to the meaning to be attached to the lots. In a late document, Ex. 28, v. 30, they are referred to as carried in the high priest's breastplate. The whole question of Urim and Thummim is obscure, even the meaning of the words, which have been translated as Lights and Perfections, or as Light and Darkness, being uncertain. See Breastplate; Lot.

Urine. Fluid containing waste material abstracted from the blood.

Urine is secreted by the kidneys, from which it is passed through the ureters to the bladder, and thence is voided at intervals through the urethra. Normal urine is of a yellow colour, which may vary in tint to a considerable degree without indicating any deviation from health. The most important pigment is termed urochrome, and there are smaller quantities of other pigments. The reaction of normal urine is acid, this being due chiefly to the presence of acid sodium phosphate. Urine becomes less acid during the process of active digestion, and is also less so in vegetarians and herbivorous animals. The chemical constitution also undergoes various alterations during pregnancy.

An increase in the amount of urine passed occurs in diabetes, certain forms of nephritis or Bright's disease, and occasionally in hysterical attacks. It may also result from taking drugs which stimulate the flow of urine, such as caffeine and citrate of soda. Albumen is present in the urine in high fevers and in certain diseases of the kidney. Sugar in the urine is indicative of diabetes, but small amounts may be present in certain affections of the nervous system, in physical fatigue, and in other diseases. Bile may be present; obstruction of the bile ducts results in the bile passing into the blood stream. Blood in the urine occurs in black-water fever, in acute nephritis, and in injuries to the kidney and bladder. Pus there may be due to suppuration in any part of the urinary channel. Bacteria may be present in typhoid, gonorrhoea, tuberculosis, and other diseases, while occasionally eggs of Bilharzia, or indications of other parasites, are found. Deposition of urates and other salts while the urine is still in the kidney or bladder gives rise to the formation of calculi and gravel. Extravasation is leakage of the urine into the surrounding tissues owing to injury of some part of the walls of the channel. Suppression of the urine occurs when the kidneys have ceased to exercise their function, the commonest cause being acute nephritis.

Uri-Rothstock. Alpine peak of Switzerland, in the canton of Uri. It rises to 9,620 ft., S.W. of the S.E. end of Lake Lucerne. To the S.W. is the Engelberg Rothstock, 9,250 ft.

Urmia, URUMIA, OR URUMIYA. Lake of Persia, also called Daria Shah, or the royal lake. Lying at an alt. of 4,000 ft. in Azerbaijan

prov., it has no outlet and is very shallow. Owing to its saltness, fish cannot live in it. The area is 1,795 sq. m., length about 80 m., and width varies up to 35 m. The most important town near the Lake is Tabriz, on the E.

Urmia, **URUMIA**, or **URUMIYA**. Town of Persia. Situated 12 m. W. of the lake of the same name, in Azerbaijan prov., it is said to be the birthplace of Zoroaster (*q.v.*). It is now the seat of an R.C. bishop. Raisins are exported.

Urmston. Urban dist. of Lancs, England, comprising the townships of Urmston, Flixton, and Davyhulme. About 5 m. W.S.W. of Manchester, it is a residential suburb with a large industrial estate. There are three rly. stations. Pop. 37,500.

Urn (Lat. *urna*). Vase of clay, glass, stone, or metal, especially one with an egg-shaped body on a pedestalled base. In ancient Rome urns were used for drawing lots, storing water, or depositing before tombs. Ruder sepulchral wares were placed in Neolithic, Bronze Age, and late-Celtic graves in Britain and elsewhere. The modern tea urn retains the

Urn depicted in bas-relief on a Greek stela of the 5th century, B.C.

characteristic shape. See Canopic Jar; Cinerary Urn.

Urn-Burial. Interment of human remains in a jar-shaped receptacle, usually of clay. The urn may enclose the whole body, the severed parts, or the disjointed bones after the removal of the flesh; these being placed in the urn either immediately or after a preliminary earth-burial. The custom is traceable, for unburned and burned remains, in pre-Columbian and recent aboriginal America.

Urn-Burial is the short title of a book written by Sir Thomas Browne and published in 1658. Its full title is *Hydriotaphia, Urne-Buriall*; or a discourse of sepulchral urnes lately found in Norfolk. It is regarded as containing, especially in its final chapter, some of the most magnificent passages in English prose. See Browne, Sir T.

Urotropine or **HEXAMETHYLENETETRAAMINE**. Drug prepared by the action of ammonia on formaldehyde and also known as hexamine (*q.v.*).

Urquhart or **URCHARD**, **SIR THOMAS** (c. 1611–c. 1660). Scottish author and translator. Eldest son of Thomas Urquhart of Cromarty, he was educated at King's College, Aberdeen. As an opponent of the Covenant, he took part in the abortive movement in the north in 1639, and then took

Sir Thomas Urquhart, Scottish author. From an old print

refuge at the English court, where he was knighted in 1641. In 1649 he joined the Royalists, and was taken prisoner and confined in the Tower, but was released through the clemency of Cromwell in 1652. In that year appeared *The Jewel*, a panegyric of the Scottish nation, and in 1653 *Logopandectes*, an outline of a universal language marked by great ingenuity.

Urquhart's reputation rests on his translation of Rabelais, one of the masterpieces of its kind. As one critic said, "In point of style Urquhart was Rabelais incarnate, and in his employment of the verbal resources, whether of science or pseudo-science and slang, he almost surpassed Rabelais himself." Little is known of Urquhart's later years. Tradition says that he died of an uncontrollable fit of laughter when he heard of the Restoration of Charles II.

Ursa Major or **THE GREAT BEAR**. One of the northern constellations. Its brightest stars form the Plough or Charles's Wain, a familiar constellation in the N. sky. It consists of seven bright stars denoted by the first seven letters of the Greek alphabet, and a number of fainter stars. α and β Ursae Majoris are called the pointers from the fact that the line joining them points approximately to the pole star. Six of the chief stars are of the second magnitude, and the seventh, ϵ Ursae Majoris, or Mizar, was the first telescopic double star to be detected. There are many other double stars in the constellation, and the well-known Owl planetary nebula.

Ursa Minor or **THE LESSER BEAR**. Constellation between Ursa Major and the north pole. The constellation was also known as the Twister, from its obvious constant

circling of the pole. α Ursae Minoris is Polaris, the pole star.

Ursula (5th century). Virgin martyr, the patron saint of maidens. She is said to have been the daughter of a Cornish prince and to have fled with her friends to Gaul to escape the Saxon invaders of Britain. After a visit to Rome she is reported to have been slain with many others by the Huns about 453, near the banks of the Rhine, and to have been buried at Cologne. She is commemorated with her fellow virgin martyrs on Oct. 21.

Ursulines. R.C. religious order for women. It was founded at Brescia by S. Angela di Merici (1470–1540).

The original institution was an association of young ladies living at home, devoting their spare time to works of piety and especially to the education of poor children. In 1535 the association received episcopal approval as a religious community; the spread of the work in the next few years led to the approval of Pope Paul III. Under the protection and guidance of S. Charles Borromeo it was made an enclosed religious order under the rule of S. Augustine by Gregory XIII in 1572. The order, which is famed for its schools, maintains several convents in Great Britain.

The Company of S. Ursula is another congregation founded at Dôle by Anne de Xaintonge in 1606. Occupied in conducting elementary and secondary schools and in pious works, it has houses in Europe and America.

Urticaceae. Botanical name for the nettle family. This is an extensive family of herbs and shrubby plants, natives of the temperate and warm regions. They have mostly alternate leaves, and the flowers have usually the sexes separate. The fruits are one-seeded. Familiar examples are wall-pellitory (*Parietaria*) and the stinging nettle (*Urtica*).

Urticaria. This complaint is described in the article Itch.

Ursulines. Habit of the Order

Uruguay. River of S. America. With the Paraná it forms the Plate river (*q.v.*). It rises in the coast range of S. Brazil and flows W.N.W. as the Pelotas, through a little known jungle forest. Most of its course of 1,000 m. is over the plateau. For the lowest 100 m. it is a broad stream, 6 to 9 m. across. Sea-going vessels reach Paysandú, 150 m. upstream; smaller vessels are stopped by rapids at Salto, 50 m. farther; above the rapids barges traverse the next 300 m. The chief affluent is the Rio Negro. For the lowest 400 m. the river separates Uruguay from Argentina.

Uruguay (Republica Oriental del Uruguay, republic east of the Uruguay).

Uruguay arms

S. American republic which takes its name from the river Uruguay. It is wholly within the S. temperate zone, on the Atlantic coast, S. of Brazil, separated from Argentina by the Uruguay on the W. and by the estuary of the Plate on the S.W. The old name of the country, dating from the time when Uruguay was part of the Spanish viceroyalty of Rio de la Plata (River Plate), and still in local use, is La Banda Oriental (the eastern bank), whence the inhabitants style themselves Orientals.

Uruguay, which has an area of 72,153 sq. m., is the smallest in size, and second smallest in pop. (2,202,936 in 1942), of the S. American republics. A-third of the pop. lives in Montevideo (est. 770,000), the capital. The birth rate is 19.9 per thousand; the death rate 10.4.

Uruguay owes its independent existence to its geographical position. Historically it belongs to the Spanish system of River Plate provinces which formed the Argentine confederation. It is an extension of the treeless grassy plain of the Argentine pampa, though the Uruguayan open country is less flat and uniform. The grass lands sweep in long undulations or ridges. The *cuchillas* or tops of the ridges form as it were natural causeways. The gentle declivities between them slope down to winding *cañadas* or watery hollows which feed innumerable small streams mostly flowing into the affluents of the Uruguay. The streams and rivers are bordered by low trees; otherwise the grass lands are usually treeless except for occa-

sional plantations. Five considerable rivers, of which the Negro is the largest, flow W. into the Uruguay, three flow E. into the Lagoa Mirim, an extensive lagoon about 50 m. from the Atlantic coast. To the N. of the Rio Negro the hills are higher and steeper than S. of it.

Uruguay enjoys an excellent climate, in spite of summer heat and the rapid fall in temp., especially from Oct. to Jan. (summer), caused by the *pampero* or violent line squall from the S. or S.W. At Montevideo the mean temp. ranges, on the average, from 72° F. in Jan. to 51° F. in July; the highest temp. recorded is 102° F. and the lowest 32° F. Rain falls at all seasons, the nature of the distribution determining whether wheat or maize is grown. The country is well adapted for white labour, and there has been considerable immigration, particularly from Italy and Spain.

CONSTITUTION. A new constitution, approved by popular vote in 1942, confirmed the existing legislative and governing bodies of (a) president and vice-president and a cabinet of nine ministers, (b) senate of 30, presided over by the vice-president, who holds the casting vote, and (c) chamber of

There is universal suffrage, women being given the vote under the 1934 constitution. Elections for both houses are held every four years; voting is secret. The country is divided for local administration into 19 depts.

Uruguay enjoys complete liberty of religion, but the majority of the people are R.C. Elementary education is compulsory; elementary and secondary education are free. Montevideo is the seat of a university opened in 1849 and normally attended by some 19,000 students.

The people of Uruguay are predominantly of European origin, with some admixture of American Indian and negro blood. They are of a simpler and less cosmopolitan type than the Argentines, preserving in a greater degree the old-fashioned Creole ways. Montevideo, the capital, is also the chief port. Paysandú, Salto, and Fray Bentos lie on the navigable Uruguay. Spanish is the language of the country. There is a prolific and ably conducted newspaper press. Uruguay's best known writer was J. E. Rodó (*q.v.*).

Ocean steamers ascend the Uruguay as far as Paysandú; large river steamers can get as high as Salto. Above the cascades

Uruguay. Map of the pastoral republic of South America formerly known as La Banda Oriental, i.e., the eastern bank of the Uruguay

deputies of 99; but whereas, under the constitution of 1934, 15 of the senate seats and three cabinet posts were assigned to the party taking second place in a general election, seats in both senate and chamber were filled on a basis of P.R., and the president was left free to choose his cabinet.

which give this town its name, smaller craft ascend to the Brazilian frontier and beyond. The 1,477 m. of rly. were, except some 80 m. already under state control, British owned until bought by the Uruguay govt. in 1948; they are of standard gauge. Good motor roads connect the capital with most of the important cities; long distance bus services plying over 2,600 m. of highway. There are air services to all N. and S. American countries, Carrasco to the E. of Montevideo being the chief airport.

Most of the occupations of Uruguay are pastoral, principal products and exports being meat, wool, and hides; there are large establishments, notably at Fray Bentos, for making meat extract and canning meat; jerked beef is

still prepared by old-fashioned methods for export to Brazil and the W. Indies. Meat and wool account for 85 p.c. of the value of Uruguay's exports. There are, however, some important industries, among manufactures produced being boots and shoes of first-class quality, woollen and worsted fabrics, cotton goods, carded yarn, and rayon fabrics, jute bags, cordage, flour and biscuits, glass and bottles, cigars and cigarettes, wines, beer, and spirits, and motor car tires. This industrial development arose chiefly from the need to produce goods otherwise unobtainable during the two Great Wars by the cutting off of European manufactures.

A govt. organization enjoys a monopoly of the manufacture of chemicals which include alcohol, sulphate, chloride, carbonate of soda, chloroform, collodion preparations, sulphuric ether and acid, superphosphate, sulphate of iron, benzol, toluol, naphthalene, nitric acid, hydrochloric acid, caustic soda, and ammonia. Large quantities of soap are manufactured in Montevideo. Uruguayan marble is used extensively in Argentina and Great Britain.

Damming of the Rio Negro and the construction of a hydro-electric plant, in progress in 1948, promised a great increase in Uruguay's industrial potential.

HISTORY. Little is known of the history of the area which came to be called Uruguay before the arrival of Solis, first European navigator to reach the Plate estuary who landed on its N. shore 1512, but on a second visit was killed and eaten by the savage Charruas, the natives of the country. In the 17th century Spanish Jesuit missions endeavoured to Christianise the Indians. The first white settlement was made in 1678, when the Portuguese of Brazil founded the port and settlement of Colonia del Sacramento on the shore opposite to Buenos Aires, to be an outpost of Portuguese advance and a base for the smuggling trade with the Spanish provs. beyond the river.

This was the beginning of the rivalry between Portugal and Spain, later between Brazil and Argentina, for possession of the Banda Oriental, a conflict which is the principal cause of the turbulent history and late development of Uruguay. The governor of Buenos Aires asserted Spanish sovereignty over Colonia, and during the following 85 years it changed hands eight times. Finally

the place was taken and its fortifications destroyed by the Spaniards in 1777. After Buenos Aires became independent in 1810, Montevideo was still held by the Spaniards, but surrendered to Argentine forces in 1814.

But dissensions broke out between the Argentine commander and the local leader Artigas (*q.v.*), who proclaimed the independence of the Banda Oriental, Aug. 25, 1825. Brazilian occupation of Montevideo followed, there was a revolt headed by Lavalleja, the second hero of Uruguayan independence, and three years war, 1825-28, between Argentine and Brazil for the possession of the country. Through British mediation peace was made Aug. 27, 1828, on the basis of the independence of Uruguay, which became a buffer-state. Her independence was still not respected. Amidst the strife of local leaders, complicated by Brazilian intervention, Rosas (*q.v.*), the tyrant of Buenos Aires, tried to conquer the country; Montevideo received the help of Garibaldi in its eight years' siege. Only after the fall of Rosas in 1853 was Uruguay free to start national construction. She joined Argentina and Brazil in the war against Paraguay, 1865-70.

During the First Great War Uruguay broke off diplomatic relations with Germany; during the Second she declared war on Germany and Japan on Feb. 22, 1945. During both, she was an important supplier of food, particularly meat, to the Allies. She was a foundation member of the United Nations, being represented at the San Francisco conference in April, 1945. *Consult* Uruguay, W. H. Koebel, 1912; *The Argentine and Uruguay*, H. J. G. Ross, 1917; *Utopia in Uruguay*, S. G. Hanson, 1938; *Historia de la Republica O. del Uruguay*, 8 vols., J. Salgado 1943.

Urus. Name given by the Romans to the European wild ox, *Bos taurus primigenius*, also called by its German name Aurochs (*q.v.*).

U Saw (1900-48). Burmese politician. Acting as premier during 1940-41, he visited London on a mission to discuss with Winston Churchill the future status of his country. On leaving England he got into touch with the Japanese consul in Lisbon. The British govt., apprised of this, had his aircraft overtaken and forced down in Palestine, and U Saw was interned for the remainder of the war. Released

in 1946 he returned to Burma, and was one of a deputation under U Aung San conferring with the British govt. in London. Refusing to sign the agreement

U Saw,
Burmese politician

reached on Burma's political future, he resigned his seat in the cabinet. After the assassination of U Aung San and six ministers, July 19, 1947, U Saw was tried on charges of abetting the murders and conspiring to overthrow the govt. He was found guilty and executed May 8, 1948.

Usedom. Island in the Baltic Sea. It lies N. of the Stettiner Haff, between the Swine and Peene channels. Length 36 m., area 158 sq. m. The people engage in cattle rearing, farming, and fishing. Sea-bathing resorts dot the coast. Swinemünde and Usedom are the chief towns. In 1945 the island, long a German possession, came within the Russian zone of occupation, except for the extreme E. point, allotted to Poland.

Uses. English legal term. Uses means the use or enjoyment of a thing, apart from actual ownership, and a similar meaning attaches to the word use, the modern equivalent of which is trust. In feudal times land could not be bequeathed or transferred to a religious house, so to surmount the difficulty the lawyers invented the theory of uses. Land was transferred, as far as its legal ownership was concerned, but the original owner, or someone selected by him, enjoyed the profits therefrom. In 1536 the statute of uses was passed to prevent this practice, but it was a failure as other methods were invented by the lawyers. *See* Land Laws.

Ushabti. Funerary statuette in the form of a mummy, interred with the dead in ancient Egypt. The word is usually said to denote "answerers," who respond on behalf of the deceased to the call for service in the realm of Osiris. At first made of stone or wood, by the end of the 18th dynasty ushabtis were almost always made of glazed faience. The many-coloured type was afterwards replaced exclusively by plain blue, with the name of the deceased, and usually also the 6th chapter of the Book of the Dead, inscribed in black. In the tomb of Seti I there were found 700 ushabtis, and in

the Saite age 400 were regularly enclosed in partitioned boxes in each tomb.

Ushak. Town of Asiatic Turkey. In the vilayet of Kütahya, it is about 120 m. E. of Izmir, with which it is connected by rly. It is famous for its carpets. Pop. est. 17,000.

Ushant. English name for the island of Ouessant, dept. of Finistère, France. The westernmost of the islands of Brittany, it

Usk, Monmouthshire. Ruined keep of the Norman castle
Valentine

lies 26 m. W. by N. of Brest. Of granite formation, bare and treeless, it measures about $4\frac{1}{2}$ m. in length, and is surrounded by small islets and rocks. A small port, Ouessant, lies to the W., and there are fortifications. On July 27, 1778, an indecisive naval engagement took place off Ushant, between the English fleet, under Keppel (*q.v.*), and a French fleet, under d'Orvilliers. In 1794 Howe gained the victory of the Glorious First of June over the French off Ushant. The island was known to Pliny as Uxantos. Pop. est. 3,000. Pron. Ush-ant.

Ushaw. Village of Durham, England, lying on moors 4 m. W. of the cathedral city. It is known principally for the R.C. college and seminary of S. Cuthbert, where men have been trained for the priesthood since 1804. This is the successor of a similar college at Douai (*q.v.*) closed in 1793, students having been accommodated at Crook Hall, Durham, in the interval. Under the presidency (1837-63) of Charles Newsham great extensions to the buildings were carried out, and in

1883 a third church was added. Classics dominate the curriculum, and about 300 students are taken by the college. Educated here were Cardinals Wiseman and Bourne, Francis Thompson, and Lingard, who bequeathed his books and papers to Ushaw.

Usk. River of S. Wales and Monmouthshire. An affluent of the Severn, it rises on the border of Carmarthenshire and Brecknockshire, cuts between the Brecknock Beacons and the Black Mts., continues S.E., and reaches the lowlands at Abergavenny, whence it flows S. to the Bristol Channel. The lowest reach, $3\frac{1}{2}$ m., is navigable to the seaport of Newport, where there are good docks.

Usk. Market town of Monmouthshire, England. It stands on the river Usk, 11 m. S.W. of Monmouth. There are ruins of a castle built in the 12th century as a defence against the Welsh. The church of S. Mary also dates in part from the 12th century, having been originally that of a Benedictine nunnery. The town has an agricultural trade, a nylon factory, and is a centre for salmon fishing. It occupies the site of a Roman settlement. Pop. 1,600.

Üsküb. Turkish name for a Yugoslavian town, described under its Yugoslav name of Skoplje.

Uskudar. Town of Asiatic Turkey. It is in the vilayet of Istanbul and stands opposite that city on the E. shore of the Bosphorus. The Anatolian rly. starts here. Anciently called Chrysopolis (golden city), the place was known to the west as Scutari when Florence Nightingale organized the hospital during the Crimean War. There are many

Uskudar, Asiatic Turkey. Water-front of the suburb facing Istanbul

mosques, a palace, barracks, and other buildings of the dynasty of sultans, and a vast and beautiful cemetery. Silk, muslin, and cotton goods are made. The name means courier. Pop. 100,000.

Uspallata. Pass in the Andes, S. America. It lies on the route from Mendoza, Argentina, to Valparaíso, Chile. The summit at La

Cumbre is 12,795 ft. high. Below it is the tunnel of the Transandine rly. at a height of 10,390 ft.

Ussher OR **USHER, JAMES** (1581-1656). Irish prelate. Born in Dublin, Jan. 4, 1581, he was educated at Trinity College there, and was ordained in 1601. He became chancellor of S. Patrick's cathedral, Dublin, in 1603, regius professor of divinity at Trinity College in 1607, was consecrated bishop of Meath in 1621, and translated to Armagh four years later. During his closing years he was preacher at Lincoln's Inn, London, and he died at Reigate, March 21, 1656. One of the greatest scholars of his age, he calculated the chronology which is to be found in old editions of the Bible, and was the author of Antiquities of the British Churches, Annals of the Old and New Testaments, and Annals of the World—all in Latin.

James Ussher,
Irish prelate

U.S.S.R. Initials representing Union of Soviet Socialist Republics. The names of the individual republics are listed under that heading, and each has its own entry. See also Russia.

Ussuri. River of E. Asia, a tributary of the Amur, which it joins near Khabarovsk, in the Far Eastern Region of the U.S.S.R. It flows N.N.E. from Lake Khanka, and for much of its course divides Russia from Manchuria. It is about 500 m. long. On its banks an agricultural industry has been

developed. The Ussuri is navigable, and its valley is used for the rly. to Vladivostok.

Usti. Czech name for the Bohemian town described under its German name Aussig.

Usufruct (Lat. *usus et fructus*, use and enjoyment). Term of Roman law. It means the right to use anything belonging to another,

such as land, and to enjoy its profits or fruits, provided that the substance is not wasted.

Usumacinta. River of Central America. It rises in the mts. of W. Guatemala and traverses that country eastward, then flows N.W. across S. Mexico to reach the Bay of Campeche after a course of 400 m. The lower course is navigable for a short distance from the sea, the middle course is the boundary between Mexico and Guatemala, and the upper course is in an almost unexplored jungle forest.

Usury (ultimately from Lat. *uti*, to use). Originally, any interest payable for the loan, i.e. use, of money. The word soon acquired a derogatory sense. Taking usury or interest from the Hebrews was expressly forbidden by the Mosaic Law (Ex. 22, v. 25; Lev. 25, vv. 35-37; Deut. 23, vv. 19, 20), and the practice was regarded by the Christian Church as a form of robbery down to the 16th century. In England from the reign of Henry VIII onwards many statutes were passed regulating the rates of interest; 10 p.c. was allowed in 1545. All these were repealed in 1854, but moneylenders' charges are liable to variation if proved to the satisfaction of the court to be harsh or excessive, and pawnbrokers' rates are strictly regulated by law. See Interest; Money-lender; Pawnbroker.

Utah. Lake in the state of Utah, U.S.A. It is some 20 m. long, with an extreme breadth of 11 m., and lies 4,490 ft. above sea-level. The river Jordan carries its surplus waters northwards to the Great Salt Lake (*q.v.*).

Utah. State of the U.S.A. In the Rocky Mts. area, bounded N. by Idaho, N.E. by Wyoming, E. by Colorado, S. by Arizona W. by Nevada, it covers 82,346 sq. m. The picturesque Wasatch Mts., penetrated by deep cañons, traverse the central part of the state from N. to S. To the E. are the Uinta Mts., and farther S. broken groups occur, while the area W. of the Wasatch Mts. forms part of the Great Basin and has a consistent elevation of about 5,000 ft. The Colorado, with its tributaries, drains the E.; the rivers of the W. have no outlet and discharge into the Great Salt, Utah, and other lakes. The soil is generally sterile except when irrigated, and only 3·3 p.c. of the area is tilled land; about 1 p.c. is "dry farmed" on soil which, though not irrigated, is made productive by a rainfall exceeding 10 ins. per year. Livestock dealing is important; but

mines containing all the generally known metals furnish employment to half the working pop.

The rlys. have a total length of 2,400 m. but air travel has to some extent superseded other modes of transport. Schools have been unsectarian since a dispute with the Mormon church as to religious instruction ended in 1921. Utah university provides higher instruction. Of the world total of 760,000 Mormons, two-thirds are in Utah, which was founded in 1847 when Brigham Young led his followers thither, calling the land Deseret. By the help of irrigation the Mormon settlers succeeded in establishing agriculture (the principal product being beet sugar) in soil that before their coming was little better than desert. Utah was refused admission to the Union so long as the Mormons continued the practice of polygamy; it was admitted in 1896, Salt Lake City being the capital and by far the largest place. Two senators and two representatives are sent to congress. Pop. 550,310. Consult Mormon Country, W. E. Stegner, 1941.

Utakamand. Variant spelling of the Indian hill station of Ootacamund (*q.v.*).

Uterus or **WOMB.** Organ in which the foetus or immature offspring develops and is nourished before birth. The uterus in the human female is a pear-shaped body about 3 inches. long, within the pelvis. The broad upper part is called the fundus, and to it are attached the Fallopian tubes in which conception or the union of ovum and spermatozoon occurs. The central part of the organs is termed the body. The lowest part, the neck or cervix, projects into the vagina and contains an opening termed the os. The cavity of the unimpregnated uterus is triangular.

Externally the uterus is covered by the peritoneum, and internally by the mucous membrane, the wall of the organ consisting of muscular tissue. During pregnancy the uterus expands greatly and occupies a considerable part of the abdominal cavity. After delivery it contracts again, but always remains slightly enlarged as compared with the virginal state.

Displacement of the uterus, which may be backwards, forwards, sideways, or downwards, is not an infrequent result of pregnancy and labour. The most prominent symptoms of this condition are aching pains in the back and interference with the function of menstruation. Many cases can be

relieved by wearing an appropriate pessary, but in severe cases an operation for replacing the uterus into its normal position may be necessary.

Inflammation of the mucous membrane of the uterus is called endometritis. When the muscular substance of the organ is involved the term metritis is sometimes used. The condition is most often due to gonorrhoea or septic infection following labour or attempts at abortion. In an acute case the most marked symptoms are rise of temp. and purulent discharge from the vagina. If the infection spreads to the Fallopian tubes or other adjacent organs, or involves the peritoneum, there is grave danger to health.

The commonest tumour in women who have not borne children is a fibromyoma, usually known as a fibroid. This is non-malignant, i.e. does not tend to spread to other parts of the body, and, unless large, is usually curable by an operation which does not involve serious risk to life. Cancer of the uterus is much more frequent in women who have had children. The first symptom is generally haemorrhage from the vagina, having no relation to the menstrual periods. Later, pain, wasting, and offensive discharge occur. If the disease is diagnosed early there is very good prospect of complete removal of the growth by a surgical operation.

Utes. Group of N. American Indian tribes, mainly in Colorado and Utah, whence they are named. Of Shoshonian stock, they number only some 2,000. Warlike hunters, without agriculture, their comparatively early acquisition of the horse gave them their success in raids on their neighbours. See American Indian colour plate.

Uther Pendragon. Legendary chief king of Britain and father of King Arthur. His story is set forth in the British History of Geoffrey of Monmouth, and is also told in the opening chapters of Malory's *Morte d'Arthur*.

Uthwatt Report. Report of a British committee appointed in Jan., 1941, to make an objective analysis of the payment of compensation and recovery of betterment in respect of public control of the use of land. It was presided over by Mr. Justice Uthwatt (1879-1949), and submitted an interim report advising that the govt. should declare that payment of compensation in respect of the public acquisition or control of land would not exceed sums based

on the standard of values at March 31, 1939.

In the final report published Sept. 10, 1942, post-war reconstruction was taken to mean rebuilding devastated areas combined with reconstruction of areas that needed it. It was assumed that there would be national planning to achieve the best possible use of land. As regards undeveloped land, i.e. rural land or land in towns not built over, the committee declared that there should be a balanced allocation of space for agriculture; for open spaces, playing fields, coastal areas, national parks; for transport—roads, rlys., aerodromes; for requirements of defence; and perhaps for completely new dwelling areas. The most suitable land for each purpose should be selected, irrespective of the values attaching to individual pieces of land. Rejecting the proposal of immediate nationalisation, the committee recommended that rights of development should be vested in the state on payment of fair compensation, there being compulsory powers of acquisition.

As regards developed land, i.e. that built over, the main requirements were considered to be widening of existing roads; provision of more open spaces; rebuilding of bombed and overcrowded areas; rehousing of displaced people; provision of amenities and cultural facilities—schools, libraries, cinemas, etc.; provision of industrial necessities—docks, offices, factory sites, etc. Interference with existing users and buildings would be much greater than on undeveloped land, so the cost of compensation might well be enormous.

In 1944 a white paper on urban development laid it down that owners of land should continue to enjoy development rights but their schemes must be approved by a planning authority. Fair compensation for loss of development value as at March 31, 1939, would normally be payable, and compulsory purchase was recognized. Under the Town and Country Planning Act carried in 1947, the planning authority received the right to designate land for compulsory purchase. See Town and Country Planning.

Utica. Ancient city of N. Africa. Founded by the Phoenicians, it was the greatest city of ancient Africa after Carthage, and was situated 20 m. N.W. of that city. It was generally the ally of Carthage, but in the Third Punic War sided with the Romans, and on the

fall of Carthage was granted the greater part of that territory. Here occurred the last stand of the Pompeian party against Caesar and here the younger Cato killed himself. The remains of the ancient city include the amphitheatre, an aqueduct, and ruins of the artificial harbour.

Utica. A city of New York, U.S.A., the co. seat of Oneida co. It stands on the Mohawk R., 94 m. W.N.W. of Albany, and is served by the New York Central and other rlys., and by the state barge canal. It is noted for the number of its charitable institutions. About one-third of the pop. is engaged in the textile industry. There is a large arms industry; during the First Great War the city's production of Lewis guns reached two-thirds of Great Britain's entire output. Y Drych, the only American periodical in Welsh, is published at Utica. Settled in 1786, and incorporated in 1798, Utica became a city in 1932. Pop. 100,518.

Utilitarianism (Lat. *utilis*, useful). System of ethics which sets up as the rule of conduct the best interests either of the individual or of the community. It had its beginnings, in the more selfish form, in the hedonist schools of the Cyrenaics and Epicureans, and, indeed, till the 18th century its aim was held to be the acquisition of pleasure.

A scientific system was first formulated by Jeremy Bentham. According to him the object to be aimed at was the greatest happiness of the greatest number. His theories took no account of the quality of pleasure, a defect remedied by J. S. Mill, who modified Bentham's doctrine by introducing the view that certain pleasures possessed an intrinsic value which rendered them superior to others.

Herbert Spencer registered a further modification in the form of evolutionary influences. Certain methods of conduct in the same conditions, he thinks, will produce the same results, either good or bad. There exists, therefore, an experience of humanity which is superior to our own judgements and idiosyncrasies. When the evolutionary process is complete the conformity between the individual and his surroundings will also be complete. See Bentham; Mill, J. S.; Spencer, H.

Utility Goods. Term used in Great Britain in the Second Great War and after to describe consumer commodities made to specifications standardised by the board

of trade and sold to the public at a fixed price. Most utility goods were exempt from purchase tax. Utility cloth and clothing were introduced in 1941 and labelled CC41; restrictions on trimmings, initiated at the same time, were later dropped. Also in 1941 utility lighters, of brass and plastic, were introduced. In 1942 utility pottery and enamelware were placed on the market, and in the next year utility furniture, cutlery, and household textiles, including carpets.

U Tin Tut (1895–1948). Burmese politician. Born Feb. 1, 1895, and educated at Dulwich and Queen's

U Tin Tut, Burmese politician

College, Cambridge, he studied law. In 1922 he entered the Indian civil service, the first Burmese to do so. During the Second Great War, when Burma was

overrun by the Japanese in 1941, he was appointed secretary to its cabinet at Simla, and in 1947 was one of the delegation under U Aung San which visited London to discuss the constitutional position. High commissioner in London, he was recalled to Rangoon as foreign minister in the first free Burma government. In 1948 he was again in London negotiating the treaty of independence. Having resigned in Aug. his post as foreign minister to become inspector-general of Burmese auxiliary forces, this pro-British Liberal was assassinated by Communists in Rangoon, Sept. 18.

Utopia (Gr. *ou topos*, nowhere). Romance by Sir Thomas More (*q.v.*). It describes an imaginary island commonwealth based on the idea of community of goods. Written in Latin, and published at Louvain, 1516; Paris, 1517; Basel, 1518; and Venice, 1519, it first came out in English, translated by Raphe Robynson, in 1551. More's work, which gave rise to the epithet Utopian, applied to any desirable but impracticable reform, was indebted in part to his study of Amerigo Vespucci's *Voyages*, Plato's Republic, and Augustine's *De Civitate Dei* (The City of God). With it may be classed Bacon's fragmentary New Atlantis and Thomas Campanella's *Civitas Solis* (City of the Sun). Editions by J. H. Lupton, 1895, and G. Sampson, 1914, may be mentioned.

Utopia Limited, OR THE FLOWERS OF PROGRESS. Comic opera by W. S. Gilbert, with music by Arthur Sullivan. Produced Oct. 7, 1893, at the Savoy Theatre, London, it ran for 245 performances. A scene in which the court of S. James's was parodied in terms of a coloured minstrel show caused some offence; but the piece, anyway, proved less enduring than other Savoy operas, and dropped from the repertoire. It is rarely played now.

Utraquists. Name applied to those followers of John Hus (*q.v.*) who demanded the reception of communion in both kinds (Lat. *sub utraque specie*). They are also known as the Calixtines (*q.v.*).

Utrecht. Smallest prov. of the Netherlands. It lies contiguous with the provs. of Gelderland, S. Holland, and N. Holland. The prov. has a flat surface, with good rly. and waterway communications. The chief rivers are the Eem, Vecht, Amstel, Neder Rijn, Kromme Rijn, Lek, and Yssel. Livestock is extensively bred, and dairy produce, especially Gouda cheese, is important; cereals, fruit, and vegetables are also grown. Industries are chiefly concentrated in the capital, Utrecht. Other notable towns are Amersfoort, Amerongen, Doorn, Driebergen, and Zeist. Area, 526 sq. m. Pop. est. 544,656.

Utrecht. Fourth largest city of the Netherlands, capital of the prov. of Utrecht. It lies on the Kromme Rijn (Crooked Rhine), which branches into the Vecht and Old Rhine, 2½ m. by rly. N.E. of Rotterdam, and has two rly. stations, a junction, and rly. engineering sheds. Industries include engineering, distilling, and the manufacture of cloth and woollens, carpets, glass, motor cars, tobacco, chemical products, pottery, and tiles. The town, a financial and commercial centre, is the seat of a cardinal-archbishop.

The Oude Gracht (old canal) and the Nieuwe Gracht (new canal) run through the centre of the town, the main part of which is surrounded by the Buiten Gracht (outer canal). These, with their bridges and old houses, are a picturesque feature of Utrecht. The Gothic cathedral of S. Martin, an 8th century foundation, was begun in 1254 on the site of older buildings, and finished in the 15th century. The tower (338 ft.) has a carillon of 42 bells. Close by is the principal building of the university, founded in 1636, which has a fine library and geological and zoological museums. Pop. 183,251.

Utrecht, the Netherlands. 1. 14th century cathedral tower, which was isolated from the cathedral when the nave was blown down in 1874. 2. Ancient house built by Pope Adrian VI. 3. The existing cathedral

Utrecht was the Roman Trajectum ad Rhenum. It became the seat of powerful episcopal princes in the late 7th century, their temporal power being yielded to the emperor Charles V in 1528. In 1579 the seven provs. here formed the Union of Utrecht. Occupied by Louis XIV, 1672, the city was also taken by the French in 1795, and was the capital of the French dept. of Zuyderzée until 1814. Under German occupation from May, 1940, Utrecht was liberated only after the final capitulation, May 5, 1945; but the Germans retired to the E. for a few days in Sept., 1944, at the time of the air landings at Arnhem, expecting that operation to succeed.

Utrecht, PEACE OF. Name given to the treaty signed at Utrecht in 1713, and sometimes to the whole group of treaties, including those of Rastatt and Baden, 1713-15. The actual treaty of Utrecht put an end to the War of the Spanish Succession. After a preliminary

agreement in London, a congress met at Utrecht in Jan., 1712. Great Britain, France, Savoy, Portugal, the Emperor, Prussia, and the Dutch republic were represented, and later Spain. In March and April, 1713, the main treaties were signed. Others followed, that between Spain and Portugal being delayed until 1715.

France ceded Newfoundland, Acadia or Nova Scotia, the district around Hudson Bay, and St. Kitts to Great Britain, which had conquered them. From Spain Great Britain acquired Gibraltar and Minorca, as well as the monopoly of the slave trade with Spanish America, called the *Asiento*. Louis XIV recognized the Protestant succession, and promised not to aid the Stuarts. Great Britain and France also

concluded a commercial treaty.

The crown of Spain, with its American possessions, was given to the French claimant, Philip V. It was stipulated, however, that the same person should never be king of both France and Spain. Philip's Austrian rival, the emperor Charles, was consoled with Naples, Milan, Sardinia, and the Spanish, henceforward called the Austrian, Netherlands; all these had been Spanish. Prussia, recognized as a kingdom, received part of Gelderland; France promised to secure the title of king for the duke of Savoy, who took Sicily.

The treaty of Utrecht was bitterly denounced in England by the Whigs, and four of those responsible for it were impeached. See Europe; consult Cambridge Modern History, vol. v., 1908.

Utrera. Town of Spain, in the prov. of Seville. It lies 17 m. S.E. of the city of Seville, with which it is connected by rly., in a fertile plain adjacent to the river Guad-

aira. Parts of the medieval walls and fortifications still exist. Spirits, flour, leather, soap, and oil are the principal products. Pop. 21,500.

Utrillo, MAURICE (b. 1884). French painter. Son of the painter Suzanne Valadon, he was born in Paris, Dec. 25, 1884, and educated there. From 1909 he exhibited regularly with the Salon des Indépendants; during this period he painted the famous series of street scenes and buildings in Montmartre, chiefly in white tones, e.g. Rue St. Rustique, Cabaret du Lapin Agile. He was more concerned with design than with strict representation, and his use of the palette knife and delicate colour effects placed him among the group which developed the Post-Impressionist manner. His Place du Tertre is in the Tate Gallery. Studies were written by F. Cano, 1921; G. Tabaraut, 1926; G. J. Gros, 1927.

Utsunomiya. Town of Japan, in the is. of Honshu, 66 m. by rly. N. of Tokyo. The 11th cent. castle was built by the founder of the Utsunomiya clan. Pop. 61,666.

Uttar Union or **UTTAR PRADESH**. Name since 1950 of the United Provinces (*q.v.*) of India.

Uttoxeter. Urban dist. and market town of Staffs, England. It is 15 m. N.E. of Stafford, near the river Dove, and has rly. stations. The chief building is S. Mary's church, modern save for the tower. There is a grammar

long and giving rise to a cough, it may be snipped. *See* Throat.

Uxbridge. Urban dist., giving its name to a co. constituency of Middlesex, England. About 14 m. W. of London, it has rly., bus, trolley bus, and Green Line services. Here also the Grand Union Canal runs between two branches of the Colne. The 15th century church of S. Margaret was restored in 1872. Ironfounding, brickmaking, and brewing are the chief industries, and there is an important R.A.F. barracks, an intake centre for recruits, and training centre for R.A.F. police. An ancient borough and market town, Uxbridge was granted a weekly market and an annual fair in 1294. Lynch Green was the scene of burnings at the stake in 1555. At the Crown, or Old Treaty House, there met in 1645 the abortive conference between 16 commissioners of Charles I. and representatives of parliament. Pop. est. 52,000.

Uxmal. Ruined city of Mexico, in the W. of Yucatan state. Situated 37 m. S. by W. of Mérida, it has many magnificent ruins, including one called the governor's palace, a remarkable structure 320 ft. long, 40 ft. wide, and 25 ft. high, containing many fine sculptures. *See* Maya.

Uzbek or **UZBEK**. People of Turkic descent in Soviet Central Asia. Numbering some 600,000, especially in what used to be W. Turkistan, with numerous congeners in Afghanistan and Sinkiang, they represent a confederation formed E. of the Caspian

after the break up and disintegration of the Golden Horde (*q.v.*).

Uzbek. Asiatic republic of the U.S.S.R. Created in 1924, it includes the old dists. or provs. of Khiva, Bokhara, Samarkand, Fergana, and Khokan (*qq.v.*), and the Kara-Kalpak autonomous republic. It borders all the other republics of Soviet Central Asia and on the S. touches Afghanistan, covering 159,170 sq. m. The capital is Tashkent, the eighth largest Russian city; there were in 1948 nine regions, not counting Kara-Kalpak. Less than a quarter of the pop. of

6,282,450 is urban; racially Uzbeks predominate, and in religion the Sunnite form of Islam. The rich history of this region is sketched in articles on the places mentioned, but broadly it shows a struggle between Mongols, Turks, and Persians, all making use of the native tribes, until Russia took the conquest in hand in the mid-19th century. Bokhara and Khiva retained a partial independence until the 1917 Revolution, and fought against the Soviet regime. In 1925 Uzbek S.S.R. or Uzbekistan had its present status recognized.

Watered by the Amu-Daria (Oxus), Syr-Daria, and Zerafshan, but with a continental climate and usually scanty rainfall, the republic depends on great irrigation schemes, which have rendered it the chief cotton-growing area in Russia and a land of intensive farming. Just before the Second Great War many canals and reservoirs were finished. Raw cotton grown in 1939 came to 1,600,000 tons. Silk is produced; among cereals are wheat, barley, maize, and lucerne; among fruit, grapes, melons, and almonds. Huge coal deposits were struck during the war, and oil, copper, building stones, and ozokerite occur. The Tashkent region is highly industrialised, making cement, leather goods, paper, and agricultural machines. Hydro-electric power is rapidly being adopted. Except Khiva, all the big towns are on the Turk-Sib rly. *Consult* History of the Mongols, H. Howorth, 1876; Soviet Asia, R. A. Davies and A. J. Steiger, 1943.

Uzhgorod (Magyar, Ungvar; Czech., Uzhorod). Town of Ukraine S.S.R. It lies 80 m. N.N.E. of Debreczen. Before the First Great War it was capital of the Hungarian co. of Ung; after that war it was capital of Ruthenia, Czechoslovakia, and the seat of a Uniat bishop. In the area ceded to Hungary, March, 1939, it was captured during the Second Great War by the Russians on Oct. 27, 1944, a victory which virtually cleared the Germans from Ruthenia. With that district, it was absorbed into the U.S.S.R. in 1945. Uzhgorod, which makes pottery, is the seat of a state university. Pop. est. 17,000.

Uzziah or **AZARIAH**. King of Judah. Son of Amaziah (*q.v.*), whom he succeeded at the age of 16, he is said to have reigned 52 years. He restored the town of Elath, and when he became a leper his son Jotham acted as his representative. *Consult* 2 Kings 14 and 15; 2 Chron. 26.

Uxbridge arms

Uttoxeter, Staffordshire. Market Place and High Street

school dating from 1558, and the place has associations with Johnson. Agricultural implements, biscuits, and dairy produce are made, and there is a large agricultural trade. Uttoxeter was made a borough about 1200, and was long in the duchy of Lancaster. It had fairs, and its markets were important until about 1800. Market day, Wed. Pop. (est.) 7,130.

Uvula. Elongated muscular process covered with mucous membrane, which projects from the free margin of the soft palate. It shares in any local inflammation. If too

UP to a relatively late date the story of the letter V is that of the letter U, for the two were scarcely differentiated until the 15th century. Some scholars find its origin in the Semitic letter *vau*, which represented approximately the sound now represented in English by W. This would mean that even in its derivation V was closely allied to F (see F). The Greek digamma **F** also represented

the w sound. The Latin alphabet adopted the digamma, first introducing the combination FH to represent the consonant sound off, but eventually eliminating the H. The w sound had therefore to be represented by some other symbol, for which purpose the early Chalcidean form **V** of the Greek upsilon was adopted. For difference of V and U see U; and for that between V and W, see W.

V Twenty-second letter of the English and Latin alphabets, if it be regarded as distinct from U in the latter. It is a soft labial, or lip-sound, corresponding to the hard *f*. In printed and written form it is a variant of U. In the Latin alphabet it fulfilled the double function of vowel and consonant in early times, but in a later age *u* became exclusively used as a vowel. Its sound is invariable, as in *vat*, *love*. See Alphabet; Phonetics.

V. Symbol of victory which became popular in Great Britain and on the Continent during the Second Great War. See V Campaign; VE-day; VJ-day.

Vaagso. Island of Norway. Situated 100 m. N. of Bergen, on the coast of Sogn-og-Fjordane, it has a pop. of 250, whose only industry is a fish-processing factory. After the German invasion of Norway, the island was developed as a radio station and refuelling base for German light coastal craft. At dawn on Dec. 27, 1941, a British and Norwegian force was landed by the R.N. under cover of the R.A.F. After some resistance from the German garrison, control of the town was gained, and all military installations on shore and some 15,000 tons of German shipping in the harbour were destroyed. About 100 German troops and Norwegian quislings were taken prisoner. With the simultaneous raid on Maaloy, this was the first use of Combined Operations (*q.v.*).

Vaal, KAI GARIEP, OR YELLOW RIVER. River of S. Africa. It rises in the Rand Berg, in the Ermelo dist. of Transvaal, and below Standerton forms for nearly all its westward course of 500 m. the boundary between Transvaal and the Orange Free State. Chief tributary of the Orange river, it falls thereinto below Douglas, in the Cape Province.

The Vaal barrage, 19 m. below Vereeniging, was opened in 1923 at a cost of £1,320,000; it holds back the river for 42 m. and forms a reservoir of 13,633 million gallons. The Vaal dam begins 18 m. upstream from that town and is the biggest work of its kind in the

S. hemisphere, being up to 15 m. across; it supplies water to Johannesburg and environs.

Vaal-Hartz. Irrigation project, the biggest in the S. hemisphere. The area concerned is between Taunags and Border, on the boundary between Cape Province and Transvaal, S. Africa. First mooted in 1881, the project was authorised by parliament in 1934. The rivers Vaal and Hartz flow parallel about 20 m. apart, but the bed of the former is about 450 ft. higher, and its water has been caused to irrigate about 150 sq. m. in the Hartz valley. Water is also supplied to the vast gold-mining and industrial area of the Rand. The principal dam, near the confluence of the Vaal and Wilge, is 135 ft. high, 1,900 ft. along the crest, and has a submerged area of 62 sq. m.

Vaalpen (Boer, grey-paunch). Primitive negro tribe. They live mostly in the Magalakwane valley between the Waterberg and Zoutpansberg dists., Transvaal. Dwarfish black hunters and trappers, they can produce fire, but have no handicrafts. Occupying caves, rock-shelters, and underground hovels, they comprise a few family groups, each under a domestic headman.

Vacation (Lat. *vacare*, to be empty, unoccupied). Interval of time between two periods of regular work. The word is specifically applied to the intervals between law and university terms. See Term.

Vaccination (Lat. *vacca*, cow). Term popularly applied to protective inoculation against small-pox. The human system, having once survived an attack of small-pox, contains for some years an excess of protective substances rendering it immune from further attacks. Even if the original illness is mild, this same effect is produced, and in ordinary vaccination the protection is obtained by deliberately inoculating the person with a very attenuated form of the disease, namely, cow-pox. The nature of the virus in small-pox and cow-pox is essentially the same. In a previously healthy bovine animal,

in practice a calf, the disease appears as a pustular rash, but not a severe illness. The virus is present in the lymph which exudes from this rash, and for medical use is collected from the calves with every aseptic and sanitary precaution, in the U.K. under strict official supervision.

When a small quantity of this infective calf lymph is placed in intimate contact with a scratch in the human skin, the person becomes infected at that point with the weakened form of the disease, the typical vaccination pustule appearing in about four to five days, followed by immunity to small-pox itself which is almost complete for five or six years, but thereafter gradually weakens. Nevertheless, although the complete protection dies out, a modifying power remains, and therefore, if a vaccinated individual does contract small-pox many years later, the disease is mild, and the rash leaves little or no scarring.

A person who has been exposed to small-pox should always be vaccinated immediately, unless this has lately been done. The incubation period of cow-pox being about four days, whereas that of small-pox is about 12, if vaccination be carried out even six days after the exposure, then prevention or at least modification of the small-pox may still result.

In 1721 Lady Mary Montagu introduced from Turkey the practice of putting into healthy individuals lymph from the rash in mild cases of actual small-pox. The aim was to protect these people by giving them as light an infection as possible, after which they became immune. Towards the end of the 18th century, when small-pox was rampant in England, the practice of variolation, as it was termed, became very common. Indirectly the results were good, since, although the mortality from variolation was in itself 2 p.c., yet among un-inoculated people infected with small-pox nearly 30 p.c. died. In 1796 vaccination was discovered. It was before that time well known among farmers and dairy-

men in the west of England that cow-pox was contracted through a scratch on the hand while milking an infected animal. They found also that those who had suffered from the eruption produced upon the hands and arms did not develop small-pox. Edward Jenner (*q.v.*) inoculated a boy with lymph from a case of cow-pox and found six weeks later, when he tried to inoculate him with virulent small-pox, that the disease would not develop. This new vaccination became rapidly and widely popular. As a result, not only was the incidence of small-pox remarkably reduced, but its severity also. During the 18th century, about 9 p.c. of the mortality in England was due to small-pox. About 1875, when vaccination was compulsory, this figure had fallen to 1.5, and since then it has decreased to a negligible quantity: a condition, however, for the achievement of which improved sanitation must be taken into account.

The first English legislation on vaccination dates from the Vaccination Act of 1840, which prohibited variolation and recommended vaccination. In 1853 came a Compulsory Vaccination Act, which ordered that every child should be inoculated before reaching the age of three months. Acts of 1867 and 1887 amended and superseded these; the age limit was raised to six months, and provision was made for conscientious objection on the part of the parents. All were repealed in 1946 by the National Health Service Act, which requires local authorities to arrange with medical practitioners for persons to be vaccinated.

Vaccine. Emulsion of dead bacilli intended to be injected into the system for the treatment or prevention of disease. This method of preventive medicine has now been applied to many infectious diseases, often with highly satisfactory results, one of the most striking instances being the immunity conferred against typhoid. Vaccine therapy recognizes that defence mechanisms of the body are challenged by the presence of measured poisonous material. These mechanisms are thus ready to repel the attacks of the living germ or virus should it attack the animal organism. See Bacillus; Inoculation; Vaccination.

Vacciniaceae. Botanical name for the bilberry family of shrubs and small trees, natives of temperate and tropical regions. By

some authorities they are included in the family Ericaceae. They have usually alternate, undivided, evergreen leaves, and bell-shaped or tubular flowers. The fruits are mostly berries, useful as anti-scorbutics. See Cranberry; Whortleberry.

Vachell, HORACE ANNESLEY (b. 1861). British novelist and dramatist. Born Oct. 30, 1861, he was

Horace Annesley Vachell.

Russell

educated at Harrow and Sandhurst, and became an officer in the Rifle Brigade, but took to literature and wrote successful novels and plays, in which the study of character rather than of incident predominates. His novels include *The Shadow Third*, 1902; *Brothers*, 1904; *The Hill*, 1905, a sympathetic story of school life at Harrow; *The Face of Clay*, 1906; *The Waters of Jordan*, 1908; *Quinney's*, 1914; *The Fourth Dimension*, 1920; *Quinney's Adventures*, 1924; *A Woman in Exile*, 1926; *Vicars' Walk*, 1933; *Joe Quinney's Jodie*, 1936; *Quinney's for Quality*, 1938; *Quiet Corner*, 1948. A dramatized version of Quinney's was presented in 1915, and Vachell wrote other plays, alone and in collaboration. He also published memoirs, *e.g.* *Distrikt Fields*, 1937; *Now Came Still* *Evening On*, 1946; *Twilight Grey*, 1948.

Vacuum. Space from which matter has been partially or wholly exhausted. A high vacuum is usually taken to imply pressures less than 10^{-5} atmospheres, *i.e.* approx. 10 dynes per sq. cm. Radio, X-rays, low pressure distillation, evaporation of metals on surfaces, etc., all require vacuum technique. To provide a vacuum a pump is generally used. There are two main classes of vacuum pumps, those which work at atmospheric pressure and those requiring a reduced pressure. Typical of the first class is the oil-

rotary pump in which a rotor is

mounted eccentrically on its shaft within a cylinder attached to an inlet tube from the system to be pumped out and an outlet tube to the atmosphere. The cylinder is filled with oil having a low vapour pressure. As the rotor revolves it drags air around from the inlet to the outlet. Pressures as low as 10^{-5} mm. of mercury can be obtained with such pumps, which will exhaust spaces of 6 litres per min. Typical of the second class of pump is the mercury (or oil) condensation pump, in which molecules of gas become trapped between molecules of mercury vapour drawn out by a force-pump. The mercury vapour is condensed by a cooling system (using water), and so returned to a heated mercury reservoir. These pumps reach pressures as low as 10^{-6} or 10^{-7} mm. of mercury, and speeds of pumping as high as 70,000 cc. per sec. have been reached.

The absolute measurement of such low pressures is difficult. Gauges have to be calibrated against a standard, in the search for which many physical phenomena have been used, *e.g.* the variation in heat loss from an electrically heated wire as pressure varies, or the change in ionisation current in a thermionic valve with pressure. Gauges have also to be calibrated with the gas in the system under test. Absorption by charcoal at a low temp. is the usual method of removing the last traces of gas.

VACUUM DATA

Units of Pressure

1 atmosphere	= 1.013×10^6 dynes/cm. ²
1 bar	= 10^6 " "
1 millibar	= 10^3 " "
1 microbar	= 1 " "
1 micron (μ)	= 10^{-3} mm. mercury
1 mm. mercury	= 1.33×10^5 dynes/cm. ²
(sometimes called 1 Torr)	

Pressures used in some typical vacuum devices

Gas-filled incandescent lamp	500 mm. mercury	
Gas-filled photocell	3×10^{-3} " "	
Gas-filled X-ray and cathode-ray tubes	10^{-2} " "	
Metal-filament lamp	10^{-3} to 10^{-4} " "	
"Sputtering" apparatus	10^{-6} (or less) " "	
Radio valves	10^{-5} (or less) " "	
Vacuum photocells	10^{-6} " "	
Hard cathode-ray tubes	10^{-4} " "	

Vacuum Brake. Type of rly. brake (*q.v.*) acting by pressure differences on each side of a piston in an exhausted air chamber.

Vacuum Cleaner. Mechanical device for the removal of dust and dirt from floors, walls, furniture,

etc., by air suction. The three essentials of a vacuum cleaner are the apparatus for producing the vacuum, i.e. some form of air-pump; the separator, where the dust and dirt are retained from the insucked air; and the nozzle, which passes over the surface being cleaned. Small vacuum cleaners may be worked by foot or hand or electric power from an electric light socket; larger ones are worked by an internal combustion or other engine, and are connected to their work by hose pipes. The shape of the nozzle depends largely upon the use to which the vacuum cleaner is put, and varies from long rectangular to circular. With some types of domestic cleaner removable alternative nozzles may be used.

Vacuum Flask. Glass vessel having a storage chamber or receptacle surrounded by a vacuum space. Liquids placed in vacuum flasks neither lose nor gain heat during more or less lengthy periods. Thus liquefied gases remain in that state, and hot liquids do not cool down.

Vacuum Flask. Sectional diagram showing surrounding chamber or vacuum

travellers, etc., have an outer case of thin metal, which protects the glass vessel.

Vacuum Metallurgy. The use of vacua in the smelting, refining, and subsequent treatment of metals is comparatively new and in the experimental stage. A vacuum may be used merely to protect the metal from gaseous attack during some process, usually one involving heat; or to speed up reactions which would take place slowly at normal temperatures and pressures, if at all. Reactions often can be effected at reasonably low temperatures if the pressure is reduced to 0.01 mm. of mercury or less, and so commercial processes become possible. One of the first

was devised by Dr. Pidgeon of Toronto, who during the Second Great War was able to produce

Vacuum Cleaner. Diagram illustrating the construction and working of a vacuum cleaner
Courtesy of Hoover Ltd.

magnesium, needed for aircraft construction, by the reduction of dolomite with ferro-silicon. Processes for the production of calcium, lithium, barium, columbium, titanium, and zirconium are being commercially developed. Many metals may be refined, either by distilling the metal under vacuum or by removing the more easily volatile impurities. A metal may be cast under vacuum to reduce the quantity of gases dissolved in the metal or to prevent its oxidation; and vacuum may be used for protection during heat treatment. Another development is the deposition of metallic coatings after vaporisation of metals under reduced pressure. Such coatings are used on glass for mirrors, on paper for the cheap production of electrical condensers, for decorative purposes, etc.

Vacuum Pan. Device to facilitate evaporation. The boiling point of a liquid falls as the pressure is reduced. In industry the application of a vacuum to an evaporation process may be expedient because it is possible to use waste heat from another process and thus economise in fuel, or because the material under treatment is sensitive to heat and may

therefore be spoiled if exposed to the temp. necessary to evaporate the liquid at reasonable speed at atmospheric pressure.

Vacuum pans often work in series, each being at a pressure and temp. lower than the preceding one. In practice many complications arise and three stage (triple effect) evaporators are usual, though some 5-stage (quintuple effect) pans are used. The efficiency is dependent on fuel economy, and beyond a certain point the increased space occupied and cost of plant and accessories, such

as pumps, etc., becomes excessive. The design and working conditions depend upon the material being handled. Noteworthy examples are used in the salt, soap, sugar, and caustic soda industries.

Vacuum Tube.

Glass tube having metallic wires (preferably ending in flat disks) fused through the ends, forming a connexion between the inside space and a source of high voltage, e.g. 10,000 volts. When it is connected

and the air gradually pumped out, a series of luminous changes occurs. At normal pressure, the air is an insulator, and the tube is dark. Then at an early stage in evacuation, a band of light, called the positive column, stretches from one electrode to the other. As the

Vacuum Tube. Geissler bulbous vacuum tube with serpentine connexion. Right, type known as electric egg

pressure is further reduced, this breaks up into short sections called striae, and a relatively long gap called the Faraday dark space appears near the negative electrode. The striae and a negative glow then move towards the positive electrode, a second gap, the Crookes dark space, intervening at the negative end. With further evacuation, the movement of the bands continues until at a pressure of about a millionth of one atmosphere the Crookes dark space fills the tube. This space

represents the mean free path of the electrons issuing from the negative electrode, and the disappearance of the luminescence indicates that the electron stream has now reached the glass, causing the latter to glow.

There are two sources of luminescence, viz. the rarefied space and the tube itself, and the colours depend on the materials involved, e.g. if the original gas is neon, a bright red colour is given; while the kind of glass, or of powder deposited on its inside surface, determines the colour and brilliance of the fluorescence. Advancement has been taken of these phenomena to produce the various kinds of fluorescent lamp and other discharge tubes.

Small purely decorative vacuum (or "Geissler") tubes have been made for many years, to demonstrate the above principles, two examples being given in the figures; the upper of which shows clearly the negative glow, Faraday dark space, and striae. Details of further vacuum phenomena, including cathode and X-rays, are given under Cathode Ray Tube; Crookes Tube; Discharge Tube; Oscillograph.

Vác or **VAC**. Town of Hungary. It is situated 20 m. by rly. N. of Budapest, on the left bank of the Danube, where the river turns sharply S. through the Vác Gorge. There are a fine cathedral and the bishop's palace. During the Second Great War Vác was captured by the Russians from the Germans and Hungarians, Dec. 9, 1944. Pop. est. 19,000.

Vaduz. Capital of Liechtenstein. It is 24 m. S. of Lake Constance, on the right side of the Rhine valley at a height of over 1,500 ft. Above it is the castle, rebuilt 1523-26, residence of the ruling family. The town attracted many rich settlers, especially from Germany during the Nazi regime, but also from other countries because of its low taxes. It has many fine houses, a modern church, and the government buildings. The town is the centre of fruit and wine trade, and there is some textile industry. The language is German, the religion mostly R.C. Pop. 2,020.

Vag or **VAH**. River of Czechoslovakia. It rises in the Carpathians, and flows W. in a steep-sided, narrow valley as far as Zilina, and then, in general, S. between the White Carpathians and the Nitra Mts., to join the Danube after a course of 250 m. Its main affluent is the Arva from the W.

Beskids. The valley is used by the important rly. from Bratislava to Kosice (Kassa).

Vagina. Canal leading from the vulva or external genitals of the female to the entrance of the uterus or womb. See Uterus.

Vagrancy (Anglo-Fr. *walcrant*, wandering). Vagabondage or loitering. The Vagrancy Acts in English law give the word a much wider meaning and create a large number of criminal offences, e.g. fortune-telling, or gaming for money in the street, many of which have no connexion with vagrancy in its strict meaning. The early Vagrancy Acts were designed to deal with conditions for several centuries after the break up of the feudal system, when large numbers of workless and homeless persons were wandering the countryside. The Acts dealt with the crimes that such persons were likely to commit, and also assisted the operation of the poor laws. The Vagrancy Act, 1824, which makes it an offence for a person to lodge in the open air (after being directed to accommodation), and to fail to give a good account of himself, is often used for the benefit of persons in need of protection. Persons guilty of offences against the Vagrancy Acts are declared to be idle and disorderly persons, rogues and vagabonds, or incorrigible rogues, a separate punishment being prescribed for each category.

Vagus Nerve. Important nerve on each side of the body, which arises from the base of the brain and passes out of the skull through the jugular foramen, an aperture in the base of the cranium. It proceeds vertically down the neck, close to the carotid artery, and enters the thorax. The right vagus passes behind the root of the right lung, where it forms the posterior pulmonary plexus. From this the nerve continues down behind the oesophagus and passes through the diaphragm or large horizontal muscle, to supply the posterior surface of the stomach and give off branches to plexuses of nerves in the abdominal cavity.

The left vagus passes over the arch of the aorta or main blood vessel, and breaks up behind the root of the left lung into the posterior pulmonary plexus. The nerve subsequently makes its way down through the diaphragm in front of the oesophagus, and is distributed to the anterior surface of the stomach, with branches to various nerve plexuses. The vagus nerve is sometimes called the pneumogastric. See Anatomy; Neck; Nerve.

Vaihinger, HANS (1852-1933). German philosopher. Devoting his whole life to philosophy, he worked at Strasbourg, 1878-84, and Halle, 1884-1906. His most famous book is *The Philosophy of As-If*, which advances the theory that all human ideas are relative, and that human thought is fictitious. He also became an acknowledged authority on Kant and, in 1904, founded the Kant Society, which became the largest body of its kind in the world. Vaihinger died Dec. 17, 1933.

Vair. In heraldry, fur, represented by small cup-like white and blue shields. These are placed in rows, the bases of the white resting on the bases of the blue. In a variant, known as counter-vair, the shields of one tincture are placed base to base. If the tinctures are different from the above, the fact should be mentioned. See Heraldry colour plate.

Vaisya. Third or ordinary class in ancient Hindu society. Described in the Rig-Veda as sprung from the thighs of Purusha, it comprised the free commonalty, the ordinary folk engaged in providing the Aryan community with the necessities of life. To them were entrusted the material interests of agriculture, cattle-raising, handicraft, and trade, apart from those menial occupations which were allotted to the servile Sudras. Their peaceful penetration of the Dravidian population in S. India proceeded for centuries before the Kshatriya class undertook military dominion in that region, and their commercial intercourse with other lands led to much racial admixture. In recent censuses the bulk have been returned under modern caste names. See Caste.

Valais. Canton of Switzerland. It lies between the Bernese Alps on the N. and the Pennine Alps on the S., and comprises the Rhône valley above the lake of Geneva, and a number of tributary valleys. More than a fifth of the area of 2,021 sq. m. is covered with glaciers. Lead, iron, anthracite, marble, and limestone deposits are worked; vineyards, famous for their wine, and orchards occur in the lower valleys; higher the main industry is pastoral.

Conquered by the Romans in 57 B.C., the dist. was then known as Vallis Pennina; Burgundians, Franks, kings of Burgundy and Arles, bishops of Sion, and counts of Savoy held successive sway within it until the 15th century, since which time it has been Swiss, being made a canton in 1815.

An earthquake was recorded here, Jan. 25, 1946.

In the lower Valais in the W. the people are French-speaking; in Upper Valais they are descendants of German Swiss colonists. Sion is the capital. The Simplon and Loetschberg rlys. cross the canton, from which roads lead over the St. Bernard, Simplon, Furka, and Grimsel passes. The Simplon tunnel, opened in 1906, is the longest rly. tunnel in the world (14 m.). A second tunnel, parallel to the first, was completed 1922. Pop. 148,310.

Valdepeñas (Sp., valley of the rocks). Town of Spain, in the prov. of Ciudad Real. It is 140 m. by rly. S.E. of Madrid on the Jabalón river, and on the highway to Andalusia. From it a branch rly. runs to the mercury mines of Almadén. It is almost solely known for the red

châtel to Pontarlier, and is drained by the river Arcuse. At St. Sulpice are valuable asphalt mines.

Valdez. Coast town of Alaska. It stands at the head of Port Valdez, an inlet of King William Sound. In the neighbourhood small lode mines are worked for gold. Pop. est. 300.

Valdivia. Prov. of S. Chile, adjacent to the provinces of Llanquihue and Cautín and to Argentina. In the W. are the coast ranges, in the E. the Andes; between is a portion of the great longitudinal valley of Chile. The mts. are forested, and lumbering is carried on. The valley is given over to agriculture and grazing. Its area is 7,721 sq. m. Pop. 191,642.

Valdivia. Town of Chile, capital of the prov. of the same name. It is on the Valdivia river, 16 m. from

of Oxford lies between the scarp of the Chilterns and the gentle slope of the Cotswolds.

Valen, FARTEIN (b. 1887). Norwegian composer. He was born at Stavanger, and spent his childhood in Madagascar, where his father was a missionary. He studied at Oslo, and under Reger in Berlin. In 1924 he became director of music in Oslo university. In 1935 he was awarded a govt. grant, which enabled him to give all his time to composition. Works include *Pastorale*, *Sonetto di Michelangelo*.

Valence. Town of France, capital of the dept. of Drôme. It lies on the left bank of the Rhône, 66 m. by rly. S. of Lyons, and 4 m. below the mouth of the Isère river. It is a rly. junction, and there is a busy river trade. Among the industries are dyeing, distilling, flour milling, food-preserving, etc. The Romanesque cathedral of S. Apollinaire was consecrated in 1095, suffered severely in the Wars

Valdivia. Riverside quays at this important commercial port of southern Chile

wine produced in the dist. Distilling, tanning, cooperage, and flour-milling are subordinate industries. The town was heroically defended against the French in 1808. Pop. 26,800.

Valdes, ARMAND PALACIO (b. 1853). Spanish novelist. See *Palacio Valdes, Armand*.

Valdes-Leal, JUAN DE (1630-91). Spanish painter. Born at Seville or Córdoba, he studied probably under the

Juan de Valdes-Leal, Spanish painter

elder Herrera. In 1658 he went to Seville, and in 1663 became president of the new academy founded by Murillo. Valdes practised sculpture, engraving, and architecture with indifferent success. His art is tinged with pessimism and lacks serenity. In the museum at Seville is a series of scenes by him from the Life of S. Ignatius. He died at Seville, Oct. 14, 1691.

Val de Travers. Valley of Switzerland, in the canton of Neuchâtel. It lies in the Jura Mts., is traversed by the rly. from Neu-

the mouth at Corral or Valdivia port, a fine harbour, and is connected by a branch with the Longitudinal Rly. There are tanneries, shipbuilding yards, breweries, soap and candle factories. Wheat, hides, wool, and whale oil are exported. It is famous for its surrounding resorts, with woods, lakes, and beaches. Pop. 49,481.

Valdivia, PEDRO DE (c. 1498-1554). Spanish soldier. Born near La Serena, Estremadura, he served

in Italy, and about 1534 went to the New World, being of great assistance to Pizarro in Peru. He was then sent to conquer Chile, where in 1541 he founded Santiago, and for six years fought against the natives. After fighting again in Peru, he returned to Chile, and during a revolt was killed by the Indians.

Vale. Name applied to a type of valley common in the lowlands of England. Usually it is a wide level-floored valley between hill ridges, with a scarp on one side and a gentle slope on the other. The vale

Pedro de Valdivia, Spanish soldier

Valence, France. The Romanesque cathedral of S. Apollinaire

of Religion, and was restored in 1609, with additions in 1861. The Romanesque chapel called *Le Pendentif* was built for the Mistral family in 1548. Valence, known to the Romans as *Valentia*, was long under the suzerainty of its bishops, but put itself under the protection of Louis XI. It was a noted centre of Protestantism. During the Second Great War Valence was liberated with little opposition from the Germans by the U.S. 7th army Aug. 31, 1944.

Valencia. Former kingdom in E. Spain. Lying on the Mediterranean coast, between Aragon, N., and Murcia, S., it comprised the

area now divided into the provs. of Valencia, Alicante, and Castellón de la Plana. It came into existence at the downfall of the caliphate of Córdoba, and was a Muslim kingdom from 1021 until 1094, when it fell into the power of the Almoravides (*q.v.*). Early in 1095 the Cid Campeador besieged and took the city; but the Moors resumed possession in 1101, and remained there until the conquest by James I of Aragon, 1238. On the marriage of Ferdinand and Isabella in 1469, the kingdom was incorporated in that of Castile. See Aragon; Castile: Spain.

Valencia. Prov. of Spain. On the S.E. Mediterranean coast, it lies between Castellón and Alicante. It is crossed by the Sierra Martés, and is drained by the Júcar, Guadalaviar, and their affluents. Its vegas or cultivated plains, and huertas or irrigated gardens, form one of the most productive dists. in Europe, and yield abundance of rice, citrus fruits, wine, and olive oil. Sheep and goats are reared on the highlands. Manufactures are mainly confined to the capital, Valencia, and to towns such as Alcira, Requena, Cullera, Liria. Area 4,239 sq. m. Pop. 1,419,184. See Spain.

Valencia. Third city of Spain, capital of the prov. of the same name, and a Mediterranean port.

Valencia arm:

It is 2½ m. from the mouth of the Guadalaviar, 185 m. E.S.E. of Madrid. Its outport, El Grao, at the mouth of the river, is one of the best harbours of the E. coast of

Spain. Valencia lies within a huerta, a vast irrigated shady orchard with fine groves of orange, citron, and mulberry trees. Formerly capital of a kingdom, it is probably the most Moorish-looking city in Spain. Pop. 562,967.

The cathedral of Our Lady, with a fine octagonal tower, El Miguelete, was begun in 1262 on the site of a Roman temple. It was for a time a mosque, and its structure was not completed until 1482. In front of its Puerta de los Apóstoles meets weekly the water court, the oldest tribunal in Spain, which controls the supplies of irrigation water. The churches of San Andrés and Corpus Christi are adorned with fine frescoes and paintings. The provincial museum of paintings occupies the former Convento del Carmen. The silk

Valencia, Spain. Left, archiepiscopal palace, containing a famous library. Right, cathedral of Our Lady, built on the site of a Roman temple

exchange, La Lonja de la Seda, erected on the site of the Moorish Alcázar, is a glorious Gothic edifice, which is the heart of the city's commerce. A custom house erected by Charles IV is now a tobacco factory. The bull ring, Plaza de Toros, is reputed the finest in Spain.

The finest public squares are the Plazas del Mercado, de Tetuán, del Príncipe Alfonso, and de la Reina. Ancient walls have been replaced by boulevards, but the watch towers, Torres de Serranos and Torres de Cuarte, are of interest as extant specimens of medieval fortifications. The university, founded in 1411 by the union of two earlier educational foundations, was at its height in the 16th century; it has regained its earlier importance since the reorganization of 1848-58. According to tradition the first printing press in Spain was established in Valencia in 1474.

Rice, citrus fruits, wines, silks, olive oil, and dried fruits are the main exports. Tobacco, silks, linens, hempen goods, velvets and plush, fans, leather goods, glazed pottery and bricks (azulejos), and iron and bronze articles are manufactured.

In 138 B.C. the city gained the Jus Latinum. Taken by the Visigoths in 413, and by the Moors in 714, it became the capital of the independent Moorish kingdom in 1021. The Moors regained control after its capture by the Cid in 1095 until its final conquest by James I of Aragon in 1238. During the Spanish Civil War Valencia was the seat of government after the evacuation of Madrid, Nov. 7, 1936. On Oct. 30, 1937, the government was transferred to Barcelona. See Spain.

Valencia OR TACARIGUA. Lake of N. Venezuela. It lies between the state of Carabobo and Aragua.

Of the two W. outlets, the Trincheras communicates with the Caribbean Sea by the Agua Caliente. The lake is 22 m. long, 6 m. wide, and has a greatest depth of 300 ft.

Valencia. Town of Venezuela, capital of the state of Carabobo. It stands on the Cabrales river, 24 m. by rly. S. of Puerto Cabello, near the W. end of Lake Valencia. It has a fine early 19th century cathedral, a university, and hand-

some plazas. One of the chief manufacturing places in Venezuela, it exports coffee, sugar, cacao, and hides. Valencia was founded in 1555, and here Bolívar fought battles in 1814 and in 1821; by his second victory he freed Venezuela from Spain. The place suffered severely during an earthquake in 1812. Pop. 49,963.

Valencia de Alcántara. A frontier town of W. Spain, in the prov. of Cáceres. It is the last Spanish station of the rly. from Madrid to Lisbon. Agricultural produce and phosphates are the chief articles of trade. Pop. 13,500.

Valenciennes. Town of France in the dept. of Nord. It lies on the Escaut, here joined by the Rhonelle, 20 m. by rly. E. of Douai, and is a rly. junction. The chief industries are in cambric, iron foundries, metal working, and rly. materials, and there is commerce in sugar and coal. Valenciennes lace, for which it was once famous, is no longer manufactured here. The 17th century hôtel de ville with its fine façade was burnt in 1940. The chief churches are Notre Dame de S. Cordon, 1850-64, and S. Géry, founded 1225, with modern restorations and tower. The 16th century Jesuit college is now a lycée. In the museum is a collection of Flemish paintings and tapestries. Pop. 38,684.

After having independent status Valenciennes was merged in the co. of Hainault, but passed to France by the treaty of Nijmegen in 1678, and from then until the Revolution was the capital of French Hainault. Occupied by the Germans during the First Great War, it was retaken by Canadian troops, Nov. 4, 1918. The metal factories were robbed of much plant. Baldwin of Flanders, Froisart, and Watteau were born here.

Valenciennes. Variety of pillow lace. Originally made by hand at Valenciennes, it was later manufactured by machine at Nottingham. In the 18th century, the manufacture by hand was at its peak, and the craft employed about 4,000 workers in Valenciennes in 1750, but in 1851 only two lace-makers survived. The meshes, made of two threads partly twisted at the top, form irregular hexagons. *See* Lace plate.

Valency (Lat. *valēre*, to have force). Maximum combining power of a chemical element. The valency is expressed in relation to the number of hydrogen atoms with which one atom of another element can combine. For example, chlorine, bromine, and iodine combine with or can replace one atom of hydrogen, these elements being called univalent or monads. When an element such as oxygen combines with two atoms of hydrogen it is termed bivalent or dyad, when with three atoms (*e.g.* nitrogen), trivalent or triad, and with four (*e.g.* carbon), quadrivalent or tetrad.

Other elements show higher valencies, the terms used being quivalent or pentad, sexivalent or hexad, septivalent or heptad, and octavalent or octad. Where an element such as argon does not combine with another element it is said to be non-valent. The valency of the elements has been ascertained by experiment.

Valencies are indicated in what are known as graphic symbols by bonds, *e.g.* hydrogen chloride (hydrochloric acid) is shown as H-Cl. There is, however, the difficulty that some elements do not exhibit a constant valency. Phosphorus, for instance, combines with chlorine in two proportions, one containing three atoms of chlorine (PCl₃), and the other five (PCl₅). To explain this it is suggested that there are differences in the condition of the atoms.

Three chief types of linkage are recognized: (1) Covalency bonds, involving the sharing of a pair of electrons, one from each atom; this type of bond is exemplified by organic compounds which are non-ionisable. (2) Electrovalency bonds, where electrons are transferred from one atom to the other, that losing an electron becoming a positive ion and the other a negative ion; this type of bond gives some explanation of electrolytes. (3) Coordinated bonds, where a pair of electrons is shared but both are provided by the same atom.

Valens, FLAVIUS (c. 328-378). Roman emperor of the East, 364-378. He was the younger brother of Valentinian I

Flavius Valens,
Roman emperor
From a coin

(*q.v.*), who associated Valens with him in the government, assigning to him the Eastern provinces. His reign was marked by fighting with the Persians and with the Goths, the latter of whom, pressed by the Huns on the E., menaced the N.E. frontier of the empire. Valens, having become sole emperor on Valentinian's death in 375, let them settle in Thrace, but at the disastrous battle of Adrianople, Aug. 9, 378, the Roman arms were completely defeated, and Valens disappeared. During his reign the Arian controversy raged fiercely. The emperor himself was a supporter of the Arians and persecuted orthodox Christians.

Valentia. Island of co. Kerry, Eire. Lying 3 m. S.W. of Cahirciveen, it is 7 m. in length and 3½ m. in breadth, only about half being cultivated. It is separated from the mainland by Valentia Harbour, which is landlocked. There are Protestant and R.C. churches and schools on the island, the inhabitants of which are mostly sailors and fishermen. Valentia was selected as the E. terminus of the Anglo-American Telegraph co.'s Atlantic cable service. Pop. est. 1,500.

Valentian. In geology the lowest division of the Silurian system in Great Britain. It is named after the old Roman province of Valentia in S. Scotland, where strata of this age occur. The term is synonymous with Llandovery. *See* Silurian.

Valentine (Lat. *Valentinus*). Name of several saints. Two of them, a priest and a bishop, are said to have been martyred near Rome on the same day, Feb. 14, about 270. The practice of sending love tokens on their festival, Feb. 14, seems to have been a survival of the Roman custom of boys drawing the names of girls by lot in honour of Juno Februialis at the Lupercalia (*q.v.*) about the same date. In Great Britain the custom declined during the 19th cent., the decorative tokens of affection becoming gradually vulgarised.

Valentine. One of the Two Gentlemen of Verona in Shakespeare's play of that name. He

is in love with Silvia. A minor character in Shakespeare's Twelfth Night is also called Valentine.

Valentinian I (321-375). Roman emperor of the West, 364-375, whose full name was Flavius Gratianus Valentinianus. Born at Cibalis in Pannonia, he rose to high rank in the army, and on his election by the troops as emperor after the death of Jovian he associated his brother Valens (*q.v.*) with himself in the government of the empire. The rebellion of Procopius was crushed in 366. There was fighting against the Alamanni on the Rhine frontier, which kept Valentinian in Gaul for a great part of his reign. He was a ruler of considerable ability, and endeavoured to alleviate the condition of his subjects now grievously burdened by taxation. A Catholic Christian, he tolerated Arianism and all forms of religion. He was prone, however, to ungovernable fits of passion, in one of which he burst a blood-vessel and died, Nov. 17, 375.

Valentinian II (371-392). Roman emperor of the West, 375-392. A mere child, he became joint emperor with his half-brother Gratian after whose death in 383 his mother, Justina, was virtual ruler of the empire. With the advance of Maximus, whose claims as an independent sovereign had been recognized beyond the Alps, Valentinian took refuge with his brother-in-law, Theodosius, who defeated Maximus and restored Valentinian. An uneventful reign ended with his assassination by one of his generals, Arbogast the Frank, May 16, 392.

Valentinian III (419-455). Roman emperor of the West, 425-455. Son of Constantius and Placidia, daughter of Theodosius, he succeeded Honorius, his mother acting as regent. In his reign the Vandals, and Huns, who had invaded Italy, were checked by Aetius, but this general in 454 was treacherously put to death by Valentinian, who a year later shared the same fate at the hands of Petronius Maximus.

Valentinians. Sect of Gnostics. They were named after Valentinus, a priest of Alexandria, who was excommunicated in Rome, acquired a reputation as a philosophical theologian, and died in Cyprus about 180. He was one of the first to attempt the formation of a syncretistic theosophy by amalgamating Judaism and Christianity with the theogonies and philosophy of ancient Greece and the Orient. Only a few of his writings are

preserved, what is known of him being gathered from the works of Irenaeus, Hippolytus, Tertullian, and Clement of Alexandria. See Gnosticism; *consult also* Bampton Lectures, E. Burton, 1828.

Valentino, RUDOLPH (1895-1926). Italian-born American film actor. He was born at Castellaneta,

Rudolph Valentino,
Italian-born
American film actor

May 6, 1895, his real name being Rudolph Alphonso Guglielmi di Valentino d'Antongiuella. He went to the U.S.A. in 1913, intending to take up farming, but soon went on the stage as a dancer, appearing in London as partner to Gaby Deslys. "Discovered" by Rex Ingram, he made his screen debut in 1922 in *The Four Horsemen of the Apocalypse*, and soon acquired by his grace and virility an unparalleled reputation in highly romantic parts, e.g. in *The Sheik*, *Blood and Sand*, and *Monsieur Beaucaire*, this last, 1924, being considered his finest performance. Dying suddenly in New York, Aug. 23, 1926, his funeral was attended by hundreds of thousands. For a time his memory became something of a cult among numerous women filmgoers. Valentino published in 1923 a book of poems, *Daydreams*. Biographies by his second wife, Natacha Rambova, and S. G. Ullman, appeared in 1927.

Valenza. City of Italy, in the Piedmontese prov. of Alessandria. Situated on the river Po, 9 m. by rly. N. of Alessandria, it has a 16th century cathedral and some trade in silk.

Valera y Alcalá Galiano, JUAN (1824-1905). Spanish novelist and diplomatist. Born at Cabra in Andalusia, Oct. 18, 1824, and educated at Granada university, he entered the diplomatic service in 1847. A prominent publicist, he was in 1868 director of public education. Between 1881 and 1895 he represented Spain in Lisbon, Washington, Brussels, and Vienna. He died April 18, 1905.

A volume of poems, 1856, was followed by *Critical Studies of Literature*, 1864, but Valera's first novel, *Pepita Jiménez*, did not appear until 1874 (Eng. trans. by M. J. Serrano, 1891). It is regarded as a classic, and was followed by *The Illusions of Dr. Faustino*, 1875; *Knight Commander Mendoza*, 1877; *Dofia Luz*, 1879; a volume of short stories,

1887; and other novels, including *Juanita la Larga*, 1896, a study of Andalusian peasant life.

Valerian OR **ALL-HEAL** (*Valeriana officinalis*). Perennial fetid herb of the family Valerianaceae. It is a native of Europe and Asia. The leaves are deeply cut into two rows of lance-shaped segments. The stem, 3-5 ft. in height, terminates in many clusters of the small, pale pink, funnel-shaped flowers. The rootstock is used in medicine as an antispasmodic. In drying it develops the fetid odour which is attractive alike to cats and rats.

Spur valerian (*Kentranthus ruber*) is a perennial herb of the family Valerianaceae, native of Europe, W. Asia, and N. Africa. The lower part of the stem is woody, and from it erect, round, hollow branches are produced, with opposite lance-shaped, thick, grey-green, undivided leaves. The small crimson, tubular flowers differ from those of valerian chiefly in having a long spur.

Valerian (c. 190-286). Roman emperor, 253-260. His full name was Publius Licinius Valerianus. A leading senator, and censor in 251, he was sent by the emperor Gallus against the upstart emperor Aemilianus on the Danube, but both Gallus and Aemilianus were murdered, and Valerian, who had been proclaimed emperor in Rhaetia, was acknowledged by the senate. He issued edicts against the Christians and persecution and martyrdoms followed. A good soldier and administrator, he deputed his son Gallienus to rule the west and, after defeating the Goths in 257, he recovered Antioch from the invading Persians, and pursued their king Shapur I to the Euphrates. Valerian was captured near Edessa, 260, and lived the rest of his life in ignominious captivity.

Valerianaceae. A family of herbs and a few shrubs. Natives chiefly of the N. temperate zone,

they have opposite leaves, and small, mostly irregular, tubular flowers in cymes or solitary. The fruits are small, dry, and one-seeded. Their medicinal properties as antispasmodics have been known since ancient days. See Spikenard; Valerian.

Valeric Acid. One of the fatty acids. It occurs in four isomeric modifications, viz. (1) normal valeric acid or propylacetic acid, obtained by heating normal butyl cyanide with potash; (2) inactive valeric acid or isopropylacetic acid, found naturally in valerian root (*Valeriana officinalis*) or prepared by oxidising amyl alcohol; (3) methyl ethyl acetic acid; and (4) trimethyl acetic acid. Inactive valeric acid forms salts known as valerates, those of ammonium and zinc being employed in medicine. Both the acid and its salts have a distinctive smell resembling that of old cheese.

Valerius Flaccus, GAIUS. Roman poet. Little is known of him, except that he was one of the *Quindecimviri sacris faciundis* at Rome, 15 officials to whom the keeping of the Sibylline books was entrusted, and that he died young, about A.D. 90. He was the author of *Argonautica*, an account of the voyage of the Argonauts, in eight books, dedicated to the emperor Vespasian.

Valéry, PAUL (1871-1945). A French poet. He was born at Cette, Oct. 30, 1871, and educated at Montpellier university. In 1891 he went to Paris, where he met Mallarmé. Some of his early verse attracted little attention, and for nearly 20 years he ceased to write. The appearance in 1917 of *La Jeune Parque*, a long poem, gained him a large public; other volumes followed, as well as a collection of essays in 5 vols. under the title *Variété*. In 1925 he became a member of the academy, and in 1937 professor of poetry at the Collège de France. A metaphysical poet, too abstruse for the general reader, Valéry nevertheless enjoyed a great reputation. He died July 20, 1945.

Valetta. Alternative spelling for the capital of Malta, entered in this work as Valletta.

Valette, JEAN PARISOT DE LA (1498-1568). French grand master of knights of S. John of Jerusalem. A native of Toulouse, he entered the order

Valerian. Leaves
and flower clusters

Valerian,
Roman emperor
From a coin

Jean de la Valette,
Grand Master

as a young man, becoming grand master in 1537. His naval operations against the Turks led to their investment of Malta with a fleet of 150 vessels. Valette, with a force of 9,000 men, kept them at bay for five months, and when the Muslims raised the siege and withdrew, their losses amounted to over 20,000 men. Valette died Aug. 15, 1568. The name is sometimes spelled Vallette. *See* Malta.

Valga (Russ., Valk; Ger. Walk). Town of Estonia S.S.R., capital of a dist. of the same name. It lies near the Latvian frontier on the right bank of the Peddel, an affluent of the Embach, 125 m. S.E. of Tallinn, and is an important junction on the Riga-Tallinn, Riga-Pskov main rlys. Founded as Peddel in 1334 by the knights of Livonia, it was several times destroyed during the wars between Sweden and Poland, and was burned by the Russians in 1702. It has a distillery and a brewery, and trade in flax, linseed, grain, wax, and other agricultural products. During the Second Great War Valga, overrun by the Germans during July, 1941, was recaptured by Gen. Bagramyan's 1st Baltic army Sept. 19, 1944. Pop. 10,000.

Valhalla (Old Norse *valhöll*, hall of the slain). In Norse mythology, Odin's hall in Asgard on the top of Bifröst (*q.v.*). It was thatched with shields, hung with mailcoats, and lit with swords, and had 540 doors through each of which 800 champions marched to the last fight. In Valhalla Odin received dead warriors, who there refought their battles by day and feasted by night. (*See* Odin.) The name was also given to the hall of fame commemorating eminent Germans, near Regensburg, on the N. bank of the Danube. It was built 1830-42 by King Louis I of Bavaria, and contained over 100 busts of distinguished Germans.

Valk. Russian name for the Estonian town Valga (*v.s.*).

Valkyrie (Old Norse *valkyrja*, chooser of the slain). In Norse mythology, name for Odin's warrior maids, half human and half unearthly, who rode to battle over sea and through the air to choose the slain for Valhalla. They belong to the Viking age. The names are recorded of thirteen who lived in Vingolf, part of Valhalla, and carried the mead round at Odin's feasts.

Valkyrie, *THE* (*Die Walküre*). Opera by Wagner. The second of the four works comprising *Der Ring des Nibelungen*, it was

completed in 1854, but not produced until Aug. 16, 1876, at Munich, being given at Baireuth the same year. The first London performance was at Her Majesty's, 1882, and the first English version at Covent Garden, 1895. This work, with its Ride of the Valkyries, introduces Brunhild (*q.v.*).

Valkyrie.

Name of three British yachts. Owned by Lord Dunraven, they were prominent in connexion with his attempts to win the America Cup, 1893-95. Valkyrie I competed in 1893, being beaten by Vigilant. In 1894 she was sunk in the Firth of Clyde after colliding with another vessel. Valkyrie II and III competed unsuccessfully in 1894 and 1895 respectively. *See* America Cup; Yachting.

Valla, LORENZO OR LAURENTIO (c. 1400-57). Italian scholar. He was born in Rome, became professor of eloquence at Pavia in 1431, and opened a school of eloquence in Naples, where he died Aug. 1, 1457. Writer of many works of history, criticism, dialectics, and moral philosophy, he has been described as the father of modern negative criticism, owing to his exposure of a notable papal imposture in De Donatone Constantini. His *De Elegantis Linguae Latinae*, 1471, and translations of Herodotus and Thucydides, were his other best known works. *See* Donation of Constantine.

Valladolid. Prov. of Spain. It is adjacent to Palencia, León, Zamora, Salamanca, Avila, Segovia, and Burgos, and is well drained by the Douro and its affluents. The

N.W. is occupied by the Montes de Torozos, and the remainder is a fertile plain, yielding cereals and fruit in vast quantities. The forests on the mts. provide timber for numerous sawmills. Area, 3,155 sq. m. Pop. 354,331.

Valladolid. City of Spain, capital of the prov. of the same name. Situated on the left bank of the Pisuerga, 102 m. direct N.W. of Madrid, it is an important rly. junction connected with the capital. For a long period it was the capital of Castile and León, and later, until 1560, of Spain.

Beside the Plaza de Portugalete is the incomplete Renaissance cathedral, begun by Juan de Herrera in 1585; it contains paintings by Giordano. The most interesting church is the Gothic Santa Maria la Antigua (1088). Cardinal Torquemada remodelled in the 15th

Valladolid, Spain. The 17th century university building. Top, façade of the church of San Pablo

century the 13th century church of San Pablo, and the duke of Lerna reconstructed it two centuries later; herein the ancient Cortes met frequently. Like the Colegiata de San Gregorio, now municipal offices, it is one of the finest Gothic edifices in the world.

Valladolid university, dating from 1346, is now housed in a palace of the 17th century. It has six faculties and over 5,000 students. The ancient royal palace is now the seat of the provincial authorities. Philip II was born, Columbus died, and Cervantes lived in Valladolid. Church councils were held here in 1124, 1137, and 1322. The French sacked the city and destroyed many artistic treasures in 1808. There is considerable trade in agricultural products. Pop. 135,785.

Valladolid. Town of Mexico. In the state of Yucatan, it is 95 m. E.S.E. of Mérida. Founded in 1544, it has a Jesuit college and remains of a convent, and manufactures cotton.

Vallauris Ware. Porous red clay pottery produced at Vallauris, near Cannes, France. It is covered with an opaque olive-green glaze and decorated with flower overglaze. At Golfe Juan, at the foot of the village, art pottery of a high order is made.

Valle d'Aosta (Fr. Vald'Aosta). Autonomous region and prov. of Italy, formerly included in Piedmont. It lies in the extreme N.W. of Italy, next to the French and Swiss frontiers. Most of the people are French speaking, in spite of efforts to Italianise them. In 1945, France claimed the area; but when Italy agreed to give the valley local autonomy, and recognized French as on an equality with Italian, France abandoned the claim. Area 1,260 sq. m. Pop. 84,000.

Valletta or **VALETTE**. Capital of Malta. On a promontory on the N.E. coast of the island, it has a

Valletta arms

commodious harbour on each side, and the light-house and fort of St. Elmo at the extremity. Fortified, and the chief British naval and coaling station in the Mediterranean Sea, equipped with docks for naval and other vessels, it is one of the foremost ports of call in the world on the Suez route to the Orient. There is a rly. to Citta Vecchia, the old capital, about 8½ m. to the W.

The governor's residence (1573-77) was formerly the palace of the Knights of St. John. Other notable buildings were the palaces of the Maltese nobility, the university, library, and museum. The city was named after Jean Parisot de la Valette, who defended it against the Turks in 1565. It was heavily damaged during the Second Great

War. A substantial part of the £30,000,000 grants for reconstruction made by the U.K. govt. to Malta from 1942 was devoted to Valletta. A bronze tablet on the wall of the palace commemorates a visit by F. D. Roosevelt, Dec. 8, 1943, and his expression of U.S. admiration for Malta. See *Malta* illus. p. 5449; Malta in the Second Great War; Malta, Knights of; Vallette, J. P. de la.

Valley. Low-lying strip of ground bounded on either side by higher land. Most valleys have been carved out by erosion, being worn down by water or ice action, the intervening high ground being largely residual. Rift valleys (*q.v.*) due to faulting, and valleys resulting from down-folding of the earth's crust, are exceptions. Erosion naturally favours bands of soft-rocks, or zones of shattering in the earth's crust. Valleys therefore often mark such features e.g. the low ground below the chalk ridges of the N. and S. Downs eroded in the soft Gault Clay bed, and the Great Glen of Scotland carved along the line of a major zone of fracture.

Valleys in early stages of development are narrow gorges with irregular longitudinal profiles. They develop into evenly graded features in which the floor becomes smoother and wider until a broad flood-plain of alluvium flanked by gently rising bluffs is established.

Valletta. Plan of the town and harbour of this British Mediterranean naval port

The sides of such valleys have a V-shaped cross-section and are the result of water erosion. U-shaped or trough-like valleys are formed by valley glaciers scraping away the valley floor and lower slopes of the sides. These valleys often have precipitous walls over which the tributary streams cataract. Drowned valleys are the result of encroachment of the sea upon the lower reaches of rivers. The estuary so formed has a very irregular shape owing to the flooding of the main valley and its tribes. Many important harbours are drowned valleys, e.g. Plymouth, Sydney, Hong Kong.

Valleys are usually more densely populated than the neighbouring higher ground. They control the great routes of land traffic, e.g. the Rhône-Rhine, Vardar-Morava, Hudson-Mohawk routes. Even when the rivers are not navigable roads and rlys. use the valleys.

VALLEY BREEZE. This is a term applied to the breeze which may blow up a valley or a mt. slope during the day, when the ground is warmed by the sun. The air, heated in turn, becomes less dense and rises, producing the upward flow. A valley breeze is the reverse of the katabatic wind. See Katabatic; Mountain; Rift Valley.

Valleyfield or **SALABERRY DE VALLEYFIELD**. Town of Quebec, Canada. It is near the head of Beauharnois Canal, and is served by the C.N.R. and St. Lawrence and Adirondack rly. It has textile factories, paper and flour mills. Pop. 17,052.

Valley Forge. Village of Pennsylvania, U.S.A. It stands on the Schuylkill river, 20 m. N.W. of Philadelphia. In its neighbourhood

Valletta, Malta. View of part of the town looking towards Fort St. Elmo, showing the water-front of the Grand Harbour

Washington and his army of 10,000 men passed the winter of 1777-78, suffering greatly from cold and want. The tract, of about 500 acres, is now a public park, containing relics of the camp and several memorials.

Vallombrosa. Pleasure resort of Italy. It is 21 m. due E. of Florence, in the prov. of that name, and stands amid the forests

Bournonville, the united French forces amounting to 50,000 men. The Prussians on Sept. 20 attacked Kellermann at Valmy, and were defeated. Though no more than a cannonade, this action is ranked by Creasey among the decisive battles of the world, for it saved the new-born French republic.

Valois. Name of a famous French family, members of which

were kings from 1328 to 1589. The name comes from Vez, a town in the dept. of the Oise, the dist. around which was called Valois. The co. of Valois became crown property under Philip Augustus. In 1285 it was given to Charles, son of Philip III, and a later Philip, the son of Charles, became king of France as Philip VI in 1328. He and his successors are therefore known as the Valois kings. The direct line ruled until 1498, when the branch of Orléans in the person of Louis XII succeeded. From 1515 the Angoulême branch reigned, and the extinction of the royal house of Valois came with the death of Henry III in 1589, when the

Bourbon kings began. The duchy of Valois, created in 1406, was held by various royal ladies before 1630, and from then to the Revolution was, with intervals, a possession of the dukes of Orléans. *See France.*

Valona. Italian form of the name of the Albanian town Vlonë (*q.v.*).

Valonia. Acorn cup of *Quercus aegilops*, the Turkish or Greek oak. It contains a high percentage of tannic acid, the Turkish valonia 32-36 p.c., and the Greek 26-30 p.c., and is extensively used in the preparation of leather, especially the higher grades. The name is derived from Vlonë.

Valparaiso. Fortified city and seaport of Chile, capital of the prov. of Valparaiso. The city, which is the principal seaport on the W. coast of S. America, stands on the Bay of Valparaiso, 116 m. by rly. W.N.W. of Santiago. The bay is sheltered on three sides, but is open to the N., and the town is built on the slopes of a range of hills about 1,500 ft. alt.

On the S. side of the bay is the finest thoroughfare in the town, the Avenida de las Delicias. The W. part of Valparaiso contains the port, where there are a large number of public buildings and warehouses bordering the docks and quays. Among the principal buildings are the custom house, government house, post office, city hall, exchange, prisons, hospitals, theatres, and police barracks. There are a natural history museum, a naval school, and other naval establishments. In the city are several fine squares adorned with monuments of Columbus, Arturo Prat, Admiral Cochrane (who founded the Chilean navy), and other celebrities.

The industries include brewing, distilling, sugar refining, and

Vallombrosa, Italy. The historic Benedictine convent

of the Apennines, at an alt. of 3,140 ft., and is reached by a cable rly. Here, about 1030, was founded a Benedictine abbey, which was destroyed by the troops of Charles V in 1527. It was rebuilt, but was suppressed, and in 1870 the buildings were taken for a school of forestry. Here is a meteorological station founded in 1654. The "autumnal leaves that strow the brooks in Vallombrosa" are referred to in *Paradise Lost*.

Valls. Town of Spain, in the prov. of Tarragona. It is 11 m. by rly. N. of Tarragona city and 50 m. S.S.W. of Barcelona, and stands in a fertile plain, from which rise its well-preserved walls and towers. There are textile factories, paper mills, distilleries, and tanneries. Here in 1809 the Spaniards were defeated by the French. Pop. 14,700.

Valmy. Village of France. In the dept. of Marne, it is 6 m. W. of Ste. Meneshould, on the main road to Châlons, and was the scene of an action between the French and the Prussians, Sept. 20, 1792. The latter had entered French territory on Aug. 12, and were first opposed by Dumouriez, who was afterwards joined at Ste. Meneshould by Kellermann and

Valparaiso, Chile. The waterfront; because of the narrow beach, small boats are hoisted on to the roadway, as seen here, to avoid damage by heavy seas. Upper picture, the City Hall in the Plaza del Castillo

coach-building, and there are foundries, machine shops, and government rly. sheds. Valparaiso is a port of call for several steamship lines, and there is rly. communication with Buenos Aires through a tunnel in the Andes, and daily air service.

Founded in 1536 by Juan de Saavedra, Valparaiso was captured by Drake in 1578 and by Hawkins in 1596. In 1600 it was pillaged by the Dutch, and was greatly damaged by the Spaniards who bombarded the town in 1866. It suffered during the revolt of 1891, and has experienced severe earthquakes. Pop. 215,614.

Valse. French form of the name of the originally German dance, the waltz (*q.v.*).

Vals-les-Bains. Town of France. In the dept. of Ardèche, it is situated in the valley of the Volane, in a volcanic dist., 12 m. W.S.W. of Privas. It is a health resort, noted for its many mineral springs, known since the 17th cent. and resorted to by persons with gastric affections, diabetes, etc. Pop. est. 4,500.

Valtellina. Upper valley of the river Adda, N. Italy. It stretches E. from Lake Como for about 55 m. towards the Stelvio Pass, which is reached by a high road through the valley. The rly. runs to Tirano from Lake Como. The valley floor is fertile, and yields wheat, figs, mulberries, and a celebrated aromatic red wine. In the Middle Ages it formed part of Lombardy; became part of Grisons in 1512; the successful French expedition sent by Richelieu, 1624, which led to its annexation, was his first incursion into international politics. Later the valley was papal property; in 1814 it was Austrian, and in 1859 Italian.

Value (Fr. *valoir*, to be worth; from Lat. *valere*, to be strong). Word used in various contexts to denote worth, efficacy, significance, strength; e.g. the value of a house, a suggestion, a medicine, a vowel. In criticism of painting the term tone-value denotes the effect of light and atmosphere on objects, while colour-value denotes the inter-relation of various colours in a picture.

The notion of value as the basis of prices and exchange has been much considered by successive generations of economists. It is generally agreed that there are three kinds of value: subjective use value, the importance attached by an individual to a commodity; subjective exchange value, the ratio between subject-

ive use values in the mind of the person evolving them; and objective exchange value, the ratio in which persons actually exchange commodities. Ordinarily a buyer gives less than he would be prepared to give, and hence through exchange acquires a surplus of subjective use value. As money usually intervenes in practical exchanges, the prices at which goods are sold measure their objective exchange values in terms of money. A general rise of prices indicates that money has become relatively of less value than most commodities; and vice versa. There cannot be a rise in the exchange values of everything.

According to the labour theory of Adam Smith, Ricardo, and Mill, the value of a commodity depended on the labour—time, effort, ingenuity, skill, hardship, etc.—embodied in it. Marx believed that the value of a commodity depended on the socially necessary labour its production would require from time to time under changing methods of production. Neither of these theories adequately fitted the facts, for value arises not so much from any characteristics of the thing as from our attitude to it. Today the final utility or marginal utility theory of value, elaborated in the last quarter of the 19th century by Jevons, and later by Marshall, is generally held. This states that the subjective exchange value of a commodity measures the ratio between the importance an individual attaches at any time to an additional unit of the commodity and a unit of money. The subjective exchange values of different people constitute the demand for a commodity (*i.e.* the quantities that would be bought at various prices) and the supply of a commodity (*i.e.* the

quantities that would be offered for sale at different prices). Marshall likened demand and supply to the two blades of a pair of scissors, the price at any time being the cutting point.

A thing is said to have scarcity value when its desirableness and hence its market value arise principally through its relative rarity (*e.g.* particular postage stamps, works of art). Monopoly value attaches to any commodity the supply of which is controlled by one potential supplier, who, theoretically, aims at fixing the price at the level which will yield the maximum profit. The normal value of a commodity is the ideal towards which market values tend during a period within which known conditions of supply operate; the value that will maintain equilibrium between supply and demand. See Economics; Exchange; Price; Wealth.

Valuer. One who appraises for another property or estate, real or personal, generally land or houses for purposes of letting, selling, or mortgaging, for compensation for dilapidation, or compulsory acquisition, or assessing for taxes, rates, etc. A valuer is responsible for loss caused by his ignorance or negligence. See Appraiser.

Valve. Device to control flow of fluids through pipes and other conduits. Automatic valves operated by fluid pressure include pump and other check valves, relief, and pressure-reducing valves. Mechanically actuated valves, time-controlled independently of the fluid, are used in hydraulic and heat engines to govern the fluid flow. The gunmetal globe valve, Fig. 1, is the best-known type of manually operated valve. Fluid flows upwards through the opened seating port when the renewable

Valve. 1. Globe. 2. Gate. 3. Swing check. 4. Foot valve and strainer. 5. Float operated. 6. Spring-loaded safety valve. 1, 2 and 3 by Crane, Ltd., Leman Street, London; 4, 5, 6, 7 by Newman Hender & Co., Woodchester, Glas.

metal or other disk is raised by turning the screwed spindle. The domestic water tap is of similar design. The gate valve, Fig. 2, offers less resistance to flow in low pressure pipe lines. Large sizes, made partly of cast iron, used on water mains are known as sluice valves. Parallel slide valves for boiler blow-down are similar, but the gate has parallel sides. Oblique or Y valves, of a globe pattern with an oblique seating as in Fig. 3, seek to combine the best features of globe and gate valves. A simple automatic reflux valve, the clack valve of the rural water pump, is a weighted disk of leather or rubber, hinged at one side to a flat metal seating. The swing check valve, Fig. 3, also admits of flow in only one direction, from right to left in the diagram. Other patterns have a horizontal seating closed by a guided mushroom disk, as with the pump suction foot-valve, Fig. 4, or by a ball which can be displaced by an upward flow of fluid. The rubber-sleeved valve of the pneumatic bicycle tire is another non-return valve: the spring-loaded valve of a car tire is similar, in principle, to Fig. 6, the pressure of air from the pump forcing the valve off the seating against the thrust of a spring. The ball valve, Fig. 5, shuts off a flow of water automatically when a ball float attached to the lever reaches a predetermined level, variable by the adjusting screw on the left. Safety or relief valves, Fig. 6, are used on such pressure vessels as boilers and compressed air receivers: other patterns have dead-weights or a weighted lever in place of a spring. The casing should be lock-fast, and fitted with casing gear for testing. The pressure-reducing valve, Fig. 7, automatically reduces fluid pressure. The double-beat valve, held open by the thrust of the adjustable spring, closes when the reduced pressure acting under the piston exceeds the spring pressure. In practice,

Valve. 7. Spring-loaded pressure-reducing valve.

thus controlled, adjusts the valve opening to maintain equilibrium. Steam traps are fluid-operated automatic valves designed to control discharge of condensed steam, and to prevent loss of useful steam. The mechanism may be actuated by the level within a casing, or by

Valve. 8. Tappet valve of internal combustion engine.

temperature. The mushroom or tappet valves of an internal combustion engine, Fig. 8, are typical of many mechanically actuated valves, working in a definite time-relation to the firing of each cylinder. One cam opens the mixture (inlet) valve prior to compression and firing, and another opens the exhaust (outlet) valve immediately after firing, to exhaust spent gases. The positions of the tappet valves distinguish side-valve from overhead-valve engines. See Radio; Thermionic Valve.

Valve. In music, a piston applied to certain wind instruments, whereby the speaking length is increased, and consequently the range of available sounds extended. The same result can be partially secured by piercing the tube with holes which can be stopped by the fingers or by keys, but there are practical difficulties connected with the limited stretch of the fingers which led to the invention of valves, so that chromatic notes and free modulation could be made possible. Used separately, the first valve lowers the pitch by a tone, the second by a semitone, the third by a tone and a half, and the fourth by two tones and a half. See Cornet; Horn; etc.; and other wind instruments.

Vampire (Serbian *vampir*). Nocturnal demon of the folklore of Slavonic and other peoples. It is manifested in various forms, the most usual being that of the spirit of the recently dead, or a demon occupying the dead body, returning to suck the blood of the living. Examination of a body thus demonstrating its vampirism would reveal a fresh, ruddy colour and the suppleness of life. The ways of destroying the vampire were either to drive a stake through the body, or to decapitate and burn it. Bram Stoker's story, *Dracula*, 1897, later dramatised and filmed, is based on the legend.

Vampire. British fighter aircraft. Designed in 1942 by the De Havilland co., it first flew in 1944, and was the first aero-

plane to exceed 500 m.p.h. at operational altitudes. Powered by a single turbo-jet engine, the Vampire had a wing span of 40 ft. and an overall length of 30 ft. There were twin tail-carrying booms on either side of the engine and cockpit nacelle. The cockpit was armour-plated and pressurised, and armament consisted of four 20-mm. cannon mounted below the cockpit. The Mark 4 Vampire introduced in 1947 had an operational radius of 1,390 m. The Sea Vampire was the first jet-propelled aeroplane to land on and take off from an aircraft carrier at sea. Vampires were provided for the R.A.F. and many Commonwealth and foreign air forces. See Aeroplane illus., p. 130.

Vampire Bat. Name given to the members of a family of bats (*Desmodontidae*). Found in Central and S. America, they live by sucking the blood of animals. There are two genera, *Desmodus* and *Diphylla*, with one species each. Both the arrangement of their teeth and the structure of the stomach have been specialised for blood-sucking. By a bite with their sharp teeth these small bats remove a very thin slice of skin from their victim, and then suck the blood. These bats transmit

Vampire Bat. Blood-sucking bat of Central and South America

the virus of rabies and thus infect cattle. The large *Vampyrus* or *Phyllostoma spectrum* of Brazil, and several other bats, formerly thought to be blood suckers, are harmless.

Van. Dutch word meaning of. Used as a prefix to surnames, it is the equivalent of the French *de* and the German *von*. Dutch names, like French and German ones, are alphabetised in this Encyclopedia under the main word, not under the prefix (see Arvelde; Eyck, etc.). The few exceptions are those where British or American usage has made the van inseparable from the name proper, e.g. Van Buren, Van Dyck.

Van (abbrev. of caravan). Large covered wagon, or a carriage attached to a railway train for carrying luggage. The van is

usually a four-wheeled vehicle, either driven by motor or drawn by one or two horses, and is much used by tradesmen and others for carrying light goods. The word *van* (Fr. *avant-garde*) is used also for the front of an army or the foremost division of a fleet, and (from Lat. *vannus*, fan) for a fan for winnowing grain. See *Caravan*; *Police*.

Van. Lake of Asiatic Turkey. This sheet of salt water, without visible outlet, lies between the vilayets of Van and Bitlis. Its length is about 75 m. from E. to W., its width from N. to S. varying from 20 to 40 m. Its elevation is 5,200 ft.

Van. City of Asiatic Turkey. Standing on the E. shore of Lake Van, it is capital of the vilayet of the same name.

One of the chief places in Turkish Armenia, it manufactured cotton goods, and had a fair general trade. Itself ancient, it is built on the site of Thospia, the capital of the long-departed kingdom of Bialina. One of its interesting features is a hill, on the rock face of which are cuneiform inscriptions of the Urartu (Ararat) kings, who were strong enough to contend with the Assyrians. In the Middle Ages Van was the seat of independent Armenian princes. During 1895-96 it was the scene of Armenian massacres, and in the First Great War it suffered terribly, being taken and retaken by Turks and Russians. The vilayet of Van has a pop. of 126,919.

Vanadinite. Ore mineral of vanadium, and minor ore of lead. Its chemical composition is lead chlorovanadate $PbCl_2 \cdot 3Pb_3(VO_4)_2$. It occurs as reddish or yellowish prismatic crystals or crusts in the zone of oxidation of lead veins; and accompanies other vanadium-bearing minerals in some sediments.

Vanadium. One of the chemical elements. Its chemical symbol is V; atomic number, 23; atomic weight, 50.95; density 6.0 gm. per c.c.; m.p. 1,720° C.; b.p. about 3,000° C. It has a body-centred cubic structure.

The metal was discovered by Del Rio in 1801 in a Mexican lead ore, but its true nature was not

realized until Sefström had rediscovered it in a Swedish iron ore in 1830. The name is derived from Vanadis, the Scandinavian goddess of love. It is thought to be more abundant than important metals like tin and lead. It is not found native, but is widely distributed as a vanadate or sometimes as silicate, sulphide, or oxide, in igneous and sedimentary rocks. Typical ores are vanadinite (*v.s.*), from which Del Rio first obtained vanadium compounds; and carnotite, a hydrated potassium uranyl vanadate $K_2 \cdot UO_2(VO_4)_2 \cdot 3H_2O$, which serves as an important source of radium, uranium, and vanadium. Both these ores are common in the U.S.A. and the former occurs also in Sweden and S.W. Africa and the latter also in

Van, Asiatic Turkey. The ancient city at the base of the Castle Rock, which has been a stronghold for 3,000 years

Australia. The world's greatest producer is Peru, where the element is found as a sulphide, patronite.

Many methods of extraction are used, these falling into two classes: acid methods, giving soluble vanadyl compounds, and alkali methods, giving soluble alkali vanadates. The vanadium is finally obtained as the oxide V_2O_5 , ferrous vanadate, or calcium vanadate, all of which are commercial materials. The production of pure vanadium is difficult and is best effected by reduction of the oxide with calcium in a bomb. There is little demand for metallic vanadium; it is mainly used as ferrovanadium. This used to be made from the oxide by the thermit process, but is now being prepared on an increasing scale in an electric furnace.

The metal is oxidised on heating in air and combines directly with chlorine, nitrogen, and carbon on being heated. It is not soluble in dilute sulphuric or in hydrochloric acid, but is soluble in nitric and concentrated sulphuric acids.

Aqueous alkalis have little effect, but fused alkalis convert it into water soluble vanadates.

Vanadium forms oxides corresponding to the valencies 2, 3, 4, and 5, each of which gives rise to a series of salts. Those formed from the lower oxides are powerful reducing agents, and the oxide V_2O_5 is amphoteric, yielding the vanadates. There are also formed vanadyl compounds which contain the radicals VO, e.g. vanadyl monochloride $VOCl$ or V_2O_3 , e.g. vanadyl sulphate $(VO)_2(SO_4)_3$. The main use of vanadium is in the preparation of special steels where its action is partly as a scavenger and partly as an alloying constituent. The element is added as ferrovanadium which is a more efficient scavenger than ferrosilicon or ferromanganese and owes its efficiency to the readiness with which it combines with oxygen, nitrogen, and carbon. The amount of ferrovanadium added is such as to give about 0.3 p.c. vanadium in the alloy. It is generally used in connection with other alloying elements, e.g. in chrome-vanadium steels. Its addition to steel imparts a fine grain structure and increases shock and vibration resistance. Of the vanadium compounds the oxide V_2O_5 is widely used as a catalyst in many oxidation processes. Other compounds have been used as mordants, insecticides, inks, for glass, and in medicine in the treatment of rheumatism and pulmonary tuberculosis.

Vanbrugh, DAME IRENE (1872-1949). British actress. Daughter of Prebendary R. H. Barnes, and sister of Violet Vanbrugh, she was born at Exeter, Dec. 2, 1872, and educated at Exeter and in Paris. She first appeared on the stage at the Theatre Royal, Margate, in 1888, as Phoebe in *As You Like It*, and made her London debut at the Globe that year in a revival of *Alice in Wonderland*. An actress of great charm, she excelled in comedy and created the parts of Gwendolen in *The Importance of Being Earnest*, 1895; Rose in *Trelawny of the Wells*, 1898; Lady Mary in *The Admirable Crichton*, 1902; later outstanding successes were in *Mr. Pim Passes By*, 1919; *The Truth About Blayds*, 1921; *Hamlet*,

Irene Vanbrugh, British actress

1930, in which she played the Queen; Viceroy Sarah, 1935; In Good King Charles's Golden Days, 1939; An Ideal Husband (revival), 1943. Irene Vanbrugh, who was created D.B.E., 1941, and was president of the R.A.D.A., married in 1901 Dion Boucicault (1859-1929). Her autobiography, *To Tell My Story*, was pub. 1948. She was acting until within a week of her death, Nov. 30, 1949.

Vanbrugh, Sir JOHN (1664-1726). English dramatist and architect. Born in London, he studied architecture in France, became a captain in the army, and was arrested as a spy in France and imprisoned in the Bastille. He wrote ten comedies, as grossly indecent as other dramatic productions of the period, but undeniably witty and realistic. He was one of the dramatists attacked by Jeremy Collier. Best known of his plays are *The Relapse*, 1696; *The Provok'd Wife*, 1697; and *The*

Sir John Vanbrugh,
English dramatist

Memorable performances included *Glass Houses*, 1910, *The Young Person in Pink*, 1920; *Evensong*, 1932; *Muted Strings*, 1936. In her 74th year she appeared on the London stage with her sister in a shortened version of *The Merry*

Vanbrugh, VIOLET (1867-1942). British actress. Daughter of Prebendary R. H. Barnes, and sister of Irene Vanbrugh, she was born at Exeter, Junell. 1867, and educated there and in France and Germany. She made her stage debut in a burlesque, *Faust and Loose*, at Toole's Theatre, London, 1886, and after touring with the Kendals in the U.S.A., went on as Anne Boleyn to Irving's Henry VIII at the Lyceum, 1891. She acted under the management of her husband, Arthur Bourchier (*q.v.*) at the Royalty Theatre, and was particularly successful in depicting society women.

Violet Vanbrugh,
British actress
Hugh Cecil

The plays in which she gave memorable performances included *Glass Houses*, 1910, *The Young Person in Pink*, 1920; *Evensong*, 1932; *Muted Strings*, 1936. In her 74th year she appeared on the London stage with her sister in a shortened version of *The Merry*

Wives of Windsor. She died Nov. 11, 1942.

Van Buren, MARTIN (1782-1862). American statesman. Born at Kinderhook, Dec. 5, 1782, of Dutch parentage, he became a lawyer, practising successfully at Hudson and later at Albany. During 1815-19 he was attorney-general of the state, and he was one of the powerful group that did much to fasten the spoils system on the country.

In 1821 he was elected to the U.S. senate, and in 1829 became governor of New York, being almost immediately made secretary of state by Andrew Jackson, whose election he had helped to secure. For a few months in 1831-32 he was minister to Great Britain, but in 1832 he was chosen vice-president. For four years he acted as Jackson's lieutenant, and in 1836 was elected to succeed him. He held office for one term only, as he was defeated in 1840, but remained a figure in public life, being at the end a supporter of Lincoln, until his death, July 24, 1862. Consult *Life*, E. M. Shepard, 1899.

Martin Van Buren,
American statesman

Vance, ALFRED GLENVILLE (c. 1838-88). A British comedian, known as the Great Vance. Born in London, his real name being Alfred Peck Stevens, he became a touring actor, and later opened a

Confederacy, 1705, which, contrary to the prevailing practice, introduced humble characters on the stage. In later years Vanbrugh rose to fame as an architect; his finest work is *Castle Howard*, and his largest and most grandiose mansion is *Blenheim Palace* (*q.v.*). He designed the *Haymarket Theatre*, 1705, and was its first lessee and manager. Knighted by George I in 1714, he was chosen controller of the royal works. He died March 26, 1726. A study by L. Whistler was published in 1938.

ISLAND OF
VANCOUVER
English Miles

0 10 20 30 40
Railways

Vancouver. Map of the island off British Columbia, whose forests yield vast supplies of timber, while its coast-line supports a large fishing industry.

See following page

dancing school at Liverpool. He again toured as a character singer on the variety stage at the Metropolitan and South London music halls, where his humorous cockney songs, *e.g.* I'm a Chickalery Bloke, and later such rousing chorus songs as Act on the

Alfred Vance,
British comedian

Square, Boys, became popular. He died Dec. 26, 1888.

Vancouver. Canadian island in the Pacific Ocean, part of the province of British Columbia. Off the W. coast of British Columbia, it has an area of about 12,408 sq. m., and is 285 m. long by from 40 to 80 m. broad. It is separated from the U.S.A. by the Strait of Juan de Fuca, and from the mainland of British Columbia by Queen Charlotte Sound and the Strait of Georgia. The forested mountainous backbone of the island is a N. continuation of the Coast Range of the U.S.A.; its average height is 2,000 ft. to 3,000 ft., culminating in Victoria Peak in the N., 7,484 ft. Victoria, Alberni, and Esquimalt are ports; Nanaimo and Cumberland centres of coal mining. George Vancouver (d. 1798) circumnavigated the island in 1792, and the present capital, Victoria, was founded as a trading post by the Hudson Bay co. in 1843. Pop. 121,933.

Vancouver. City and seaport of British Columbia, Canada. It stands on a magnificent harbour on the southern side of Burrard

Inlet, on the mainland of British Columbia, 1,480 m. from Winnipeg. The buildings, nearly all erected since a fire in 1886, include the university of British Columbia. The chief industry is shipping, for which there are spacious docks, which can handle the whole Alberta wheat crop. From here vessels go to the Pacific ports and across to China, Japan, and Australia. Trans-Canada air lines link it with all parts of the N. American continent. It is also the terminus of the C.P. rly. and is served by the national system. The main C.P.R. line from Vancouver to St. John, New Brunswick, is 3,367 m. long. Other industries are sugar refineries, flour mills, saw mills, and shipbuilding. It is also a centre of the lumber industry and for general business. Pop. 273,353.

Vancouver, NORTH. City of British Columbia, Canada. It stands on Burrard Inlet, just opposite Vancouver city, with which it is connected by a ferry. It is surrounded by beautiful scenery, and this, with its position on the coast and facilities for shooting and fishing, make it a popular place for pleasure-seekers. Its industries include shipbuilding, quarrying, canning, and lumber mills. Pop. 12,500.

Vandals. Teutonic people of the E. Germanic stock. Although closely associated with the Goths (*q.v.*), they were, unlike them, destitute of the nobler barbarian qualities. Having moved from the shores of the Baltic to the middle Danube, they migrated westward. At the beginning of the 5th century they poured into

Gaul, and in 409 made their way into Spain. Thither they were soon followed by the Visigoths, who partly destroyed them, penning the survivors into the district which still bears their name in the form Andalusia. About 428 they left Spain for N. Africa. Upon the Mediterranean littoral they established a powerful dominion, and there they ruled for a hundred years.

Of their kings the most famous was Gaiseric (*q.v.*), who carried out the conquest between 429 and 439, and sacked Rome in 455. Their fanatical devotion to Arianism made them fierce persecutors of the Catholics. The pirate fleets of the Vandals spread terror over the whole Mediterranean, but in 533 the emperor Justinian, dispatched Belisarius (*q.v.*) to bring them to heel. He attacked them so vigorously that the Vandal race was blotted out.

Vandamme, DOMINIQUE RENÉ (1770-1830). French soldier. Born at Cassel, Nov. 5, 1770, he was by the age of 22 a brigadier-general in the revolutionary force. His greatest exploit was the reduction of Silesia in 1806-07. In 1813, after Dresden, he was defeated at Kulm and surrendered with 10,000 men. When, in 1815, Napoleon returned to France, Vandamme joined him and commanded a corps at Ligny. Exiled by the Bourbons until 1824, he died July 15, 1830.

Van de Graaff Machine. This apparatus is described under Electrostatic Machine.

Vandenberg, ARTHUR HENDRICK (b. 1884). American politician. Born March 22, 1884, at

Vancouver, British Columbia. 1. City Hall. 2. Arts building, University of British Columbia. 3. Hastings Street, one of the principal business thoroughfares of the city, looking west

Grand Rapids, Mich., he was educated at the university of Michigan law school, became a reporter, and rose to be editor and general manager of the Grand Rapids Herald. In 1928 he was appointed to fill a senate vacancy, and was re-elected 1934, 1940, and 1946.

An advocate of non-intervention before the Second Great War, he attacked the lease-lend bill, but after the Japanese attack on Pearl Harbour supported the administration. Roosevelt appointed Vandenberg delegate to the U.N. conference at San Francisco, 1945, and next year he was named temporary president of the senate. He favoured President Truman's foreign policy and the Marshall plan. Had Dewey won the presidential election of 1948, Vandenberg was regarded as his certain choice as secretary of state. He led the U.S. delegation to the U.N. in Paris after Marshall returned to the U.S.A. in Nov., 1948.

Vanderbilt, CORNELIUS (1794-1877). An American capitalist, familiarly known as "Commodore." Born at Staten Island, May 27, 1794, he began, as a lad of 16, a ferry to carry passengers and goods thence to New York, and in a few years was the owner of a large fleet

Cornelius Vanderbilt, American capitalist

of harbour craft, among which was the first steamboat to run between New York and New Brunswick, 1817. His interests were organized in 1824 into a company which, under his management, greatly developed. By 1867 he had obtained control of the New York Central and other rlys. Before his death he controlled a trunk line between New York and Chicago. He died Jan. 4, 1877, leaving a fortune of over £20,000,000. By his will the Vanderbilt university was founded in Nashville. *Consult* Life, A. D. Howden Smith, 1928.

Vanderbilt, WILLIAM HENRY (1821-85). American capitalist. Son of "Commodore" Cornelius, he was born in New Jersey, May 8, 1821. He became clerk in a New York bank in 1839, but took to farming in Staten Island. There he be-

W. H. Vanderbilt, American capitalist

came president of the Staten Island railroad, and made it such a success that he was taken into partnership by his father, on whose death in 1877 William became president of the New York Central and Hudson railroads. By untiring energy and unfailing business acumen, he obtained control of other important systems, and at his death, Dec. 8, 1885, was worth about £40,000,000. During his lifetime he made large donations to the Vanderbilt university.

W. K. Vanderbilt, American capitalist

W. H. Vanderbilt was succeeded in the business by three sons, Cornelius (1843-99), William Kissam (1849-1920), and George Washington (1862-1914). The eldest became vice-president of the New York Central and director of some 35 other rly. enterprises. He gave largely to philanthropic and religious causes. W. K.'s daughter, Consuelo, married in 1895 the 9th duke of Marlborough. Her brother, Harold Stirling Vanderbilt (b. 1884), railway magnate and bridge player, was also the yachtsman who in his Rainbow successfully defended the America Cup in 1934.

Van der Goes, Hugo (c. 1435-82). Flemish painter. Born probably at Ghent, where he joined the painters' guild in 1467, becoming dean in 1473, he took part in the decorations of Bruges on the occasion of the marriage of Charles the Bold and Margaret of York in 1468. In 1476 he retired to the monastery of Roodenclooster, near Brussels, where he continued to paint, and where he died. Concerned chiefly with historical, heraldic, or allegorical figures, Van der Goes won high approval for his study of the female. Brilliant colour and strong draughtsmanship make him one of the greatest early Flemish artists. There is doubt as to the authenticity of some works, even S. Vincent with a Canon (now at Glasgow). The Uffizi at Florence received a fine altar-piece; and the Death of the Blessed Virgin is at Bruges.

Van der Neer, ARTUS OR ARNOLD (c. 1604-77). Dutch painter. Born at Gorinchem, he worked at Amsterdam, where he kept a wine-shop. Of his life almost nothing is known. He painted landscapes with figures, often winter scenes of ice-skating, and a large number of views of towns, excelling

in moonlight effects. There are landscapes by him in the National Gallery and Wallace Collection, London. He died in poverty, Nov. 9, 1677.

Vandervelde, EMILE (1866-1938). Belgian politician. Born in a suburb of Brussels, Jan. 25, 1866, he studied law at the university there. He early joined the Socialist movement, was a conspicuous member of the International, and entered the Belgian chamber in 1894, soon becoming chairman of the Socialist group. In the First Great War he went into exile with the parliament, and represented his country at the peace conference in Paris, 1919. He was then minister of Justice, and during the period of the Locarno treaties he was minister of foreign affairs (1925-27). During 1936-37 he held the portfolio for public health. This prolific writer, made professor of political economy at Brussels in 1924, died Dec. 27, 1938.

Van der Waals, JOHANNES DIDERIK (1837-1923). Dutch physicist, born at Leyden, Nov. 23, 1837. A self-educated man, he taught physics in schools, and when 40 was appointed professor at Amsterdam, holding the post for 30 years. His special subject of study was the 'liquefaction of gases' (see Gas), and his discoveries included the existence of forces named after him, the Van der Waals Forces (v.d.). In 1910 he was awarded the Nobel prize for physics. Van der Waals died March 9, 1923.

Van der Waals Forces. Intermolecular forces. They are chiefly responsible for the deviations of the so-called permanent gases from the behaviour of "perfect" gases. The forces are very weak and arise from the mutual interaction and polarisability of the electron shells which enclose the molecules.

Van der Weyden, ROGER (1400-64). Flemish painter. Born at Tournai, he studied under his

Roger Van der Weyden, Flemish painter

father, a sculptor named de la Pasture. Apprenticed in 1427 to Robert Campin, he became in 1432 a master of S. Luke's guild, and worked at Tournai and Brussels, visiting Italy and Germany. His painting is ascetic in character; one may cite his Deposition, in the Escorial, Last Judgement, at

Beaune, and Mater Dolorosa and Ecce Homo, in the National Gallery, London. Leader of the Brabant school, he died in Brussels, June 18, 1464. See Charles illus. p. 1958.

Van de Velde, ADRIAN (1636-72). Dutch painter. Born at Amsterdam, Nov. 30, 1636, the son of Willem Van de Velde the elder, he studied under his father, and Wynants, Wouwerman, and Potter. He excelled in landscapes and coast scenes, with or without human figures or animals. There are many examples of his art in the Rijks Museum, Amsterdam, and he is well represented in the National Gallery, London. Some of his works were executed in collaboration with Ruysdael and Hobbema. He died at Amsterdam, Jan. 21, 1672.

Van de Velde, WILLEM (1633-1707). Dutch painter. Born at Amsterdam, Dec. 18, 1633, son of

Willem Van de Velde the elder, he studied under his father and de Vlieger. At the invitation of Charles II he settled with his father at Greenwich about 1676, and established the highest

W. Van de Velde,
Dutch painter
After Kneller

reputation as a painter of sea battles and other marine subjects. Many of his pictures are in England. He died at Greenwich, April 6, 1707. See Dutch School illus. p. 2879.

Van Diemen Gulf. Arm of the Timor Sea, on the N.W. coast of Northern Territory, Australia. It extends E. to W. for about 100 m., and is entered by Dundas and Clarence Straits on either side of the extensive Melville Island. The N. shore is Cobourg Peninsula.

Van Diemen's Land. Island off S.E. Australia, since 1856 called Tasmania (*q.v.*). Discovered by Tasman, 1642, it was named by him after Anton van Diemen (d. 1645), governor of the Netherlands E. Indies, who commissioned the expedition.

Van Dine, S. S. Pseudonym of Willard Huntington Wright, (1888-1939). American writer of crime stories. He created the character of Philo Vance, one of the earliest amateur detectives to follow the inductive method and show in his talk an amazing range of scholarship. Vance, with some aid from Inspector Markham, Sergeant Heath, and the narrator Van Dine, solved the Bishop, Canary, Greene,

and other fictitious murder cases in the 1920s; he was portrayed on the screen by William Powell. Wright himself was born at Charlottesville, Va., and educated at Harvard. Beginning a career as literary editor on the Los Angeles Times, 1907-13, he was literary, dramatic, art, and music critic to various magazines. In 1929 he was made a police commissioner in New Jersey. His death was announced April 13, 1939.

Van Druten, JOHN WILLIAM (b. 1901). British dramatist. Born in London, June 1, 1901, he was educated at London university, and became a solicitor, lecturing on law at the university of Wales, Aberystwyth, 1923-26. Early plays, *The Return Half*, 1924, and *Chance Acquaintance*, 1927, had moderate success, but with his study of adolescence, *Young Woodley*, 1928, he achieved fame. Later plays included *After All*, and *London Wall (q.v.)*. Van Druten went to the U.S.A. before the Second Great War, and for the New York stage wrote *Old Acquaintance*, 1940; *The Damask Cheek* (with Lloyd Morris), 1942; *The Voice of the Turtle*, 1943; *I Remember Mama* (adaptation), 1944. He published *Way to the Present*, an autobiography, 1938.

John Van Druten,
British dramatist

Van Dyck, SIR ANTHONY (1599-1641). Flemish painter. Born at Antwerp, Mar. 22, 1599, he studied under Hendrik van Balen, and in 1618 became a freeman of the guild of S. Luke. About then he entered Rubens's studio as an assistant, employed in copying that master's pictures for the engravers, making large cartoons from his sketches, and painting historical pieces on the Rubens model. Van Dyck had, however, embarked on portraiture with considerable success before his first visit to England in 1620. The artist returned to Antwerp in 1621, and the same year went to Genoa, thence to Rome, Mantua, Palermo, and Brescia, and back to Genoa, where he remained till 1627. After working at Antwerp and The Hague, he was induced by the offer of a pension to visit England, March, 1632, and was knighted, July.

During 1635-40 he was engaged upon his many portraits of the English court and its entourage.

His output was enormous; he is reputed to have painted Charles I 36 times. Handsome and agreeable in person, he lived, as he painted, magnificently and prodigally. The king married him to Mary Ruthven of Montrose in order to check, if possible, his dissipated habits. In 1640, Rubens having died, Van Dyck hurried to Antwerp in order to secure the patronage of the Spanish king. His demands, however, were too high, and he went on to Paris, only to find that his objective, the decoration of the Louvre, had been given to Poussin. He returned to London, seriously ill, died Dec. 9, 1641, and was buried in S. Paul's. His tomb was destroyed in the Great Fire of 1666.

Van Dyck's work may be roughly divided into four periods. Up to 1621 it shows the influence of Rubens, *e.g.* early self-portraits, and the Van der Geest in the National Gallery. Next comes the Italian period, which includes religious paintings and such portraits as the Balbi children in the National Gallery. The third period shows Rubens's influence once

Self-portrait in
the Uffizi Gallery,
Florence

more, in such works as *The Crucifixion*. The last and most prolific English period includes magnificent works in galleries and private collections of the U.K. Several portraits are at Windsor Castle.

As a portraitist Van Dyck excelled in the purity of his colouring, the character which he infused into his portraits, and, above all, the beauty with which he endowed hands. His influence on future English portrait painters was enormous, Reynolds in particular expressing admiration. For examples of his portraits, see Charles I; Falkland, 2nd Viscount; Hen-

rietta Maria; Rupert. As an etcher he has seldom been surpassed. Interest attaches also to the landscape sketches, in many ways foreshadowing the British water-colour school, in the possession of the British Museum. It is possible that only the rapidity with which he worked prevented his taking rank with the greatest painters of all time. There are studies by M. Rooses, 1902; E. Schaeffe, 1909.

Vane, Sir Henry (1589-1655). English politician. Son of a Kentish gentleman, he was born Feb.

Sir Henry Vane,
English politician

18, 1589, and educated at Brasenose College, Oxford. In 1611 he was knighted, and in 1614 entered the house of commons. He was soon an official of the royal household, and became one of the chief counsellors of Charles I. As secretary of state he had a hand in momentous events, being largely responsible for the condemnation of Strafford in 1641. He then became less devoted to Charles, and was dismissed, possibly on account of treachery, whereupon he appeared as a supporter of the parliamentary cause. Politically active until his death, he received no further preferment.

Vane, Sir Henry (1613-62). English politician, known as the younger Vane. Son of the above

Sir Henry Vane,
English politician
After Lely

Sir Henry, he was born in May, 1613, and educated at Westminster and Magdalen Hall, Oxford. In 1635, having adopted Puritan views, he went to Massachusetts, of which colony he was made governor. Returning to England in 1637, Vane entered parliament, and was knighted in 1640; as one of the parliamentary chiefs he was concerned in the political moves of the next few years, succeeding Pym as leader in 1643. About 1648, however, he separated himself from his colleagues, and consequently had no part in the king's death, but after it he returned to active political life.

Sir Harry proved an able organizer of the commissariat in

Cromwell's Scottish expedition, and a skilful member of the committee of foreign affairs in 1651. His reorganization of the navy was largely responsible for English victories over the Dutch. A firm advocate of tolerance, he enjoyed Cromwell's confidence until he opposed his dictatorial methods. Then he was accused of fomenting Anabaptist agitation and was imprisoned in 1656. After the abdication of Richard Cromwell Vane was appointed a member of the committee of safety and a councillor of state. On the Restoration he was tried for treason, and in spite of an eloquent defence was executed, June 14, 1662. *Consult* Lives, J. K. Hosmer, 1888; W. W. Ireland, 1907.

Väner, VÄNERN, OR WENER. Lake of Central Sweden. It is the largest of lakes occupying part of the subsistence trough connecting the S.W. and E. coasts. It has an area of 2,141 sq. m., and is 93 m. long, 292 ft. in greatest depth, and is situated at an altitude of 144 ft. It outflows by the Göta to the Kattegat. By means of Väner, Vätter, and other lakes, and the Göta and Tröllhätten canals, there is a navigable waterway from Gothenburg to Stockholm. The lakes are frozen from Dec. to May.

Van Eyck. The Flemish artist brothers, Hubert and Jan, are each placed in this work as Eyck.

Van Gogh. This Dutch painter appears as Gogh, Vincent van.

Vanguard. Military term meaning a portion of the advanced guard. The strength and composition of the vanguard depends on the strength of the main body of troops, the type of country in which the force is moving, and the estimated strength of the enemy which may be encountered in the area.

Vanguard. British battleship. Laid down at Clydebank in 1941, and completed in 1945, she cost £9,000,000 exclusive of main armament. Displacing 50,000 tons fully

laden on a length of 814 ft. and a beam of 107 ft., the Vanguard is propelled by geared turbines developing 120,000 s.h.p., and has a speed of 30 knots. Armament consists of eight 15-in., 16 5.25 dual-purpose, and 71 40-mm. guns. She carries a complement of 2,000 officers and men. In 1947 the Vanguard took King George VI and his family to S. Africa for the royal tour of that dominion.

There have been several ships of the R.N. named Vanguard. The first carried the flag of Wynter against the Armada in 1588 and in 1594 that of Frobisher at the siege of Brest. Another Vanguard was flagship of Monk in 1653, and another carried Nelson's flag at the battle of the Nile. In the First Great War, the battleship Vanguard was lost at Scapa Flow on July 9, 1917, as the result of an internal explosion; there were only 97 survivors out of 724.

Vanilla (*Vanilla planifolia*). Perennial climbing herb of the family Orchidaceae. A native

Vanilla. Flowers and leaves of the Central American orchid. Inset, pod

of Central America, it has large, fleshy, oblong leaves, and green or white and green flowers, succeeded by slender seed-pods, about 6 ins. long, which are utilised for flavouring chocolate, liqueurs, etc. Other species are sometimes used, but

Vanguard. The British battleship, H.M.S. Vanguard, off Spithead. When completed in 1945, she was the Royal Navy's biggest warship, displacing 50,000 tons

are not equal to *V. planifolia*. See Plants, colour plate.

Vanity Fair. In Bunyan's Pilgrim's Progress, one of the dangerous places through which Christian journeyed on his pilgrimage to Zion; a fair wherein were displayed all the worldly vanities for tempting him from his way. Here Faithful was executed by the authorities.

Vanity Fair. Novel by W. M. Thackeray, published in 1848. The author's most characteristic work in the more serious satiric vein, it presents a group of selfish people living, in his own phrase, without God in the world. Social pretence, snobbery, meanness, chicanery are typified and held up to reprobation in the astounding gallery of firmly drawn characters presented in this novel of English life during the early years of the 19th century culminating in the Waterloo campaign. See Sedley, Amelia; Sharp, Becky; Steyne, Marquis of.

Vanloo, JEAN BAPTISTE (1684-1745). French painter. Born at Aix-en-Provence, Jan. 14, 1684, he went to Paris in 1719, becoming an Academician in 1731. He visited England in 1738, where he became a fashionable portrait painter, executing, among others, portraits of Cibber and Walpole. He died at Aix, Dec. 19, 1745. (See Cibber; Hervey, 1st Baron.)

His brother, Charles André (1705-65), was born at Nice, Feb. 15, 1705, and after studying in Rome, settled in Paris, 1734. He became a member of the Academy, 1735, and died July 15, 1765. His Marriage of the Virgin is in the Louvre. See Frederick the Great.

Van Loon, HENDRICK WILLEN (1882-1944). Netherlands-born American historian. He was born at Rotterdam, Jan. 14, 1882, and after studying at Cornell and Harvard settled in the U.S.A. at 21. In turn a journalist and a teacher of history, he achieved a great success in 1922 with the publication of The Story of Mankind, a picture history book originally intended for children, but appealing equally to a grown-up audience. Similar books were Ancient Man, 1923; The Home of Mankind, 1933. Van Loon died March 10, 1944. Report to St. Peter, an incomplete autobiography, appeared in 1948.

Vannes. Town of France. The capital of the dept. of Morbihan, it lies about 2½ m. from the Gulf of Morbihan, 83 m. by rly. N.W. of Nantes, and has steamboat connexion with the chief islands in the gulf. The town is built on a hill, and its small port admits vessels

up to about 300 tons. Salt and grain are exported. The cathedral of S. Pierre contains work of the 13th and 15th-18th centuries; in the N. transept is the tomb of S. Vincent Ferrier, who died here in 1419. There are remains of the town walls, notably the 14th century Tour du Connetable. Vannes takes its name from the Celtic Veneti, whose capital it was. In German occupation during the Second Great War from June, 1940, it was already under the control of the French forces of the interior when it was entered by a U.S. armoured column Aug. 6, 1944. Pop. 28,189.

Vansittart, ROBERT GILBERT VANSITTART, 1ST BARON (b. 1881). British civil servant and publicist.

Lord Vansittart,
British publicist

He was born June 25, 1881, and educated at Eton. On the staff of the foreign office he served in Paris, Teheran, Cairo, and Stockholm. During 1920-24 he was secretary to Curzon, then foreign minister, and during 1928-30 principal private secretary to the prime minister. In 1938-41 he was chief diplomatic adviser to the foreign secretary. Knighted 1929, Sir Robert was raised to the peerage in 1941. Vansittart's opinion that the Germans held the main responsibility for aggressive wars over centuries found expression in contributions to a wide range of periodicals and newspapers, and also in a booklet, Black Record, widely circulated during the Second Great War. He also made a name as a playwright, with People Like Ourselves, Dead Heat, and Sweet William. A book of memoirs, Lessons of My Life, appeared in 1945.

Vansittart, NICHOLAS. This British politician is dealt with under his later title, Baron Bexley.

Vannes, France. West front and portal, rebuilt in 1875, of the 13th century cathedral of S. Pierre

Van 't Hoff, JACOBUS HENRICUS (1852-1911). Dutch chemist. Born at Rotterdam, Aug. 30, 1852, and educated at Delft, Leyden, Bonn, and Paris, he graduated at Utrecht, 1874. In 1878 he became professor of chemistry at Amsterdam, and in 1896 research professor of chemistry at the Royal Prussian academy of sciences, Berlin. Van 't Hoff is chiefly known for the theory he formed that the graphic chemical formulae developed by Kekulé must be extended in three-dimensional space to accord with the facts of organic chemistry. This theory laid the foundation of stereochemistry. Next followed a study of the laws of chemical equilibrium, which enabled the Stassfurt salt deposits to be worked to economic advantage. Van 't Hoff was awarded the Nobel prize for chemistry in 1901. He died March 2, 1911.

J. H. Van 't Hoff,
Dutch chemist

Vanzetti, BARTOLOMEO. This central figure in an American cause célèbre is dealt with under Sacco-Vanzetti Case.

Vaporiser. Apparatus for delivering a liquid as a spray, usually for treatment of nose or throat.

The simplest instrument forces air from a rubber bulb, drawing liquid from a container beneath and delivering it from a tube in the form of a fine spray or mist. Vaporisers are usually of metal and glass, but all-glass models are made. Medicaments can also be carried with moist vapour generated in an inhaler or croup kettle.

Vapour (Lat. *vapor*, steam). In physics, the gaseous form assumed normally by a liquid and occasionally by a solid when passing out of those states. The pressure exerted by the gas is termed the vapour pressure. If several gases or vapours are present in the same space each exerts the pressure it would exert in the absence of the others. In meteorology, the V.P. is that part of the total atmospheric pressure due to water vapour. See Gas.

Vaquier, JEAN PIERRE (ex. 1924). Basque poisoner. While working at a hotel in Biarritz in 1924, he met Mrs. Mabel Theresa Jones, wife of the proprietor of the Blue Anchor inn, Byfleet, Surrey. Becoming infatuated, he followed her to England, stayed at a London hotel, and eventually went to Byfleet, where Jones was recovering from an illness. On March 1, 1924, Vaquier was in London, where he bought strychnine, alleging that he was going to use it for wireless experiments. On March 29 Jones took some health salts, and died of strychnine poisoning within a few hours. Vaquier was arrested on April 19, was tried at Guildford in July, found guilty, and executed at Wandsworth Aug. 12, 1924.

Var. Dept. of France. Part of the former prov. of Provence, it is adjacent to the depts. of Alpes-Maritimes, Basses-Alpes, and Bouches-du-Rhône, bounded S. by the Mediterranean. In the S. are the mountainous chains of the Maures and Estérel, and to the N. the S. buttresses of the French Alps. The natural beauty of Var is heightened by its fine climate, and the coast is dotted with beautiful bays. The Argens river flows from W. to E. to the sea near Fréjus; other streams are the Siagne, Aille, Dardennes, Gapeau, Verdon, and Artuby. Iron, salt, lead, and marble are found. There are sardine, tunny, and anchovy fisheries. The capital is Draguignan. Its area is 2,333 sq. m. Pop. 370,688.

Varallo. Town of Piedmont, Italy. In the prov. of Verceili, it lies S.E. of Monte Rosa in the Sesia valley, 34 m. by rly. N.W. of Novara. Near by is the pilgrimage resort of Sacro Monte. Cottons are manufactured. Pop. 3,500.

Varanger Fjord. Arm of the Arctic Ocean in N.E. Norway. The port of Vardö at its entrance is ice-free all the year round. Vadsö, Nasseby, and Nyborg are among other settlements. Lapps rear reindeer in the neighbourhood. It receives the waters of the Neidenelv, whose valley provides an easy route from the fjord to Finland.

Varangians (Late Gr. *Barangoi*. fr. Old Norse *vaeringjar*, followers, retainers). Name applied to the bands of Norsemen who organized the Russian state in the 9th century, and were gradually absorbed by the Slavs.

The Varangian guard, a mercenary force containing many Englishmen, was maintained at Constantinople by the East Roman emperors. It originated with a body of troops obtained in 988 by Basil II (g.v.) from Vladimir, prince of Kiev. See Russia.

Vardar (Gr. *Axios*). Yugoslav name of a river of the Balkans. It rises in the Sar Plan (Shar Dag), in S. Serbia, Yugoslavia, and flows N.W., then bends S.E. towards Skopje, and, after a S.E. course, falls into the Gulf of Salonica, about 10 m. W. of the city of that name. Its length is 200 m. With its tribs., the Bregalnitsa on the E., and the Tcherina on the W., it figured in the first and second Balkan Wars, and in the First Great War.

In the latter there were two battles of the Vardar, fought between the Allies and Bulgaria. The first began Oct. 19, 1915, shortly after the arrival of the Salonica expedition of the Allies. The French were railed up the Vardar valley to link up with the Serbians, but the Allies were insufficiently strong to maintain any prolonged advance, and retired into Greece on Dec. 12. The second battle was fought Sept. 15-30, 1918. It took the form of a strong Allied offensive and a Bulgarian retreat which lasted until the armistice with Bulgaria, Sept. 30.

Varden, DOLLY. Character in Dickens's novel *Barnaby Rudge*, the beautiful, coquettish, charming daughter of the locksmith Gabriel Varden. She gave her name to a style of hat, popular in the 1880s, a small flat bedowered bonnet perched on the top of the coiffure and tied with ribbons below the chin.

Vardö. Seaport and fishing town of N.E. Norway, in the co. of Finmark. It is situated on an island at the N.W. entrance to Varanger Fjord. The fortress of Vardöhus, the most northerly in

the world, dates from the 14th century. There are extensive cod fisheries in the neighbouring water, and the harbour, which is ice-free, exports codfish and cod-liver oil.

Vardon, HARRY (1870-1937). British professional golfer. This Jerseyman, born at Grouville May 9, 1870, came to Totteridge as professional to the S. Herts golf club in 1903 and remained there till his death, March 20, 1937. Except that his putting was

Harry Vardon, professional golfer

fallible, he was probably the finest player of all time. Six open championships were gained, in 1896-98-99, 1903-11-14. He won the American title in 1900, tied for it in 1913, and finished second in 1920 when 50 years old. In remarkable matches at the turn of the century Vardon beat Taylor and Park; and in 1905 with Taylor he defeated Braid and Herd in foursomes. Playing 36 holes against Massy in France, 1910, Vardon ended 18 up. He was a fine teacher, and superintended the laying out of courses.

Varennes. Village of France, in the dept. of Meuse. On the river Aire, 18 m. W.N.W. of Verdun, it figured in a famous incident of the French Revolution, for Louis XVI and his family, seeking to leave the country, were stopped here on June 21, 1791. In German occupation throughout most of the First Great War, Varennes was in ruins when recovered by American troops on Sept. 26, 1918.

Varese. Town of Italy, in the prov. of Varese. It is 10 m. E. of Lake Maggiore, and is a rly. junction 37 m. N.N.W. of Milan. The 16th century church of San Vittore and the ducal palace, now a museum with a valuable collection of historical and antiquarian relics, are the principal buildings. Wine, silk, paper, organs, and carriages are manufactured. Pop. 44,832.

Vargas, GETULIO DORNELLES (b. 1882). Brazilian statesman. After study at Porto Alegre faculty of law, he entered politics in 1911 as deputy in the Rio Grande do Sul state congress, a position he retained until 1919, and again 1922-26. He was president of that state from 1927 until 1930, when he led the revolutionary movement that resulted in his

becoming president of Brazil. Vargas assumed dictatorial powers, and was re-elected when in 1934 a new constitution was proclaimed. He made the opening address to delegates of 21 American republics at the Rio conference in 1942, announcing his country's entry in the Second Great War on Aug. 22. Next year he conferred with Roosevelt at Natal, Brazil, on Brazil's contribution to the U.N. war programme. Vargas was compelled by army leaders to resign, Oct. 29, 1945. The elections of Oct., 1950, returned him to the presidency for 1951.

Vargas, Luis de (1502-68). Spanish painter. Born in Seville, he studied in Rome, and remained in Italy, c. 1527-55. He excelled in religious subjects, especially in fresco, but much of his work in this medium has perished. His best work in oils is in the cathedral of Seville, and there are examples in the Louvre and the Prado at Madrid.

Vargas Diamond. Reputedly the third largest diamond in the world. It was found at Minas Geraes, Brazil, in 1938, and named after President G. D. Vargas (*q.v.*). Sold to a Dutch firm for about £80,000, it weighed 726 carats. In 1941 it was announced that the diamond was to be cut into 20 gems.

Variable Pitch. Mechanical method of altering the angle of an airscrew's blade to attain maximum efficiency at varying altitudes. See *Airscrew*.

Variation. Biological term applied to diversity of any kind among organisms of a particular race which are in the same stage of development. As the sum total of such diversity may be almost infinite, no system has yet been devised for studying it completely. Studies of the manner in which races vary in special features show that at least two sets of causes interact for the production of variation as a whole. These are differences in heritable constitution and in environment. Well defined features of members of one race developing in the same surroundings are often found to vary in such a way that they may be separated into circumscribed categories. This discontinuous variation is often called Mendelian variation, since the features behave in breeding according to Mendel's laws.

Organisms, on the other hand, having so far as can be determined the same genetical constitution, exhibit features such as height and

weight whose magnitudes form a continuous series. These are continuous variations. When studied statistically they are found to obey the laws which govern the effect of numerous independent chances interacting to a common end. Chance incidence of many environmental conditions will have their chief effect on organisms during their development; hence continuous variation is also sometimes environmental or developmental, though not necessarily. Interaction of many heritable factors distributed according to the laws of chance will also produce continuous variation. See *Evolution*; *Mendelism*.

Variations. In music, the ornamentation and development of a given theme. In the 16th century, composers began to elaborate their music by devices of figuration and imitation, which reached culmination in such forms as the ground bass, chaconne, and passacaglia. In these the theme was either untouched or so little altered as to be readily recognizable throughout.

Beethoven, Mendelssohn, and others tended to regard the theme as affording opportunities of development, so that the interest should be cumulative. Beethoven's variations for piano on a waltz by Diabelli may be cited as typical of the new viewpoint. Some fine works for full orchestra are Brahms's variations on a theme of Haydn; Elgar's on an original theme (*Enigma*); Dvořák's symphonic variations; and those of Franck for piano and orchestra. Tchaikovsky rounds off his third suite with a theme and variations, and Glazounov uses that form for the slow movements of his sixth symphony and piano concerto.

Variations, CALCULUS OF. Mathematical term for methods of applying the differential and integral calculus to problems concerning not so much the values of functions as the variations of those values. One of the earliest problems of this type was the famous brachistochrone problem posed by John Bernoulli in 1696: To find the path from point O to point A along which a particle could move freely under gravity in the shortest time. The calculus of variations deals principally with questions of maximum and minimum values under complex conditions.

Varicocele. Condition in which the veins of a testis are dilated, back pressure causing fluid to form in the sac containing the testis. The fluid usually has to be

drawn off while the cause of back pressure is investigated.

Varicose Veins. Condition in which the veins of the leg are prominent, tortuous, dilated, and diseased. The tortuosity is associated with distortion of the valves inside the vein in advanced cases. Varicose veins give rise to but few symptoms until they reach a fairly advanced stage. The legs then become heavy, aching, and tired. Neglected varicose veins give rise to complications, amongst the most important being ulceration, eczema, swelling, and thrombophlebitis (inflammation of the vein associated with clots).

At least 10 p.c. of the pop. suffer from this complaint to some extent, *i.e.* in the U.K. there may be five million sufferers. No precise cause is known; but heredity plays an important part in the incidence of the disease, while the erect stance of the human being is probably the most important factor. The disease is more prevalent in those whose work compels them to stand for long periods of time, *e.g.* waiters, policemen, nurses; and can be caused by disturbance of muscle balance due to flat foot and similar conditions. The disease does not appear in the quadruped.

Recognition of varicose veins is simple; correct treatment for the individual case is a matter for expert advice. All cases can be benefited by correct treatment; and complications can usually be avoided by sufficiently early treatment. Patients suffering from the dreaded complications of ulceration, phlebitis, etc., are in general lazy and tolerant individuals who have not taken the trouble to have the primary disease of varicose veins adequately treated. All sufferers should therefore seek advice early.

In some instances surgery offers the best chance of cure. The operation can be performed under local anaesthesia within an average period of 24 hrs.; the surface veins are tied off at thigh and ankle and the bloodstream thus forced to seek a deeper channel. Mild varicose veins can be benefited by injection. This treatment may have to be renewed, but in selected cases good results follow careful use of the injection fluid, or sclerosant.

Patients in whom added complications are present (such as damage to the deep veins of the leg or the presence of some general debilitating disease) may obtain the necessary support for

the limb by elastic stockings or bandages or some form of adhesive plasters.

Variolite. Obsolete name for a dark green variety of the mineral orthoclase (*q.v.*). It came from late Lat. *variola*, small-pox, the stone once being thought a cure for the disease.

Varley, JOHN (1778-1842). British artist. Born at Hackney, Aug. 17, 1778, he studied under J. C. Barrow, and was an original member of the Water Colour Society (founded 1804). Exhibiting at the R.A. from 1798, he painted landscapes and sea pieces, was the friend and benefactor of Blake, a teacher of art, and an amateur astrologer and prophet. He died in London, Nov. 17, 1842.

Varna. Seaport of Bulgaria. It stands on the N. shore of Varna Bay, an inlet of the Black Sea,

Varna. Orthodox Greek cathedral of the Bulgarian seaport

and is 325 m. by rly. E.N.E. of Sofia. As a seaport it ranks with Burgas; there are extensive harbour works, and exports include cattle and dairy produce, grain, leather, wine, and cloth. Heavily fortified, it is the seat of a Greek metropolitan and, since 1870, of a Bulgarian bishop; it has a notable cathedral. Wladyslaw I of Hungary was defeated and killed here, Nov. 10, 1444, in his second campaign against the Turks. Varna was occupied by the Russians in 1828, and in 1854 by the Allies, who organized here the invasion of the Crimea. Ceded to Bulgaria by the treaty of Berlin, 1878, the town was bombarded by the Russian Black Sea fleet in 1915. During the Second Great War it was occupied by the Russians, Sept. 8, 1944. The town was renamed Stalin in 1949. Pop. 69,944.

Varnish. Solution forming a hard, shiny film over a surface on drying. Varnishes are of two classes—oil and spirit. Oil varnishes consist essentially of resins, natural or synthetic, combined with drying oil (usually linseed, sometimes also China wood),

driers (usually compounds of lead, cobalt, or manganese), and thinned to working consistency with volatile solvents. The film, therefore, dries at first by evaporation of the solvent and then by changes in the residual film, due partly to oxidation of the oil by reaction with oxygen from the air and partly to polymerisation. Spirit varnishes consist of resin dissolved in a volatile solvent; drying is due to evaporation of the solvent.

OIL VARNISHES. The resin gives the film hardness, the oil content controls the elasticity and, according to the treatment during manufacture, affects gloss and durability. Copal resins are commonly used in oil varnishes. Insoluble in oil in their natural state, they must first be "run," i.e. partially decomposed by heat. In this process they lose 15-30

p.c. by weight. Great care in the addition of the oil and subsequent "cooking" is necessary to obtain a stable mixture. Thinners are added and the varnish has then to be matured for from a few weeks to three years, during which time

complex changes occur and undesirable substances are precipitated. Filtration assists clarification, but time is essential to the production of first-class varnish. With synthetic and modified natural resins, the running process is eliminated, but heat treatment of the oils and of the oil-resin mixture still determines the quality of the varnish. Much research is directed to producing varnishes which combine very rapid drying with a high durability and gloss. Here, and in waterproof varnishes, china wood oil is valuable.

Varnishes are classified according to their resin-oil ratio: long oil contains less than $\frac{1}{2}$ resin; medium $\frac{1}{2}$ to $\frac{3}{4}$, short $\frac{3}{4}$ to 1. Long oil varnishes are highly elastic, short oil tend to be brittle. Short oil varnishes of the lowest oil content (rubbing varnishes) are applied as foundations for subsequent coats, before applying which the surface is rubbed down with a fine abrasive. Varnishes for seats, etc., are on the "short" side because they must be hard, while a high degree of elasticity and durability is not required. Coach varnishes must be very durable

and also very elastic, to withstand vibration and mechanical shock. Boat varnishes must have similar properties, and in addition a high degree of water resistance. Ordinary outside varnishes are somewhat inferior to coach varnishes in hardness; inside varnishes vary from the "church oak" type, in which hardness is rather more important than elasticity, to long oil elastic varnishes used on ordinary woodwork for decorative purposes.

SPIRIT VARNISHES. The two most important groups are: (1) *Shellac varnishes*, of which French polish is typical, made by dissolving lac resin in alcohol (about 3 lb. to a gallon). Cheaper finishes contain varying amounts of spirit-soluble resins such as manila copal; they have less durability and water resistance. Very cheap varnishes for articles of temporary value such as toys may consist of little more than rosin or ester gum dissolved in suitable volatile solvents with perhaps a little oil added to give elasticity. An almost colourless series of shellac varnishes is made from bleached lac.

(2) *Manila spirit varnishes.* The alcohol soluble grades of manila copal yield a series of transparent spirit varnishes, the lightest being white hard spirit varnish. Darker grades of the resin yield brown hard spirit varnish. Price and quality can be reduced by using rosin or estergum.

Other spirit varnishes of less commercial importance are the mastic varnish used by artists to protect oil paintings. This consists of mastic dissolved in turpentine. A harder and more brittle varnish is obtained from sandarac resin.

BITUMINOUS VARNISHES. Natural pitches, asphalts, and bitumens used in the manufacture of varnishes include Gilsonite from the U.S.A., Manjabs from Barbados, and asphalt from Trinidad. Industrial products include the residues from petroleum distillation and coal tar pitches. Stearine pitch, produced in the distillation of fatty acids, is used with the natural bitumens as it reduces sensitivity to light and increases elasticity. The more soluble bitumens are used in making black stoving varnishes and similar cheap protective coatings for metal work, e.g. mudguards of motor cars and bicycle frames. A high class bituminous varnish is as carefully made as a good oil varnish, and the best grades possess a high degree of efficiency for the service for which they are

designed. See Lac; Resin. Consult Varnish Making, T. H. Barry and Y. W. Dunster, 1934.

T. Hedley Barry

Varnish Tree (*Melanorrhoea usitata*). Evergreen tree of the family Anacardiaceae. A native

Varnish Tree. Spray of leaves of the evergreen tree. Inset, flower cluster, and, top, single flower

of the East Indies, it grows to a height of 100 ft., and has thick, oval, alternate leaves. The red flowers are produced in clusters from the base of the leaves. The timber is hard, heavy, and dark-coloured, one of several kinds known as *lignum vitae*. The sap is used as a lacquer for domestic articles.

Varro, MARCUS TERENTIUS (116-23 B.C.). Roman scholar and miscellaneous writer. Born at Reate, in the Sabine country, he studied at Athens, and distinguished himself at sea in Pompey's war against the pirates. Having followed Pompey in the civil war, he was pardoned after the battle of Pharsalus, 48 B.C., and spent the rest of his life in study. Most learned and voluminous of Roman authors, he wrote a great work on the political and religious antiquities of Rome, papers on the liberal arts, philosophy, geography, and law, as well as the *Saturae Menippeae*, a medley of prose and verse. Apart from fragments, valuable for the information they give on Roman institutions, his only extant works are the philological treatise, *De Lingua Latina*, and the treatise on agriculture, *De Re Rustica*, Eng. trans. On Farming, L. Storr-Weston, 1912.

Varus, PUBLIUS QUINTILIUS (d. A.D. 9). Roman general. Having been consul and governor of Syria, he was in A.D. 7 appointed to the chief command in Germany, where his vexatious administration roused the Germans to revolt in 9, under the able leadership of Arminius (q.v.). The Romans were caught in the swamps of the

Teutoburger Wald, three legions were annihilated, and Varus committed suicide, as the result of what Creasy calls one of the world's decisive battles.

Varves. Rhythmic layers found in clays which were deposited in lakes fed by water flowing directly from glaciers. The ground-up rock-flour and fine detritus were carried down into the lakes during summer when the ice melted; but in winter the supply of transported material was negligible. Because of this the coarser sediment supplied in summer sank rapidly to the bottom of the lake, but in winter the fine material in suspension had time slowly to settle. Each year therefore a double layer, or varve, was deposited. Thick deposits of such varved clays have been formed over long periods, and the length of time required for laying down individual deposits can be accurately estimated by counting the annual varves. Correlation between varved clays permits the establishment of a time scale of geological events which reaches back some 13,000 years. Use of varves was first recognized by Baron de Geer in Sweden in 1885. See Ice Age; consult Dating the Past, F. E. Zeuner, 1946.

Vasa. Seaport of Finland. Formerly Nikolaistad, it is the capital of the dept. of Vasa, on the E. side of the Gulf of Bothnia, almost opposite the island of Björkö. A rly. terminus and seaport, it has a nautical school and shipbuilding yard, and trades in timber products, oats, and fish. The original town founded in 1606 was burned down in 1852, and rebuilt on its present site, 3 m. to the N.W., in 1862. Pop. 38,597. Vasa dept. has an area of 15,062 sq. m. and pop. 599,774.

Vasa. Family name of the rulers of Sweden from 1523 to 1654. The first was Gustavus I (q.v.), who secured the throne in 1523. The last was Christina, daughter of Gustavus Adolphus, who abdicated in 1654. Collateral descendants held the throne until 1818. A branch of the family gave three kings to Poland, who reigned there 1557-1668. See Sweden.

Vasari, GIORGIO (1511-74). Italian architect, painter, and author. Born at Arezzo, July 30, 1511, he attracted in youth the attention of Cardinal Passerini, and was by him taken to Florence, where he studied under Michelangelo and Bandinelli, and secured the patronage of the Medici. On their exile he removed to Rome,

where, although only 18, he won honour as an artist. Political insecurity led to his moving between Arezzo and Florence, and he visited Mantua and Venice in 1541. Cardinal Farnese suggested his writing *The Lives of the Painters*, which Vasari published in 1550. Farnese also gave him the commission to execute the frescoes of the Cancellaria. In 1553 he returned to Florence, where he mostly remained for the rest of his life. He effected the restoration of the ducal palace, and was at work on the frescoes of S. Maria del Fiore when he died, June 27, 1574. Vasari's paintings have scarcely stood the test of time.

Vasco da Gama (c. 1460-1524). Portuguese navigator, entered as Gama, Vasco da.

Vascular Bundle (Lat. *vasculum*, small vessel). In botany, a system of vessels or tubes composed of long, narrow specialised cells which transport water and food through the plant.

Vascular System (Lat. *vasculum*, small vessel). In anatomy and physiology, system consisting of the heart, arteries, veins, capillaries, and lymph vessels and glands, which maintain the circulation of the blood and lymph throughout the body. See Blood; Heart; Lymph.

Vas Deferens. Duct by which sperms reach the urethra in birds, mammals, and reptiles. It is the Wolffian duct, originally draining the mesonephros, which remains as the epididymis applied to the testis. Section and ligation of the duct will produce sterility without interfering with the activity of the testes in the production of hormones; this operation is called vasectomy.

Vase (Lat. *vas*, a vessel). Vessel, usually tall in relation to its width, and decorative in design or purpose. Generally coverless, it may be without handles, or have two symmetrical handles. The term denotes numerous types of Oriental porcelain and of ancient Greek pottery—often wrongly called Etruscan—whose vase-paintings are a priceless record of contemporary life. The engraved silver vase of Entemena at Lagash is dated 2950 B.C. Egyptian vases were often of porphyry or alabaster; one is 32 ins. high. See Jasper; Portland Vase; Rockingham Ware; Samian Ware.

Vassal. Word of doubtful origin meaning a tenant or dependent. It is chiefly used in connexion with the feudal system for one

Vatican, Rome. 1. Sala Regia, the hall where ambassadors were formerly received, completed in 1573. 2. Great hall of the library, profusely decorated and containing cases in which are preserved many priceless MSS. and books. 3. The palace, from the piazza of St. Peter. 4. Villa Pia, a summer-house in the extensive gardens, built by Pius IV in 1560

who was subject to the authority of a lord. See Feudalism.

Vassilievsky, ALEXANDER MIKHAILOVICH (b. 1900). Russian soldier. Son of a Volga peasant, he entered the Imperial army, but joined the Bolsheviks in the Revolution of 1917. A product of the Russian general staff schools, he helped to reorganize Soviet armies in 1940, and was attached to the high command on his country's entry into the Second Great War. Created marshal, 1942, and chief of staff, 1943, he planned the counter-offensive carried out by Zhukov against the Germans at Stalingrad (see Stalingrad, Battle of). In 1945 he assumed command of the 3rd White Russian army, after Chernyakhovsky's death, and completed the conquest of E. Prussia. He was c-in-c. of the force which occupied Manchuria in Aug. that year. Appointed deputy minister to Marshal Bulganin, 1947, he succeeded him as minister for the armed forces, 1949, and was elected to the supreme soviet, 1950. Twice a Hero of the Soviet Union, and holding the Order of Victory, Vassilievsky was made G.B.E., 1944.

Västerås. City of Sweden, in the co. of Västmanland. It stands on the N. shore of Lake Mälär. 69

m. by rly. W.N.W. of Stockholm. The fine Gothic cathedral, built by Birger Jarl on the site of an earlier church, was consecrated in 1271, and has been twice restored. It has the loftiest tower in Sweden (309 ft.). Iron and copper are mined, sulphuric acid and aluminium are manufactured, and ships are built. Here Gustavus Vasa defeated the Danes in 1521 and six years later held a diet which established Protestantism in Sweden. Pop. 51,034.

Vasto. Town of Italy, in the prov. of Chieti. It stands on rising ground $1\frac{1}{2}$ m. from the Adriatic Sea, 131 m. by rly. S.S.E. of Ancona. With walls dating from the Middle Ages, it has a Gothic cathedral, an old castle, and a town hall containing a museum of Roman antiquities. Silks, wines, wax candles, and bricks are the chief products, while fishing and olive culture are carried on.

Vathek. Romance by William Beckford. Named after its principal figure, it was written in French, and published in French in 1787. Samuel Henley's Eng. trans. had appeared a year earlier. Vathek is regarded as the most remarkable Oriental tale imagined and written by a European author.

Vatican City. Official residence of the pope in Rome. It lies on a

low hill, the Mons Vaticanus of ancient Rome, within a N.W. extension of the city walls, immediately to the N. of St. Peter's, and consists of a vast irregular group of palaces, courts, chapels, and offices, with a large private garden; the whole area, 108.7 acres, including St. Peter's and other buildings, being extraterritorial, under the sovereignty of the pope, who has resided here since 1870. Popes regarded themselves as prisoners until 1929, when three treaties were signed between the Holy See and the Italian govt., regulating political, spiritual, and financial matters and confirming the papal jurisdiction in Vatican City. (See Papacy.)

Pope Symmachus about 500 built a house here, which was rebuilt about 1200, but the Lateran palace was the usual papal residence until the popes moved to Avignon. Gregory XI, who restored the papal seat to Rome in 1377, made the Vatican his permanent residence, though later popes often lived in the Quirinal, which was originally a summer palace. The existing buildings of the Vatican were begun about 1450 by Nicholas V, who reconstructed the older palace on a grand scale. Additions were made by later popes, the last important building, the Braccio

Nuovo, having been erected under Pius VII. The Vatican is said to contain about 7,000 rooms.

The Borgia apartments, begun by Nicholas V and finished by Alexander VI, were the scene of the latter pope's murder by poison. Some rooms were decorated by Pinturicchio, and others by Perugino and Sodoma. Four entire rooms, today known as the Stanze di Raffaello, were treated by Raphael. After the fall of the hated Borgias the Pinturicchio frescoes remained neglected and covered up until their restoration in 1890-97. The most famous of the Vatican chapels is the Sistine Chapel (*q.v.*), built by Sixtus IV. It is approached by the Scala Regia, a staircase designed by Bernini, and the Sala Regia, a hall decorated with scenes from the lives of the popes. The little chapel of Nicholas V has frescoes of the lives and deaths of SS. Stephen and Lawrence, painted on the walls by Fra Angelico.

East of the court of Damascus, built by Leo X, is the Apostolic Residence, a lofty building surrounding a quadrangle, and overlooking the piazza of S. Peter. It contains the private apartments of the pope. E. of it are the barracks of the Swiss Guards. The great N. wing of the Vatican, a quarter of a mile long, consists of the Belvedere, a villa built by Innocent VIII, and two parallel galleries connecting it with the old palace. This wing houses the library and most of the art collections. The library contains some 34,000 MSS., and about 250,000 printed books. The museums are devoted to (1) classical antiquities, Greek and Roman, Etruscan, and Egyptian, collected in the first place by Julius II, Leo X, Clement VII, and Paul III, and developed by Pius VI, Pius VII, and Gregory XVI; and (2) Early Christian relics, gathered from the catacombs. Among the Vatican's statuary may be cited the two Discoboli, after Myron, the Apollo Belvedere, the Laocoon, and the Doryphorus, after Polyclitus (*q.v.*). See Colonade; Conclave; Rome; St. Peter's.

Vatican Council. Council of the R.C. Church, summoned by Pius IX in 1868. The encyclical convoking it was issued June 29, 1868, just over 300 years after the dissolution of the council of Trent (*q.v.*), and at a time judged by many Roman Catholics to be inopportune. Pius was determined, however, and the council met at St. Peter's, Dec. 8, 1869. There were over 700 prelates present, including 49 cardinals, 121 archbishops,

and 479 bishops. Several sessions were devoted to restating theological points before the real subject of the council was reached, but on July 18, 1870, the definition was made of papal infallibility (*q.v.*). Although little, if any, doubt was expressed as to the doctrine itself, many prelates felt grave doubts as to the opportuneness of its definition. The outbreak of the Franco-Prussian War and the capture of Rome by the Italians necessitated an adjournment on Oct. 20.

Vatnajökull. Icefield of S.E. Iceland. It is an elevated mass culminating in the height of Öræfa Jökull at 6,425 ft., covered by the largest icefield in the island. Volcanic eruptions occurred in 1389 and 1753.

Vattel, EMMERICH DE (1714-67). Swiss jurist. Born at Couvet, April 25, 1714, and educated at Basel and Geneva, he entered the state service of Saxony and went to Berlin as minister of the elector, Augustus III, 1746. He wrote on literature and jurisprudence, and in 1758 published in French his famous work on the Law of Nations. This was translated into many languages. Vattel died Dec. 28, 1767.

Vättern, VÄTTERN, OR WETTER. Lake of Central Sweden. It is the second in size of the subsidence lakes, has an area of 733 sq. m., is 81 m. long, and 390 ft. in greatest depth. It is situated at an alt. of 289 ft. It drains to the Baltic by the Motala. See Väner.

Vatutin, NIKOLAI FIODOROVICH (1900-44). Russian soldier. Born Dec. 16, 1900, he joined the Red army in 1920 and the Communist party next year. From the beginning of the German attack on Russia in 1941, he was given a command at the front. His first major achievement was the recapture, Feb. 13, 1943, of Voroshilovgrad, overcoming elaborate defences built by the Germans. He collaborated with Koniev and Malinowski in the final recapture of Kharkov, Aug. 23, and commanded the 1st Ukrainian army which, after a brilliant outflanking movement, took Kiev by storm Nov. 6. During the rest of the winter of 1943-44 he was engaged in a contest with von Manstein, in which he made great use of cavalry, capturing, losing, and recapturing Zhitomir and Korosten. He took Sarny (in pre-war Poland) on Jan. 12, 1944, and with Koniev encircled and annihilated 10 German divs. near Korsun on the Dnieper, Feb. 3-18. But on March 5 it was announced that on account of ill-

ness he had been replaced by Zhukov. Vatutin died in Kiev April 14, 1944. He received the order of Lenin in 1941, of Suvorov in 1942.

Vauban, SEBASTIEN LE PRES-TRE DE (1633-1707). French military engineer. Born in a Burgundian village, he was educated at Semur and about 1650 entered the army. In charge of various siege operations during the war with Spain, after the peace of 1659 he turned his attention to fortress work. Vauban's fame rests on the work he did for France during wars carried on by Louis XIV. About forty fortresses were taken under his direction, and here his genius was most fully shown. He modernised almost every fortress on the French borders, the total number on which he was employed being put at over 160. He was a marshal when he died, March 30, 1707. See Fortification. Consult Vauban: Builder of Fortresses, E. Halévy, Eng. trans., 1924.

Vaucluse. Dept. of France. Part of the former prov. of Provence, the principality of Orange, and the papal territory of Avignon, it is adjacent to the depts. of Ardèche, Drôme, Basses-Alpes, Bouches-du-Rhône, and Gard. A small portion of this dept. is entirely surrounded by Drôme. A broad alluvial plain lies in the W., and to the E. rises the Alpine buttress round Mt. Ventoux; farther S. are the Plateau de Vaucluse and the Lubéron chain. The Rhône and Durance bound the dept. on the W., and numerous tributaries of these include the Lauzon, Lez, Meyne, Nesque, Ouvèze, Auzon, and Mède. Chiefly agricultural, Vaucluse produces cereals, vegetables, fruit, vines, olives. Avignon is the capital. The dept.'s area is 1,381 sq. m. Pop. 249,838.

Vaud. Canton of Switzerland. It adjoins France and the Lake of Geneva, and is mainly an elevated plateau between the Jura Mts. and the lake, its greatest height being the Diablerets, 10,650 ft. Lausanne is the capital. Montreux, Vevey, and Château d'Oex are tourist resorts, the first two on the Lake of Geneva. The inhabitants are chiefly French-speaking Protestants. Formerly part of the kingdom of Arles, the dist. became imperial in the

Sebastien de Vauban,
French soldier
After Lebrun

11th century. The counts of Savoy ruled over it in the 13th century; Berne governed it during the 15th and 16th centuries. It became a canton of the Swiss confederation in 1803. Its area is 1,239 sq. m. Pop. 343,398.

Vaudeville. In drama, originally a light and amusing play in which dialogue is intermingled with songs, and almost identical with musical comedy. The term originated in the 15th century with Olivier Basselin of the valleys of the Vire, in Normandy, the author of a number of drinking and love songs, which he circulated under the title *Lais des Vaux de Vire*, of which Vaudeville is a corruption. In the 20th century the word has become almost synonymous with theatrical variety.

Vaudeville Theatre. London playhouse on the N. side of the Strand. It was opened April 16, 1870, with a performance of *For Love or Money*, and for many years was famous for comedies, e.g. *Our Boys*, 1875. It was reconstructed and reopened in 1891, and put on children's plays, comedies, and musical pieces, e.g. *Bluebell in Fairyland*, 1901; *Quality Street*, 1902; *Jack Straw*, 1908. The First Great War brought revues like *Buzz-Buzz*. Again remodelled, it reopened under the management of Archibald de Bear, in 1926, with the revue *R.S.V.P.* Later successes were *Lottie Dundass*, 1943; *No Medals*, 1944; *Now Barabbas*, 1947; *The Chiltern Hundreds*, 1948. The theatre seats 650.

Vaudois. Alternative name of the religious community better known as the Waldenses (*q.v.*).

Vaughan, BERNARD (1847-1922). British priest. A younger brother of Cardinal Herbert Vaughan, he was born Aug. 20, 1847. Educated at Stonyhurst, he became a priest and joined the Society of Jesus. From 1883 to 1901 he worked in Salford, later removing to London, where he preached eloquently at the Jesuit church in Farm Street. Some of his addresses on social questions were published as *The Sins of Society*, 1906. He died Oct. 31, 1922. A memoir by C. C. Martin-dale appeared in 1923.

Vaughan, CHARLES JOHN (1816-97). British divine. A Leicester boy, he was educated at Rugby

and Trinity College, Cambridge, where he was bracketed senior classic. In 1841 he was ordained in the Church of England and passed three years as vicar of S. Martin's, Leicester. During 1844-59 Vaughan was headmaster of Harrow, and from 1860 to 1869 vicar of Doncaster. Then he was chosen master of the Temple, and in 1879 dean of Llandaff. He died Oct. 15, 1897. As headmaster, his personal influence was great.

Vaughan, HENRY (1622-95). Welsh poet. Born at Newton-on-Usk, April 17, 1622, he studied law, but became a practising physician at Brecon, where he favoured the Royalist cause in the Civil War. Known as the Silurist, his birthplace being in the old country of the Silures, Vaughan as a poet was influenced by the "metaphysical" school of Donne, Carew, and Herbert. Their work partly inspired his devotional volume, *Silex Scintillans*, 1650, which in turn was to influence Wordsworth. Of the poems, edited by E. K. Chambers in 1896, the most famous are *The Retreat*; the lines beginning *They are all gone into the world of light*; and the exquisite *My soul, there is a country*. The translator of Ovid, Juvenal, and other classics, Vaughan died April 23, 1695. A study by F. E. Hutchinson appeared in 1947.

Vaughan, HERBERT ALFRED (1832-1903). British cardinal. Born at Gloucester, April 15, 1832, he was the eldest of eight brothers. He was educated for the priesthood at Stonyhurst and in Belgium, Paris, and Rome. Ordained in 1854, he became vice-principal of S. Edmund's College, Ware, and was for three years head of a missionary college at Mill Hill before becoming bishop of Salford in 1872. In 1892 he became archbishop of Westminster, and next year a cardinal. He died June 19, 1903. His great work was the erection of the cathedral at Westminster (*q.v.*).

Vaughan, KATE (1852-1903). British actress, whose real name was Catherine Candelon. Born in London, she made her debut as a dancer in 1870, first appearing as an actress in 1872. During 1876-83 she was acting in burlesque at the Gaiety Theatre, and in 1886 organized, with H. B. Conway, the Vaughan-Conway comedy company. Her health failing, she went to Australia, 1896, and S. Africa, 1902, dying at Johannesburg, Feb. 21, 1903.

British actress
Downey

Vaughan Williams, RALPH (b. 1872). English composer. This son of a clergyman was born

Vaughan Williams,
English composer

Oct. 12, 1872, at Down Ampney, Glos, and went from Charterhouse to Trinity College, Cambridge, taking his music degree in 1894; he studied further under Stanford and Parry at the R.C.M. and under Bruch in Berlin. Joining the Folk-song Society in 1904, he travelled round England collecting folk tunes, their influence being shown in three Norfolk rhapsodies and the ballad *Linden Lea*. He emerged into prominence with a choral work, *Toward the Unknown Region* (1907), to words by Whitman. There followed the song-cycle, *On Wenlock Edge* (1909), from Housman's verse; and next year the Sea symphony. A stirring tune was written for the hymn *For All the Saints*; and incidental music for Aristophanes's comedy *The Wasps*.

He had already shown that mastery of counterpoint and fondness for modal polyphony which were never to desert him. To these qualities and a gift of melody of a peculiarly English type he added in the London symphony (1914) occasional cacophony to represent street noises, which brought the work some criticism. After war service Vaughan Williams was chosen teacher of composition at the R.C.M., conductor of the Bach choir, and director of the English folk-dance society. In the 1920s came his Pastoral symphony; an opera, *Hugh the Drover*; Mass in

G minor; *Flos Campi*, an orchestral suite; and a violin concerto. Sir John in Love (1930) was a light opera based on *The Merry Wives of Windsor*; it contains the beautiful setting of Greensleeves.

Development of a deeply religious mind that yet was fully aware of strife in the world was expressed in ballet music for *Job*; the exquisite fantasia for strings on a theme of Tallis; another choral work, *Benedicite*. Award in 1935 of the O.M. underlined the general feeling that the deaths of Elgar, Delius, and Holst had left Vaughan Williams without an equal in English music. That year Italy invaded Abyssinia, and of his violent fourth symphony the composer remarked, "I don't know if I like it, but that's what I meant to say." For Wood's jubilee as a conductor he produced a *Serenade to Music* of unearthly beauty. Later works showing his interest in various instruments were a suite for viola and orchestra, oboe concerto, and two-piano concerto. He wrote music for the film *49th Parallel*. In the fifth symphony (1943), with its unparalleled close, many heard the summing-up of a whole spiritual journey; the work was suggested by passages from Bunyan, and dedicated to Sibelius. In 1948 his sixth symphony was performed; in 1950 *Folk Songs for the Four Seasons* (written for the Women's Institutes) and a concerto grosso for strings (for the Rural Music Schools' Association). Consult R.V.W.: a Study, H. Foss, 1950.

Alan Phillips

Vault (Lat. *volvere*, to roll). Literally, an arched roof. It is also a chamber with such a roof and, as these are often underground, the word has come to be used for cellars where wine is stored. Architecturally, the earliest form was the barrel vault, shaped like the upper section of a rly. tunnel. This was invented by the Persians; later the Romans discovered how to construct the groined vault by intersecting two barrel vaults at right angles to each other, the groin being the angle formed by the meeting of the two surfaces. This method was used in Norman building until the introduction of the ribbed vault.

In the groined vault the solid construction required a great weight of masonry, which had to be carried by a proportionately heavy supporting wall; but the ribbed vault was constructed by means of a series of narrow stone arches crossing each other diagonally, and so

forming a framework for the arch, the intervening spaces being then filled up, with comparatively light

Vault. The Roman groined vault, formed by intersecting two barrel vaults, top. See text

webbing, so as to complete the roof. During the 13th century the number of ribs was increased; in the 14th, important modifications were made in their curvature; in the 15th the pitch of the vault was reduced, and the ribs again grew more numerous, and the spaces between them narrower. This led to the introduction of cross ribs to divide their length, and to the formation of *lierne* vaulting, whence sprang fan-tracery (*q.v.*) vaulting, climax of Gothic skill. See *Architecture*; *Gothic Architecture*; *Tomb*.

Vaupés or **VAPES**. Commissary of Colombia. It is drained by the Guaviare, Inirida, Vampés, and Apaporis rivers, and lies E. of the Andean Cordillera, touching Venezuela and Brazil on the E. Area, 57,842 sq. m. Pop. est. 7,830.

Vauquelin, LOUIS NICOLAS (1763-1829). French chemist. Born

at St. André d' Hébertot, Normandy, May 16, 1763, he went to Paris as an assistant in pharmacy, and later became laboratory assistant to Fourcroy. He was inspector of the mint and professor of applied chemistry to the museum of natural history. Vauquelin first isolated chromium and beryllium, and made an accurate analysis of carbon disulphide, lithium, cyanogen, allantoin, and the hyposulphites. In 1802 he was made a member of the legion of honour, and he died Nov. 14, 1829.

Vauxhall. District of London. On the Surrey side of the Thames, W. of Kennington, with a rly. station, it is in the bor. of Lambeth (*q.v.*), and returns an M.P. It was originally known as *Faukeshall*, or *Fulke's Hall*, after a Norman knight, *Fulke de Bréauté*, who owned the manor in King John's time. In its manor house, later called *Copped or Copt Hall*, Lady Arabella Stuart was a prisoner.

Vauxhall became famous for its gardens, a popular resort for about 200 years. Laid out in Charles II's time, and at first called *New Spring Gardens*, to distinguish them from the gardens near Charing Cross, and referred to by Pepys and the Restoration dramatists, also described by Dickens, Thackeray, and other writers, they were finally closed, July 25, 1859. Vauxhall Park, 8 acres, was opened in 1890; Vauxhall Bridge, connecting with Millbank (*q.v.*), in 1906, in place of one that dated from 1816. Ambrose Phillips and Henry Fawcett were residents. The first Rowton House (*q.v.*) was opened here in 1892. Pop. 29,056.

Vavasor (old Fr. *vavassour*, from medieval Lat. *vassus vassorum*, vassal of vassals). In the feudal system, a term applied to various kinds of vassals, sometimes for a

Vauxhall. Scene in the fashionable pleasure gardens when they were at the height of their fame. From a drawing by Rowlandson

class below barons or tenants-in-chief, and above knights. See Feudalism.

V Campaign. Campaign of symbolical resistance against the German occupier carried out in Europe during the Second Great War. It was started by Victor de Laveleye, a member of the Belgian parliament who escaped to England and, joining the B.B.C. as an announcer, suggested in a broadcast to Belgium during Jan., 1941, the

chalking on walls of the letter V for *vrijheid* (freedom in Flemish and Dutch). The idea was taken up by "Colonel Britton" (*q.v.*), who broadcast regularly to Europe in English. Under his influence and with the added implication of victory in English, *victoire* in French, the use of the V signal spread to France, the Netherlands, Norway, Den-

mark, Czecho-Slovakia, and Poland, causing so much alarm to the Germans that they attempted to adopt the symbol as their own, asserting that it stood for the "old German word *Viktoria*" (*Sieg* being German for victory). They inflicted severe punishments for its use, described by them in the Netherlands as "satanically inspired devilry." A Britton broadcast at midnight on July 20-21, 1941, followed by a message from the British premier Churchill, gave the movement immense fresh impetus. It took two forms—painting of Vs on walls, pavements, doors, public vehicles, etc., and the tapping out or humming of the morse code V (three dots and a dash). The opening bars of Beethoven's Symphony No. 5 (V), which are in the rhythm of the morse V, were adopted as signature tune for the B.B.C.'s European broadcasts in English; and Churchill greeted admirers everywhere by raising his hand with the first and second fingers spread wide in the shape of a V. The campaign was kept up in the occupied countries until liberation during 1944-45.

Veddar. Month of the Jewish calendar intercalated at leap year. The ordinary year consists of 12

lunar months, making 354 days. To ensure that Passover, the 15th day of Nisan, shall occur at the full moon of the spring equinox, an adjustment is made by introducing a leap year, of 384 days, seven times in each period of 19 years. In the leap year, an additional day is added to the month Adar, and the remaining 29 days form the month Veadar (double Adar), which is intercalated between Adar and Nisan, thus becoming the 7th month of the civil and the 1st of the eccles. year. See Calendar.

Veal (old Fr. *veël*). Flesh of the calf prepared as food. Good meat is pale in colour, firm and closely grained, and the fat white. It should be eaten fresh.

Vecht. Name of two rivers of Europe. (1) The Vecht or Vechte rises near Billerbeck, Westphalia, Germany, and with a generally W. course enters the Netherlands near Gramsbergen, flowing into the Zuyder Zee (Yssel Meer) near Genemuiden. It is navigable up to Schüttorf, Hanover, receives as tributaries the Aa, Dinkel, and Regge, and is linked by canals with the Ems and other waterways. Length, 90 m. (2) The Vecht (prov. of Utrecht, Netherlands) is a division of the lower Rhine, which branches at Utrecht into the Vecht and Old Rhine. It drains N.W. and N. into the Yssel Meer. Its length is 20 m.

Vector (Lat., carrier). In mathematics any quantity involving direction and magnitude. Such a quantity is usually represented by a line with an arrow. Vector quantities in physics are those which can be represented by a vector. Examples are linear velocities, and forces acting on a body. Vectors can be compounded by the parallelogram law of mechanics. Vector analysis is that branch of mathematics concerned with the properties of vectors; this is of particular use in physics, *e.g.* the electro-magnetic theory.

Vedas (Skt. *veda*, knowledge, *c.f.* Eng. *wit*). Oldest sacred literature of the Hindus. Written in Sanskrit, they are regarded as having been the work of poets who lived between 2000 and 1000 B.C. They are divided into the Rig-Veda, Yajur-Veda (prayers), Sama-Veda (hymns for sacrificial occasions), and Atharva-Veda. See Brahmanism, Brahma Samaj; Hinduism; Rig-Veda; Sanskrit.

V.E.-day. Popular name given to May 8, 1945. This was the date on which victory in Europe in the Second Great War was assured to the Allies. The German high com-

mand having signed at Reims an unconditional surrender of all fighting forces on May 7, this was confirmed in Berlin on May 8. May 8 and 9, 1945, were, except in essential industries, national holidays in the U.K.

Vedda. Primitive people in Ceylon. Numbering some 5,000, they are scattered over an area E. of the Mahawale Ganga river, comprising the E. prov., one-fifth of Uva, and a corner of the N. Central prov. Of Caucasoid stock, they are dark-brown, wavy-haired, long-limbed, long-headed, 5 ft. $\frac{1}{2}$ in. in height. They consist of forest Veddas, still preserving the primitive culture; village Veddas, who have intermarried with the Sinhalese and practise rude agriculture; and coast Veddas, dwelling for the most part N. of Batticaloa, who display Tamil admixture. Descended from the Yakkas, recorded in the 6th century B.C., they are probably immigrants from pre-Dravidian India, and were preceded by a Palaeolithic people known only by their chipped stone implements.

Vedette (Lat. *vidère*, to see). French military term adopted in English and other languages. Strictly a vedette is a mounted sentinel placed in front of the pickets to warn them of the approach of an enemy. The word is also used for a small boat used for a similar purpose.

Vedrenne, JOHN EUGENE (1867-1930). British impresario. He was born July 13, 1867, and, leaving a commercial career, became business manager to various London theatres. In 1904 he took the Court Theatre, where, in partnership with Granville-Barker (*q.v.*), he put on striking productions, including plays of Euripides and Bernard Shaw. The partnership ended in 1907, and Vedrenne became associated with Lewis Waller at the Lyric Theatre. He was with Dennis Eadie at the Royalty, 1911-19, and then lessee of the Little. He died Feb. 12, 1930.

Veering. Term applied to the wind when it is changing in a clockwise direction in either hemisphere, *i.e.* N.-E.-S.-W.; when the change is in the opposite direction the wind is said to back. In the N. hemisphere the winds at a place to the N. of a westerly depression generally back from S.E. through E., when the centre of the depression is due S., to N.E. and N. as it passes away. South of the track of the depression the winds veer from S.E. to W., when the centre is due N., and finally

V Campaign. The V sign, being given by Winston S. Churchill, who frequently greeted admirers with this symbol of ultimate victory during the Second Great War

to N.W. In the S. hemisphere the winds around a system of closed isobars are in the reverse direction; hence there the wind will veer where it would back in the N. hemisphere, and vice versa. The wind may veer or back with increase in height above the earth's surface. See Buys-Ballot's Law.

Vega. The brightest star of the N. hemisphere. It is the first star, Alpha Lyrae, in the constellation of the Lyre. A very white star, at a temp. of about 15,000° C., its parallax is 0.124 secs., and it has a brilliancy equal to that of 50 suns. It will be the Pole Star between A.D. 13,000 and 15,000.

Vega Carpio, LOPE FELIX DE. Spanish poet and dramatist. See Lope de Vega.

Vegetable. In its narrow, everyday use, word indicating any herb that is cultivated specially for table use in whole or part, such as turnip (root), cabbage (leaves), broccoli (flowers), peas and beans (fruit). All the common vegetables are in this work dealt with separately. In its widest sense the term vegetable includes all living things that are not animals—trees, shrubs, herbs, ferns, mosses, seaweeds, fungi, and the microscopic diatoms. Separate articles under these heads should be consulted.

The unit of structure, the cell, is essentially the same in both animals and plants, but the combination of the cells into tissues and organs shows marked differences in the two forms of life.

All animals depend for their food upon material originally elaborated by plants. The green plants alone have the power to construct the basic food material from elemental substances, and physiological processes different from those of animal assimilation are rendered necessary. The fungi (*q.v.*) approach the animals in this respect; they must feed upon material that has already done service as part of the structure of other plants or of animals. The fine divisions of roots explore the soil in search of water in which are dissolved the salts of sodium, iron, potassium, phosphorus, calcium, sulphur, etc. The hairs with which the rootlets are clothed absorb this fluid by osmosis, and it is passed upward through the long vessels of the wood bundles until it reaches the cells of the leaf. These cells contain green bodies (chloroplasts) in their protoplasm, and it is the chlorophyll that imparts the green colour to leaves and soft shoots. In the leaf-skin (epidermis) there

are innumerable pores or stomata through which surplus water from the roots is evaporated and through which atmospheric air is admitted to the spaces between the leaf-cells.

The chloroplasts in these cells have the power by what is known as photosynthesis to utilise solar energy in decomposing the carbon dioxide of the air, and the cells retain the carbon, setting free the oxygen. Water from the roots is also broken up into its elements, hydrogen and oxygen, and with these plus carbon starch is formed. This, converted into grape sugar, is passed from cell to cell (see Phloem) to parts of the plant where it is needed for the production of new cells, wood, bark, leaves, or fruit. Starch is the material from which all the organic substances produced by the plant are built up.

The surplus over present requirements is stored up as reserves, in seeds, enlarged roots or stems, bulbs, or tubers for renewed growth or floral display at a later season. Waste products are converted into resins, oils, wax, or alkaloids—many of these being of considerable economic value to man. Part of the water stream from the roots passes by osmosis from cell to cell, where it is necessary in order to keep the protoplasm in an active condition; any insufficiency is followed by a flagging of the tissues, the drooping of leaves and young shoots. In addition to the absorption of carbon by the protoplasts for building purposes, the leaf-cells also take up oxygen from the atmosphere and give off carbon much as animals do.

As the plant respires without lungs and assimilates without digestive organs, so also it can effect movements without a muscular system and react to external stimuli without a nervous system. It is sensitive to light and heat; many plants have distinct night and day positions for their leaves. It responds positively and negatively to the force of gravity, the root going down into the earth and the stem rising into the air. The growing tip of a stem or shoot commonly nutates, *i.e.* moves from side to side or in a circle or ellipse. The plant can orientate itself, *i.e.* take up a definite position in re-

gard to the incidence of light or other external stimulus. These movements appear to be controlled largely by alterations in the position of the mobile chloroplasts.

The reproductive process is, in essentials, similar to that of animals, the ovules or seed-eggs in the ovary requiring to be fertilised by male sperms represented by the pollen grains produced in the anthers. The result of such fertilisation is to cause the ovule to develop into an embryo capable of further development under suitable conditions into a plant resembling the parent. See Botany; Market Gardening; Plant.

Vegetable Ivory OR NEGRO'S HEAD (*Phytalephas macrocarpa*). Small tree of the family Palmac also known as Ivory Nut (*q.v.*).

Vegetable Marrow (*Cucurbita pepo*). Annual creeping or bush plant, bearing edible fruits,

Vegetable Marrow. Round fruited Tender and True bush variety of the marrow

By courtesy of Sutton & Sons

of the family Cucurbitaceae. It grows in any ordinary rich soil. The flowers, in which the sexes are separate, are best fertilised by means of a camel-hair brush. Marrows are raised from seed sown in a greenhouse temperature in spring, and planted out in the summer. Much application of water is necessary after the fruit is set, in order to make it swell to a good edible size. Unless plenty of ground is available with a sufficiency of rich, well-decayed manure, the cultivation of bush marrows is not recommended from an economic point of view. See Cucurbitaceae; Gourd.

Vegetarianism. Name given to the movement which aims at making vegetable foods the sole diet of human beings. It began about 1850, and its followers abstain from eating the flesh of animals and birds. Some eat fish, but others do not, while the strictest vegetarians abstain from all food which comes from animals, such as eggs, milk, butter, and cheese.

One reason for vegetarianism is the dislike of inflicting pain, but it is also advocated as providing a more nourishing and economical diet. It is also claimed that a vegetarian diet makes persons less liable to certain diseases, *e.g.* cancer, and less gross in their appetites and desires, while it is also advocated on economic and patriotic grounds. Akin to the vege-

tarians are the fruitarians, who maintain life solely on a diet of fruit.

In the 19th century the movement made much progress in Great Britain, the U.S.A., and several European countries. Vegetarian restaurants were opened in large towns, and other measures taken to popularise vegetarian dishes. Societies exist for the promotion of vegetarianism, and several periodicals are published in its interests. *See Diet*; *Food*.

Vegetation (Lat. *vegetare*, to quicken). General term for plants growing in a locality, but applied mainly to trees, shrubs, herbs, and ferns with green foliage. It cannot properly be limited in this way, but must be understood as embracing all plants—including mosses, seaweeds, etc. *See Botany*; *Ecology*.

Vegetius Renatus, FLAVIUS (c. A.D. 375). Roman writer on war. His Epitome of the Institutes of Military Science, though not original, but consisting largely of excerpts from the works of other military writers, was regarded during the Middle Ages as the great authority on the art of war.

Veglia. Italian name of the Yugoslav island whose native name is Krk. In the Adriatic Sea, it was formerly part of the Austrian crownland of Istria. It is separated from the Croatian coast by the narrow channel of Morlaacca, and is 23 m. long by 12 m. wide. Marble is quarried, livestock reared, and there are extensive fisheries. Krk (or Veglia), on the W. coast, is the capital.

Veii. Ancient city of Etruria. On the Cremera, it was about 10 m. N. by W. of Rome. Probably the most powerful of the 12 Etruscan cities, it was in constant enmity with Rome, and was finally taken by the Romans under Camillus in 396 B.C. after a siege, it is said, of ten years. After the sack of Rome by the Gauls in 390, there was a proposal, overruled by Camillus, that the Romans should give up their city and settle in Veii. In rock tombs archaeologists have discovered examples of Etruscan paintings of the earliest period.

Veil (Old Fr. *veile*, from Lat. *velum*, cloth). Article of feminine dress, used as a covering for the head, especially the face. In the ancient world, as in the Indian subcontinent today, a mantle wrapped round the head was, when so desired, drawn over the face as a veil. In some Mahomedan countries, but not among the nomadic Arabs, custom requires the veiling of women in public or in the presence

of men. The Turkish yashmak veils the face from below the eyes.

In the R.C. church a woman admitted into a religious order takes the white veil of reception on entering her novitiate. When she is fully professed and takes the nun's life vows, she receives the veil of profession, usually black, though in some orders it is white.

Vein. Vessel by which venous blood—i.e. blood which has parted with its oxygen, passed through the capillaries, and picked up waste material from the tissues—is conveyed back to the heart. The walls of veins are thinner than those of the arteries, but, like the latter, consist of three coats. Veins differ also from the arteries in possessing valves so disposed as to prevent the blood from flowing in the reverse direction. The veins from the legs and lower part of the body all pass eventually into a main trunk, the inferior vena cava, and those from the arms, head, and upper part of the body into another main trunk, the superior vena cava, both of which open into the right auricle of the heart.

Phlebitis is inflammation of a vein, and is often associated with thrombosis. The vessel becomes swollen, painful, and hard, and dropsy of a limb may arise because the forward passage of the blood is prevented. Infective phlebitis is a serious condition in which microorganisms are present in the thrombosis, and may give rise to general blood poisoning with formation of abscesses in various parts of the body. In simple phlebitis, the limbs should be kept completely at rest in order to lessen the risk of detachment of emboli. Belladonna fomentations may be applied. The patient should be kept in bed until all inflammation has subsided, and time has been given for the clot to become organized, i.e. converted into fibrous tissue, which is not likely to be displaced. It is usual to allow not less than 6 weeks for this process. In infective phlebitis, when suppuration has occurred, the abscess should be opened without delay. *See Anatomy*; *Artery*; *Blood*; *Thrombosis*; *Varicose Veins*.

Vein, greatly enlarged, showing pocket-like valves

Vein. In geology, a mineral deposit in fissures and cracks of rocks. Such mineral ores have usually been deposited from solutions, and may be metallic or non-metallic; the two kinds are usually found in veins together. The non-valuable mineral deposit in a vein is known as the gangue. Veins are sources of many valuable metals, e.g. gold and silver, and vary in size from the almost invisible to several hundred feet in thickness. *See Dyke*; *Gangue*; *Lode*.

Veining. Metallurgical term describing the faint network of oxide that sometimes forms within metal crystals on cooling. The oxide is precipitated in this form when the solubility of oxygen in the solid metal decreases with falling temperature. It may be removed by high temperature annealing in a suitable reducing atmosphere, or by cooling rapidly from a high temperature.

Vejer de la Frontera. Town of Spain, in the prov. of Cadiz. It stands on the river Barbate, 6 m. N.E. of Cape Trafalgar, and has a pop. of 16,000. Here in 711 Rodrigo, last king of the Visigoths, was defeated by Moorish invaders.

Vejele. Seaport of Denmark, in Jutland. It is in a hilly and forested district, at the mouth of a river and the head of a fjord, all of which have the name Vejele. The town is a rly. junction 16 m. N.W. of Fredericia. Many of the pop. of 27,107 depend on the fisheries.

Velazquez (OR VELASQUEZ) DE CUÉLLAR, DIEGO (1465-c. 1522).

Spanish administrator. Born at Cuéllar, near Valladolid, he sailed with Columbus on his second voyage, and in 1511 conquered Cuba, of which he became governor, founding several towns, and remaining there until his death. Velazquez was responsible for an expedition which discovered Yucatan in 1517, and sent Cortés to Mexico next year. Regretting, however, the extensive powers he had given to Cortés, he sent a force under Panfilo de Narváez, which was overthrown by Cortés, 1520.

Velazquez OR VELASQUEZ, DIEGO RODRIGUEZ DE SILVA Y (1599-1660). Spanish painter. Born at Seville, June 6, 1599, his early days as an artist were passed with Francisco Herrera, whose fiery temper soon drove him to a more

Diego Velazquez, Spanish administrator

congenial teacher, Pacheco, an excellent master, though not a clever painter. He appreciated the genius of his pupil, and gave him his daughter Juana as wife. Velazquez also came under the influence of Luis Tristan, a pupil of El Greco. Settling in Madrid in 1623, he there painted a portrait of Fonseca, almoner to Philip IV, which introduced him to the notice of the king. In the same year he painted a portrait of Philip IV, the first of a very long series which he painted of that king at every period of his life.

In 1628 Velazquez met Rubens, who came to Madrid as ambassador from the regent of the Netherlands. Having then conceived an eager desire to visit Italy, he left Spain, 1629, journeying to Venice, and then to Rome, by way of Ferrara and Bologna, and in 1630 was in Naples. The next year saw him back again at Madrid, and from that time began his long series of notable portraits.

His second visit to Italy was paid in 1649, when his main object was to collect pictures and casts from the antique. On this occasion he painted his celebrated portrait of Pope Innocent X. In 1651, home again in Spain, he was given a high court appointment by the king, which took up much time. His pictures at this period include Maids of Honour, and the Tapestry Weavers. He died in Madrid, Aug. 6, 1660.

The main feature of the art of Velazquez is its absolute fidelity to visual truth. He was an impressionist in the truest meaning of the word, could seize upon an effect in its momentary force, and represent it in all its bare truth, painting colour as it really was. He had an unequalled command of tone values. There is never any false lighting or inaccurate incidence of light in his pictures, and he not only understood atmosphere, but grasped the mystery of shadows and darkness. He selected essentials with unerring judgement, and no other works are more near than his to the effect of nature, or produce more effectively the true perspective of the atmosphere.

His work can be properly studied only in Madrid, where there are at least 46 undoubted pictures. Other fine works are in London, in the National Gallery, notably his only important nude, Venus and Cupid. Several of his finest portraits are in Vienna, the Louvre, and in Russia, Holland, and Germany, but without proper study of his subject groups, especially the Surrender of Breda, The Maids of

Honour, and The Tapestry Weavers at Madrid, the nobility and greatness of Velazquez cannot be understood. *Consuli* Life, Sir W. Stirling-

Diego Rodriguez de Silva y Velazquez
Self-portrait in the Uffizi Gallery, Florence

Maxwell, 1855; and the complete Phaidon Press edition of paintings and drawings by V., 1944.

Veld (Dutch, field). The extensive, open, temperate grasslands of the plateau of S.E. Africa. In the wetter parts, towards Basutoland and the Drakensberg Mts., agriculture is possible, but pastoral pursuits are more important in the drier parts. *See* Steppes.

Vélez. Town of Colombia, in the prov. of Santander. It is on the Suarez river, 103 m. N. of Bogotá. Dating from 1539, Vélez was the second city founded in New Granada.

Vélez-Málaga. A seaport of Spain, in the prov. of Málaga. It stands on the left bank of the river Vélez, 1 m. from the Mediterranean Sea, and 19 m. by rly. E. of Málaga. To its strategic situation, which earned it the title of the Key of Andalusia, it owes its Moorish citadel. The Moors held the town from 711 until its capture in 1487 by Ferdinand of Castile. Its most famous edifice is the church of San Pedro. Raisins, sugar, and olive oil are products. Pop. 25,300.

Velia or **ELEA**. Ancient Greek colony on the W. coast of Campania, S. Italy. It was founded by Phocaean from Corsica in the 6th century B.C., and is chiefly known as the name-place of the Eleatic school (*q.v.*) of philosophy. There are remains of the town at Castellammare della Brucca, 25 m. S.E. of Paestum.

Velia was also the name of a hill between the Palatine and the Esquiline, surmounted by the arch of Titus.

Velikii Luki. Town of the R.S.F.S.R., capital of the region

of the same name. It lies 132 m. S.E. of Pskov, on the banks of, and on an island in, the river Lovat, which flows into L. Ilmen. Mentioned as part of the republic of Novgorod in 1166, it was destroyed in the course of subsequent civil wars, but reconstructed by Tsar Michael Feodorovitch in 1619. It had remains of a moat and earth walls constructed at the time of Peter the Great. There were tanneries and boot and candle factories. Captured by the Germans, Aug. 26, 1941, it was turned by them into a strong "hedghog" defence point, and was recaptured Jan. 1, 1943, by Russian forces, including Uzbeks and Kazakhs from central Asia, only after fanatical fighting for every "pillbox," house, and street. Gen. Scherer, on Hitler's orders, having announced that reprisals would be taken on the family of any soldier who surrendered, the German garrison was killed to the last man.

Velino. River of Italy. It rises in Mt. Velino, in the Central Apennines, and flows N.N.W. past Rieti to join the Nera, an affluent of the Tiber, near Terni, after a course of 54 m., part of which divides the depts. of Abruzzi and Latium. The celebrated Falls of the Velino, called the Marble Cascades, consist of three leaps of 30, 300, and 190 ft. *See* Terni.

Vellala. Indian caste of farmers in the Tamil country. Numbering about 2,500,000, almost wholly in Madras and Travancore, besides a considerable number of emigrants to Ceylon, they are a long-headed, frugal, industrious, and peaceable people. Traditionally descended from Vaisya cultivators who came from the N. into the ancient Pandya kingdom, they are the chief Tamil-speaking caste-Hindus.

Velletri. City of Italy, in the prov. of Rome. It is situated on the slopes of the Alban Hills, 26 m. by rly. S.E. of Rome. The 17th century cathedral of San Clemente is the seat of a cardinal-bishop. The Palazzo Ginatti has a fine interior. Wine is the chief product. Known as Velitrae, the city was captured from the Volscians by the Romans in 338 B.C. Garibaldi gained a victory over the Neapolitan forces here in May, 1849. Pop. 26,000.

Velletri and Valmontane 10 m. to the N.E. were main bastions of Kesselring's "Rome line," covering the capital, during the Second Great War. Both were captured by U.S. forces June 2, 1944, after a week's heavy fighting. The

vineyards around Velletri were full of German snipers who had to be put out of action in detail. Both Velletri and Valmontane were severely damaged, and in both the German troops had looted many portable objects of value.

Vellore. Town of Madras state, India. In the div. of N. Arcot, 75 m. W. by S. of Madras, it is situated on the Palur river and joined by rly. to Pondicherry. Here are a celebrated fort and temple, and a medical college established by British and American missionaries. Pop. 71,502.

Vellum (Old Fr. *velin*, from Lat. *vitulinus*, of a calf). Fine kind of parchment, made from the skins of calves or kids, and given a smooth finish. The once celebrated Strasbourg vellum was prepared with remarkably fine pumice stones. Vellum, known since earliest times as a material for MSS. and books, is now chiefly used for bookbinding. See Book-binding; Parchment.

Velocipede (Lat. *velox*, swift; *pes*, foot). Early form of bicycle. Originally a development of the draisine, a two-wheeled machine propelled by thrusting the feet against the ground, it was improved by a Frenchman named Michaux and fitted with cranks and pedals on the front wheel. The machine was also known as the boneshaker in England.

Velocity. Rate at which a point or particle changes its position. The change in the position of a particle must have both magnitude and direction, so that velocity is a vector (*q.v.*) quantity. It may vary both in regard to its magnitude and to its direction, and its magnitude may be constant while its direction continually varies, as when a train goes round a curve. To measure a particle's velocity, two things must be determined; (a) the space over which the particle has moved in a given time; (b) the change of direction of motion during this time. Hence, if a particle moves in a straight line and so preserves a constant direction, and passes over equal spaces in successive equal times, its linear velocity is said to be constant. If, however, it is moving in a circle, say, and passes over equal arcs in equal times, its speed is constant, but its linear velocity is not. Constant speed is measured by dividing the space passed over in any given time by that time. Unit speed is such that unit space is passed over in unit time.

The unit of velocity is that velocity with which a point passes over

unit length in unit time, *e.g.* one foot per second.

Angular velocity is angular speed round an axis. To define it fully, a straight line must be given in length, direction, and position, and is known as a rotor or localised vector. See Speed.

Velour (Fr., velvet). Fabric used for various purposes. Similar to felt, but having a pile like velvet or plush, it is made of linen and double cotton warps with weft of mohair yarn, and is used chiefly for hats and in upholstery. See Cloth; Hat and Hat-making.

Velvet (Ital. *velluto*, from Lat. *villosus*, shaggy). Fabric with a short thick silk pile. The back is today usually of cotton. Velvet was possibly first made in the Far East, and seems to have been unknown in Europe until the end of the 13th century or the beginning of the 14th. The finest velvets came from Italian looms, especially from Genoa, Florence, Milan, Venice, and Lucca; and the velvets of Spain and Flanders, notably from Bruges, were also famous. France learned the art of velvet-weaving from Italy, and at the revocation of the Edict of Nantes, in 1685, the French Protestant refugees brought it to Spitalfields, London. Perhaps the finest effect is that known as "velvet on velvet," where rich patterns are formed by a long pile on a shorter pile. The "out velvet" of Japan is marked by consummate delicacy of design and craftsmanship. The old custom of improving the set of velvet by stiffening it with gum, which soon wore out the fabric, explains such allusions as that to Falstaff's horse, which is described by Poins as fretting "like a gummed velvet." Downy skin on the antlers of growing deer is called velvet.

Velveteen. Pile fabric resembling velvet, but usually with a cotton or rayon pile instead of silk. Further, in velvet the warp threads form the pile, whereas in velveteens the weft threads usually do so. Some velveteens are ribbed, and resemble corduroys or Bedford cords.

Vemork. Village of Norway. Situated in the Rjukan valley, in Telemark co., it contains the Norsk Hydro hydrogen electrolysis plant which in the Second Great War was the only considerable source in Europe of heavy water used by the Germans for experiments in atomic energy. In 1942 three Allied attempts were made to sabotage the plant by dropping demolition parties by parachute, but none was successful. On Feb. 27, 1943, a Norwegian party was

dropped near the plant, and after overcoming the German guards destroyed the high concentration equipment together with 3,000 lb. of heavy water (*q.v.*). In Nov. a raid by the U.S.A.A.F. decided the Germans to dismantle the installation and send it to Germany.

Vendavales. Name given to the strong, squally S.W. winds which blow in the Straits of Gibraltar and off the E. coast of Spain. These winds, bringing rough weather and heavy rain, are associated with the passage of depressions, chiefly between Sept. and March.

Vendée. Dept. of France. Formerly the prov. of Bas-Poitou, it lies contiguous with the depts. of Loire-Inférieure, Maine-et-Loire, Deux-Sèvres, and Charente-Inférieure, and is bounded W. by its low, sandy Atlantic seaboard. The dept. includes the islands of Noirmoutier and Yeu. The surface is generally flat, with low hills to the E. The central part, known as the Bocage, is wooded, and the marshy tracts to the S. are fertile. Vendée is largely agricultural; wheat, oats, potatoes, flax, and colza are grown, and cattle and sheep are reared in the S. The Vendée, Yon, Lay, Vie, and reaches of the Maine and Sèvre are among the many rivers. The capital is La Roche-sur-Yon, other towns being Fontenay-le-Comte, Montaigu, St. Gilles, Les Sables d'Olonne, Luçon, and Ste. Hermine. The dept.'s area is 2,690 sq. m. Pop. 393,787.

Vendée, RISING IN. Episode of the French Revolution. In 1793 conscription was introduced by the republican govt., and the Royalist peasantry in Vendée, with some sympathisers in Anjou, Maine, Poitou, and Brittany, broke out into open revolt. Several *émigré* nobles joined them, and military successes were gained over inefficient republican generals, but eventually the Vendéans were beaten at Cholet (Oct. 16) and crushed at Savenay (Dec. 23). A conciliatory policy was then applied by Hoche, representing the Convention.

Vendémiaire. First month in the year as rearranged during the French Revolution. The month of vintage (Lat. *vindemia*), it began on Sept. 22 or 23, the opening of the Republican year.

Vendetta (Lat. *vindicta*, vengeance). Form of blood feud (*q.v.*), by which the privilege and duty of avenging the death of a murdered person rests primarily upon the next of kin. The term is specifically applied to the practice in S.

Italy, and still more particularly to the Corsican vendetta. This last was at its climax during the closing decades of the 18th century, when about 7,000 murders are said to have been committed in the island. If the next-of-kin fails in his duty by the dead, his relatives take up the vendetta, which may spread with disastrous effects, since, if the murderer succeeds in eluding his pursuers, vengeance may be taken on his relatives, and family feuds may thus be perpetuated. The term is also used figuratively of any private quarrel in which persistent vindictiveness is shown.

Vendôme. Duchy of France. The former county of Vendôme was raised to a duchy by Francis I in 1515 in favour of Charles de Bourbon (d. 1536). The duchy was held by, among others, César de Bourbon (1594–1665), natural son of Henry IV by Gabrielle d'Estrées, legitimised in 1595, who was known as a general in the Huguenot wars, 1621, and imprisoned for conspiracy, 1626–30. An ally of Mazarin, he became governor of Burgundy, 1650, fought for the royal army in Guienne, 1653, and defeated the Spanish fleet off Barcelona, 1655. His grandson, Louis Joseph, duke of Vendôme, is noticed separately. This line became extinct in 1727.

Vendôme. Town of France, in the dept. of Loir-et-Cher. It lies on the Loir, 42 m. by rly. N.E. of Tours, and is a rly. junction. There is trade in agricultural produce, and industries in leather dressing, glove making, and paper making. The church of the Trinity, formerly an abbey church, dates from the 12th to 15th centuries. There are remains of the 10th century château. Vendôme was captured by the Prussians, Dec. 16, 1870. Pop. 10,315.

Vendôme, Louis JOSEPH, Duc de (1654–1712). French soldier. He was born in Paris, July 1, 1654,

the great-grandson of Henry IV. His military career began in the Dutch campaign in 1672, and he subsequently fought in Germany, Alsace, the Low Countries,

and Italy. In 1695 he commanded the army in Catalonia, and crowned a brilliant campaign with the capture of Barcelona in 1697. During the War of the Spanish Succession he first fought in Italy, and

in 1706 defeated the Austrians at Calcinato. Transferred to the Low Countries, he lost the battle of Oudenarde to Marlborough in 1708, and was relieved of his command. He retrieved his reputation in Spain, where he was sent in 1710 to assist Philip V against the British and the Austrians, defeating the former at Brihuega and the latter at Villa Viciosa. Probably the best French commander after Villars, he died June 11, 1712.

Vendor. In law, a person who sells to another, called the purchaser, at a price in money, any property. When goods are the subject of the sale, the parties are more properly called buyer and seller; and the terms vendor and purchaser are reserved for transactions in other kinds of property.

Veneer (Ger. *furnieren*, to furnish). Thin sheet of ornamental wood glued over inferior wood. Such sheets may be as thin as paper, and enable a rich effect to be obtained at a reasonable cost. Most contemporary wooden furniture of medium price (e.g. walnut, dark oak, the "Empire" woods) is veneered. See Inlaying; Marquetry.

Venereal Disease. Term covering several otherwise unrelated diseases conveyed from one person to another by sexual intercourse and rarely by any other means. The diseases comprise clap or gonorrhoea (*g.v.*), pox or syphilis (*g.v.*), soft sore or chancroid (*see* Chancre), "non-specific" urethritis, and certain other conditions caused by viruses or specific micro-organisms. Other conditions sometimes conveyed during intercourse include infestation by the crab louse, and scabies.

Venereal diseases may be transmitted not only after their appearance but also in the incubation period (i.e. the time following exposure but before the development of lesions). They may lead to serious congenital defects in offspring. Though in theory these diseases are preventable, in practice prophylactic measures have shown disappointing results. Treatment with the sulphur drugs is usually effective, though cases occur in apparently increasing numbers in which it fails for unknown reasons.

The ministry of Health requires medical officers of health to have special qualifications for treating venereal diseases. It is an offence for a person to advertise that he will treat any person for venereal disease or prescribe any remedy or give any advice or, except with the sanction of the ministry of

Health, recommend to the public in writing or print any medicine for its prevention, cure, or relief. It is also an offence for any unqualified person for reward to treat or give advice on the disease.

Defence regulation 33B, announced on Nov. 11, 1942, empowered medical officers of health in the U.K. to require the attendance for treatment by specialists of all persons believed to be the source of infection with venereal disease of at least two separate patients.

Venerie OR **VENERY** (Lat. *venari*, to hunt). Obsolete term for hunting, the chase, game; also for a kennel for hunting dogs. It is used in connexion with hunting by Chaucer, Gower, Spenser, and Malory. Browning, in his *Flight of the Duchess*, uses the word *venerers* for hunters. *Venery*, a term derived from *Venus*, was applied to promiscuous sexual intercourse.

Venetia. Name under Roman rule of an area approx. that of the later republic of Venice. It covered the modern "three Venices" (*la tre Venezie*): Trentino-Alto Adige (Venezia Tridentina), Veneto (Venezia Euganea), and Venezia Giulia (*g.g.v.*), and was called after the Veneti, the tribe inhabiting the area. After the city of Venice became a state in the 9th cent. she gradually absorbed the whole of Venetia. In 1797 Venetia was given to Austria, and confirmed to her by the treaty of Vienna, 1815. After the defeat of Austria by Prussia in 1866, part of Venetia was given to Prussia's ally Italy, who received nearly all the rest of it in 1919.

Venetian Alps. Section of the Eastern Alps. They lie between the Adige and the Tagliamento S. of the Dolomites and culminate in Monte Pramaggiore, 8,133 ft.

Venetian Glass. Fine variety of glassware produced in Venice, and first made c. 1100. The craftsmen by their skill turned out articles of great beauty, and Venetian glass took on its characteristic elegance and lightness. The island of Murano became the headquarters of the industry, and there it still flourishes, having been revived in the 19th century. *See* Glass.

Venetian Red. Pigment obtained by calcining green vitriol. It is ferric oxide, and is a permanent colour.

Veneto OR **VENEZIA EUGANEA.** Region of Italy. It comprises the provs. of Belluno, Padua, Rovigo, Treviso, Venice, Verona, and Vicenza, and lies between the Adriatic sea and the eastern Alps, the southern slopes of which are

Duc de Vendôme,
French soldier

included in it. Most of it is an almost level plain across which the rivers Piave and Brenta meander to the sea. It includes Venice, Verona, and Vicenza, as well as many smaller towns. Area, 7,098 sq. miles. Pop. 3,600,000.

Venezia Giulia. Name of a former region of Italy, sometimes called in English the Julian Marches. Italy acquired the area, 3,457 sq. m., from Austria after the First Great War, losing all but 183 sq. m. of it after the Second to Yugoslavia and the free state of Trieste. Venezia Giulia lay along the E. of the Gulf of Venice, and included Istria, Trieste, and Fiume. The small part remaining to Italy after 1947 was reconstituted as the prov. of Gorizia, and included in the new region of Friuli-Venezia Giulia.

Venezia Tridentina. Former name of a region of Italy, since 1947 called Trentino-Alto Adige (q.v.).

Venezuela (Estados Unidos de Venezuela, United States of Venezuela). Republic of S. America. It borders the Caribbean Sea, with Colombia on the W. and S.W., Brazil on the S.E., British Guiana on the E., the Atlantic on the N.E. The area, 352,143 sq. m., embraces a variety of natural features and products. The dominant features are first the chain of the Andes and its E. extension in mountainous and hilly country along the Caribbean Sea, and secondly the river Orinoco, with its 436 tributaries.

The Cordillera de Mérida, the highest part of the Venezuelan Andes, with snowy peaks exceeding 16,000 ft., trends N.E. from the

Colombian frontier towards the Caribbean Sea; two parallel lower ranges enclose in their valleys and uplands the richest and most populous parts of the country.

South of the mts. to the Orinoco, and also over the whole S.W. of the republic, stretch the llanos, the vast grassy plains, about 100,000 sq. m. in extent, which in their general formation resemble the Argentine pampa. S. of the Orinoco to the borders of Brazil and British Guiana, and into the Amazon river system, stretches the vast region of tropical forest which covers more than half the territory of the republic, but contains only a small fraction of its pop. Four-fifths of the territory is drained by the Orinoco.

Though Venezuela lies wholly within the tropics, its climate is as varied as its alt. and configuration, from the torrid heat of the lowlands to the temperate airs of the hills, the icy blasts of the Andine páramos or high passes, and the snowy cold of the great heights. The trade winds

from the Atlantic cool and refresh the Caribbean coastal strip, but hardly affect the torrid shores of L. Maracaibo.

The llanos in their E. part are cooled by the N.E. trade wind. Caracas, the capital, situated near the coast at over 3,000 ft., has a tropical climate, mean monthly temp. varying between 64° F. in Jan. and 70° F. in May; two-thirds of the yearly rainfall of 32 ins. occurs during June-Oct.

CONSTITUTION. Venezuela's first constitution was signed in 1811. Later constitutions were introduced in 1908, 1936, and 1947. That of 1947 gave the state an important rôle in developing the national economy, while recognizing the right to private property; guaranteed individual right to education, work, and health services; gave to labour the right to organize and to strike, pensions, paid holidays, and some profit sharing, and to employers the right to form associations and to a fair return on capital; empowered the president to arrest, with congress's approval, suspected plotters against the regime, and, subject to revision by a plebiscite in 1949, to appoint governors of the states. Congress consists of a senate of 40 and a chamber of 160 deputies elected for four years. The president is elected by direct universal suffrage; in 1945 he was granted the power of veto on legislation, to be overcome only by a two-thirds vote of both houses of congress. He is assisted by a cabinet of ministers. Men and women vote from the age of 18; illiterates vote by means of coloured ballots. The 20 states of Venezuela are autonomous, each with a legislative assembly and a governor.

to be overcome only by a two-thirds vote of both houses of congress. He is assisted by a cabinet of ministers. Men and women vote from the age of 18; illiterates vote by means of coloured ballots. The 20 states of Venezuela are autonomous, each with a legislative assembly and a governor.

The R.C. religion prevails, but all religions are tolerated. Elementary education is free and in theory compulsory, but many of the people are illiterate. The pop., 3,850,771 in 1941, is of mixed

Venezuela. Carácas, the capital. 1. The Pantheon, housing the tomb of Simón Bolívar. 2. The Capitol. 3. General view of the city

European, indigenous Indian, and negro origin. Indian tribes inhabit the Guayana forests, and the territory of the independent Goajiro Indians extends from Colombia into N.W. Venezuela. The language is Spanish. The chief towns are Carácas, Valencia, and Maracaibo. The chief ports on the open sea are La Guaira, the port for Carácas, and Puerto Cabello, connected by rail with Valencia. The La Guaira and Carácas rly. (23 m.), connecting La Guaira with the capital is used only for freight; passengers travel by bus. The cities, 8 m. apart, have between them a mountain of 9,000 ft.

COMMUNICATIONS. Rlys., of a total length of 634 m., include a line connecting Puerto Cabello-Valencia-Carácas; Carácas-Ocumare; Barquisimeto-Tucacas; and lines carrying coffee and ores from the mountainous regions of Tachira, Mérida, and Trujillo. There are three main trunk roads from Carácas to Ciudad Bolívar (600 m.); from La Guaira to the Colombian frontier and on to Bogotá (736 m.); and from Coro

in the N., southwards through Trujillo and Mérida to San Cristóbal. This third highway connects with La Ceiba, whence there are lake boats to Maracaibo. The part of the Pan-American highway (g.v.) running through Venezuela was opened in 1943. There are in all 3,829 m. of roads passable in all weathers.

Most of the rivers running into L. Maracaibo are navigable by small craft, and the Orinoco and its tribs., in spite of obstructions, shallows, rapids, and changes of water-level, provide great stretches of navigation, estimated at 12,000 m. In the wet season ocean steamers can reach Ciudad Bolívar, 200 m. from the sea; smaller craft can ascend the river and its W. affluent, the Apure.

Venezuela is the second largest producer and the largest exporter of petroleum in the world, the basin of Lake Maracaibo being the most prolific known source of oil in S. America; there are other oilfields in E. Venezuela. The oils vary in grade from light to heavy and are exported mostly

in the crude state in tank steamers, though Venezuela is setting up its own refineries; 397,213,000 barrels of crude oil were exported in 1947, more than half to the Netherlands W. Indies for refining.

Gold is mined near Ciudad Bolívar; a little copper is produced; pearls, off the island of Margarita, asbestos, mica, tin, and salt are other products. Large iron deposits were found 50 m. S. of Ciudad Bolívar in 1949. Coal of poor quality is produced at Coro and elsewhere.

One-fifth of the pop. is occupied in agriculture, the principal products being coffee, sugar, cotton, cocoa, tobacco, and tonka beans. Coffee and cacao constitute about three-fourths of the agricultural exports of the country. Lack of transport has checked development in that part of the country suited to stock raising. Total head of cattle is some 4,000,000. The forests have been little worked; 600 species of woods have been identified. There are textile mills, glass, and cement factories, and a considerable industry in woodworking. Most of the large towns have electricity.

HISTORY. The European history of Venezuela begins with Columbus and his immediate successors. Spanish settlement on the coast dates from the early 16th century. A curious and unique episode in S. American history was the concession granted by Charles V to the Augsburg banking house of the Welsers to conquer and settle the W. region to which alone the name Venezuela was then applied. But Spanish authority soon replaced that of the Germans, and Venezuela proper, the W. part of the present republic, was attached to the government of Santa Fé de Bogotá. The E. part formed a separate government connected with the Spanish Antilles. It was not till 1776 that the captaincy-general of Carácas was constituted, comprising substantially the present limits of the republic.

Upon the fall of the Spanish monarchy in 1808, a junta was

Venezuela flag. Yellow, blue, and red

formed in Carácas "to preserve the rights of Ferdinand VII." But events moved towards separation, and in 1811 a Venezuelan

congress issued the first Latin-American proclamation of complete independence. There followed 11 years of destructive war between

royalists and republicans, with many sensational vicissitudes before Bolivar finally achieved Venezuelan independence.

Under Bolivar, Venezuela was united with New Granada and Quito to form one vast republic under the title of Colombia. But separatist and local influences detached Venezuela from this union in 1829 under the leadership of Paez. Paez remained the most powerful person in independent Venezuela, and maintained comparative tranquillity for about 17 years. The succeeding period of disorder, strife, and revolution was closed by the 20 years' dictatorship of Guzman Blanco (1870-89). A period of disturbance followed, which was, however, marked by the settlement of the boundary dispute with British Guiana through the intervention of the U.S.A. From 1901-08 Castro was dictator, and was succeeded by General Gomez, 1908-15. Venezuela remained neutral in the First Great War. She joined the League of Nations in March, 1920. Gomez returned to the presidency 1922-29 and 1931 until his death Dec. 17, 1935. Under President Angaritsa, Venezuela was neutral in the Second Great War until Feb. 16, 1945, when she declared war on Germany and Japan. She was a founder member of the United Nations, being represented at the San Francisco conference,

1945. President Gallegos, who took office Feb. 15, 1948, was deposed by a military revolt on Nov. 23, a fate not uncommon among Venezuelan presidents. *Consult* Venezuela's Place in the Sun, N. Roosevelt, 1940; *Archaeological Survey of Venezuela*, C. Osagoon and F. D. Howard, 1944.

Vengurla. Harbour of India, in Ratnagiri dist., Bombay state. It is situated on the shore of the Arabian Sea, 33 m. N.N.W. of Goa. Formerly a favourite haunt of pirates, it was the site of a Dutch factory (1638) and a British factory (1772). In 1812 it was ceded to the British by the rani of Sawantwari, the adjoining state. Pop. 24,000.

Venial Sins. In R.C. doctrine, term applied to sins which do not imperil the salvation of the soul. Such are either objectively or subjectively venial. In the first category are sins which in themselves are light, such as pilfering, impatience, or the telling of "white lies"; subjectively venial sins result when the evil-doer commits what may be a serious fault but is excused by imperfect knowledge or by thoughtless consent.

Venice. English form of the Latin Venetia and the Italian Venezia. It has been used for the area formerly comprising the republic of Venice, and for the modern Italian region Venezia Euganea, as well as for the city of Venice (v.i.).

motor boats, which created a wash that endangered the old buildings lining the canals. Steamboats ply through the Grand Canal to the Lido, the popular bathing station, and to the neighbouring islands, Murano, Burano, Chioggia, Torcello, etc. The Merceria, connecting the Piazza with the Rialto, is the principal street.

The heart of Venice is the Piazza of S. Mark. Approached from the narrow, irregular network of bridged canals behind it, this marble-paved square opens out into a blaze of light and life and colour. The approach from the water is through the Piazzetta, on which stand two granite columns brought from the East in 1125, one crowned with the winged lion of S. Mark, the other with a statue of S. Theodore, the first patron saint of Venice. The Piazzetta is flanked W. by the royal palace, begun 1582, and the old library, a beautiful building by Sansovino, 1536, and E. by the doge's palace. At the entrance to the Piazza rises the Campanile, reconstructed after the original watch-tower of the republic collapsed in 1902, destroying in its fall the exquisite Loggetta by Sansovino at its base. The ordered arches of the 15th and 16th century Procuratie, or government offices, line the N. and S. sides of the great square. At the E. end is grouped the most wonderful mingling of Byzantine and Gothic architecture in Europe, the blue-dialled clock tower, built 1499, the cathedral of S. Mark, and the doge's palace.

The Bridge of Sighs (c. 1600) connects the judgement halls of the palace with the prisons for ordinary criminals. The façade of the doge's palace is composed of three storeys, of which the upper, faced with rose-coloured lozenge-shaped slabs of marble, is equal in height to the two lower. This was the hall of the great council.

Sansovino built the mint (*zecca*) which now houses the immense treasures of the library of S. Mark, founded by Cardinal Bessarion, 1468. The academy, the civic museum, and many of the churches contain priceless examples of the Venetian school of painting.

The city's treasures escaped uninjured in the Second Great War except for the campanile of S. Niccolò dei Mendicoli, struck by a German shell during the German evacuation of the city; some window glass and Tripolo's fresco Antony and Cleopatra were damaged by the explosion of a German ammunition ship. British troops

For allied information see the article Italy and the biographies of the great Venetian painters, e.g. Canaletto; Guardi; Tiepolo; Tintoretto; Titian; and statesmen, e.g. Dandolo; Manin. See the entries Bucentaur; Doge; Gondola; and others associated with the Republic. See also S. Mark's

Venice (Ital. Venezia), a city and seaport of Italy, and the capital of the prov. of Venice, is situated at the head of the Adriatic. It is built mainly on piles in the Venetian Lagoon. The city, a naval station, is connected with the mainland by a rly. viaduct across the lagoon, 2½ m. long. Its pop. is 303,262.

Venice arms

The three chief thoroughfares are waterways: (1) the Canale della Giudecca, separating the principal part of the town from the island of Giudecca, with the church of the Redentore by Palladio, 1580; (2) the open stretch of the Canale di San Marco, dividing the island of S. Giorgio Maggiore, with a church by Palladio, 1665, from the public gardens, the arsenal,

founded 1104, the Riva degli Schiavoni, the Doge's palace, the Piazzetta, and the royal palace; (3) the Canalazzo, or Grand Canal, issuing from the junction of these two at the point occupied by the 17th century custom house and the impressive pile of S. Maria della Salute, by Longhena, 1631. Winding in the shape of an S, the Grand Canal divides the city into two almost equal parts.

The Grand Canal, lined with the noble palaces of old patricians, is crossed by the famous bridge called the Rialto, by Boldù, 1588. This was the old business quarter of the merchants of Venice. More than 150 smaller canals (*rii*), with narrow paved passages along their banks, intersect the city. The canals, formerly navigated only by gondolas propelled by an oarsman on the raised stern, became under Mussolini highways for

entered Venice, already in the hands of Italian patriots, April 29, 1945.

HISTORY. Venice was one of a dozen settlements upon the marshy islands which stretch along the N.W. shores of the Adriatic from the Piave to the Adige. These the inhabitants of the old Roman cities of Venetia used as temporary refuges from the Huns, 452. Under pressure from the Lombard invasion, they adopted them as their permanent homes. Heraclaea and Malamocco, on the Lido facing the Adriatic, at first disputed pre-eminence; but when Pepin's fleet threatened to enforce their allegiance to the Western empire, the confederate islanders decided to concentrate at Rivo Alto, a cluster of islands in the very heart of the lagoons, 811. Protected by tortuous channels, they defeated the Franks.

The state which thus arose became the great mart for exchange of goods between the East and N.W. Europe, a republic whose maritime supremacy endured for centuries, and one of the chief factors in European history. It was a community of merchant adventurers who, turning their backs upon the mainland, looked eastward and seaward for development. Under Doge Pietro Orseolo II (991) the Slav and Saracen pirates were suppressed and the essential water-

way of the Adriatic secured. The doge was recognized as duke of Dalmatia, whence timber for the fleet and food for the people were obtained. A ceremony called *la senza* was instituted, which later became the famous wedding of the sea (1177-1797), when the doge, from his gilded barge Bucentaur, cast a ring into the Adriatic, as a symbol of maritime dominion.

Medieval Enterprise

Profiting by the Norman conquest of the maritime cities, Venice shared the carrying trade of the Mediterranean with Pisa and Genoa. Owing allegiance to the Eastern empire, she obtained commercial concessions there. A Venetian quarter was founded in Constantinople (Istanbul), c. 1100, and factories were erected in the Syrian coast towns. Venice supplied goods and transport to the Crusaders and pilgrims; and the shrewd doge, Enrico Dandolo, diverted the fourth Crusade to the conquest of Constantinople, 1204. Out of her share of the spoil Venice obtained the Morea, many islands of the Aegean, and much of the mainland. She purchased Crete and Salonica, and held fast to Zara (Biograd) and other Dalmatian towns. Communications with Constantinople and the Syrian coast were thus rendered secure. The republic had become mistress of the Levant.

Her success involved an exhausting war with Genoa for the monopoly of the Levantine trade, 1294-1381. After many vicissitudes, Vettor Pisani crushed the Genoese fleet which endeavoured to blockade Venice from Chioggia, 1380. Venice emerged the supreme naval power in the Mediterranean. She subdued the whole coast from the estuary of the Po to Corfu, 1421, and acquired Cyprus, 1489. During the 14th century, in order to secure her food supplies and the free passage of her goods, she extended her empire to the mainland of Italy.

Under Foscari (1423-57) and such famous condottieri as Gattamelata and Bartolommeo Colleoni she advanced her territory to the Alps, the Adda, and the Po. A magnificent equestrian statue of Colleoni by Verrocchio and Leopardi stands outside SS. Giovanni e Paolo. Now one of the five leading Italian states, Venice aimed at supremacy. To check her aggression, the European powers combined in the league of Cambrai, 1508; yet at the treaty of Noyon, 1516, Venice emerged with little loss of territory. Her subjected towns maintained their allegiance, for the rule of the republic was lenient and just. Her colonial policy was to develop trade and leave local institutions free under a civil and a military governor. Venice had now reached the zenith

of her power. Her citizens numbered nearly 200,000; her revenue amounted to 1,250,000 golden ducats. But the wars with Genoa and the European powers had sapped her vigour. She was paralysed by the discovery of the Cape route to the Indies, which diverted the eastern trade to Lisbon.

Rivals on the sea arose in England, Spain, Portugal, and the Netherlands. The capture of Constantinople by the Ottoman Turks, 1453, struck her another deadly blow. Venice was cut off from her trade with the Levant and through Egypt. Friuli was devastated. Yet the decline of Venice was very gradual and very brilliant. During the 16th and 17th centuries Venetian art reached its greatest, and the republic was almost the sole bulwark of Europe against the aggressive Turks.

But in spite of such brilliant episodes as Lepanto, 1571, she was gradually stripped by Turkey of all her possessions in the archipelago and the Morea, of Cyprus, 1571; Crete, 1669; and Negroponte (Euboea). Dalmatia she still retained by the treaty of Passarowitz, 1718. Yet splendour and pagantry reigned in the republic until it fell before Napoleon, 1797. He assigned it first to Austria and then to his kingdom of Italy, 1805. Austrian rule was restored by the congress of Vienna, 1815. The hated oppressor was expelled in 1848, when the republic of S. Mark was proclaimed with Daniele Manin for president. Radetzky reduced it after a siege lasting more than a year, July, 1848–Aug., 1849, and Austria ruled it until compelled to cede Venetia to Italy in 1866.

Constitution of the Republic

The constitution of the Venetian republic was originally democratic. At first twelve tribunes from the loosely confederated townships conducted the business of the lagoon commonwealth. A chief tribune or doge (*dux*) was elected as an executive head by assembly of the whole Venetian people, 697. But experience proved that the assembly was liable to adopt rash decisions, and that doges were tempted to make themselves hereditary tyrants.

The doge was reduced to a mere figurehead by the appointment first of two and then of six councillors who elected and advised him. On important questions he was also compelled to invite the advice of leading citizens. These advisers developed into a senate. The assembly was reduced to a deliberative council, which appointed the

officers of state, its legislative and judicial functions passing presently to the senate. This great council of 480 representatives, elected originally by the people, was in 1297 restricted to those whose paternal ancestors had sat in it since 1172. The names of this Venetian aristocracy of merchant princes were inscribed in the famous Golden Book.

The closing of the great council marks the final establishment of an oligarchy which proved one of the most stable and successful govts. known to history. To deal with a revolt against it in 1310 a council of ten was elected by the great council. Empowered to act swiftly and secretly in defence of the state, and aided by the doge and the ducal councillors, it soon absorbed the judicial and executive powers of the senate, leaving to that body the direction of finance and foreign affairs. In 1355 it decreed the execution of Marino Faliero for conspiring to make himself despot.

Brown; Venetian Painters of the Renaissance, B. Berenson, 3rd ed. 1903; Story of Venice, T. Okey, 1905; Venezia, P. Molmenti, Eng. trans. 1906–08; Venice: An Aspect of Art, A. Stokes, 1945.

Venice, GULF OF. Northern portion of the Adriatic Sea between Istria and the Venetian lagoons; its north-eastern corner forms the Gulf of Trieste.

Veni, Creator Spiritus (Lat., Come, creator spirit). Pentecostal hymn in the Roman breviary. Though commonly attributed to Charlemagne, it is found in manuscripts written before his time, and was probably composed by S. Gregory the Great. It was translated into English (Come, Holy Ghost, our souls inspire) by Bishop J. Cosin (1594–1672).

Venison (old Fr. *veneison*, from Lat. *venari*, to hunt). Flesh of the deer. The buck is regarded as providing better meat than the doe. It should be hung as long as possible to make it tender.

Venite. First word (come, plur.) in the Latin version of the 95th Psalm (94th in the Vulgate). This psalm figured from very early times in the breviary as an introduction to the first service of the day which was sung in the monasteries after midnight. It may have been introduced into the West by S. Benedict and so entered the Roman breviary, being used daily save on the last three days of Holy Week. Taken into

the Anglican Prayer Book of 1549 as part of the introduction to morning prayer, the Venite has remained there ever since. The 1928 Prayer Book permitted omission of the last four verses.

Venizelos, ELEUTHERIOS (1864–1936). Greek statesman. He was born Aug. 23, 1864, in comparatively humble circumstances at Canea, Crete, and was educated at the university of Athens, becoming a barrister in 1886. Elected a member of the

Eleutherios Venizelos, Greek statesman

Cretan assembly next year, he soon was leader of the Liberals, and in 1896 headed the Cretan revolution. In 1905 he led a further revolt, resulting in the withdrawal of Prince George of Greece, the high commissioner.

Venizelos went in 1909 to Athens, where he was chosen as head of a revolutionary military league which sought to purify political life. From that time he was the real leader of Greece, and its prime minister 1910–15. He attached his country to the Balkan League, fought through the Balkan Wars, and secured large additions of territory, including Crete.

On the outbreak of the First Great War he desired that Greece should support the Allies. Thwarted by King Constantine, he left Athens in 1916 and placed himself at the head of the Salonica revolution, establishing a government there. On the dethronement of Constantine in 1917, he went back to Athens as prime minister, joined the Allies against Germany, organized an army, and sent it into the field. An outstanding figure at the congress of Versailles, he secured great advantages for his country. But in the election following the death of King Alexander, he was defeated, Constantine returning to Athens.

He was premier in 1924 for a month; then left shortly before the proclamation of the republic. In 1928 he was again prime minister, but Royalist opposition led to his resignation in May, 1932, though he formed a brief ministry in June. Apparent sympathy with the attempted *coup d'état* of Gen. Plastiras (*q.v.*) next year led to Venizelos's eclipse as a popular figure. He died in Paris, March 18, 1936. Lives in English were written by S. B. Chester, 1921; H. A. Gibbons, 1921.

Venlo OR VENLOO. Town of the Netherlands, in the prov. of Limburg. It lies on the right bank of the Maas, 15 m. by rly. N.E. of Roermond, connected by bridge with its suburb Blerik on the opposite bank, and is a rly. junction. There are miscellaneous industries concerned with tobacco, electric lamps, paper, and engineering works. Venlo became a fortified place in 1343, was captured by Charles V in 1543, and was in French possession during 1801-14. Very badly damaged in the Second Great War, when Blerik was captured from the Germans by the British 2nd army Dec. 4, 1944, Venlo itself remained in German hands until cleared by the U.S. 9th army about March 1, 1945. Part of the "temporary" Waterloo bridge was later used in the construction of a temporary bridge at Venlo. Venlo had a noteworthy town hall, 1595, and a 15th cent. church of S. Martin. Pop. 41,000.

Vennachar. Loch of Perthshire, Scotland. About 4 m. in length and up to $1\frac{1}{2}$ m. across, it is

Vennachar. The loch, described in *The Lady of the Lake*, from the N. shore formed by the river Teith, and lies 2 m. W. of Callander, surrounded by beautiful scenery. Ben Ledi overlooks it. It figures in Scott's poem, *The Lady of the Lake*.

Venosa. City of Italy, in the prov. of Potenza. It is 52 m. by rly. S.S.E. of Foggia. The 15th century castle, the abbey church of the Santa Trinità (1059), which contains the tomb of its founder, Robert Guiscard, and the remains of an amphitheatre are the chief buildings. The Roman Venusia, it was the birthplace of Horace.

Venti. In classical mythology, the personifications of the winds. Their ruler was Aeolus (q.v.), who

kept them in a cavern in Aeolia. Some of the winds, such as Zephyrus, the W., were regarded as beneficent, while others, such as Aquilo, the N.E., were maleficent. The latter class were supposed to be the progeny of the monstrous giant Typhon (q.v.).

Ventilation (Lat. *ventilare*, to blow). Maintenance of an adequate circulation of fresh air of reasonable cleanliness and temp., allied with the continuous withdrawal of vitiated air. Air in occupied rooms becomes vitiated by exhalation, body heat, odours arising from the evaporation of perspiration, etc., and may be further impaired by products of combustion, as from the fuelless burning of gas and oil. Ventilation, as distinct from air conditioning, is confined to the filtration, temp. adjustment, and distribution of air. In houses and small buildings a

sufficient circulation of fresh air is normally obtained by natural exhaustion and infiltration; large buildings almost invariably require mechanical ventilation.

The relative purity of air is defined by volumetric standards expressed either as a number of complete air changes per hour, having regard to the degree of occupancy, or as a tabulated volume of fresh air to be provided every hour for each occupant.

Standard ventilation of public buildings is usually laid down by the local authority. Such regulations vary slightly from one district to another, but broadly con-

form to the standards shown in Table 1.

The Factory Act does not advance numerical standards of the volume of air to be circulated to maintain the "adequate" ventilation required in factories. It does, however, direct that not less than 400 cu. ft. of space, within a height of 14 ft., shall be provided for each occupant of a workroom; and recommends, in general terms, that the air be changed at least 6 times per hr. This is equivalent to 2,400 cu. ft. ($400 \times 6 = 2,400$) of air per person per hr. In special cases of low occupancy of large rooms a lesser air change, e.g. 4 per hr., would normally be sufficient. In contrast, processes productive of dusts or noxious fumes would entail more than 6 changes per hr. Rooms in which cellulose paints are sprayed are subject to 30 changes per hr.; up to 40 changes are not uncommon in kitchens and grills in large hotels.

In buildings subject only to natural ventilation by air infiltration and exhaustion aided by flues and chimneys, the hourly air change is dependent on a natural air flow, without draughts, and is of the order indicated in Table 2.

TABLE 2: Assumed Minimum Natural Air Change

Room	Hourly Air Change
Living room ..	1.0
Bed-sitting room ..	1.5
Bedroom ..	1.5
Nursery ..	1.5
Kitchen ..	2.0
Entrance hall ..	2.0
Bathroom ..	1.5
Water closet ..	2.0

Additions up to 50 p.c. are made for rooms having more than one external wall with door or windows.

Except where there is overcrowding, the figures in Table 2 compare well with the governmental recommendations quoted in Table 3, based on an allowance of 600 cu. ft. per person per hour.

TABLE 3: Recommended Minimum Standard of Ventilation

Room	Air Supply per hr.
Living room (4 persons) ..	2,400 cu. ft.
Bedroom (2 persons) ..	1,200 " "
Bedroom (1 person) ..	600 " "
Kitchen (cooking for 6 persons) ..	1,000 " "
Halls and passages	1 air change
Bathrooms and w.c.s.	2 air changes (or more)

Natural ventilation, other than cross-ventilation between open windows due directly to wind, relies on the displacement of warmed air from within a building by a natural convective inflow of cooler and, therefore, denser air from outside. In houses, the outflow occurs chiefly through the chimneys of fireplaces and boilers, the inflow via ill-fitting doors and windows, and through high-level air-bricks connected to hopper-shaped deflectors inside rooms. Alternatively, a low-level grated inlet may be located behind an encased heating unit, e.g. a column radiator. This virtually solves the problem of cold draughts, and is probably the most satisfactory method of wintertime natural ventilation yet devised. Chimney draught normally induces one air change per hr. during summer, and 4 when a fire is alight; 10 changes may occur in an extreme case of a large fireplace and chimney, and a very low outside temp. The down-draughts felt near windows in heated rooms, and countered by heavy curtains, are due more to the sudden descent of previously warmed air, cooled by contact with cold glass, than to the ingress of cold fresh air. In buildings other than houses, the outflow may be arranged through louvered or cowed roof ventilators, connected to extract ductwork when the building is partitioned into rooms.

The principal disadvantages of natural ventilation are that little control can be exercised over the quality, quantity, and temp. of the incoming air, and that a completely reversed circulation may be set up by an adverse wind.

Mechanical ventilation implies the mechanical propulsion of air by means of a fan. The three systems, in order of simplicity, are (a) extract, (b) intake or plenum, (c) combined intake and extract.

(a) The requisite quantities of air are exhausted from the building by one or more fans, normally of the propeller pattern. Inflow occurs as in natural ventilation, but without risk of reversed circulation. In the domestic application, an electrically driven fan, 6 ins. in diam., is fitted into a kitchen window or wall, and is used only during periods of cooking and washing. This provides the kitchen with 6 to 10 or more air changes per hr. The continuous flow of air towards the kitchen prevents steam and cooking smells from reaching other rooms, and materially improves the ventilation of the whole house. The kitchen window

Ventimiglia, Italy. The frontier town, from the sea; in the centre stands the former citadel, to the right of which is the Gothic cathedral

and outside door should be closed to prevent short-circuiting of air.

(b) In plenum ventilation (Lat. *plenus*, full) a centrifugal fan draws air into a building, thus creating an internal air pressure slightly in excess of that of the atmosphere outside the building. This prevents the haphazard ingress of air as in natural and extract systems. The sole air inlet is the fan intake. This is usually arranged to draw air through a filter, and then over a heating or cooling battery before propelling it through the distribution trunking and grilles. Outflow occurs through grated openings in external walls during cold weather: these would be closed by shutters during summer when windows would usually be open.

(c) The combination of mechanical extraction with plenum ventilation admits of a considerable measure of heat conservation by the recirculation of some 75 p.c. of the total hourly requirements of the rooms, and further allows the withdrawal of smoke-laden air just above head level. This is the system used in air conditioning.

Circulating ceiling and desk fans are in no way connected with ventilation. The localised air movement set up by them serves only to give a feeling of comfort in still, humid air by increasing the convective cooling of the skin. See Air Conditioning; Fan; Humidity.

J. W. Cowan
Ventimiglia. Seaport with fortified harbour, and health resort, of Italy, in the prov. of Porto Maurizio (Imperia), and in the Riviera di Ponente. On the shores of the Ligurian Sea, travellers from France to Italy here pass through the customs and change trains. The town is 95 m. by rly. S.W. of Genoa

and has direct rly. connexion via Cuneo with Turin. The Gothic cathedral occupies the position of a former Lombard church which was built on the site of a temple to Juno. An old castle crowns the hill. About 3 m. E. are remains of the ancient city, Album Intimilium, including parts of the walls, a theatre, and tombs. Roman antiquities form a collection in the modern town hall. The Balzi Rossi caves are of archaeological interest. Olive oil, wines, and flowers are the principal products. Bombed by Allied aircraft in the weeks preceding the Allied landing in S. France, Aug. 15, 1944, Ventimiglia was captured by the French, April 27, 1945. Pop. 16,000.

Ventnor. Watering-place and urban dist. of the Isle of Wight, England. Situated 12 m. S. of Ryde, on the rly., the town is built in the sides of a cliff, its buildings rising in terraces one above the other. Its mild climate attracts many invalids, and here is the Royal National hospital for consumptives. In the locality are St.

Ventnor, Isle of Wight. Bathing beach and part of the town built on the steep cliff-face

Boniface Down and Bonchurch. The latter has a Norman church, S. Boniface, of great age; in the churchyard of its new church Swinburne is buried. Steephill Castle is also adjacent to Ventnor, as is the Undercliff. Pop. 6,943.

Ventôse (Fr., month of wind). Sixth month in the year as rearranged during the French Revolution. It began on Feb. 19 or 20. See Calendar.

Ventriculites. Genus of fossil sponges, found in the Upper Chalk beds. They may be either simple or compound. They possess cups, either funnel-shaped or cylindrical, attached to the rock by root-like appendages of siliceous fibres. They often occur enclosed in flints, and are common in Thanet and the Isle of Wight. *See* Sponge.

Ventriloquism (Lat. *venter*, stomach; *loqui*, to speak). Art of making the human voice appear to proceed from a distance, or from some person or object other than the actual speaker. Ventriloquism has often been described as speaking in the stomach. This is not the fact, but some contraction of the stomach muscles does take place in speaking with immobile lips. Making a voice appear to proceed from a distance or from images was a trick practised at ancient oracles, especially in Egypt. While much skill and practice are required in the control of the voice by a clever ventriloquist, a great portion of the illusion is brought about by suggestion, the performer subtly indicating to his audience the direction or position whence the voice is supposed to come. The effect of distance or direction is produced by accurate mimicry of the sound as it would appear if actually emanating from the supposed source. *See* Acoustics; Sound; Voice.

Ventspils (Ger. Windau; Russ. Vindava; Lith. Ventpilis). Seaport of Latvia S.S.R. It lies in the Courland pen. where the river Venta enters the Baltic. Trade through its safe harbour consists of imports of salt herring, machinery, coal, exports of timber, alcohol, wheat, linseed. Here are distilleries, breweries, saw-mills, and a school of navigation. Fishing is an occupation. The castle was built in 1244 for Dietrich, then head of the Teutonic order. The town dates from 1314: it was annexed to Russia in 1795 on the abdication of Peter, duke of Courland. During the Second Great War, the Germans captured Ventspils, July 1, 1941, and held it until after the general surrender in May, 1945.

Venturimeter. Instrument for measuring the rate of flow of a liquid in pipes; sometimes called a venturi tube. There is a tube, with a constriction in its centre, and other small tubes at the entrance to and narrowest part of the constriction. The free ends of the tubes are led to the two sides of a U-tube containing mercury. When the venturimeter is placed in the line of the pipe whose rate

of flow is to be measured, the difference in level of the mercury in the two legs of the tube measures the difference in pressure in the two small tubes. The flow of liquid in the pipe can be calculated by the formula:

$$Q = ab\sqrt{(2gH)/((a^2 - b^2))}$$

where Q is the flow in cu. ft. per sec.; g , the acceleration due to gravity (32.2 ft. per sec. per sec.); H , the difference of heights of mercury in tube in ft.; a , the cross-sectional area of pipe at widest portion in sq. ft.; and b , the cross-sectional area of pipe at narrowest portion in sq. ft..

Venue. English legal term signifying the county or place whence the jury who are to try a case must come. At common law certain actions could be tried only in and by a jury of the county where the subject-matter of the action was situate. The Judicature Act, 1873, abolished all local venues in civil actions. In criminal cases, as a rule, a prisoner is tried in the county where the crime was committed.

Venus. In Roman mythology, originally the goddess of gardens, and subsequently identified by the

mother of Aeneas, the legendary founder of the race, Venus became one of the major deities of the Romans, though before the 4th century there is little evidence of her worship. *See* Adonis; Aphroditē; Astartē; Cupid; Paris.

Venus. One of the inner planets. Known to the ancients as Phosphorus and Hesperus, the morning and evening star, it is the second known planet from the sun, revolving in an orbit between the earth and Mercury. Its mean distance from the sun is 67,270,000 m., diameter 7,700 m., and period of revolution round the sun 224.7 days. Venus presents to the earth phases like those of the moon, and is the brightest planet at all times, ranging between three and 12 times as bright as Sirius. It is faintest when at the far side of its orbit, where, though its phase is full, the illuminated disk is small; and also when closest to the earth, where, though it appears large, only a thin crescent is illuminated. It is brightest when its phase is like that of the five-days-old moon. The planet has no satellite; its mass can be estimated approxi-

mately from the perturbations it produces in the motion of the earth and of Mars: it appears to be about eight-tenths that of the earth. Its density is 90 p.c. that of the earth.

The surface of Venus is white and highly reflecting, and shows little trace of detail in the telescope. Its period of axial rotation is a matter of dispute. Early observations suggesting a period of about 23 hours were discredited in 1890 by Schiaparelli, who decided that the planet always presented the same face to the sun and must therefore rotate in 225 days. Pickering in 1920 deduced a period of 68 hours and stated that the axis of rotation is inclined at only 4°-5° to its orbital plane.

Ultra-violet photographs by Ross in 1927 showing variable markings are inconsistent with a short period; while spectroscopic observations showing that the velocity of rotation is too small to

Venus. Famous statues of the ancient goddess. Left, the Venus of Milo, in the Louvre, Paris, dating from the 2nd century and discovered at Melos in 1820. During 1940-45 it was hidden in a castle on the Loire. Right, the Medici Venus, in the Uffizi Gallery, Florence

Romans with the Greek Aphroditē, goddess of love. All the myths relating to Aphroditē were attributed also to Venus. As the wife of Mars, a deity widely worshipped among the Romans, and as the

measure suggest a period of at least 25 days. The temp. of the dark side is, however, too high for Venus to be always turned away from the sun, so a period of rotation of 1-6 months is likely.

The atmosphere of Venus can be seen telescopically in the crescent phase, when the "twilight arc" sometimes extends right round the dark disk. Spectroscopic study is confined to that portion of the atmosphere which extends above the visible surface; this almost certainly consists of clouds. Adams and Dunham showed in 1932 that absorption bands in the infra-red spectrum were due to carbon dioxide, but could detect neither oxygen nor water vapour. The nature of the clouds is unknown.

Transits of Venus across the surface of the sun have been watched with great interest as offering a means of calculating the distance of the earth from the sun. The transits take place in June and Dec. The June ones run in pairs separated by eight-year intervals, as do the Dec. ones; the period from one pair of transits to the next is over 100 years. The next transits are June 8, 2004, and June 6, 2012. The first to be recorded was in 1639, by Horrocks.

Venus and Adonis. Poem by Shakespeare, first published in 1593, and the earliest work bearing his name. Based on one of the stories in Ovid's *Metamorphoses*, it tells how Adonis, having scorned the proffered love of Venus, went boar-hunting and was killed, and how, where he fell, there sprang up a flower said to be either the anemone or the adonis. The sensuous, beautiful poem is written in six-line stanzas, closing with a couplet, like the sestet of the Shakespearean sonnet.

Venusberg (Ger., mountain of Venus). In German legend, the name of several hills, especially the Hürselberg, near Eisenach, in Thuringia, where Venus was said to hold her court in a cave. Towards the close of the Middle Ages the name of Venus was substituted for those of the native divinities Hürsel and Holda, both, perhaps, names of the Teutonic goddess of love, Frigg. Tannhäuser (q.v.), like others, was beguiled by Venus. A section of Wagner's opera Tannhäuser is known as the Venusberg music.

Venus's Fly-trap (*Dionaea muscipula*). Perennial insectivorous herb of the family Droseraceae. A native of N. Carolina and Florida, it has a somewhat bulbous root-

stock from which all the leaves proceed direct. Each leaf has a long stalk which is winged on each side, the blade of the leaf forming two nearly half-circular lobes whose outer margins are fringed with sharp rigid spikes. These lobes close together, under certain conditions, when the fringe of spikes interlocks like the teeth of a rat-gin. In the centre of each lobe stand three sensitive filaments, and when either of these is touched by any insect, the lobes immediately shut together, entrapping the insect. See Bog Plants; Insectivorous Plants.

Venus Shells. Genus of marine bivalve molluscs of the order Eulamellibranchiata. Of almost world-

leaves, and tubular flowers, blue inside and lilac outside.

Vera Cruz (Span., true cross). Maritime state of Mexico, on the Gulf of Mexico. The interior is mainly mountainous, Orizaba, on the Puebla boundary, exceeding 18,000 ft. Agriculture is the staple industry, the chief products being coffee, tobacco, fibre, cacao, cotton, and sugar. Petroleum is extracted; cattle are reared; and textiles are manufactured. The capital is Jalapa. There is a state university. Area, 27,736 sq. m. Pop. 1,619,338.

Vera Cruz. One of the leading seaports of Mexico. In the state of Vera Cruz, it stands on the Bay of Campeche, 265 m. E. by S. of

Vera Cruz, Mexico. The Custom House, Post Office, and, in the centre distance, the railway station

wide distribution, six species are found native on British coasts, whilst a seventh, the Clam (*Venus mercenaria*), whose wave-worn valves the N. American Indians used to make "legal tender" under the name of wampum, has become naturalised in the Humber. The Smooth Venus (*V. chione*) has a triangular-oval shell nearly 4 ins. long. See Bivalve; Mollusca; Shell.

Venus's Looking Glass (*Specularia perfoliata*). Annual herb of the family Campanulaceae, a native of Europe and N. Africa. It has small, oval or spoon-shaped

Mexico City. It has a spacious and secure harbour, but is an unhealthy city, with few architectural features. Coffee, ores, tobacco, sugar, and rubber are the leading exports, and machinery, textiles, and iron and steel ware the principal imports. Fishing is engaged in, and cigars and furniture manufactured. Pop. 75,756.

In 1599 the town of Villa Nueva de la Vera Cruz, founded by Cortés in 1519, was transferred to the present site. The castle of San Juan de Ulúa was begun in 1582. Besieged by the French in 1838 and 1862, and by the Americans in 1847, the city was held for a few months in 1914 by U.S. troops.

Veraval. Harbour of India, in the union of Saurashtra. It is situated 40 m. N.W. of Diu, on the S.W. coast of the Kathiawar peninsula, and has a coasting trade and rly. service. Once the chief port of embarkation for pilgrims to Mecca, it has interesting temples. The port of Somnath lies 3 m. S.E. Pop. 24,000.

Verb (Lat. *verbum*, a word). Part of speech which asserts something about something else in reference to an action or state. In some languages there is no verb, its place being supplied by

Venus's Looking Glass. Spray of leaves and flowers. Inset, left, root; right, tubular flower

nouns and adjectives, or indicated by the position of words in the sentence, as in Chinese. Other languages, notably Turkish, exhibit an extraordinarily large number of verbal forms. Verbs may be transitive, the action of which passes on to an object (he sees me); intransitive, requiring no object (he stands); or impersonal, which cannot be used with a personal subject (it rains).

Grammarians distinguish also other classes of verbs: causative, desiderative, frequentative, inchoative. Verbs have (or had) three voices, active, middle, and passive, the last being the latest development; four moods, imperative, indicative, optative, subjunctive; tenses varying in number in different languages, referring to present, past, and future time; three numbers, singular, plural, dual; three persons, first, second, and third, referring to the speaker, the person spoken to, the person or thing spoken of. The infinitive mood so called is not really a mood, but the case of a noun. See Noun.

Verbena. Genus of herbs and sub-shrubs of the family Verbenaceae (*v.i.*), mostly natives of

Verbena. Leaves and flower spikes of vervain. Inset, single flower

America, with opposite or alternate leaves, and small tubular flowers in terminal clusters or spikes. Many are in cultivation for greenhouse decoration or summer bedding outdoors. The vervain or holy herb (*V. officinalis*) is a native of Europe, N. Africa, and W. Asia, growing in dry, waste ground. It is a downy perennial, with dense spikes of tiny lilac flowers.

Verbenaceae. A family of herbs, shrubs, and trees. They are natives mainly of tropical and temperate regions. Leaves are opposite or whorled, mostly undivided. Flowers are tubular with the mouth cleft into four or five spreading lobes, usually forming two lips. The family includes

the genera *Tectona* (teak), *Lippia*, *Clerodendron*, *Lantana*, *Vitex*, and *Verbena*.

Vercelli. City of Italy, in the prov. of Vercelli, Piedmont. It stands on the Sesia, in a low fertile

Vercelli, Italy. The Romanesque church of Sant' Andrea, built by canons from Paris in the early 13th century

plain, and is a rly. junction 44 m. W.S.W. of Milan and 49 m. N.E. of Turin. The 17th century cathedral library contains many rare MSS., including the Vercelli Book (*v.i.*). The Romanesque Gothic church of Sant' Andrea dates from 1219. A centre for trade in rice and wheat, the town also has large flour and rice mills. Silks, machinery, matches, silver ware, and surgical instruments are other products. Here Marius defeated the Cimbri in 101 B.C. The city passed from the rule of the Visconti of Milan to that of Savoy in 1429. Pop. est. 39,000. *Pron.* Vair-chellee.

Vercelli Book. Anglo-Saxon MS. of the early 11th century, containing unique copies of Cynewulf's poems, Andreas, and the Fates of the Apostles, as well as the beautiful Dream of the Rood, probably of earlier date, three other poems, a prose Life of S. Guthlac, and some homilies. The MS. was discovered in 1822 in the cathedral library of Vercelli, Piedmont, by a German scholar.

Vercingetorix (d. 46 B.C.). Chieftain of the Arverni. In 52 B.C. he was the leader of Central and Southern Gaul in their last struggle for independence against Rome. A leader of unusual ability and the most formidable foe encountered by Caesar in his Gallic campaigns, he was finally compelled to take refuge in the strong fortress of Alesia, on the fall of which he was taken prisoner to Rome, where he was put to death.

Verden. Town of Germany, in Lower Saxony. On the Aller, 23 m. S.E. of Bremen, it is a rly. junction and river port. Its

industry includes the making of furniture, bricks, tobacco, and soap. Its main claim to fame is that Charlemagne here, after defeating the Saxons in 782, was alleged to have beheaded 4,500

hostages. The town was the seat of a bishopric from 785 to 1648. For 150 years a free city, Verden was under Swedish rule during 1648-1712, then belonged to Denmark, coming to Hanover in 1719. Among its finest buildings are the churches of S. John and S. Andrew, both 12th century, and the 13th century cathedral.

After the Second Great War, in which it escaped serious damage, Verden came within the British zone of occupation. Pop. 18,200.

Verderer (Late Lat. *viridarius*, from *viridis*, green). Forest official. He was chosen in the county court by the freeholders. His duty was to inquire into complaints brought by the foresters with regard to injuries done to the vert (forest covers) or venison (beasts of the chase). See Dean, Forest of; New Forest; Speech House.

Verdi, GIUSEPPE (1813-1901). Italian composer. Born at Roncole, Parma, Oct. 9, 1813, he received his earliest lessons in music from the parish organist, whose place he took at the age of 10. Verdi then attended a school at Busseto, and studied at the Milan conservatory. In 1839 his first opera, *Oberto*, was produced, and was followed three years later by *Nebucco*. With the production of *I Lombardi*, 1843, Verdi's reputation as the leading Italian composer was established, and his fame became world-wide with the appearance of *Rigoletto*, 1851, and *Il Trovatore* and *La Traviata*, both in 1852. Their melodious arias have never lost their popularity. The *Sicilian Vespers*, 1855; *Un Ballo in Maschera*, 1859; and *La Forza del Destino*, 1862, enhanced the composer's fame. In *Aida*, 1871, written for the khedive

Giuseppe Verdi

Ismail Pasha, he produced both musically and dramatically a masterpiece which some consider the best of his compositions.

In 1887 *Otello*, technically one of his best works, was performed, and with *Falstaff*, 1893, his sole effort in comedy, Verdi closed his active career as the most popular Italian operatic composer of the century. He had been made a senator in 1874, and during his life occupied a unique place in Italy. In 1898 he endowed at Milan a home for old and invalid musicians, devoting £40,000 to that purpose. He died at Milan, Jan. 27, 1901. In addition to operas Verdi wrote the *Manzoni Requiem*, 1874; *Hymn of the Nations*, 1862; and some romances and quartets, all of which showed considerable merit. In 1898 he composed four pieces of sacred music. *Consult* Lives, F. Toye, 1931; F. Werfel, 1944; F. Bonavia, 1948.

Verdict (Lat. *vere*, truly; *dictum*, spoken). In law, the finding of a jury as declared to a judge. A verdict is either general or special. A general verdict is where the jury determines the case in favour of one party or the other. If there be more than one issue to be tried, the jury may find some of them in favour of one, and some of the other party. A general verdict is delivered orally in court.

A special verdict is one in which the jury finds certain facts, generally in answer to written questions put by the judge. These questions and answers constitute a special verdict, and on them the judge must apply the law, and give judgement for plaintiff or defendant accordingly. Special verdicts are of the rarest possible occurrence in criminal cases.

In Scotland a verdict goes by the majority, but in England it must be unanimous. In Scotland, also, in a criminal case, a jury may find not proven, meaning thereby that they are not satisfied of the innocence of the prisoner, but neither are they convinced of his guilt. *See* Trial.

Verdigris. Mixture of the three basic acetates of copper used as a pigment, and in dyeing and calico printing. Verdigris is prepared at Grenoble and Montpellier in France, by acting on sheets of copper with the residues from the wine factories. In ten to twenty days the copper plates become covered with green crystals of verdigris, the variety prepared in this way being known

Verdun, France. 1. The town and cathedral viewed from the Meuse. 2. The town hall. 3. The Chatel gate, showing on the left, the water-tower which was a gift to their adopted town from the citizens of London

as blue verdigris. Green verdigris is made in England by placing cloths moistened with acetic acid on copper plates, so arranged as to allow of free access of air. The process takes five to six weeks.

The name is also applied to the bluish-green skin formed on metallic copper when exposed to air containing carbon dioxide. The green basic carbonate of copper, $\text{CuCO}_3 \cdot \text{Cu(OH)}_2$, is most probably formed. While this is not desirable for the industrial uses of copper, verdigris is thought to improve the appearance of copper or bronze used for decorative purposes, such as for statuary. *Prom. ver-digresse.*

Verditer. Basic salt of copper. It is prepared by shaking chalk with a solution of copper nitrate, when a green precipitate is obtained. If the precipitate is mixed with freshly burnt lime a blue pigment, blue verditer, results.

Verdun. Town of France, in the dept. of Meuse. It lies on the hilly banks of the Meuse, 30 m. N.N.E. of Bar-le-Duc and 174 m. by rly. E. of Paris. Verdun is the seat of a bishop, and after 1870 became a first-class fortress, its ring of surrounding forts forming, with those of Toul, one of the main

defences of the French E. frontier. There is much river traffic on the Meuse, which here begins to be navigable. Pop. 14,609.

The cathedral of Notre Dame was consecrated in 1147, replacing the original 5th century church, rebuilding taking place after a fire in 1755. The roof was destroyed during a bombardment in 1917, but the wood carvings of the choir were removed for safety in 1916. The *Porte Chaussée*, a bridge-gate dating from the 15th century, was untouched. The damaged citadel occupies the site of the abbey of S. Vanne, and was first begun in 1552. Many old houses rising steeply from the river bank were demolished, 1916-17, and the town hall also suffered. The law courts were almost destroyed in the Second Great War.

Verdun is one of the most ancient historic towns of France. The Roman fortress of Verodunum replaced a Gallic stronghold. Owned by Clovis and by the rulers of Austrasia, it gave its name to the treaty signed here in 843. The county of Verdun passed into the hands of the bishops of Verdun in the 10th century, but a communal charter was secured by the

townspeople after a revolt in 1247. Henry II of France gained the town in 1552, his acquisition being confirmed by the treaty of Cateau-Cambrésis, 1559. It resisted a Huguenot attack, 1589, and was captured by the Prussians, 1792. In the Franco-Prussian War, Verdun, poorly protected, surrendered on Nov. 8, 1870. Its part in the First Great War is described below. In 1916 the town received the cross of the Legion of Honour and other Allied war decorations. Near Fort Douaumont is a memorial marking the place where 57 French soldiers died in defence of Verdun, buried alive when their trench gave way.

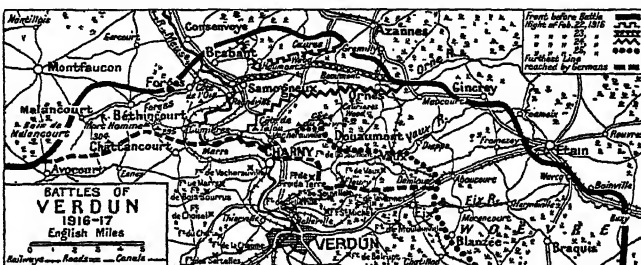

In the Second Great War, following the break-through in Champagne, German armoured and infantry formations developed a fanwise advance, the most spectacular achievement of which was the capture of Verdun after a brief resistance on June 15, 1940. After the Franco-German armistice it lay in the occupied zone. Verdun was liberated on Sept. 1, 1944, by Gen. Patton's U.S. 3rd army after a 60-m. advance from Reims.

Verdun, BATTLE OF. Major engagement of the First Great War, fought between German and French forces and occupying the greater part of 1916. The first phase, from Feb. to June, consisted of a series of increasing German attacks with the object of capturing the Verdun garrison. Though they met with some success, their prime object was not achieved. The second phase, June to Dec., saw the success of great French counter-strokes which drove the Germans from ground they had won at high cost.

The German offensive, under the command of the crown prince, opened Feb. 21. In the initial stage five picked German divs., with overwhelming artillery, overran French defences to the N. and N.W. of Verdun held by only two French divs. Reinforcement of the French by two further divs. was not sufficient to stem the advance, and defending forces to the E. and S.E. were drawn in closer to the town. Gen. Pétain was placed in command of the defence on Feb. 25, on the same day that Fort Douaumont and the Harcourt strong-work to the N.E. fell to the Germans. But the first crisis was now over, as further French reserves were arriving rapidly and the defenders were superior in everything but artillery. After desperate fighting the

front N. of Verdun was temporarily secured by the end of Feb., with the Germans still about 3½ m. from the garrison.

The second German attack opened March 4 to the N.W. On March 9 the attack was intensified on both sides of the Meuse by 10 German divs. For the most part this attack was broken, the attackers making only minor advances. The Germans therefore changed their tactics, limiting their offensive to attacks of great violence on smaller fronts. These continued throughout March and April, but in spite of small advances the opposition was most determined, and the attackers received at least as much as they gave. By the beginning of May the French had been able to recover some of the ground lost in these attacks.

Verdun. General map of the area included in the battles of 1916-17, where some of the most determined fighting of the First Great War took place

The third big German attack opened May 3 in the hope of securing the commanding heights of the Mort Homme region to the N.W. of Verdun. Terrible fighting ensued for the various hills, with fierce attacks and counter-attacks. Then early in June the German artillery concentrated on the reduction of Fort Vaux to the N.E. It fell on June 8. This success led the Germans to attempt yet another attack on June 23, in the hope of seizing Fort Souville, only one m. N. of Verdun, and possibly of breaking into Verdun itself. Advancing with 50 battalions, they captured Fleury and penetrated into Fort Froide Terre, but failed in the main objective. By the following day the guns on the Somme had opened in preparation for the British attack of July 1, and from that moment the pressure on Verdun was eased. However, the loss of Fort Vaux had compelled the opening of the Somme battle at an earlier date than had been intended.

Under Nivelle, now in command at Verdun, and determined to hold the Germans as tightly as possible to assist the Somme offensive,

the French began to gain ground. The Germans were obliged to remove most of their heavy batteries to the Somme, and had no fresh troops available. On Oct. 24 Mangin struck a tremendous blow in the Douaumont region, and made a rapid advance. Fort Douaumont was stormed by Moroccan troops and held against four German counter-attacks. Over 6,000 German prisoners were taken. Mangin next prepared to recapture Fort Vaux, but on Nov. 2, just as he was about to deliver a final assault, it was evacuated by the Germans as untenable. By Nov. 5 the French had recovered most of the vital points to the N.E. of Verdun.

To continue the offensive Mangin had to wait to accumulate shells and construct roads, but on Dec. 15 he renewed the attack,

and within three days had ended the battle with the re-establishment of the French front to the N.E. almost as it had stood in Feb. Moreover, he had captured 11,387 prisoners and 115 guns.

German losses from Feb. 23 to Nov. 5 were 328,500. French losses to the end of the year were 348,300.

The positions the Germans had secured on the Mort Homme and elsewhere to the N.W. were retaken by the French in Aug., 1917.

Verdun. Residential suburb of the city of Montreal, Canada. It stands on the island of Montreal. Pop. 67,349.

Vere. Name of a famous English family. They came from Ver, in Normandy, and in the 12th century in England Aubrey de Vere secured the hereditary office of lord great chamberlain and his son the earldom of Oxford. With occasional intervals, due to political troubles, they held the office until the death of the 18th earl in 1625, and the title until the death of the last male of the line, Aubrey, 20th earl, in 1703. The barony of Vere then passed to his daughter, Diana, wife of the 1st

duke of St. Albans. Their chief seat was Castle Hedingham, Essex, and they had large estates in that county. See Oxford, Earl of; consult *The Fighting Veres*. Sir C. R. Markham, 1888.

Vere, SIR AUBREY DE (1788-1846). Irish poet. Born Aug. 28, 1788, eldest son of Sir Vere Hunt, of Curragh Chase, Limerick, a collateral descendant of the 15th earl of Oxford, he was educated at Harrow, succeeded to his father's baronetcy in 1818, and assumed the name of De Vere by letters patent in 1832. His first literary work was a dramatic poem on Julian the Apostate, 1822. It was followed by Irish and other poems, a volume of sonnets which received high praise from Wordsworth, and a drama with Mary Tudor as its central figure, published posthumously in 1847. De Vere died July 5, 1846.

Vere, AUBREY THOMAS HUNT DE (1814-1902). Irish poet and essayist. Born at Curragh Chase, Limerick, Jan. 10, 1814, third son of the above Sir Aubrey, he was educated at Trinity College, Dublin, and in 1857 became a Roman Catholic. Among his poems, much influenced by Wordsworth, are *The Search after Proserpine*, 1843; *The Sisters*, 1861; *St. Peter's Chains*, 1888; *Mediaeval Records and Sonnets*, 1893; and two poetical dramas, *Alexander the Great*, 1874, and *St. Thomas of Canterbury*, 1876. He also published volumes of critical essays, 1887 and 1889, and a book on Ireland, 1848.

Vere, SIR FRANCIS (1560-1609). English soldier. A grandson of the 15th earl of Oxford, in 1585 he

Sir Francis Vere,
English soldier

joined Leicester's expedition to the Netherlands, and for his services at the defence of Sluys and of Bergen-op-Zoom was knighted in 1588. Next he was appointed commander of English troops in the Netherlands. In 1596 he served in the expedition against Cadiz, but was soon again in Holland, where he was made general of Elizabeth's forces. During

1599-1604 he added to his reputation by victories at Bommel and Nieuport, and by his defence of Ostend. He died in London, Aug. 28, 1609. Vere's leisure was occupied in writing his Commentaries, published in a popular edition in 1883.

Vere, SIR HORACE (1565-1635). English soldier. Younger brother of the above Sir Francis, he went

Sir Horace Vere,
English soldier

to the Netherlands in 1590 and on the expedition to Cadiz in 1596, when he was knighted. He distinguished himself under his brother at the battle of Nieuport and the defence of Ostend, and in 1604 succeeded Sir Francis in command of English forces there. In 1620 he was chosen to lead a body of English soldiers to the aid of Frederick, elector palatine; he landed in Holland, and was soon participating in the Thirty Years War, but after a fine and prolonged defence of Mannheim was forced to surrender to Tilly in 1622. He died suddenly at Whitehall, May 2, 1635.

Vereczke Pass OR **VERECKY PASS**. Way over the Carpathian Mts. In Ukraine S.S.R., it is on the old frontier between Poland and Slovakia, and carries the rly. between Lvov and Budapest. Its alt. is 2,750 ft.

Vereeniging (Afrikaans, union). Town of the Transvaal, S. Africa. At 4,750 ft. above sea level, it stands on the Vaal 49 m. by rly. S. of Johannesburg, and has a pop. of 11,500 Europeans and 29,000 others. This is the principal coal-producing centre in the Union, and has plentiful hydro-electric power, iron and steel works, saw-mills, and factories making drills, nuts and bolts, bricks and tiles, and farm implements. The govt. maintains a pasture research station, and there are up-to-date municipal buildings. Vereeniging was laid out in 1892, was the venue of a conference which led to the Anglo-Boer treaty (v.i.) ten years later, and received municipal status in 1905.

Vereeniging, TREATY OF. Peace signed between Great Britain and the representatives of the two Boer republics, Transvaal and Orange Free State, May 31, 1902. The terms included the annexation of the republics by Great Britain; all in arms were to sur-

render; and all who took an oath of allegiance to the king were to be returned to their homes. £3,000,000 was given to the Boers as compensation for the destruction of their farms, and the Dutch language was allowed in schools and law courts. Great Britain undertook to grant a civil administration to the two colonies at an early date, and to respect the liberty and property of the Dutch. As the treaty was actually signed at Pretoria, it is sometimes called the treaty of Pretoria. See *South African War*.

Vergennes, CHARLES GRAVIER, COMTE DE (1717-87). French diplomatist. Born at Dijon, Dec. 28, 1717, he was minister at Treves, 1750, and in 1755 ambassador at Constantinople, where he proved slow in following Choiseul's instructions to secure Turkish aid for Poland, and was recalled, 1768. He then held the embassy at Stockholm, 1771, but his real work for France was done as foreign minister from 1774. Vergennes concluded the treaty with America against England, 1778, and those of Teschen, 1779, and Versailles, 1783. As chief of the finance council, 1783, he concluded the Eden treaty (q.v.) with England, 1786; and having secured the appointment of Calonne (q.v.) died at Versailles, Feb. 13, 1787.

Vergil. Publius Vergilius Maro, the great Roman poet, is entered in this work as Virgil.

Vergil, POLYDORÉ (c. 1470-c. 1555). Anglo-Italian historian. He was born at Urbino, to whose duke he became secretary. He wrote *Proverbiarum Libellus*, 1498, and *De Inventoribus Rerum*, 1499, translated into English by J. Langley, 1546, new ed. 1868. Sent to England as a collector of Peter's pence, he was appointed rector of Church Langton, Leics, 1503. Naturalised in 1510, he was imprisoned in 1515 for offending Wolsey. Vergil published the first edition of *Gildas*, 1525; next year came his treatise *De Prodigis*; and in 1534, in Latin, that History of England from the Earliest Times to the 16th Century which is his chief monument. A tr. of part of the History, ed. Sir H. Ellis, was published by the Camden Society, 1844-46. Vergil returned to Italy about 1550, and died at his native town.

Comte de Vergennes,
French diplomatist
After A. Callet

Aubrey de Vere,
Irish poet
Fred Hollyer

Vergniaud, PIERRE VICTORNIEN (1753-93). French revolutionary. Born at Limoges, May 31, 1753, he was educated at the Collège du Plessis, Paris, and became

Pierre Vergniaud, French revolutionary

a barrister at Bordeaux, 1781, entering the legislative assembly in 1791. He became its president in Oct., 1792, being also leader of the Girondin club. An orator of remarkable power and classical style, and an uncompromising enemy of the monarchy, he supported the declaration of war against Austria and Prussia, and stood against the September massacres. Vergniaud made his mistake in consenting to the death sentence on Louis XVI. He could thereafter do nothing to check the Terror, and opposition to Robespierre led to his arrest with the other leaders in June, 1793. Tried in Oct., he was guillotined on the 31st. *Pron.* Vairnyô.

Verhaeren, ÉMILE (1855-1916). Belgian poet. Born at St. Amand, near Antwerp, May 21, 1855, he was educated at Ghent, and studied law at Louvain university. There as founder of the review, *La Semaine*, he showed poetic gifts, and he was a leader of the literary revival in Belgium centering in *La Jeune Belgique*. He published his first book of verse, *Les Flamandes*, 1883. Other volumes include *Les Moines*, 1886; *Les Soirs*, 1888; *Les Campagnes Hallucinées*, 1893; *Les Villes Tentaculaires*, 1896; *Toute la Flandre*, 1904-11; *Les Rhythmes Souverains*, 1910; and largely inspired by the First Great War, *Les Ailes Rouges de la Guerre*, 1916. Verhaeren was accidentally killed in Rouen rly. station, Nov. 27, 1916. He was in many ways the most distinctive and powerful of modern Belgian writers.

Émile Verhaeren, Belgian poet

Verity, HEDLEY (1905-43). English cricketer. Born at Rawdon, near Leeds, May 18, 1905, he first appeared for Yorkshire in 1930 and gradually succeeded W. Rhodes (*q.v.*), on whose style he had modelled his slow left-arm bowling. In 10 seasons of cricket he took 1,956 wickets at an average cost of

14.87 runs each, figures which created a record among bowlers of his type. He played in 40 test matches, first going to Australia in 1932. Among his world records were 17 wickets in a day, 1933; 14 in a day in a test against Australia, 1934; all 10 wickets for 10 runs, 1932. In his last first-class match, 1939, he sent seven batsmen back for 9 runs. Verity's best season, 1936, brought 216 wickets and 855 runs, and for some weeks he headed the batting averages. The perfect stylist, he finished top in the bowling averages in 1930 and 1939, and never lower than fifth. He died of wounds received in action in Italy, July 31, 1943.

Verkhoyansk. Capital of a province in Yakutsk A.S.S.R., Asiatic Russia. On the Yana, it is reached by air services from Yakutsk. Here the mean Jan. temperature is -61° F., and that of July is 60° F., which gives a mean range of 121°, the largest in the world.

Verlaine, PAUL (1844-96). French poet. He was born at Metz, March 30, 1844. After a short period as a clerk, he began publishing poems influenced by Baudelaire, which won him fame among those who came to be known as the Decadents. *Poèmes Saturniens*, 1865, were followed by *Fêtes Galantes*, 1869, and *La Bonne Chanson*, 1870. As a result of activities during the Paris Commune, 1871, he went into exile in England and elsewhere with Arthur Rimbaud (*q.v.*). In 1874 he published *Romances sans Paroles*. In Belgium Verlaine quarrelled with Rimbaud, fired a pistol at him, and in consequence spent two years in prison at Mons. The alcoholic Bohemian artist emerged

Hedley Verity, English cricketer

Paul Verlaine, French poet

a devout Catholic, and after another sojourn in England as a teacher of French, he settled in Paris, in broken health and poverty.

In 1881 Verlaine issued *La Sagesse*, tender religious poems reflecting his new spirit; this was followed in 1884 by a volume of prose criticism, *Les Poètes Maudits*, and a further book of poems, *Jadis et Naguère*, 1885. Later

works included *Amour*, 1888; *Parallèlement*, typifying the duality of the poet in strange alternations of verses on sin and repentance, 1889; *Bonheur*, 1891; *Dédicaces*, 1894; *Confessions*, 1895. Only just before he died Jan. 8, 1896, was Verlaine acclaimed one of the greatest French lyric writers. His *Oeuvres Complètes* were published in 1899-1900.

Bibliography. *Life and Work*, E. Lepelletier, Eng. trans. 1909; *Derniers Jours de Paul Verlaine*, F. A. Cazals and G. Le Rouge, 1923; *Poet under Saturn*, M. Coulon, Eng. trans. 1932; *Life*, H. Nicolson, new ed. 1934.

Vermeer, JAN (1632-75). Dutch painter. Johannes Van der Meer was born in Delft, christened Oct. 13, 1632, and at 15 apprenticed to the guild of S. Luke there. After his marriage to Catherine Bolenes in 1653 his name was entered on the guild's books as a master-painter. A pupil of Fabritius, he was probably employed at the Delft faience factory. As a painter he was appreciated during his lifetime, but far less for a century after his death, which occurred at Delft, Dec. 13, 1875.

Among the finest Dutch masters, he painted chiefly portraits and genre-like compositions of two or three figures, and an occasional landscape. He is unsurpassed in technique: bright red, blue, white, yellow, and black are miraculously combined to produce a luminous effect. He invented a technique of underpainting, probably a thin coat of tempera on water-colour covered by a layer of varnish, on top of which the oil colour was applied. His figures show little movement; their gestures appear to reflect their tranquil lives. Modern scholarship recognizes only 41 pictures as definitely by Vermeer. The most famous are *Head of a Girl*, and *View of Delft*, at The Hague; *Lady at the Virginals*, in the National Gallery; *The Music Lesson*, at Windsor Castle; *Girl with Pearl Necklace*, which was at Berlin, and *The Artist in his Studio*, at Vienna. The forgeries perpetrated by Van Meegeren in 1945 are mentioned under *False Antiquities*. A standard monograph on the artist is by C. Hofstede de Groot, 1909; and E. V. Lucas published a study, 1922.

Vermejo OR **BERMEJO** (Sp., *vermilion*). River of S. America. It rises near the border of Bolivia, and flows S.E. across the Chaco region of N. Argentina to reach the Paraguay after a course of 750 m. Its name arises from the colour of its flood waters.

Vermicelli (Ital., little worms). Italian food manufactured from a wheaten paste such as is used for macaroni, and pressed out into thin threads resembling worms. It is used chiefly in soups and puddings. See Macaroni.

Vermicide (Lat. *vermis*, worm; *caedere*, to kill). Substance made to kill worms, especially those in the intestines of men and animals.

Vermiculite. Name applied to biotite micas which have undergone alteration by hydrothermal solutions. Dark yellowish-brown in colour, the mineral expands more than ten times by exfoliation on heating. Vermiculite is mostly used for insulating interior walls of buildings against heat and sound, and for fireproofing; mixed with cement and gypsum, it makes partition walls, floors, and plasters. Finely ground, it may be used in oilless lubricants in place of graphite.

Vermilion. Variety of mercuric sulphide used as a pigment. It is prepared by subliming the black sulphide obtained by heating sulphur with mercury in an iron pan. The sublimation process is usually carried out in clay retorts, but an alternative wet process is more economical and is becoming more widely used. Vermilion is one of the permanent pigments, a brilliant scarlet in colour, and possessing great body and weight.

Vermin (Lat. *vermis*, worm). Name given to obnoxious insects and animals. It is usually regarded as including bugs, fleas, and lice; also rats and mice; while it is frequently extended to cover weasels, rabbits, and other animals destructive to game or crops.

Vermland or **VÄRMLAND**. Län or co. of Sweden. It extends N. of Lake Vänern along the boundary of Norway, and contains most of the valley of the Klar river. It forms the S. portion of the Swedish Highlands. Iron is mined in the S.E., and copper at Vittensten in the W. The wood-pulp industry is of importance. The three long Fryken lakes form a navigable waterway for shallow draught vessels. Area of dept., 7,427 sq. m. Pop. est. 273,166.

Vermont. State of the U.S.A. In New England, its area is 9,609 sq. m. It derives its name from the Green Mts. which extend throughout its length from N. to S., containing several peaks above 3,500 ft. The Connecticut, which forms the boundary with New Hampshire, is the only river of importance; part of the W. frontier is marked by Lake Champlain, in

which are several islands belonging to Vermont. More than a million acres are under cultivation for cereals, pasture land abounds, and dairy farming is valuable; butter, cheese, and maple sugar being among the chief commodities. The state produces about half the marble of the U.S.A., besides slate and granite. There are 34 state forests, continuously replanted since 1909. Vermont talc mines rank second in the country, while asbestos production exceeds that of all other states combined. When English imports of china clay were restricted in 1939, exploitation of Vermont deposits began.

As a result of heavy migration of Anglo-Saxon stock to the far W. and the Mississippi valley the pop. has been virtually stationary since 1830; it includes a marked French Canadian element. The Vermont frugality, taciturnity, and folk wisdom, exemplified in the poetry of Robert Frost (*q.v.*) or in the personality of the native Calvin Coolidge, are proverbial throughout the U.S.A. Vermont university and other institutions provide first-class education, and there are 87 public high schools. Two senators and two representatives are returned to congress; in politics this state, like Maine, is invariably Republican. Montpelier is the capital; other cities include Burlington and Rutland. There are c. 900 m. of rly. and 12 airports.

The first English settlements were made towards 1700, and possession of the district was disputed between New Hampshire and New York. Dissatisfied with their condition, the inhabitants declared themselves an independent state in 1777, and remained so until Vermont joined the 13 original states of the Union, 1791. Pop. 359,231. Consult V.: the Green Mountain State. W. H. Crockett, 4 vols., 1921.

Vermouth. Liqueur manufactured in or near Turin and in France. It is made from alcoholised white wine, aromatised with wormwood (Ger. *Wermuth*), gentian, oranges, angelica, etc., and sweetened. French vermouth, made by a complicated process of fortification from white Hérault wines, is "dry," and contains some 17 p.c. of alcohol. Italian vermouth ("It.") has slightly more alcohol, is "sweet," and in Italy is usually drunk with aerated water. Vermouth is one of the lighter liqueurs.

Vernal Grass (*Anthoxanthum odoratum*). Perennial pasture grass of the family Gramineae. A native of Europe, N. Asia, and N.

Africa, it has a creeping rootstock, and many erect stems. The leaves are flat and hairy. The flower cluster is oval and spike-like. There are only two stamens in each flower with large yellow or purple anthers. The plant gives off the characteristic odour of new-mown hay, such as is found also in wood-ruff, tonkabean, etc. Its name is due to early flowering, April to June. See Grass.

Verne, JULES (1828-1905). French author. Born at Nantes, Feb. 8, 1828, he early turned to

Jules Verne

writing, and soon found his special vein in the romance based on scientific discoveries, and invented extensions of them (which often anticipated later developments). Giving a sug-

gestion of verisimilitude to the wildest flights of his fancy, his stories depend for their interest entirely upon incident, and not at all upon characterisation. Nearly all have been translated into English, notably *Five Weeks in a Balloon*, 1870; *The English at the North Pole*, 1870; *Twenty Thousand Leagues Under the Sea*, which introduced Capt. Nemo and his submarine, 1870; *Around the World in Eighty Days*, 1873; *The Mysterious Island*, 1875; *From the Earth to the Moon*. Verne died March 24, 1905. His brilliance is shown by the fact that only H. G. Wells ever rivalled him as a narrator of scientific romance.

Verner's Law. Name given to a law regulating certain consonantal changes in the Teutonic languages, discovered by the Danish scholar Carl Verner. The original voiceless spirants k, t, p, in the middle of Germanic words, are represented by h, th, f, if the vowel next preceding carried the accent according to the Indo-European system of accentuation; if not, by the voiced g, d, b. Compare Skt. *satám* (hundred), Gr. *he-katon*, Lat. *centum*, Goth. *hundra*, Eng. *hundred*, where, according to Grimm's Law, th would have been expected for d. Brother (Skt. *bhrátor*) follows the rule, but father, mother (Skt. *pitár*, *mátar*) should be fader, moder, and in fact are so written in Old English. Analogy is probably responsible for the irregularity. Verner's Law is complementary to, and corrects, Grimm's Law. See Grimm's Law; Teutonic.

Vernet, ANTOINE CHARLES HORACE (1758-1835). French painter, usually known as Carle

Carle Vernet, French painter

Vernet. Born at Bordeaux, Aug. 14, 1758, son of C. J. Vernet (*v.i.*), he studied under his father and took the Prix de Rome, 1782. After a visit to Italy, he settled at Paris, and in 1788 was admitted to the Academy. He was an exceptional painter of horses, and rendered vast impressions of Napoleonic battles. He also did portraits, genre, and landscapes. He died Nov. 17, 1835.

Vernet, CLAUDE JOSEPH (1714-89). French painter. Born at Avignon, Aug. 14, 1714, he studied under his father and Adrien Manglard. He was in Italy almost continuously 1734-53, painting landscapes, and then returned to France to execute a series of French seaports, commissioned by the government. He died at the Louvre, Dec. 3, 1789.

Vernet, ÉMILE JEAN HORACE (1789-1863). A French painter. Born in Paris, June 30, 1789, he studied under his father, Carle Vernet, and F. Vincent. Having fought under Napoleon he found the most suitable subjects for his art in military portraits and panoramic battle pictures. The emotion is stereotyped, but the work was very popular. He died in Paris, Jan. 17, 1863. See Napoleon illus. p. 5965.

Verneuil, BATTLE OF. Fought Aug. 17, 1424, between the English and the French aided by a strong body of Scots. The English regent, John, duke of Bedford, was carrying on the war for his young nephew, Henry VI, while the French were striving to free their land from the invader. The rival armies met outside the little town of Verneuil. Whereas the French and Scots were 20,000 strong, the striking force being a body of 10,000 men-at-arms just landed from Scotland, the English were about 12,000. Attacking, the French and Scots were heavily defeated, and Verneuil was surrendered to the English.

Verney, SIR EDMUND (1590-1642). English courtier. Member of an old Bucks family, he was educated at Oxford, served in the Low Countries, and after travelling in France and Italy, settled at

court, being knighted in 1611. Attached to the household of Prince Charles in 1613, although a Puritan in religion, he accompanied him to Madrid, and in 1626 was made knight marshal of the king's palace. He sat in the short and long parliaments. He bore the royal standard at the battle of Edgehill, where he was killed, Oct. 23, 1642. His son, Sir Ralph Verney, fought on the parliament side in the war. A baronetcy was conferred on the head of the family in 1818.

Sir Edmund Verney, English courtier After Van Dyck

Vernier. Device applied to a scale to give accurate readings in fractions of the smallest division of the scale. A sliding caliper vernier is shown in the accompanying illustration, as engraved on the sliding jaw. The scale on the shaft gives measurements in tenths of inches. The vernier scale has ten divisions, together equal to

Vernier. Diagram of portion of a scale, reduced, showing a measurement of 1.07 in. See text

nine divisions of the scale; each therefore representing $\frac{1}{10}$ of $\frac{1}{10}$ of an inch. In the illustration the zero mark of the vernier has passed the inch mark of the scale, but has not reached the next $\frac{1}{10}$ inch mark. To decide the value of the fraction the vernier is consulted, and its 7 line is found to correspond exactly with a scale mark. It is evident that the 6 line of the vernier is $\frac{1}{10}$ of $\frac{1}{10}$ inch to the right of the nearest scale mark on its left; the 5 line, $\frac{2}{10}$ of $\frac{1}{10}$ inch; and so on to the zero mark, which is $\frac{7}{10}$ of $\frac{1}{10}$ inch beyond one inch. The reading therefore is 1.07 inch. If the vernier scale had 20 divisions equal to 19 of the scale, the difference would then only be $\frac{1}{20}$ of $\frac{1}{10}$ inch. Circular scales may also have attached verniers, which will in form be a short length of the circumference of the circle. The device is named after Pierre Vernier (d. 1637) of Brussels.

Vernis Martin. French name for a type of lacquer. So called from the four brothers Martin, who in the reign of Louis XV became famous for their lacquer work, vernis Martin was an improvement on Oriental lacquers, and not an entirely new invention. Vernis Martin work reached its greatest popularity during the 18th century. See Fan.

Vernon, H.M.S. The principal torpedo school of the Royal Navy. Originally housed in hulks moored in Portsmouth harbour, the school was moved to its present shore establishment in 1910, but is still rated as a ship. Officers and ratings attend for instruction in all branches of torpedo work, and there is a research establishment for the development of new weapons. Attached to H.M.S. Vernon is the mines school, which instructs in the arming and disarming of sea mines and in mine-laying. A party from H.M.S. Vernon dismantled the first German magnetic mine salvaged in the Second Great War.

Vernon. Town of France, in the dept. of Eure. It lies on the left bank of the Seine, 12 m. by rly. N.W. of Mantes-Gassicourt, and is a rly. junction. In the neighbourhood are mineral springs and quarries, and artillery engineering shops. To the N. stretches the Forest of Vernon, to the S. that of Bizy. Formerly a fortified town, the tower was built by Henry I of England, 1123. Here Aug. 26, 1944, the British made their first crossing of the Seine, during the liberation of France in the Second Great War. Pop. 11,242.

Vernon. Town of British Columbia, Canada. It is situated on the E. bank of Okanagan Lake, 50 m. S. of Sicamous, on the C.P.R. and C.N.R., and is the h.q. of the associated growers of British Columbia. It is the centre of a large irrigated fruit-farming district, and has a dehydrating plant and a number of fruit packing houses. Pop. 5,209.

Vernon, BARON. British title held by the family of Venables-Vernon. Its first holder was George Venables-Vernon, M.P., created a baron in 1762. From him the title passed to his son and other descendants. George, the 8th baron (1888-1915), died on active service during the First Great War, and his brother Francis William (b. Nov. 6, 1889), succeeded him as 9th baron. Lord Vernon's seat is Sudbury Hall, Derby.

Vernon, DOROTHY (d. 1584). Daughter and co-heir of Sir George Vernon, of Nether Haddon, Derbyshire, who from his wealth, lands, and generosity was called "king of the Peak." She married, after a legendary elopement, Sir John Manners (d. 1611), second son of the 1st earl of Rutland, and brought Haddon Hall to the Rutlands. She died June 24, 1584. Sullivan's opera, Haddon Hall, and several novels, were based on her romantic story. See Haddon Hall and illus.

Vernon, EDWARD (1684-1757). British sailor. Born at Westminster, Nov. 12, 1684, he joined the navy in 1701, served in the *W. Indies* and Mediterranean, and became rear-admiral at the age of 24. M.P. for Penryn, 1727-34, in 1739 he commanded a fleet to the Antilles, and captured Porto Bello. Unsuccessful operations against Cartagena and Santiago de Cuba followed, and he was again M.P. from 1741 until his death, Oct. 30, 1757. He introduced the issue of rum and water, called after his nick-name, Grog (*q.v.*).

Verona. Prov. of N. Italy, in Venetia. It is adjacent to Tirol and Lake Garda, and is drained by the

Adige. In the N. are the slopes of the Venetian Alps; the S. is a low level plain which yields rice, wine, and fruit. Its area is 1,185 sq. m. Pop. est. 500,000.

Verona. A city of N. Italy, capital of the prov. of Verona, in Venetia. It stands on a meander of the Adige, where the embanked river is crossed by 7 bridges, 72 m. by rly. W. of Venice. One of the fortresses of the quadrilateral, it is an important rly. junction.

In the large Piazza Vittorio Emanuele is the ruined amphitheatre, which dates from the time of Diocletian. On or near the Piazza are the municipal buildings, parts of the Roman walls, and the Museo Lapidario.

To the N. is the cathedral, which dates from 1187. The Castel Vecchio dates from 1355. Of the churches the most notable are the magnificent Romanesque basilica, San Zeno Maggiore (1139), San Fermo Maggiore with a fine façade, Santo Stefano, once restored by Theodoric the Ostrogoth, and the

Dominican church of Sant' Anastasia, a treasure house of pictures and sculptures. These were among 17 of the city's churches damaged in the Second Great War. The national museum and picture gallery are in the Palazzo Pompei. Cottons, flour, paper, nails, pianos, silks, soap, sugar, and candles have been manufactured. Wines, fruit, rice, and marble are the chief articles of trade. Pop. 153,708.

Verona became a Latin colony in 89 B.C., and was later a favourite residence of Theodoric, who enlarged and beautified the city. Taken by the Lombards, 568, it passed under the Frankish king Pepin. About 1250 it fell into the hands of the great Ghibelline family of Scaliger and passed to Milan, 1387, Venice, 1405, and Austria, 1797. The city became Italian in 1866. Catullus and Paolo Veronese were natives. During the Second Great War Verona was entered by the Allied 5th army, April 26, 1945, when the Adige was crossed near the city. About a third of Verona had been destroyed by Allied bombing, and much more was wrecked by the Germans, who blew up all seven bridges over the river.

Verona arms

Verona, Italy. 1. Façade of the 12th century cathedral. 2. The Municipio, showing the ancient amphitheatre on the left. 3. The 14th century Ponte Scaligero, destroyed by the Germans, 1945. 4. Air view of the amphitheatre in the Piazza Vittorio Emanuele. It was erected by Diocletian about A.D. 290.

Verona. CONGRESS OF. Meeting of plenipotentiaries of France, Russia, Austria, Prussia, and Great Britain at Verona in 1822. Great Britain was represented by the duke of Wellington. Among the points discussed were the relations of Greece, Turkey, and Russia; the slave trade; the recognition of the new S. American republics; and the question of interference in Spain, where France was desirous of checking a democratic movement against the monarchy. On this matter Austria, Russia, and Prussia declared they would follow France in their diplomatic relations with that country, but Wellington took up an independent line, thus marking the departure of Great Britain from the principles of the Grand Alliance.

Veronal or DIETHYLBARBITURIC ACID, $(C_8H_{12}N_2O_4)$. White crystalline powder. It is an hypnotic, but is not much given now, as it has been responsible for a number of cases of fatal poisoning. The symptoms of poisoning are headache, drowsiness, deep coma, and often a rise of temperature. A rash on the skin may be present, and death may occur in from one to three days. Treatment is to wash out the stomach and give stimulants.

Veronese, PAOLO (1528-88). Italian painter, whose real name was Paolo Cagliari. Born at Verona, son of Piero di Gabriele Cagliari, a decorative sculptor, he studied under his father, and then, having shown a preference for painting, under Antonio Badilla. He soon achieved a reputation in historical painting, having painted frescoes for villas at Castelfranco, went to Venice, where he met Titian, and by 1555 became the favourite decorative painter of the day.

Paolo Veronese,
Italian painter
Self-portrait

During 1560-62 he was in Rome, but his grandest works were painted in Venice, 1562-70. The Apotheosis of Venice is the most triumphant of his paintings in the great council chamber. His popular works include the Marriage at Cana (Louvre); the two great mural paintings of the martyrdom of S. Sebastian, in the church of that saint in Venice; The Family of Darius (National Gallery, London); The Supper at Emmaus (Louvre); and other multi-figured scenes that gave scope to his de-

light in sumptuous trappings of dress and architecture. Veronese died April 19, 1588, of pleurisy, in Venice. See Europa; Italy: Art.

Veronica. Genus of shrubs and herbs of the family Scrophulariaceae. They are natives of the N. temperate regions, including Great Britain, and of New Zealand, Australia, and Chile, ranging from a few inches to three feet in height, and bearing white, pink, or blue flowers. They thrive in any ordinary mixture of loam and peat, and are propagated by cuttings taken in spring, or division of the roots of the plants in autumn.

Veronica. Legendary female saint. It is said that, having been healed by Christ, she wiped His face when carrying the cross, and that an image of His features was miraculously imprinted on her kerchief. By its means she is said to have cured and converted the emperor Tiberius. The alleged kerchief is preserved in Rome, though Milan and Jaén also make claim to the honour. The name Veronica is a corruption of Berenice, the saint's name in early forms of the legend.

Verres, GAIUS (c. 120-48 B.C.). Roman provincial governor, notorious for his rapacity and cruelty. His government of Sicily, 73-71, was marked by such a degree of extortion that the inhabitants had him prosecuted at the end of his term of office. The prosecution was entrusted to Cicero, whose speech at the trial in 70 established his reputation as the most promising forensic orator of the day. So overwhelming was the evidence brought forward that Hortensius, counsel of Verres, threw up his brief, and Verres went into exile.

Verrocchio, ANDREA DEL (1435-88). Italian sculptor and painter. Born in Florence, his real name being de' Cioni, he probably studied under Donatello, and after a period in the shop of the goldsmith Giuliano Verrocchio, whose name he assumed, developed into one of the finest craftsmen of the Renaissance. He was the master of Leonardo da Vinci, and Pietro Perugino. He died in Venice. His best-known works are the heroic equestrian statue of Colleoni in Venice, and the bronze David, now in the Bargello, Florence. See Colleoni, B.

Andrea
del Verrocchio,
Italian sculptor

Versailles. Town of France, capital of the dept. of Seine-et-Oise. It stands on a plateau in a district of low wooded hills, 10 m. W.S.W. of Paris, with which there is a rly. connexion. The town is famed for its palace and park, but there are some miscellaneous industries, military and educational establishments, and nursery gardening. The cathedral of S. Louis, founded 1743, and the church of Notre Dame, 1684-86, are noteworthy.

Versailles arms

The palace and park lie to the N.W., three main avenues crossing the town to the Place d'Armes in front of the palace. A château of modest size, put up by Louis XIII in 1627, was the centre round which Louis XIV built the enormous edifice which, begun in 1661, became in 1683 the chief royal residence in France. It has a great central Cour Royale, from which depend lateral wings that surpass in length the central block. The chapel, which stands out in the front view by its distinctive style, dates from 1699-1710.

Among the best-known features of the interior are the Galerie des Glaces, in which William I was proclaimed German emperor, and the peace treaty of 1919 was signed; the bedroom of Louis XIV, 1701, and its fine antechamber; and the halls used since 1875 by the senate and chamber of deputies at an election of the president of the republic. There are also picture galleries, historical museum, etc.

The park, laid out by Le Nôtre, is a masterpiece of design, notable especially for its ornamental waters and fountains, the Trianons (q.v.), the orangery by Hardouin-Mansart, 1687, and fine alleys leading up to the Étoile Royale.

Obscure before the advent of Louis XIV, Versailles at his death, 1715, numbered about 100,000 inhabitants. The treaty of 1783, the meetings of the states-general in 1789 and the national assembly, the peace of 1871, voting of the republican constitution, 1875, and the treaty of 1919 are among historic events associated with the town. Pop. 70,141. See Fountain illus.; Louis XIV. Consult V. and the Trianons, P. de Nolhac, Eng. trans. 1906.

Versailles, TREATY OF. Treaty concluded at Versailles, Sept., 1783, between Great Britain on the one hand and France, Spain, and the U.S.A. on the other, thus ending

1. General view of the gardens, from the terrace. In the foreground is the Bassin de Latone, one of the ornamental fountains. 2. Main entrance, looking towards the principal courtyard containing the equestrian statue of Louis XIV. 3. Galerie des Glaces, the sumptuously decorated hall where William I was crowned German emperor in 1871, and where the treaty of Versailles was signed, June 28, 1919. 4. Grand Trianon, the villa built by Louis XIV in 1687-88 for Madame de Maintenon, and later associated with Napoleon I. 5. Petit Trianon, the smaller villa built by Louis XV for Madame du Barry, and subsequently a favourite resort of Marie Antoinette.

VERSAILLES: THE FAMOUS PALACE NEAR PARIS, INTIMATELY ASSOCIATED WITH MEMORABLE EVENTS IN EUROPEAN HISTORY

the War of American Independence (*q.v.*). Great Britain recognized the independence of the revolted American colonies, though retaining Newfoundland and certain fishing rights. All conquests of any importance on either side were restored, France thus regaining some W. and E. Indian possessions, but giving up New Grenada, St. Vincent, St. Kitts, and other places. Spain held Minorca and the Floridas, but ceded the Bahamas.

Versailles, TREATY OF. International treaty of peace, signed at Versailles, June 28, 1919, between the British Empire, the U.S.A., France, Italy, Japan, Belgium, Bolivia, Brazil, Cuba, Ecuador, Greece, Guatemala, Haiti, Hejaz, Honduras, Liberia, Nicaragua, Panama, Peru, Poland, Portugal, Rumania, Yugoslavia, Czechoslovakia, Siam, and Uruguay on the one part, and Germany on the other. The treaty was ratified Jan. 10, 1920, on which day its clauses came into operation. China, one of the Allies, refused to sign, and the U.S. senate rejected the treaty, so that the U.S.A. was not in the end a participant.

The terms were prepared by the Paris conference, which assembled Jan., 1919. The chief delegates were D. Lloyd George (U.K.), Clemenceau (France), Wilson (U.S.A.). The Germans did not accept the treaty until an Allied ultimatum had been delivered, then signed under protest.

Geographical Changes

The treaty established the League of Nations. Political clauses restored Alsace-Lorraine to France; and gave Posen and W. Prussia to Poland. Plebiscites were arranged to be taken to determine the futures of E. Prussia, Upper Silesia, Slesvig, and Malmédy and Eupen. The Saar Basin was ceded to the League of Nations, pending a plebiscite 15 years later. Danzig was also ceded to the League to become a free port, and Memel for eventual transfer to Lithuania. The German colonial empire was surrendered, mostly to Great Britain and France. Germany recognized the inalienable independence of Austria, Poland, and Czechoslovakia.

Military and naval clauses called for the occupation by the Allies for 15 years of German territory W. of the Rhine, Germany bearing the cost. E. of the Rhine an area of 50 kilometres, and the whole territory W. of the Rhine, were to

be wholly demilitarised. Germany was forbidden to possess any submarines, military or naval air force, tanks, armoured cars, or poison gas. Compulsory military service was to be abolished, and the army limited to 100,000. Heligoland and other fortifications were to be demilitarised and the German fleet surrendered except for 6 small battleships and 30 other craft. New warships could be built only within strict limits and the number of men serving in the German navy was not to exceed 15,000.

Reparations Clauses

In the reparations clauses Germany accepted responsibility for all loss or damage suffered by the Allies in the war, and a payment was required of £1,000 million in gold, goods, or ships before May, 1921, with large subsequent payments over 20 years. Devastated areas in France and Belgium were to be restored at Germany's expense, and all merchant ships of 1,600 tons and over, half of those with tonnage of 1,000–1,600, one quarter of her trawlers and fishing craft, and all ocean cables were to be surrendered. Other clauses demanded the surrender of animals, plant, and art treasures in reparation for those destroyed in the war; the opening of the Kiel canal to all shipping; and the trial "for a supreme offence against international morality" of the German ex-emperor.

Provision was made for the revision of the various clauses of the treaty as occasion demanded.

Almost from the moment of signing many of the most vital clauses of the treaty were a dead letter.

Some were utterly impracticable. The disarmament of Germany was evaded; the problem of reparations payments demanded the constant attention of experts with very little result, and after being defeated by the devaluation of the German mark, they were finally cancelled in 1932; the surrendered German fleet was scuttled at Scapa Flow; the Kaiser was never tried, and the only 12 German "war criminals" to be arraigned, who were of little importance, were either acquitted or escaped with trifling sentences. It was often said that the clauses of the Versailles treaty contained all the seeds of a second war. Above all, Germany resented the treaty's insistence on her guilty responsibility for the war. It was left to Hitler to flout the remaining clauses, to march into the demilitarised Rhineland with-

out protest in 1936; to annex Austria in 1938, and Czechoslovakia and Memel in 1939, to reintroduce compulsory military service (1935), and to rebuild the German air force, and (within the terms of the Anglo-German naval treaty of 1933 which tacitly ignored the provisions of Versailles) the German navy, including a powerful submarine fleet. See Dawes Plan; Germany; League of Nations; Reparations; Saar Basin; Young Plan.

Versailles Council. Allied military committee in the First Great War. It was the military section of the Allied Supreme Council formed in 1917, and it met usually at Versailles. The appointment of Foch to the supreme command made the Versailles Council of little subsequent importance.

Verse (Lat. *versus*, a furrow, from *vertere*, to turn). Universal medium of poetry. It denotes a series of syllables or sounds, ordered and measured in a particular way. The unit of measurement for this flowing or rhythmic movement is usually called a foot, since by the arrangement of these syllabic groups the character of the rhythm is determined; as it is in dancing, with which primitive poetry was associated, by the beat of the foot.

In the classical languages the unit or foot varied according to quantity, *i.e.* the distribution within it of the long and short syllables; but in modern languages the number of syllables and the incidence of the stress or accent determine the nature of the foot and so govern the metre. It is usual, however, in describing English verse to employ the classical terms, and, regarding stressed syllables as long and unstressed as short, to speak of iambic, trochaic, dactylic, or anapaestic verse.

Quantity as a governing principle never established itself in the Romance languages, since they sprang from spoken Latin, which was stressed, rather than from the literary language, to which in poetry the rule of longs and shorts was applied. These languages employed the syllabic principle, by which the number of syllables in the line is the chief determining factor, while the Teutonic peoples, to whom the principle of stress was familiar, since their own alliterative verse was governed by accent, made of that the ruling idea. Chaucer united in English, through his knowledge of French,

the syllabic with the native stress principle, and English poetry has since observed the rule of counting both, each foot containing one stressed and either one or two unstressed syllables, called therefore disyllabic and trisyllabic verse. Add to this rule another, that the natural accent of a word must not, when it is fitted into the rhythmic framework, be tortured or violated, and we have the elementary principles of English metre.

But within the simplest scheme there lie infinite possibilities of musical cadence and ripples of sound, due to alliteration, distribution of vowels, rhyme, and subtle fluctuations and inversions of stress, for which no rules can be prescribed. Rhythm in verse differs from rhythm in prose in that it can be anticipated. In all metres the mind foresees and the ear expects a certain scheme of recurrences, which constitutes the particular measure, and are satisfied when the expectation is met. But, provided that this scheme is sufficiently preserved to answer expectation, continuous and slight departures from it, a variety within the unity, are received with added pleasure. See Anacrusis; Anapaest; Dactyl; Iambic; Spondee; Trochee, etc.; also Blank Verse; Poetry.

Versicle. In church liturgies, a short verse spoken or sung by the priest and answered with a response by the choir and congregation.

Vers Libre (Fr., free verse). Term applied to poetry which is not based on any set metre or form. The supporters of *vers libre* claim that poetic expression is best achieved by the release of verse from the constricting influence of standard laws and measurements of composition, which tend to produce artificiality and often prolixity, and that the genuine

poetic impulse produces its own individual cadences and literary form. The *vers libriste* doctrines have had wide influence on contemporary poetry.

Verst. Russian linear measure. It is a little less than two-thirds of an English mile, precisely 3,500 ft.

Vert. One of the seven heraldic tinctures, green. It is represented in drawing by thin diagonal lines from dexter chief to sinister base. The French term sinople is sometimes used for vert. See Heraldry, colour plate.

Vertebra. Component bone of the spinal column. In man, the vertebrae are originally 33 in number. Of these, 24 remain movable, while five at the lower part of the spine unite to form the sacrum, and four small terminal bones constitute the coccyx. Each vertebra consists of a short cylindrical part or body, which is connected with the vertebrae above and below by an intervertebral cartilaginous disk. The vertebrae are divided into five groups—cervical, dorsal, lumbar, sacral, and coccygeal. The cervical vertebrae are the first seven, and are the smallest of the movable vertebrae. The dorsal or thoracic vertebrae are twelve in number, and support the ribs. The five lumbar vertebrae are the largest of the movable vertebrae. See Anatomy; Atlas; Coccyx; Sacrum; Spinal Column.

Vertebrates (Lat. *vertebra*, a joint). Group of the animal kingdom which includes all those animals that possess a backbone. It comprises the fishes, amphibians, reptiles, birds, and mammals, taking in about 32,000 recognized species. The phylum Chordata includes the vertebrates, and other forms which have a smooth elastic rod, called the notochord, instead of a jointed vertebral column. See Animal, colour plate.

Vertigo. Sense of instability and rotatory movement of the surroundings of the body. See Giddiness.

Vertue, GEORGE (1684–1756). English engraver and antiquary. He was apprenticed to an engraver

George Vertue,
English engraver
After J. Richardson

in London, and in 1709 was employed by Kneller to reproduce some of his portraits. Vertue brought out some 500 engraved portraits for books and plates, and travelled widely in England, taking notes and making sketches of places of historical interest. In 1717 he became engraver to the Society of Antiquaries. He died July 24, 1756. Among his principal works are the Historic Prints taken from Tudor pictures. He also collected material for a history of art which, bought by Horace Walpole, formed the foundation of that writer's *Anecdotes of Painting in England*. See Savoy illus. p. 7338; Stow, John; Throgmorton, Sir N.

Verulam. Town of Natal. It is 19 m. by rly. N.N.E. of Durban, is situated about 7 m. from the coast, and is the centre of important sugar, fruit, and tobacco plantations. Pop. est. 1,300.

Verulam, EARL OF. British title held since 1815 by the family of Grimston. William Luckyn (d. 1756), M.P. for St. Albans, having succeeded to the estates of his kinsman, Sir Samuel Grimston, Bart., took that surname. In 1719 he was made an Irish peer as Viscount Grimston. His descendant, James, 4th viscount (1775–1845), was made earl of Verulam in 1815. From him is descended the 5th earl, James Brabazon (b. Oct. 11, 1910). The earl is also a Scottish peer as Baron Forrester. An eldest son is known as Lord Forrester of Corstorphine, and the family seat is Gorhambury, St. Albans. See Bacon, Francis; Gorhambury.

Verulamium. Ancient British town in Herts, England, on the W. side of St. Albans. It was the capital of Tasciovanus, father of Cunobelinus (Cymbeline), and continued to grow and flourish after the Roman conquest of A.D. 43. It was destroyed by Boadicea in 61, but rose again and remained one of the chief towns of Britain until its decay and desertion at the time of the Anglo-Saxon invasions.

Verulamium. Foundations of main Roman gateway, as excavated 1930 near St. Albans, Herts. See also Archaeology illus.; Roman Remains illus.

Plan of Roman Verulamium, near St. Albans, Herts

Its successor grew up beside the abbey built in commemoration of one of its citizens, S. Alban (see St. Albans). Large-scale excavations begun by Dr. and Mrs. Mortimer Wheeler in 1930 revealed temples, houses, fine mosaics, and the bases of two triumphal arches. The site of part of the Roman city is now a public park, and the theatre has been preserved.

Verviers. Town of Belgium, in the prov. of Liège. It lies on the Vesdre, 17 m. by rly. E. of Liège, and has two rly. stations. The main industry is in wool; chocolate, confectionery, and leather industries are also carried on. The origin of Verviers is traced to the 7th century; it was owned by the margraves of Franchimont and obtained a charter in 1651. It was occupied by the Germans in the First and Second Great Wars. Pop. est. 40,296.

Vervins. Town of France, in the dept. of Aisne. It stands in the Vilpion valley, on the Laon-Hirson rly. line, 24 m. by rly. N.E. of Laon. There are textile industries, notably sack making. Vervins was the old capital of Thiérache, a dist. of Picardy, and was burnt by the Imperial army in 1521. The Germans held it for most of the First and Second Great Wars. The treaty of Vervins, 1598, was signed by Henry IV of France and Philip II of Spain, the latter restoring Calais, Ardres, Le Catelet, and other acquisitions to France.

Very Light. Type of firework much used for military, aerial, and naval signalling by showing a coloured light. The signals, fired from a special large-bore pistol, are made up in cardboard cartridges with a brass base, which contain a charge of black powder as the

propellant and above that a coloured star, a package of composition similar to that used for flares. A piece of quick-match and priming of mealed powder enable the star to be ignited from the propellant. See Fireworks.

Vesicant (Lat. *resica*, blister). Medicinal agent used to produce blisters as counter-irritants to inflammation, e.g. cantharides. The term is also applied to gases used in warfare, which produce blisters on the skin. See Chemical Warfare.

Vesicle. In medicine, small swelling on the skin containing serum. It is characteristic of certain eruptive diseases, e.g. chicken-pox, herpes.

Vesle. River of France, in the depts. of Marne and Aisne. It rises N. of Châlons-sur-Marne and flows N.W., joining the Aisne 6 m. due E. of Soissons. In its valley there was fighting in connexion with the German thrusts for Paris and the Allied counter-offensive of 1918. See Aisne; Marne. *Pron.* Vail.

Vesoul. Town of France, capital of the dept. of Haute-Saône. It lies on the river Durgeon, 39 m. by rly. W. of Belfort, and is a rly. junction. There is an agricultural trade, and files, paper, emery paper, and foodstuffs are manufactured. The 18th century church of S. George and palais de justice are notable. Vesoul suffered in the wars of the 14th century, and later in the French and Spanish wars, changing hands several times in 1569. It passed to the French by the treaty of Nijmegen, 1678. In occupied France from June, 1940, it was the scene of heavy fighting when U.S. troops of the 7th army reached it Sept. 11, 1944, in the Allied advance, against fierce German resistance, towards the Belfort Gap. Pop. 11,825.

Vespasian (A.D. 9-79). Roman emperor, 69-79, whose full name was Titus Flavius Sabinus Vespasianus. A

Vespasian, Roman emperor

man of obscure family, born Nov. 18, 9, he rose to high military commands in Germany and Britain, and was in charge of the war against the Jews dur-

ing the confusion which followed the death of Nero in 68. On July 1, 69, he was proclaimed emperor by his troops, and his general Primus defeating in Italy the forces of the reigning emperor Vitellius, Vespasian came to Rome in 70, leaving his son Titus to continue the war against the Jews.

Vespasian was above all a soldier, whose reign was marked by further extension of the Roman power in Britain, where N. Wales and Anglesey were annexed, and the rebellion started by the dead Boadicea put down. There was heavy fighting also in Germany, where the Roman dominion was further consolidated. At home, Vespasian devoted himself largely to setting in order the finances of the empire, which had suffered grievously under his extravagant predecessors. Economies, however, did not prevent him from erecting numerous public buildings; he began the Flavian amphitheatre, and built the magnificent temple of Peace. He died June 23, 79. See Colosseum; Rome; Sesterce. *Consul* V. and some of his contemporaries, C. Longford, 1928.

Vespers. Sixth canonical hour of the divine office as given in the breviary of the R.C. church. It consists of psalms, lessons, hymns, etc., varying day by day through the year, and is recited daily by all clergy and religious of both sexes. The term is also loosely applied to any evening service in church. The Sicilian Vespers (*q.v.*) was a massacre of the French conquerors of Sicily, at Palermo, Mar. 30, 1282.

Vespucci, Amerigo (1451-1512). Italian navigator. Born in Florence, March 9, 1451, he was

Amerigo Vespucci, Italian navigator

educated in that city and was employed in the business house of the Medici. In 1492 he set up for himself at Seville and entered into the commerce then beginning with the New World. He made several voyages thither in Spanish and Portuguese vessels, and gained acquaintance with the little-known coasts of S. America. He spent the remainder of his life making charts and maps of the New World, and died in Seville, Feb. 22, 1512.

During his voyages, which were described in a now lost letter to the Medici family, Vespucci appears to

have explored the N.W. coast of the S. American continent, which he was stated to have visited June 16, 1497, eight days before the arrival of Cabot. On the publication of his travels, by Martin Waldseemüller, 1507, a public claim was made that Vespucci had discovered the mainland, which was accordingly named after him, and though the matter was long in dispute and has latterly been decided against him, Amerigo's name, originally given to a small strip of land on the Gulf of Mexico, was eventually extended to the whole of the New World. *Consult* A. V.: Pilot Major, F. J. Pohl, 1945. *Pron.* Vespootchee.

Vesta. In Roman mythology, Italian goddess of the hearth. She was later identified by the Romans with the Greek goddess Hestia, whose attributes were similar. The worship of Vesta was a recognition of the supreme importance of fire in primitive communities. A temple, the Atrium Vestae, was maintained in her honour in the Forum. According to tradition, this sacred fire was brought from Troy by Aeneas (q.v.).

Vesta. One of the asteroids. It was discovered by Olbers, March 29, 1807, the fourth in order to be found, and is the brightest known of the asteroids. It can occasionally be seen by the naked eye and has an approximate diameter of 240 m. It revolves round the sun in about 1,326 days. *See* Asteroids.

Vest Agder. Fylke or co. of Norway, formerly known as Lister and Mandal. It terminates in the

Vestal Virgin. A statue of a priestess in the National Museum, Rome

Naze (Lindesnaes) and has an indented coast on the North Sea. Christiansand is the chief town. The area of the co. is 2,793 sq. m. Pop. 93,326.

Vestal Virgin. Priestess of the temple of Vesta in ancient Rome. The Vestal virgins were six in number, entered the service of the goddess at from six to ten years of age,

and were either offered by their parents or chosen by lot from families selected by the Pontifex Maximus. Service lasted for thirty

years in all, after which period they were free to return to civil life. During their service they were vowed to chastity, and if they broke this vow they could be buried alive by the Pontifex Maximus. Their chief duty was the maintenance of the sacred fire in the temple. The vestal virgins were abolished by Theodosius in 394. *See* Rome; Vesta.

Vesteraalen Islands. Name sometimes applied to Andö, Hindö, and Langö, the three largest of the Lofoten Islands (q.v.).

Vesterbotten OR VÄSTERBOTTEN. Län or co. of Sweden; the central co. of Norrland. It lies between Norrbotten on the N. and Jamtland and Västernorrland on the S., and between Norway and the Gulf of Bothnia. Lumbering is the chief industry. Umeå is the capital. The area of the co. is 22,839 sq. m. Pop. est. 228,627.

Västernorrland OR VÄSTER-NORRLAND. Län or co. of Sweden. It lies between Jamtland and the coast of the Gulf of Bothnia, and between Vesterbotten and Gefleborg. Lumbering is the chief industry. Wood pulp is exported from Hernösand the capital, Sundsvall, and other ports. The co.'s area is 9,925 sq. m. Pop. 274,080.

Vestfold. Fylke or co. of Norway, formerly known as Jarlsberg and Larvik. It lies on the W. side of Oslo Fjord, opposite Östfold. Larvik is the chief town. Its area is 903 sq. m. Pop. 145,027.

Vestigial Structure. Any part of the body which, once in full function, now remains only in trace and without use. Such are the appendix in man, once an active part of the intestinal tract, as it still is in the horse; and the pineal eye, a rudimentary eye, now useless, in certain lizards.

Vesting Order. Order made by an English court, generally by the chancery division, transferring the legal estate in any kind of property to a person equitably entitled to it. Such an order often saves much time and trouble and the cost of many deeds and documents.

Vestmanland OR VÄSTMAN-LAND. Inland län or co. of Sweden. It extends N. from Lake Mälär to Kopparberg between Uppsala and Örebro. Iron is mined in the W. and N., and silver has been mined at Sala since the 15th century; pig iron and iron goods are produced in several towns. The area is 2,611 sq. m. Pop. est. 187,198.

Vestments (Lat. *vestire*, to clothe). In an ecclesiastical sense, garments worn by clergy, choir,

and their assistants over ordinary dress during divine service. Vestments worn by officiating clergy are sometimes called canonicals, because prescribed by canon law. Particular references will be found under the entries alb, amice, cassock, chasuble, chimere, cope, dalmatic, hood, maniple, mitre, rochet, stole, surplice, etc. The idea that clerical vestments were derived from Jewish practice has given way to the view that they had their origin in the ordinary dress of the Roman empire, being originally, however, of more costly material, and usually white, though scarlet stripes on the deacon's dalmatic were known in the 10th or 11th century, and black was used for mourning and on certain other occasions. *See* Ornament; Ritualism.

Vestris, GAETANO (1729-1806). Italian dancer and choreographer. This Florentine made his début at the Paris Opera in 1748 and was *maître de ballet* there during 1770-76. With his extensions to the technique of male dancers, he ranks among the creative figures of ballet. His wife, Anna Heiner (1752-1808), was the inventor of the pirouette.

Vestris, LUCIA ELIZABETH (1797-1856). British actress and opera-singer. Daughter of Gaetano Bartolozzi (1757-1821), engraver, she was born in London. In 1813 she married the Italian dancer Auguste Armand Vestris (1787-1825), from whom she separated in

Lucia Vestris, British actress

1816. A year earlier she made her first appearance in opera. She acted in Paris, 1816, at Drury Lane, 1820, and won popularity in light comedy and burlesque in London and the provinces. In 1831, with Maria Foote, she opened the Olympic Theatre, London, and in 1838 married Charles James Mathews, with whom she visited the U.S.A. and assisted in the management of Covent Garden Theatre, 1839-42, and the Lyceum Theatre, 1847-54. Retiring in 1854, she died Aug. 8, 1856.

Vestry (Lat. *vestiarium*, wardrobe). Room attached to a church in which the vestments are kept. Qualified parishioners used to meet in vestry to consider parish affairs, and the name was applied to the meeting itself. The vestry in this sense now consists of the

Vesuvius. The Italian volcano on the shore of the Bay of Naples seen during a minor eruption

incumbent, the ratepayers, and occupiers of rated premises. At one time the vestry exercised wide powers, secular as well as ecclesiastical; e.g. they elected parish officials such as the assessor and collector and surveyor of highways. They have long since lost their secular powers, and the ecclesiastical have been greatly reduced. In 1921 all authority over affairs of the church, except the election of sidesmen and churchwardens and the administration of charities, was transferred to the parochial church council; and in 1933 in urban areas any remaining powers were with similar exceptions given to the borough or urban district council. See Ecclesiastical Law.

Vesuvianite. Alternative name for the mineral idocrase (*q.v.*).

Vesuvius. Volcano in Italy. It rises to a height of about 3,890 ft., 10 m. E.S.E. of Naples, on the shore of the Bay of Naples. It is a solitary height about 30 m. round, the base rising from the plain of Campania, and has two summits, the nearly perfect cone of Vesuvius and the old semicircular ridge of Somma which encloses the central cone.

The mt. is composed of tuffs or volcanic ashes, interstratified with lava flows. Among ejected blocks found on its slopes are pieces of Apennine limestone derived from the underlying basement rocks. Before A.D. 79 the crater formed a deep depression, and its slopes were obscured by thick forests. The vicinity was thickly peopled, as its volcanic nature was not suspected. On Aug. 24, 79, an eruption destroyed the top of the

mt., and Pompeii and other towns were buried under ashes, while Herculaneum was overwhelmed by a torrent of mud.

Subsequent explosions occurred at later dates; in 472 ashes reached Constantinople, and in 1036 the first outflow of lava appeared. In more recent eruptions the shape and size of the mountain have been modified, and in the intervals between them the

Vetch. Spray of flowers and leaves of *Vicia sativa*; inset, seed pods

inhabitants of the dist. have encroached on the dread area only to suffer; 18,000 people perished in 472, Torre del Greco suffered in 1631, 1794, and 1861, Torre Annunziata and other villages in 1631 and 1906.

A wire rope rly. connects the summit with the base; an observatory is maintained near the cone, whence warnings are issued of variations in the crater's quiescent condition, and expeditions start to investigate the problems of volcanism and seismography. Vesuvius and neighbouring volcanoes indicate a line of

fracture or weakness in the earth's crust, which marks the E. edge of the sunken land below the basin of the W. Mediterranean. Grapes are grown on the slopes for the wines *lacrima Christi* and *vino greco*. See Cone; Crater; Naples; Volcano. Consult *Volcanoes*, G. W. Tyrrell, 1931.

Veszprém. Town of Hungary, capital of the co. of the same name. It is 60 m. S.W. of Budapest and 7 m. N.W. of Lake Balaton. It is the seat of a bishop, and has a 14th century cathedral. Wines and fruit are produced in the locality. During the Second Great War it was captured from the Germans by Tolbukhin's 3rd Ukrainian army March 24, 1945, during a rapid advance to the S.W. of Budapest.

Vetch OR **TARE** (*Vicia sativa*). Annual herb of the family Leguminosae, the commonest of the British wild vetches. Widely cultivated as a fodder plant, it has several stems, with alternate leaves divided into five or six pairs of oval or oblong leaflets, and ending in tendrils by means of which the plant climbs up grass stems, etc. The pale purple stalkless flowers are either solitary or in pairs, and the long-slender pods are slightly hairy. See Kidney Vetch.

Veterinary Science. Science of treating the diseases of domestic animals. Formerly confined as a rule to diseases of animals bred for work, food, or sport, e.g. horses, cattle, sheep, pigs, and dogs, it was later extended to those of all pets, including birds. The main infectious diseases from which animals suffer, and which are treated by veterinary science, are rabies and distemper, peculiar to dogs; swine fever and swine erysipelas, in the pig; braxy and louping ill, peculiar to sheep; rinderpest and bovine pleuropneumonia that affect only cattle; and strangles and S. African horse sickness (only horses). Others, which attack more than one species, are quarter ill, glanders, actinomycosis, tetanus, foot-and-mouth disease, tuberculosis, anthrax, all except the first communicable to human beings.

This science is said to owe its origin to the Roman writer, Vegetius, who lived c. 300, and has been practised empirically by agriculturists of all countries and all ages, but not until the 18th century was it systematically studied. In 1761 a veterinary college was founded at Lyons, and the vast increase in scientific

knowledge that marked the 19th century made possible the veterinary surgeon of today. A portion of sums invested on totalisator betting at horse races may be devoted by the betting control board to veterinary science.

Veterinary Surgeon. One who studies the diseases of animals (including birds) and their cure. In

Royal College of Veterinary Surgeons arms

the U.K. the governing body in veterinary surgery is the Royal College of Veterinary Surgeons, incorporated by royal charter in 1844. The college is governed also by later charters and by several Acts of parliament, the most important of which are the Veterinary Surgeons Acts of 1881 and 1948. The college keeps a register of all persons who have qualified by passing its examinations or by holding degrees in veterinary science in certain universities approved for that purpose by the privy council. The council also keeps a supplementary register of persons not thus qualified but who, before the coming into full operation of the 1948 Act, were at least 28 years of age and had satisfied the council that they were of good personal character and had during the ten years preceding application for a total of seven years been engaged as their principal means of livelihood in diagnosing diseases of animals and giving them medical or surgical treatment. The period of seven years might be reduced for the benefit of persons in war service or work of national importance. A person not in either register is not allowed to practise veterinary surgery under penalty of £100 fine.

Unqualified persons may, except in certain cases, treat animals owned by themselves or by their employers or by members of their own household, and may render first aid. There are certain wider exemptions for persons engaged in agriculture. Employees of animal welfare societies may also be licensed by the ministry of Agriculture to give certain medical or other treatment or to perform specified minor operations in order to relieve pain.

A person not on the main register must not use the title veterinary surgeon and a person neither on the main nor on the supplementary register must not use the

title veterinary practitioner. Nor must a person use any name, title, description, etc., for himself, his business, or his premises calculated to lead to the belief that he has veterinary qualifications that he does not in fact possess.

The council acting through its disciplinary committee may remove the name of any person from either register on certain grounds—e.g. misconduct. An appeal lies to the high court. A practising veterinary surgeon is exempt from jury service.

The oldest school for the science in the U.K. is the Royal Veterinary College at Camden Town, London, N.W.1, founded in 1791. Affiliated to it are schools at Edinburgh, Glasgow, Dublin, Liverpool, Bristol, and Cambridge. See Royal Army Veterinary Corps.

Veto (Lat., I forbid). Term for the power of checking proposed legislation possessed by a king or body of men. In Great Britain the sovereign has not used his right of veto since 1707, and some authorities think that it has lapsed. In parliaments of two houses, one usually possesses the right of vetoing legislation passed by the other, and this was so in the U.K. until 1911. The Parliament Act that year reduced the lords' power of veto to two years. The Labour govt. introduced in 1947 a bill reducing the lords' veto to one year; thrice passed by the commons, thrice rejected by the lords, it received the royal assent, Dec. 16, 1949. The U.S. president has a veto on all legislation, unless the two houses jointly pass a vetoed measure by a majority of two-thirds. In the British dominions the only veto is that of one house over the other. The term veto was applied to the rule in the U.N. security council under which a negative vote by one of the five permanent members (U.K., U.S.A., U.S.S.R., France, China), outweighed any number of positive votes. Russia's use of the veto reduced the work of the security council virtually to nil. See *Liberum Veto*; *Parliament Act*; *United Nations*.

Vevey. Town and tourist resort of Switzerland. In the canton of Vaud, it stands on the

Veveyse, near its mouth on the Lake of Geneva, 11 m. by rly. E.S.E. of Lausanne. Steamers go from here to other places on the lake, and there is a funicular rly. up Mont Pélerin. Pop. 12,598.

Vexatious Indictment. Legal term for an indictment laid maliciously and without any possible grounds. At common law anyone could prefer an indictment to a grand jury against anyone. This power was restricted by the Vexatious Indictments Act, 1859, in regard to certain offences. In 1933 grand juries were abolished, and no indictment could be preferred unless the accused had been committed for trial or consent obtained from a high court judge; or, in the case of perjury, under the order of the person presiding over the court where perjury is alleged to have been committed.

Vexjö, VÄXJÖ, or WEXJÖ. City of Sweden, in the co. of Kronoberg. It is 58 m. direct W.N.W. of Kalmar, and has rly. connexions with Kalmar and Karlskrona. The 14th cent. cathedral is the chief building. There are iron foundries and match factories. Pop. 16,236.

Vézelay. Village of France. In the dept. of Yonne, it stands on a hill overlooking the valley of the Cure, 9½ m. W.S.W. of Avallon. A Benedictine abbey, founded in the 9th century, acquired the alleged relics of S. Mary Magdalene, and became a famous place of pilgrimage. Here, in 1146, the Second Crusade was initiated by the council convoked by Louis VII, and in 1189 Richard Coeur de Lion and Philip Augustus met before setting out on the Third Crusade. The sentences of Vézelay were promulgated by Becket against his opponents. The Romanesque abbey church of S. Madeleine, restored by Viollet-le-Duc, has a fine 11th cent. nave and Gothic sculptures. Prosperous in the Middle

Vevey, Switzerland. View of this tourist resort near the mouth of the Veveyse, on Lake Geneva

Ages, Vézelay is still surrounded by walls a mile in circuit.

Vézère. River of France, in the depts. of Corrèze and Dordogne. It rises in the Monts du Limousin, N. of the Puy de Meymac, and flows through a rocky valley in a S.W. direction to meet the Dordogne at Limeuil, joining the Corrèze near Brive. Among the towns on its banks are Uzerche, Terrasson, Le Bugue. Its length is 115 m.

Via Dolorosa (Lat., sorrowful road). Name, probably given during the Middle Ages, of a narrow street in Jerusalem, indicated by a doubtful tradition as the way along which Jesus carried His cross from the hall of judgement to Calvary. The 14 stations are marked by tablets. The term is applied also to this journey of Jesus, and in that sense was a favourite subject of the old masters, e.g. Raphael, Ghirlandajo, Ribalta.

Viaduct (Lat. *via*, way; *ducta*, led). Elevated structure, supported usually on arches, for carrying a road or rly. across a river, valley, or gorge. See Aqueduct; Holborn; Luxemburg illus. p. 5338.

Via Mala (Lat., bad road). Road in Switzerland, in the canton of Grisons. It occurs on the route over the Splügen Pass in a mt. gorge in the valley of the Hinter Rhine. Four m. in length, it passes between almost vertical limestone cliffs 1,600 ft. high, and crosses ravines by three high bridges, and in parts there are galleries and tunnels. Originally made in 1470, it was reconstructed with a width of 21 ft., 1818-24.

Vian, Sir Philip (b. 1894). British sailor. From Dartmouth he entered the navy, and achieved

Sir Philip Vian,
British sailor

celebrity in the Second Great War by rescuing in 1940 300 British seamen from the German prison ship *Altmark* (q.v.) when, as a captain, he commanded the destroyer *Cossack*. As an admiral he was in charge of convoys which ran the Malta blockade in 1942. Vian later covered the Sicilian and Salerno landings, 1943. He commanded the 1st aircraft carrier squadron in the Pacific during 1944-45, later becoming second-in-command of the British Pacific fleet. Appointed 5th sea lord, 1946, and deputy chief of naval staff (air),

1947, he was promoted admiral of the fleet, 1948, and appointed C.-in-C. home fleet, 1950. He was awarded the D.S.O. with two bars and was knighted in 1942.

Vianna do Castello. Dist. of Portugal, in the prov. Entre Minho e Douro. It has an Atlantic seaboard and is bounded on the N. by the Minho. The fisheries, salmon in the rivers, tunny and sardines in the sea, are valuable. Area, 814 sq. m. Pop. 258,596.

Vianna do Castello. Town and port of Portugal, capital of the dist. of the same name. It is at the mouth of the Lima river, 45 m. by rly. N. by W. of Oporto. Defended by the old Castello do S. Thiago, it is adorned by a Renaissance town hall, a cathedral, and other churches. The Campo da Agonia is a place of pilgrimage. Pop. est. 11,000.

Viareggio. Port and bathing resort of Italy, in the prov. of Lucca, Tuscany. It is 13 m. by rly. N.W. of Pisa and 33 m. by rly. S.E. of Spezia. Shelley's body was washed ashore here and cremated on the beach in 1822. There are shipbuilding yards and a school of navigation. In the Second Great War it was captured by the Allied 5th army Sept. 16, 1944. Pop. est. 28,000.

Via Sacra (Lat. sacred way). One of the most important streets of ancient Rome, probably so called from the numerous sacred monuments on it or in the neighbourhood. Beginning at the Capitoline Hill, it went past the Basilica Julia, and the temple of Castor and Pollux, crossed the Forum, ran along the N. of the temple of Julius Caesar, passing the temple of Antoninus and Faustina and the basilica of Constantine on the other side, and the arch of Titus at the S.E. end of the Forum, and thence to the Colosseum. During the empire the Via Sacra was carried as far as the Esquiline Hill.

Viaticum (Lat., provision for a journey). Administration of the Holy Communion to the dangerously sick or dying. The R.C. Church has a special formulary for this office, which is provided for in the Church of England by directions for The Communion of the Sick. In the ancient Church, both baptism and the Holy Eucharist were called *Viatica*.

Viborg. Town of Denmark, capital of the co. of the same name in Central Jutland. It is on the lake of Viborg, 38 m. N.W. of Aarhus and 140 m. N.W. of Copenhagen. The Romanesque granite cathedral, built 1130-69,

was rebuilt 1864-76; the bishopric dates from the 11th century. Pop. 20,084.

Viborg. Swedish name of the Karelo-Finnish town of Viipuri (q.v.).

Vibration. Regular oscillation or reciprocating motion set up in ether or matter by various forces. Such is the vibration of a violin string, the air of an organ pipe, etc. The simplest type of periodic vibration is known as a simple harmonic motion, and a vibration, or oscillation, or cycle, refers to a complete to-and-fro motion. The number of vibrations made by a body in one sec. is termed its frequency. See Ether; Heat; Light; Radio-activity; Wave; X-Rays.

Vibrator. Electrical device used in converting D.C. to A.C. Vibrators are used where radio sets are to be operated off a low-voltage battery, without a separate H.T. supply (e.g. car radio sets). They incorporate a vibrating reed carrying contacts and operated by a magnet coil in a similar manner to an electric bell or buzzer, so that the D.C. circuit is rapidly made and broken, producing a pulsating current. This can be applied to a transformer and stepped up as required, producing a high-voltage A.C. at the transformer secondary. This can then be applied to an ordinary rectifier, and re-converted into high-voltage D.C. Certain types of vibrator are arranged with additional contacts on the reed to which the A.C. supply is connected, being then rectified once more; the net effect is that D.C. can be transformed from one voltage to another in the small currents required for radio work with apparatus considerably smaller and simpler than a motor-generator set, which would otherwise be necessary. The term has also been used (as an alternative to trembler) for any form of vibrating contact.

Vicar (Lat. *vicarius*, deputy). In the Church of England, any incumbent of a parish, not a rector, entitled to solemnise marriages and keep the fees. Theoretically, the owner of the tithes is the rector, and the vicar is his deputy. Owners of tithes may be ecclesiastical corporations or laymen, to whom or to whose predecessors the great tithes of a parish have been granted. The vicarage is, strictly, the term used for the benefice, including house, glebe, fees, and offerings. It is commonly applied to the vicar's residence. Vicars-choral are the assistants of the canons or prebendaries of collegiate churches,

especially in connexion with the musical parts of divine service. In the R.C. Church, a vicar is one who represents the pope or bishop. One of the titles of the pope is Vicar of Jesus Christ. See Bishop; Curate; Ecclesiastical Law; Rector.

Vicar-General. Lay legal officer who acts as deputy of the archbishops of Canterbury and York in granting marriage licences: the institution of benefices, and the confirmation of bishops. He has under him a registrar, an apparitor, and chief clerk and record keeper. His office is 1, The Sanctuary, Westminster, S.W.1. Thomas Cromwell was appointed the king's vicar-general, vice-gerent, and chief commissary by Henry VIII in 1535; he was the only holder of that office.

In the R.C. Church, a bishop may appoint two or more vicars-general to assist him, and may assign to each jurisdiction over a particular district, or commit to one charge of contentious matters, to another voluntary jurisdiction, or give them all joint and full jurisdiction over the whole diocese, apart from offices coming under pontificalia.

Vicar of Bray. Title of a song written in the time of George I by an officer in the British army. Though telling of a vicar, supposedly of Bray, Berks, who lived in the reigns of Charles II, James II, William III, Anne, and George I, and who yet by change of faith retained his living, it is said to have in mind Simon Alleyn, or Aleyn, vicar of Bray, 1540-88. During the reigns of Henry VIII, Edward VI, Mary, and Elizabeth, he remained vicar by faith changing his faith between R.C. and Protestant.

Vicar of Wakefield, THE. Prose tale by Goldsmith, published 1766. The vicar, Dr. Primrose, narrator of the story, is by nature an admirer of human happy faces, and a firm believer that it is unlawful for a clergyman of the Church of England to marry twice. In addition to Deborah Primrose, his wife—for pickling, preserving, and cookery none could excel her—the characters include George, their eldest son; Olivia, open, sprightly, and commanding—victimised by Squire Thornhill; and Sophia, soft, modest, and alluring—who wins Sir William Thornhill, alias Mr. Burchell.

Vice. Implement with two jaws between which an object may be gripped and held fast while work is done upon it. The jaws may be held open by a spring, as in the watchmaker's pin-vice, or in the blacksmith's leg-vice, which is

bolted to a bench but has also a leg affording support from the floor. The pin-vice is formed from a single piece of steel, thinned down below the jaws to furnish the springy bow-shaped portion. In the leg-vice a separate spring between the jaws keeps them apart until the screw is operated to bring them together. A defect of both types is that the jaws open and close at an angle; the early-pattern hand-vice has the same drawback.

Vices used by engineers are made with a parallel action; one jaw usually is an integral part of a heavy slide which moves in and out horizontally in a socket of the base plate of which the other (fixed) jaw forms an integral part. The jaws are brought together by a screw of deeply cut square thread or buttress thread. In the pin-vice and hand-vice the screw is stationary, and a wing-nut applies pressure. In bigger types the nut is stationary, formed in the casting of the fixed jaw; the screw is turned with a tommy-bar to operate the movable jaw. In other vices the movable jaw is closed in by hydraulic action. Air-operated vices are used where a workshop has compressed air available for other tools.

The simplest vice used by woodworkers consists of two oblong plates of beechwood, one screwed to the face of the bench and the other moving horizontally on guide-rods. A stout screw of beech brings the loose jaw against the fixed one. A steel screw and nut are often used along with wooden plates. All-metal joiners' vices are taking the place of the earlier type. In these the complete vice, with steel or other metal jaws, is screwed or bolted to the bench. Often there is a quick-release action, so that work can be freed without running the screw back. Metal workers' vices also are made with quick-release.

Vice-Admiral. Officer in the British navy, next in rank above a rear-admiral. Upon his cuff he wears one broad gold stripe, with two narrow gold stripes above it, the upper stripe having a curl. His flag is the St. George's Cross with

Vice. Patterns in common use. 1. Carpenter's bench vice, with wooden jaws. 2. A revolving head and base vice. 3. Loose-jawed vice, with tail attached to floor. 4. Hand vice. 5. Pin vice

No. 2 by courtesy of, Abbotts, Birks & Co.

one red ball in the upper right-hand corner: The equivalent rank in the army and air force is lieutenant-general and air marshal respectively. See Royal Navy colour plate.

Vice-Admiralty Court. Tribunal formerly established in British possessions, holding jurisdiction over maritime matters. These courts were appointed under the great seal, and by an Act of 1863 dealt with all kinds of claims, piracy, prizes, etc. The Act was repealed in 1890, and the vice-admiralty courts were superseded by courts set up in the various colonies, which exercises unlimited jurisdiction in all Admiralty matters.

Vice-Chancellor. Deputy of a chancellor. In the English legal system, the vice-chancellors, originally assistants to the lord chancellor, became prominent equity officials. The title was discontinued in 1873, and the last vice-chancellor was Sir James Bacon (1798-1895). The judge of the court of the duchy of Lancaster is called the vice-chancellor. The office is an important one in English and other universities, where the vice-chancellor, as representing the chancellor, is the acting head of the university. At Oxford and Cambridge he is selected according

to seniority from among the heads of houses; normally he serves for four years. The death in office of W. F. S. Stallybrass, vice-chancellor of Oxford, in 1948, created a situation without precedent. At Manchester, Leeds, and other universities the official is appointed for life.

Vicente, GIL (c. 1470-1540). Portuguese dramatist. A native of Guimarães, he studied law at Lisbon university, but turning to literature, became attached successively to the courts of Manoel I and John III, for whom he provided dramatic entertainments. He wrote 44 plays, some in Spanish, some in Portuguese, and others in both. His work, representing the transition from the medieval to the modern drama, consists of religious plays, including the famous *Auto of the Soul*, 1508, tragicomedies for the court, and popular comedies and farces like *Ígnez Pereira*, 1523. He portrayed many national types and satirised the corruptions of Church and society. *Consult Life*, A. F. G. Bell, 1922.

Vicenza. City of Italy, capital of the Venetian prov. of Vicenza. It stands at the confluence of the Retrone and Bacchiglione, 41 m. by rly. W.N.W. of Venice. The old city, which has seven bridges across the rivers, is girdled by a moat and half-ruined walls. Many of its buildings were designed by Palladio, a native; the Basilica Palladiana surrounding the Palazzo della Ragione has a slender campanile 265 ft., the Rotonda Palladiana shows a Greek colonnade, the wooden Teatro Olimpico (1584) has curious permanent scenery on the stage. On Monte Berico, S. of the city, rises the pilgrimage church of Madonna del Monte. Silk and silk goods are the chief product; straw hats, woollens, leather, and musical instruments are also made. There is a trade in wine, wheat, and vegetables. Pop. (1936) 69,379.

Known to the Romans as Vicetia, the place in the early Middle Ages was the capital of a Lombard duchy. It joined the Lombard League against Barbarossa in the 12th century. Successively under the

control of the city of Padua and the families of Scala and Visconti, it became subject to Venice in 1404. In the Second Great War the cathedral was wrecked, six churches suffered damage, and a score of palaces were wholly or in part destroyed by fire as a result of Allied air attack on the Vicenza rail-yards in the spring of 1945.

Vice-President. American officer of state. He is elected every fourth year at the same time and in the same manner as the president, the two being voted for on a joint ticket. His only official duty is to preside over the senate, but without a vote except in case of a tie. By custom he often represents the president at social functions. His salary is \$15,000, together with various allowances. Although the normal duty of a vice-president is slight, occasions arise when it becomes of supreme importance. "In case," says the constitution, "of the removal of the president from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the vice-president." The following have stepped into the White House on the death of the president: Tyler (1841), Fillmore (1850), Johnson (1865), Arthur (1881), T. Roosevelt (1901), Coolidge (1923), H. S. Truman (1945).

Viceroy (Lat. *vice*, in place of; Fr. *roi*, king). Term used for one

who governs on behalf of a sovereign. The governor-general of British India was usually called the viceroy, as was the lord-lieutenant of Ireland until 1922. The last viceroy of India was Earl Mountbatten, appointed 1947. The Spanish king's representatives in Naples and America were officially styled viceroys. The feminine is vice-reine.

Vice Versa. Title of a humorous fantasy by F. Anstey (*q.v.*), published 1882. Paul Bultitude, a City man, is granted his heedless wish to be a schoolboy again, and for a time changes bodies, but not minds, with his son Dick. The father goes away to the son's private school while the son mis-manages the father's business. A stage version, by Edward Rose, was produced at the Comedy Theatre, London, 1910, a film version (with Roger Livesey) 1948.

Vich or **VIQUE**. City of Spain, in the prov. of Barcelona. It is 38 m. by rly. N. of Barcelona, in a hill-encircled plain, with quaint houses which straggle up the slopes. The cathedral, built in 1040 and repaired 1803, has beautiful tracery to its cloister windows. The museum of art and archaeology has prehistoric, Greco-Roman, and medieval antiquities. Textiles occupy many inhabitants; bats and paper are manufactured. Known to the Romans as Ausa, Vich was later

Vicenza, Italy. 1. The Civic Museum, one of Palladio's finest buildings. 2. The church of S. Lorenzo. 3. The Piazza del Signore, showing, right, the Town Hall

called Ausona and Vicus Ausonensis. Pop. 14,800.

Vichy. Town and health resort of France, in the dept. of Allier. It stands on the right bank of the Allier, 232 m. by rly. S.S.E. of Paris and 75 m. W.N.W. of Lyons. Its agreeable climate and thermal springs have made Vichy one of the best-known watering-places in Europe. The *Établissement Thermale* is the property of the state, and there is a large export of the bottled waters. The *Grande Grille*, *Puits Carré*, and *Célestins* are the most important springs, alleged to be efficacious for digestive ailments, gout, liver troubles, and anaemia. The waters were known to the Romans, whose name for the town was *Vicus Calidus*. The seat of the Vichy government (v.i.) 1940-44, Vichy was liberated by French forces of the interior Aug. 26, 1944.

Vichy Government. Name usually given to the govt. set up by Marshal Pétain at Vichy after the Franco-German armistice in June, 1940. Its sphere was limited to unoccupied France, which area it continued in theory to rule even after the German occupation of the whole of France in Nov., 1942. It came to an end with Pétain's forcible removal from Vichy by the Germans on Aug. 20, 1944. Until the Allied invasion of French N. Africa in Nov., 1942, it commanded the allegiance of all the French colonies except French Equatorial Africa, the New Hebrides, and New Caledonia (which declared for de Gaulle in 1940) and Syria and Lebanon (occupied by the British and Free French, July, 1941). See France in the Second Great War; Laval; Pétain.

Vickers. Name of a British engineering firm. It was established in Sheffield in 1867 as Naylor Vickers and Co., and devoted itself to the fabrication of structural steels until 1897, when the Naval Construction and Armament Co. Ltd., and the Maxim-Nordenfeldt Guns and Ammunition Co. Ltd., were taken over. The name was then changed to Vickers' Sons and Maxim, one of the chief products of the new co. being the Vickers' machine-gun. In 1911 the firm assumed its present title of Vickers Ltd.

One of the earliest builders of aircraft, it introduced in 1913 the first aeroplane to carry a machine-gun. Throughout the First Great War the company produced a succession of notable military types, culminating in the Vimy bomber (see illus. p. 137) which in

1919 made the first air crossing of the N. Atlantic. In 1928 Vickers (Aviation) Ltd. was formed as a subsidiary co. to take over aviation activities, and soon absorbed the Supermarine aviation works, originators of the Spitfire (q.v.). In 1938 this subsidiary was taken over by Vickers Armstrong. Outstanding products of the Second Great War were the Wellington (q.v.) bomber and the Warwick. In 1946 the Viking air liner was introduced, and in 1950 the Viscount, the first turbo-jet air liner on regular service.

Vickers Hardness. Standard of measurement in metallurgy. The diamond pyramid hardness of the surface of a material may be tested by a Vickers hardness testing machine. This machine, with an adjustable force and for a set time, automatically presses the shaped diamond into the surface of the specimen under test. The diamond, a square pyramid of apex angle 136° held apex down against the material, leaves a square shaped recess in the surface. By measuring through a microscope the mean length of the diagonals of the square on the surface level, and relating this dimension to the applied load by a standard equation, a figure known as the diamond pyramid hardness results. The equation is $D.P.H. = 1.854 \times \text{load} \div \text{diagonal squared}$, with load in kilograms and diagonal in millimetres. The harder the material, the smaller the recess, and the greater the Vickers hardness number.

Vickerstown. This town of Lancashire, really a suburb of Barrow-in-Furness, is described under Walney Island.

Vicksburg. City of Mississippi, U.S.A., and the co. seat of Warren co. It stands at the confluence of the Yazoo and Mississippi rivers, 235 m. by rly. N.N.W. of New Orleans, and is served by the Alabama and Vicksburg and other rlys., also by river steamers and barges. It is an important centre of the cotton trade. Industrial plants include saw mills, lumber mills, iron and boiler works, canneries, and furniture and ice factories. Negroes form 51 p.c. of the pop. Disaster threatened Vicksburg in 1876, when the Mississippi suddenly cut a new channel, isolating the city; govt. engineers diverted the Yazoo into a canal, thus transforming Vicksburg again into a river port in 1902. Settled about 1811, Vicksburg was incorporated as a town in 1824, and became a city in 1836. Pop. 24,460,

Vicksburg, SIEGE OF. Operation in the American Civil War (q.v.). In Nov., 1862, Grant had begun a series of unsuccessful movements against the great fortress of Vicksburg. On April 30, 1863, having effected the passage of the Mississippi, he drove the confederates behind Vicksburg and besieged the latter more closely. On July 4 Pemberton, Confederate commander, surrendered with 30,000 men and nearly 200 guns.

Vicomte de Bragelonne, L. Romance written by Alexandre Dumas in collaboration with Auguste Maquet, 1848-50. It is a narrative of enormous length, and introduces the heroes of *The Three Musketeers* (q.v.).

Victor. Name of three popes and two anti-popes. Victor I, pope A.D. 189-198, ranks as the 14th bishop of Rome. A native of Africa, he decreed that Easter must always be kept on Sunday. He was canonised as a martyr, but his martyrdom is not recorded.

Victor II (c. 1018-57). Pope 1055-57. The son of Count Hartwig of Bavaria, and a kinsman of the emperor Henry III, his name was Gebhard. At 24 he was made bishop of Eichstätt, and on the death of Leo IX was nominated to the papacy by the emperor on the advice of Hildebrand. Gebhard made his election conditional on the emperor returning to the papacy all possessions taken from it. On Henry III's death, 1056, the guardianship of his son fell to the pope, who crowned him Henry IV. Victor died at Arezzo, July 28, 1057, and was buried at Ravenna.

Victor III (c. 1026-87). Pope in 1086-87. Born at Benevento, of a noble Lombard family, he became a Benedictine monk, and under the name of Desiderius was chosen abbot of Monte Cassino in 1057 and created cardinal in 1058. His influence as abbot was used to bring the Normans in Italy to the support of the papacy, and to mediate between Gergory VII and the emperor. Named by that pope on his deathbed, 1085, as his successor, Desiderius resisted, but a year later was forcibly declared pope. Driven from Rome by the emperor's prefect, he retired to Monte Cassino, and only on the expulsion of the anti-pope, Clement III, did he return to be consecrated. He died at Monte Cassino, Sept. 16, 1087, and was succeeded by Urban II.

Victor IV. Title of two anti-popes. (1) Cardinal Gregory Conti, who reigned in opposition to Innocent II in March-May, 1138.

(2) Cardinal Octavian, who belonged to the powerful Roman family of the counts of Tusculum, and reigned 1159-64. Elected by a minority of the cardinals, he had the support of the clergy and people of Rome against Alexander III. The emperor Frederick Barbarossa objected to Alexander, and convoked a synod which met at Pavia, 1160, and declared for Victor, anathematizing Alexander. The anti-pope died at Lucca, April 20, 1164.

Victor, CLAUDE PERRIN (1764-1841). French soldier. Born at La Marche, in the Vosges, Dec. 7, 1764, he entered the army in 1781, and in 1793 was made a general, his daring at the siege of Toulon having brought him under Napoleon's notice. In the Italian campaigns, 1796-1800, he increased his reputation, and as a reward for his services at Friedland in 1807 was made a marshal and then duke of Belluno. In command in Spain, he was beaten by Wellington at Talavera, but in the Russian campaign of 1812 he was prominent in the rearguard action at the Beresina. Resenting some criticism passed by Napoleon upon his conduct at Montereau-sur-Yonne, where he was wounded, Victor transferred his allegiance to the Bourbons. He was war minister 1821-23, and died in Paris, March 1, 1841.

Claude Victor,
French soldier

Victor Amadeus (1666-1732). Italian monarch. Born at Turin, May 14, 1666, he succeeded his father Charles Emmanuel II in the dukedom of Savoy at the age of nine. Marrying a niece of Louis XIV, he fell under that monarch's influence, and at his instigation

Victor Amadeus,
King of Sardinia

crushed the Waldensian Protestants in 1685. Victor broke away and fought against France, 1690-96, but allied himself with her periodically after that, until in 1704 he joined the Allies until the end of the Wars of the Spanish Succession. Granted the throne of Sicily at the peace of Utrecht, 1713, he exchanged it for that of Sardinia, Piedmont, and Savoy. In

1730 he abdicated, but seeking later in the same year to regain the throne, he was arrested by his son Charles Emmanuel, and died in confinement at Moncalieri, Oct. 31, 1732. The closing events of his life form the subject of Browning's play, *King Victor and King Charles*.

Victor Emmanuel I (1759-1824). King of Sardinia, 1802-21. Born at Turin, July 24, 1759, the second son of Victor Amadeus II, he came to the throne on the abdication of his brother Charles Emmanuel II, 1802, although the French occupied all his territory except Sardinia. He regained his kingdom, with the addition of Genoa, in 1815. In consequence of the popular demand for a constitution, which the great powers of Europe forbade him to grant, he abdicated in favour of his brother Charles Felix, March 13, 1821. Retiring to Nice, he died Jan. 10, 1824.

Victor Emmanuel I,
King of Sardinia

Victor Emmanuel II (1820-78). First king of united Italy, 1861-78. Son of Charles Albert, king of Piedmont-Sardinia, he was born at Turin, March 14, 1820. He commanded a brigade in the disastrous war against Austria 1848-49, and

Charles abdicated in his favour after the defeat of Novara, March 23, 1849, leaving Victor Emmanuel to make terms with Radetzky. Refusing to be intimidated by Austria, the young king maintained the constitution and liberty of his realms, wisely appointing Count Cavour his prime minister in 1852. He participated in the Crimean War, in which Sardinia was treated as an equal by the other western powers. An alliance with France in 1859 enabled him to wage war on Austria, and, despite the peace of Villafranca, to liberate Lombardy. The following year Tuscany, Modena, and Parma, which had thrown off their despotic yokes, united themselves to Piedmont, while Garibaldi's conquest of Sicily and Naples added the whole peninsula, save Rome and Venetia, to united Italy, of which Victor

Emmanuel was declared king, Feb. 26, 1861. The inclusion of Venetia, 1866, and Rome, 1870, completed his realm.

Victor Emmanuel, despite his bluff ways and crude simplicity, was a skilful diplomatist and a conscientious monarch. His treatment of the difficult crises brought about by the impetuosity of Garibaldi and the hopeless papal attitude of *non possumus* saved the country from many domestic troubles and foreign interference. Intensely popular, the *Re galantuomo* (gallant king), as he was universally called, was a brave but moderate soldier. He kept various mistresses and married one of themmorganatically in 1869. In other respects he was a devout churchman. At all events he was the point about which all parties of the state rallied, and his death, Jan. 9, 1878, was a national loss. A Life, by C. S. Forester, appeared in 1927. See Cavour; Garibaldi; Genoa.

Victor Emmanuel III (1869-1947). King of Italy, 1900-46. Son of the prince of Piedmont (later Humbert I), he was born at Naples, Nov. 11, 1869, and entered the army in youth. In 1896 he married Princess Helena of Montenegro, and he ascended the throne on the assassination of his father, July 29, 1900. For some years he gave up the management of state affairs to his prime minister Giolitti, and gained the affections of the people, being esteemed a man of wide culture, with special knowledge of coins. He lost popularity in the First Great War. His relations with Mussolini (*q.v.*) were at first distant, but he soon allowed himself to become the figurehead and spokesman of the fascist regime. Its symbols were added to the royal arms in 1929. The king was proclaimed emperor of Abyssinia in 1936, and king of Albania, 1939. Although he welcomed Hitler to Rome, he opposed Italy's entry into the Second Great War, but failed to take any independent action until in 1943 the grand council forced Mussolini's resignation. After the Italian armistice with the Allies Victor Emmanuel's continuance on the throne was a source of contention among the Italian political parties. He agreed to retire from public life when

Victor Emmanuel III,
King of Italy

Rome was liberated from the Germans, and on June 4, 1944, handed over his powers to his son, the prince of Piedmont (Humbert II), abdicating May 9, 1946. He died at Alexandria, Dec. 28, 1947.

Victoria. Four-wheeled carriage, having a low seat for two, a raised seat in front for the driver,

Victoria. Two-horsed carriage introduced into England from the Continent in 1869

and a calash top. It is named after the British queen, in whose reign it was introduced and enjoyed great popularity. See Carriage.

Victoria. British battleship. Launched in 1887, she carried two 16-25-in. and one 10-in. guns on a displacement of 10,470 tons. She was rammed and sunk during manoeuvres in the Mediterranean by the battleship Camperdown on June 22, 1893, with a loss of 321 officers and men. The fleet was steaming in two parallel columns, Victoria and Camperdown leading, and the catastrophe arose through the admiral, Sir George Tryon (*q.v.*), who was in the Victoria, trying to turn the columns inwards in an insufficient space. Tryon went down with his ship.

Victoria. River of Australia, largest in the Northern Territory. It flows into Queen's Channel near the border of W. Australia. It drains an area of 90,000 sq. m., most of which, such as the Victoria River Downs, is splendid grass country in the occupation of pastoralists. Large vessels can navigate the lowest 50 m.

Victoria. State of the Australian commonwealth. It lies in the S.E. corner of the continent. It has an area of 87,884 sq. m., and a pop. (1947) of 2,055,252, of whom 1,226,923 live in greater Melbourne.

Victoria arms

Victoria has a warm temperate climate, characterised by a low rainfall; in the N.W. the Murray basin has less than 20 ins. annually; at the coast it varies between 25 and 40 ins. In the

Australian Alps rainfall exceeds 50 ins. in the most elevated sections; there also snow lies in the winter, and skating and other winter sports attract tourists, particularly to the Buffalo national park above the Ovens valley. Throughout the state, but more especially in the W., the greater quantity of rain falls during the winter, June-Aug., which gives Victoria a climate allied to that of the Mediterranean lands. The mean temp. of Melbourne varies between 67° F. in Jan. and 49° F. in July; its yearly rainfall is 25 ins.

An unpleasant feature of the climate of Victoria is the northerly summer winds, called "brickfielders," which carry heat and choking clouds of dust from the interior (like the sirocco of

Port Phillip is a submerged portion, and at the end of which are the Gippsland hills and lakes; the central highlands; and the S. side of the valley of the Murray.

Through the state, E. and W., run the southernmost parts of the Great Dividing range, called in the W. the Grampians and in the E. the Australian Alps, among which lie the highest peaks in the state, rising to more than 6,000 ft. These mts., of great scenic beauty, include the Buffalo plateau and national park.

The rivers form two main systems, those which flow into the sea, of which the Yarra is the most important, and those which flow into the Murray, of which the Ovens, the Goulburn, the Campaspe, and the Loddon are the longest. Victoria has made good use of its water resources: about one quarter of the total area is supplied artificially. The Goulburn system irrigates 1,300,000 acres, the Murray system 500,000 acres. Irrigation has made fruit growing

Victoria. Map of the southern state of the Australian Commonwealth, famous for the extent of its sheep runs and wheat farms

the Mediterranean). These hot, sultry spells, when daily temps. may rise well above 100° F., are suddenly followed by the violent "southerly bursters" which, by contrast, appear very cold.

Victoria is bounded on the N. and N.E. by New South Wales, from which it is separated by the River Murray; on the W. by South Australia, and on the S. and S.E. by the Southern Ocean, the Bass Strait, and the Pacific Ocean. Its greatest length from E. to W. is 490 m., its greatest depth from N. to S. 280 m. It comprises three areas, the great valley, of which

possible and has thus contributed greatly to the prosperity of the state, in which the chief occupations are agricultural and pastoral, in particular wheat growing, sheep-rearing, dairying, poultry farming, and fruit growing.

Wheat is the principal crop, with a yield varying from 3,498,000 bushels from 2,142,000 acres (1944-45) to 46,954,000 bushels from 2,757,000 (1941-42) according to the kindness of the climate. Other important crops are oats, barley, potatoes, hay, and the vine, nearly 2 million galls. of wine being made in 1945-46. Production of

raisins and currants, apples and other orchard fruits is important.

Livestock in 1946 numbered: sheep 14,655,277, cattle 1,827,087, pigs 271,887, horses 232,473; but numbers vary considerably from year to year. Wool production in 1944-45 was just over 177 million lb. valued at nearly £12 million; in 1945-46, 152 million lb. worth £9½ million; 51,600 tons of butter were produced in 1945-46; some 7,000,000 sheep and lambs are slaughtered annually for meat.

Victoria has produced much gold since 1853, in which year Ballarat became the centre of a great gold rush. After this had subsided gold mining was developed on a scientific basis and output steadily increased. Many of the mines were, however, closed during the Second Great War; 86,993 fine oz., worth £936,268, were produced in 1946. There are some black coal, and vast brown coal, deposits. Other minerals found are limestone, kaolin, and gypsum.

Industry, especially that connected with fruit preserving and the production of agricultural machinery, has greatly increased since the beginning of the 20th cent. There is also a considerable manufacture of vehicles, clothing, food, drink, and tobacco.

About a quarter of the state area is forest, timber produced including hard and soft woods, suitable for building, cabinetmaking, and other industrial purposes. The forests also prevent soil erosion.

White knowledge of Victoria begins with Capt. Cook's sighting of Cape Everard in 1770. In 1798 surgeon George Bass sailed through the strait named after him, and unsuccessful attempts at settlement on the newly discovered coast of what is now Victoria were made during the following years, the first permanent settlers being the

Henty brothers who arrived in 1834. A year later Batman traded trinkets with aborigines, who had no ownership in the land, for 600,000 acres across the Yarra and the Plenty Rivers—a bargain not ratified by the N.S.W. govt., of which the newly settled area, then called the Port Phillip dist., formed a part. In 1835 also John Pascoe Fawkner founded Melbourne. In 1851 the dist. was proclaimed a separate colony named Victoria, and given a partly elected legislative council. It received full responsible govt. four years later. In 1901 it was one of the colonies, renamed states, formed into the commonwealth of Australia.

CONSTITUTION. The parliament of Victoria consists of a legislative council of 34, and a legislative assembly of 65. There is a property qualification for members of and electors to the council, but not the assembly. Women have equal voting rights. Executive power is in the hands of a governor who is advised by a cabinet. Victoria sends ten senators to Canberra, and a number of representatives to the lower house of 74 proportionate to her pop.—in 1950, 30. The state owns 4,784 m. of rly. built to develop agriculture and industry.

Primary education is free, secular, and compulsory. There are state secondary and intermediate schools, technical and domestic science schools, and a university at Melbourne, and schools run by R.C. and various Protestant communities. See Australia; consult also Victorian

Year Book (annually); Geography of Victoria, J. W. Gregory, 1907; Centenary History of Victoria, J. Pratt, 1934.

Victoria. One of the largest islands of Canada. This Arctic territory is 420 m. by 320 m., and is separated from the mainland by Dease Strait, Coronation Gulf, and Dolphin and Union Strait. It lies S.E. of Banks Island, S. of Melville Sound, and W. of McClintock Channel and Victoria Strait, and comprises Prince Albert Land and Wollaston Land. The W. coast is mountainous and deeply indented.

Victoria. Canadian city and port, cap. of British Columbia. It stands at the S.E. end of Vancouver Island, overlooking the Strait of San Juan de Fuca. As a port it has steamship connexions with Vancouver on the mainland, San Francisco, and places in Mexico and Alaska, and is also a port of call for steamers going from Vancouver to Australia, China, and Japan. It has the second largest dry dock in N. America. Shipping apart, industries include the making of furniture, boots, clothing, bricks, soap, chemicals, etc., as well as shipbuilding, lumbering, and canning. It is on the Esquimalt and Nanaimo rly., a branch

Victoria, British Columbia. Air view of the inner harbour, containing one of the world's largest dry docks. Top, map of the harbour and adjacent districts

of the C.P.R., and also on a branch of the C.N.R. Owing to its equable climate, the city is a great tourist resort. The naval station of Esquimalt with its fine harbour is about 3 m. away. Victoria originated as Fort Victoria, a post of the Hudson's Bay co., and became a city in 1862. An Anglican cathedral was opened 1929. Pop. 87,400.

VICTORIA OR PORT VICTORIA. Capital of the Seychelles. Situated on the N.E. coast of the island of Mahé, the town has an excellent harbour, and serves as a naval coaling station. It is a picturesque place, since many of the houses, built of massive coral, shine in the sunlight like marble. The principal

exports are rum, cocoa, and bêche-de-mer. It is connected by submarine cable with Zanzibar, Aden, and Mauritius.

Victoria. Settlement in Cameroons. On Amba Bay, it was founded by the Baptist missionary society, and annexed by Great Britain in 1884, but given to Germany. It became British again 1919, on the division of Kamerun between the U.K. and France.

Victoria. Central city of the crown colony of Hong Kong on the is. of Hong Kong (*q.v.*).

Victoria (1819-1901). Queen of Great Britain and Ireland, 1837-1901, and empress of India, 1876-1901. She was born at Kensington Palace, May 24, 1819, and was baptized as Alexandrina Victoria. She was the only child of Edward, duke of Kent, the fourth son of George III, her mother being Mary Louise Victoria of Saxe-Coburg-Gotha, sister of its duke and also of Leopold I, king of the Belgians, who directed his niece's education, her father dying in 1820.

Victoria became heir presumptive in 1830, and ascended the throne, June 20, 1837, in succession to her uncle, William IV. The elder sons of George III—George IV, the duke of York, and William IV—left no surviving children, and the accession of Victoria happily prevented that of the fifth brother, Ernest, duke of Cumberland. The crowns of England and Hanover were thus separated, the Hanoverian succession lying only in the male line.

In 1840 the queen was married to her cousin, Albert of Saxe-Coburg-Gotha (*q.v.*), younger son of the duke. The eldest child, the Princess Royal, was married to the German Crown prince and became the mother of the emperor, William II. The second, Albert Edward, Prince of Wales, succeeded Victoria on the throne as Edward VII. The other children of the marriage were the Princess Alice, who became grand-duchess of Hesse-Darmstadt; Alfred, duke of Edinburgh, to whom the duchy of Saxe-Coburg-Gotha ultimately reverted; Helena, who married Prince Christian of Schleswig-Holstein; Louise, who became duchess of Argyll; Arthur, duke of Connaught; Leopold, duke of Albany; and Princess Beatrice, who married Prince Henry of Battenberg. The death of the Prince Consort in 1861 caused the queen's retirement from the public eye, though not from the discharge of her constitutional duties, throughout the remaining 40 years of her reign.

Queen Victoria. A portrait taken in the year of her diamond jubilee
Downey

At the outset of her reign she was under the experienced political tuition of Lord Melbourne, who was prime minister at the time, and from whom she learnt those sound principles of constitutional government which she practised so wisely and established so thoroughly during her long rule. Melbourne's personal guidance survived his retirement from office, and his place was subsequently taken by the Prince Consort; when he died, Victoria's long experience left her in no further need of any such support.

Queen Victoria's long reign covered an extraordinarily eventful period, but personally she had little to do with the change which developed during her reign in the status of the colonies and their relations with the mother country. She had a more direct claim to something of a personal share in the development of the idea of the imperial relations between the British and the natives of India.

The great Mutiny of 1857 led to the assumption by the crown of direct responsibility for the great dependency, and the very definite way in which she ranged herself on the side of Lord Canning, and her attitude of generous sympathy towards the Indian peoples, were of material aid in creating that spirit of loyalty which in 1914 bore such fruit as few had ventured to anticipate. Something of this was due also to her appreciation of that stroke of Oriental imagination by which Disraeli procured the queen's assumption from Jan. 1, 1877, of the new title empress of India.

Still more direct was the influence of Victoria's own personality upon the relations between the crown, ministers, and the British people. The political supremacy of parliament was indeed already a long established fact when she came to the throne. George III had, no doubt, attempted with temporary success to recover an effective supremacy for the crown

itself; but even for him the only method open had been that of organizing in parliament itself a dominant court party subservient to the royal will. That attempt had finally broken down, and neither of the sons who succeeded him renewed it.

There was no struggle between crown and parliament. The constitutional practice, established under the rulership of a single monarch exercised continuously for 64 years virtually withdrew from the crown the power of veto, which had prevented Catholic Emancipation in 1801, and even the power of dismissing a ministry without a preliminary appeal to the country, which had actually been exercised by William IV. But while there was some curtailment of actual power, the queen proved herself perfectly capable of resisting anything tending to a diminution of the crown's dignity or its indirect authority. When she was only twenty, her refusal in 1839 to give way to Peel (*q.v.*) on the Bedchamber question (*q.v.*) brought back the Melbourne ministry to office. In 1861, Palmerston (*q.v.*) was dismissed from the foreign office because he ignored the crown's claim to consultation. Several public men obnoxious to her were excluded from office. She insisted on her right to be thoroughly informed of current events, and to impress her views on ministers.

Prestige of the Crown

The crown also benefited in actual prestige, in the respect popularly accorded to it, from the high standard of personal conduct set by the queen and the prince consort, which offered a most favourable contrast to the contempt which had been brought upon it by George IV. In brief, when Victoria came to the throne the monarchy was not loved; at best it was most commonly regarded as a necessary bulwark against Jacobinism; but when she died, the constitutional monarchy was probably more secure of popular support than at any previous moment in its history.

The Osborne estate in the Isle of Wight was bought in 1845, and that of Balmoral in 1852, and in the houses built in these places a great deal of the queen's life was spent. After the death of the prince consort, she never stayed for more than a few days at a time in London. On June 20, 1887, the fiftieth anniversary of her accession, Victoria's jubilee was celebrated with great splendour by a thanksgiving service in Westminster Abbey. Ten years

later, a second festival, popularly known as the diamond jubilee, celebrated the longest reign of any British sovereign. At both jubilees great spontaneous demonstrations of loyalty took place. Victoria died at Osborne, Jan. 22, 1901, and was buried at Frogmore.

Martin, 1908; The Girlhood of Queen Victoria, ed. Lord Esher, 1912; The Early Court of Queen Victoria, 1912; and The Married Life of Queen Victoria, 1913, C. Jerrold; Letters, ed. G. E. Buckle, 1920-30; Side-lights on Queen Victoria, Sir F. Ponsonby, 1930; Queen Victoria and her Ministers, Sir J. Marriott, 1933; Victoria, the Widow, and her Son, H. Bolitho, 1934; Victoria of England, E. Sitwell, 1936.

Victoria and Albert. British order. Conferred on ladies only, it was instituted in 1862. It was remodelled in 1864, 1865, and 1880, but no conferments were made after the death of Queen Victoria. It is in four classes, the badge of the first three being a medallion of diamonds and pearls with portraits of the queen and Prince Albert; for the fourth class it is the royal cipher interlaced. The

Victoria and Albert. Badge of the order

ribbon is of white moiré, and the members use the letters V.A.

Victoria and Albert George V Docks, THE ROYAL. Part of the dock system of the port of London. They are situated in the vicinity of Canning Town, Silvertown, and North Woolwich, and cover an area of about 1,100 acres, over 240 acres water. The Victoria dock was opened in 1855, the Albert in 1880, the King George V dock (68 acres), at North Woolwich, in 1921. Frozen meat,

grain, fruit, and tobacco are the chief imports, cold storage accommodation being provided for over 13,000 tons of refrigerated meat, while the tobacco warehouses will hold some 40,000 tons. During the Second Great War considerable damage was done to sheds and warehouses, but, save for the destruction of part of the bascule bridge of King George V docks, the deep-water equipment escaped.

Victoria and Albert Museum. A London museum of fine and applied art, under the control of

Victoria and Albert Museum, London. The buildings which house the national collections of fine and applied art

the ministry of Education. Its nucleus was the Museum of Ornamental Art, established at Marlborough House in 1852. Five years later it was transferred to temporary buildings at South Kensington, becoming part of the collective S. Kensington Museum. During 1860-84 permanent buildings were constructed, and these being found inadequate, new buildings, designed by Sir Aston Webb, were completed in 1909, the year when the Victoria and Albert became an exclusively art museum. It contains one of the finest collections of decorative and ornamental art in the world, and houses some specialised collections, such as the national collection of water-colours. The Indian section, in Imperial Institute Road, and Bethnal Green Museum (1872) are branches.

Victoria and Albert Yacht. Name of three former British royal yachts. The first was built at Pembroke in 1843 and was used by Queen Victoria for an annual cruise round the British Isles. In 1855 it was replaced by a second, which in 1863 brought Princess Alexandra of Denmark to England for her marriage to the prince of Wales, afterwards Edward VII.

In 1899 the third Victoria and Albert was launched at Pembroke.

Displacing 4,700 tons she had engines developing 11,000 h.p. to give a speed of 20 knots. During

and red for the army. When worn without the cross, the ribbon carries a small replica of the decoration on its centre.

Awarded for "conspicuous bravery or devotion to the country in the presence of the enemy," the honour was originally confined to white officers and men. In 1911 the right to receive it was extended to native troops, and in 1920 to matrons, sisters, and nurses, those of ancillary medical services, and civilians of either sex regularly or temporarily under the orders of naval, military, or air forces of the British Empire.

Victoria and Albert Yacht. The third British royal yacht to bear the name Victoria and Albert, moored in Portsmouth Harbour

both Great Wars she was an accommodation ship at Portsmouth, and, condemned as being unseaworthy in 1946, was converted into living quarters for the royal family when visiting the port. In 1939 plans had been approved for a new yacht, but construction was postponed. The Victoria and Albert was kept permanently in commission; her company of 365 officers and men was the largest yacht crew in the world. Her commander, a vice-admiral, performed the functions of both admiral and captain, as she was the only ship under his command. Uniform for ratings consisted of the old-fashioned cloth trousers worn over the jumper, and all cap and sleeve badges were in white instead of red or gold. Lower deck personnel were rated as riggers instead of able seamen.

Victoria Cross. British decoration for gallantry, the highest of its kind. Instituted by Queen

Victoria Cross, awarded for valour

inscription "For Valour." From its institution the Cross was by Victoria's decree struck from the metal of guns captured at Sevastopol until, that source of metal having been exhausted, it was from 1942 struck from metal supplied by the royal mint. The cross is suspended from a crimson ribbon by a laurel bar and V-shaped link; until 1918 the ribbon was blue for the navy

Service holders of the V.C. below commissioned rank receive an annuity of £10, plus an addition of 6d. daily to the service pension. If a holder is unable to obtain a livelihood on leaving the service, the annuity may be increased to £75. For a posthumous award £50 is credited to the recipient's estate.

Altogether 1,310 V.C.s had been awarded to the end of the Second Great War, of which 525 were won before the First Great War. In that war 623 were given, 163 posthumously: the navy won 45, army 410, and R.A.F. 15; Australia 62, Canada 61, New Zealand 11, India 15, S. Africa 4. Second Great War awards totalled 162, of which 73 were posthumous: the army gained 58, navy 20, R.A.F. 19; India 29, Australia 15, New Zealand 8, Canada 8, S. Africa 4, Fiji 1.

In 1948 there were living 509 holders of the V.C., the oldest

recipient being Pte. T. Edwards, who won it in 1884 while serving with the Black Watch in the Sudan. Lt.-Col. A. Martin-Leake won the V.C. with the S. African police in the Boer War, and again with the R.A.M.C. in the First Great War; Capt. C. H. Upham, N.Z. army, won it in Crete, 1941, and again in the Western desert, 1942. Holders of a double V.C. wear a bronze bar on the ribbon. Danish Major Lassen was awarded the V.C. while serving with a British commando unit in Italy, 1945. See Medals colour plate.

Victoria Embankment. Part of the Thames embankment, London. It extends on the left bank between Westminster and Blackfriars bridges and was constructed in 1864-70. Here the double tramway tracks are segregated from the main traffic road. See Thames Embankment.

Victoria Falls. Falls on the Zambezi river in S. Rhodesia. Situated 7 m. S. of Livingstone, they were discovered by Livingstone in 1855, and are about 357 ft. deep and about one mile long. The Zambezi drops into a chasm running from E. to W., and the falls consist of different cascades broken by islands and rocks. The Zambezi is crossed, 400 yards below the falls, by a single span girder rly. bridge, 400 ft. above water level, on the main rly. N. from Cape

Victoria Falls. Map showing the configuration of the Zambezi river above and below the falls. Top, left, a view of the falls

Town to the Congo, finished in 1905. The volume of water varies between 60,000,000 and 100,000,000 gals. per min.; in 1936 the quantity fell to under 4,000,000 gals., and the E. cataract dried up. A hydro-electric station, developing 2,000 kW., was started here in 1938.

Victoria Memorial. The national memorial to Queen Victoria included an elaborate monument, new E. façade to Buckingham Palace, widening of The Mall, and Admiralty Arch was designed by Sir Aston Webb, with sculptures by Sir Thomas Brock, (*q.v.*), and cost over £300,000. The memorial proper occupies a garden space in front of the palace, took nine years to construct, and was unveiled May 16, 1911, by George V in the presence of the German emperor, William II. Mainly of white marble, it includes a pedestal surmounted by a gilded bronze Victory, with a seated figure of the queen at the base, surrounded by much elaborate ornamentation.

Victorian Order, ROYAL. British order of knighthood originally awarded to British and foreigners who had rendered service to Queen Victoria. The order dates from 1896. There are six grades, knight or dame grand cross (G.C.V.O.), knight commander (K.C.V.O.), dame commander (D.C.V.O.), commander (C.V.O.), and two classes of members (M.V.O.). The badge is a white Maltese cross with a crimson oval centre bearing the royal and imperial cipher, surrounded by a blue circle, in which is inscribed in gold Victoria, and surmounted by the

Victorian Order. Insignia of the British order of knighthood

Victoria Memorial, London. The national memorial to Queen Victoria in front of Buckingham Palace. It was unveiled by King George V in 1911

imperial crown. The ribbon is dark blue with a narrow edge of red, white and red. The chancellor of the order is the lord chamberlain. See Knighthood.

Victoria Nyanza OR LAKE VICTORIA. One of the four great freshwater lakes in Central Africa. From it issues the Nile. Known to the Arabs as Ukerewe, it was first discovered from the S. in 1858 by Speke. It is situated at an alt. of 3,726 ft., has an area of about 27,000 sq. m., and is 255 m. long by 155 m. wide. On the N. and N.W. is the Uganda protectorate, on the E. is Kenya Colony, and on the S.W., S., and S.E. is Tanganyika Territory.

The principal feeders of the lake are the Katonga, Bukora, and Kagera, entering the lake N. of Bukoba, and the Simiyu, Mbalageti, Ruwana, and Mara rivers on the S.E. side. There are a number of large gulfs, of which the Kavirondo Gulf (N.E.), the Speke Gulf (S.E.), and Emin Pasha Gulf (S.W.) are the chief. The Nile leaves the lake on the N. at Jinja, near which place are the Owen Falls. In addition to Kisumu and Jinja, the more valuable ports are Port Bell which serves Kampala, the native capital of Uganda, Entebbe, Bukoba, the chief entrance to the Ruanda country, Mwanza, at the S. end of the lake, and Shirati, on the E. side. From Jinja, the Busoga railway runs northwards to Namagali. The lake varies seasonally in height by about 43 ins., according

to the amount of rainfall in the catchment area. The Owen Falls Dam (*q.v.*), begun in 1949 as part of a hydro-electric scheme, to benefit both Uganda and Egypt, has raised the former level of the lake by some four feet and made it the world's largest reservoir

Victoria Park. London public recreation ground of 217 acres, N.E. of Bethnal Green, laid out 1842-45, and enlarged 1872.

Victoria Regia. Floating leaves of the giant S. American water lily in a hothouse at Kew Gardens, London

Victoria Regia. Giant aquatic herb of the family Nymphaeaceae. Also called royal water lily and water maize, it is a native of the Amazon, Guiana, and La Plata. It grows only in still, shallow (4 to 6 ft. deep) waters, and has a thick perennial rootstock. The floating leaves are round, measuring from 4 to 12 ft. across, with the edges turned up for several inches. The flower is 15 to 18 ins. across, and lies on the surface of the water. The top-shaped calyx has purple-brown segments, and the numerous petals are in several series, the outer ones white and much broader than the purple or rose-coloured inner ones, surrounding the fleshy awl-shaped stamens and the large ovary with

its cup-shaped depression. This develops into a large green, prickly berry, containing numerous dark brown oval seeds, which are roasted and eaten by the people of Guiana.

Victoria Station. Main line London rly. terminus, near to Buckingham Palace Road. Opened in 1860, its purpose was to provide a West End terminus for the London, Brighton, and South Coast, and the London, Chatham, and Dover rlys. Construction was undertaken by the Victoria Station and Pimlico rly. co. A year after opening, the Chatham and Dover portion was jointly leased to that co. and the G.W.R.; the latter, laying broad-gauge tracks, used it as a southern suburban terminus. The Brighton half of the terminus was also used by the London and N.W. rly. under a toll arrangement. In 1923 the whole was absorbed by the Southern rly. which opened the wall dividing the two stations.

Victoria station has 17 platforms, and handles an average of 1,052 trains every 24 hrs. The Brighton section carries a heavy electrified traffic, while the Chatham section is the starting point for Continental services, including the Golden Arrow. In the forecourt is a large omnibus terminus.

During the First Great War, No. 2 platform acquired a tragic significance as that from which the army leave trains left for France. For a short time in 1944-45 leave trains to and from the B.L.A. in France also used Victoria. On Sept. 15, 1940, a Dornier bomber shot down in the great daylight raid of that day crashed on an island of shops on the N. forecourt. Victoria gives its name loosely to a dist. and to a telephone exchange.

Adjacent to Victoria rly. station is the London terminus of B.O.A.C. etc. Near by are a Green Line and London Transport garage, and a coach station served by extra-London lines.

Victoria University. Name of an English university that existed from 1880 to 1903. It consisted of Owens College, Manchester; University College, Liverpool; and University College, Leeds. In 1903 it was dissolved, and soon afterwards the three became separate universities. The prefix Victoria is still retained by Manchester university (*q.v.*).

Victoriaville, Town of Quebec, Canada. It is situated on the Nicolet River, 40 m. S. of Three Rivers, and is on the C.N.R. Its industries include furniture and clothing factories, planing mills, and machine shops. Pop. 8,516.

Victory. British ship of the line. She was designed by Sir Thomas Slade, and launched at Chatham dockyard, May 7, 1765, but not commissioned until 1778. She was 226 ft. 6 in. long from figure-head to taffrail, 186 ft. on the gun-deck, and 52 ft. in beam, the tonnage being 2,162; and her armament on first commissioning was 12 short and 32 long 12-pdrs., 30 24-pdrs., and 30 32-pdrs. Nelson selected her as his flagship when appointed commander-in-chief in the Mediterranean, 1803, and in that capacity, and in the same ship, he won the battle of Trafalgar. She was paid off from active service in 1812, and was afloat in Portsmouth Harbour until 1922, when the condition of her hull was found so bad that it was decided to place her permanently in dry dock. Since then she has been completely restored; hull and rigging are exactly as they were at Trafalgar. Since 1825 the Victory has been the flagship of the C.-in-C. at Portsmouth. In the Second Great War she was an accommodation ship for gunners on A.A. defences.

Victory Medal. Allied medal of the First Great War. It was awarded to all officers and men in the Allied armies who entered a theatre of war on the strength of any military unit, and in the navies to all officers and men who had been afloat on duty, Jan., 1914 - Nov., 1918. It was also given to

airmen, dominion, colonial, and Indian forces, and to women's formations. Its scope was extended in 1920 to include military operations in N. Russia and Siberia, and in the Caucasus.

The medal is of bronze. On the obverse is a winged figure of Victory. On the reverse is the inscription, The Great War for Civilization, translated into the different languages. The ribbon is identical for all countries. In 1920 an oak leaf in bronze was authorised to be worn on the ribbon by any who were mentioned in dispatches. See Medal colour plate.

Victualling Yard. Admiralty depot from which vessels of the British navy can be supplied with stores of various kind, including food supplies.

Vicuña (*Arachemia vicuña*). A small species of wild llama. Found in Peru and neighbouring countries, it belongs to the camel family, but is of smaller size and more graceful form than the true camels. Its hair is light brown, with paler markings on the face. During the hot weather it is found in the valleys, but in the rainy season it frequents the higher ranges of the hills. It occurs in small flocks, each male consorting with several females. From its wool a soft clothing fabric is made.

Vicuña. Town of Chile in the prov. of Coquimbo. It is situated 50 m. W. of Coquimbo, on the rly. to Rivadavia. The neighbouring mines, orchards, and vineyards have most picturesque settings. There is an important industry in dried and crystallised fruits. Ther-

H.M.S. Victory. The old flagship of Keppel, Jervis, and Nelson, permanently in dry dock at Portsmouth

Vicuña. Small wild llama of Peru
W. S. Berridge, F.Z.S.

mal springs occur in the neighbourhood. Pop. est. 10,000.

Vicuña Mackenna, BENJAMIN (1831-86). Chilean historian and politician. He was born Aug. 25, 1831, in Santiago, and died near Valparaíso on his 55th birthday. Educated at Santiago, he took part in the revolution of 1851, and in 1856 was made a member of congress. Vicuña wrote lives of Diego Portales, 1863; Bernardo O'Higgins, 1882; Juan Fernandez, 1883.

Vic-Wells Ballet. British organization set up as a permanent ballet repertory company after the reopening of Sadler's Wells theatre (in conjunction with the Old Vic) in 1931. Under Ninette de Valois, director of the ballet from its foundation, and Constant Lambert, musical director 1932-47, the company, with its own school for training dancers, was raised to international standards. From 1946 the Sadler's Wells ballet (as it was later called) gave regular seasons at Covent Garden, a second company performing at Sadler's Wells theatre. Their first tour of the U.S.A. and Canada, Oct.-Dec., 1949, was an outstanding success.

Vidin. Town of Bulgaria, capital of a dept. of the same name. It stands on the right bank of the Danube, in a marshy dist. 95 m. by rly. N.N.W. of Sofia. A ferry links it with Calafat across the river in Rumania. On the site of the Roman Bononia, it is a fortified river port. Its principal trade is in wine, and here is a school of viticulture. It makes gold and silver filigree of local renown. Pop. 18,465.

Vidocq, EUGÈNE FRANÇOIS (1775-1857). French detective. He was born at Arras and in 1809,

Eugène Vidocq,
French detective

after serving terms of imprisonment for theft, forgery, and highway robbery, offered his services to the police, at whose instigation he served a term in prison, and was allowed to mix freely with the inmates, thus gaining their confidences and betraying them to the police. So successful was the police spy that in 1817 he was authorised to establish a regular body of detectives. He retired in 1827, tried to regain his old post in 1832, but failed, and died in poverty. Consult Life, E. A. B. Hodgetts, 1929.

Vidor, KING WALLIS (b. 1895). American film director. Born at Galveston, Feb. 8, 1895, he was educated at the high school there and at Peacock military academy. He attained fame with *The Big Parade*, 1927, a silent film about the First Great War. *The Crowd*, and *Hallelujah* were spectacular pictures involving hundreds of performers. Vidor directed *Stella Dallas*, 1937; *The Citadel*, 1938; *North-West Passage*, 1940; *On Our Merry Way*, 1948.

Vidovdan Constitution. First constitution of Yugoslavia. It was put into effect in 1921, and, although highly centralised, contained provisions for some local govt. and for a democratically elected parliament. In 1929 it was abrogated by King Alexander, who substituted for it what was in effect a personal dictatorship.

VIENNA: CAPITAL OF AUSTRIA

Simon Wolf, LL.D., (Vienna)

The famous city which has been the capital of two great empires, successfully resisted two sieges by the Turks, and created a life of cosmopolitan charm and gaiety entirely its own is here described in all its aspects

Contrary to popular belief, Vienna (Ger. Wien) does not lie on the banks of the Danube: the term *Donaustadt* (Danube city) is misleading, for Vienna's oldest districts are several miles from the main river, and newer parts are farther still. The city has ex-

Vienna arms

tended to the N., S., and particularly to the W., but only very little to the E., where the Danube flows. A branch of the river, however, the so-called Danube Canal, flows through Vienna, separating the inner and western dists. from three districts in the E. Its bridges were blown up by the Germans in the Second Great War.

Vienna is divided into twenty-one numbered districts. Of these, I, Innere Stadt; II, Leopoldstadt; III, Landstrasse; IV, Wieden; VI, Mariahilf; VII, Neubau; IX, Alsergrund, are shown in the map. The others are V, Margareten; VIII, Josefstadt; X, Favoriten; XI, Simmering; XII, Meidling; XIII, Hietzing; XIV, Rudolfsheim; XV, Fünfhaus; XVI, Ottakring; XVII, Hernals; XVIII, Währing; XIX, Döbling; XX, Brigittenau; and XXI, Floridsdorf. The Innere Stadt is the old, historic city of Vienna, round which there

Viedma. Town of Argentina. It is the capital of the territory of Río Negro, stands on the river Viedma, and is 577 m. S.W. of Buenos Aires by rly. A rly. and road bridge spans the river between Viedma and Patagones. This is the only direct rly. connexion between N. and S. Argentina. Pop. 9,000.

Vieira, ANTONIO (1608-97). Portuguese ecclesiastic. Born in Lisbon, Feb. 6, 1608, he became a Jesuit, and was ordained 1635. In 1640 he became chaplain to John IV, and served on diplomatic missions. In Brazil, 1653-61, he applied himself zealously to the conversion of the Indians and the amelioration of their lot, and secured the prohibition of their enslavement. He became superior of the Jesuits of Brazil, where he died July 13, 1697.

were fortifications until 1858-60, when they were removed. Leopoldstadt, Brigittenau, and Floridsdorf lie on the left bank of the Danube Canal; dists. III to IX (the inner dists.) were surrounded by an outer girdle of fortifications until 1892, when a number of suburbs were incorporated into the city, nearly doubling its area. More suburbs were incorporated in 1902.

Vienna, with a pop. (1947) of 1,548,137, covers an area of 469 sq. m. Some 60 p.c. of the area is woodland and arable country; another 13 p.c. is public parks, private gardens, and open spaces. Congestion in the workers' districts is very great, but housing conditions were much improved by the building of large, well laid-out blocks of workers' flats by the municipality during the 1920s.

When the fortifications around the centre of the old city were removed, the Ringstrasse was built in their place, one of the longest, broadest, and handsomest streets in the world. A semicircle of Rings (boulevards), beginning and ending at the Danube Canal, the Ringstrasse is 2 m. long and 150 ft. wide. Vienna's most famous and most gracious buildings lie on it: among them the neo-Gothic Votivkirche; the city hall (Rathaus), built 1873-1883 in modern Gothic style; the Burgtheater in Renaissance style; the dignified parliament houses; the immense com-

Vienna. Plan of the central area of the Austrian capital, which has grown up around the Altstadt or old city, showing the principal buildings and thoroughfares

plex of the Hofburg, formerly the seat of the Hapsburg emperors, now national museums; the massive university building; the imposing opera house, built 1812-1818; the arts and the natural history museums, with one of the world's largest monuments, to the Empress Maria Theresa, between them; the palace of justice (Austria's law courts); the exchange; various ministries; famous hotels, and many private palaces and beautiful dwelling houses. The Ringstrasse is flanked by several fine squares and pleasant parks and public gardens, the largest being the Stadt Park. Vienna's most representative coffee-houses are also in the Ringstrasse. The names of the boulevards constituting the Ringstrasse have been changed several times with the change in Austria's status during the 20th cent.

Famous buildings not on the Ringstrasse include S. Stephen's cathedral, dating back in part to the 13th cent., at the very centre of the Innere Stadt, and with a 450 ft. spire (it was badly, but repairably, damaged by shelling and fire during the Second Great War); the ancient church of S. Augustin; the Capuchin church, with crypts and Hapsburg graves; the Maria-am-Gestade and the Minorite churches; and, on the outskirts of the city, the castle of Schönbrunn (q.v.), the park of which resembles

the gardens of Versailles. The Prater, a vast natural park, lies E. of the Danube Canal; it has avenues, immense coffee-houses, and the elaborate Volksprater, (Wurstelprater in Viennese slang), greatest perennial fun fair in the world, where stands the famous giant wheel, Vienna's second land mark, the first being the spire of S. Stephen's.

Vienna, formerly fourth largest city in W. Europe, had sunk in 1947 to fifth, after London, Berlin, Paris, and Rome. As in the rest of Austria, the people are predominantly R.C. Jews number a few thousands only; before Nazi deportations and exterminations, the city had some 180,000 Jewish residents who, in Hapsburg and republican days, played an important part in the city's commerce, press, and industry, theatrical and artistic life.

Though their language is German, the Viennese are by no means Teutonic. On the frontiers of German, Slav, and Magyar peoples, Vienna became a melting-pot for all three. In the days of the Austro-Hungarian empire, tens of thousands of Czechs used to live in Vienna; some thousands remained. There was a considerable influx of Poles and of Hungarians. Italians added a fair Latin sprinkling to this mixture. Despite a common language, there has never been much love lost be-

tween the Viennese and the Berliner. The pop. of Vienna differs also from that of the Austrian countryside, whose peasants and mountaineers, conservative and pious, have a different way of life from cosmopolitan Vienna.

The people of Vienna, reputed to be gay, genial, friendly, and pleasure loving—result of former court life, congenial climate, beautiful surroundings, and wine from the vines growing on the slopes of the Wienerwald (Vienna wood)—did not altogether lose these characteristics even under the miseries of war and occupation. Viennese women, famous for their charm, beauty, and style, made Vienna a dangerous competitor with Paris in the world of fashion. Viennese love of music and dancing flowered in the waltzes of Strauss and Lanner. Many songs describe the beauty of Vienna and the charm of its women; performance of classical music in two large concert halls and the state opera house is the pride of the Viennese.

The people love good food, and the cuisine of Vienna is world famous. It includes *Wiener Schnitzel* (escalope of veal), *Backhendel* (spring chicken), incomparable pastries and sweets, good local wines and beers, and very good coffee with whipped cream; the coffee owes its flavour to Vienna's excellent drinking water which is brought 60 m. by pipeline from the Alps. The chief beverages of the Viennese are sour wine grown in the vineyards near the city and beer of lager type. In summer, old and young swarm into the Vienna woodland to the numerous *Heuriger* (young wine) pubs where food and drinks are served in the open and Viennese tunes are played by a *Schrammelquartett* (piano, violin, guitar, and accordion). There are many restaurants, but more coffee-houses which, to the Viennese, are his second home, club, place of rest and recreation, reading room, and sometimes even the substitute for an office.

Vienna university (established 1365) is particularly famous for its medical faculty, and has been for generations a Mecca of science for young people of the Central European countries. The hospitals are up-to-date, and Vienna's specialists attracted patients from all over the world before the city came under Nazi domination in 1938.

In addition to the state opera house and the Burgtheater, home chiefly of the classics, Vienna has many other theatres, among them

the Volkstheater, and several devoted exclusively to operettas by Lehar, Strauss, and others, most famous of which is the Theater an der Wien. There are also two variety theatres. There are dance halls, bars, night clubs, cabarets, *Kleinkunst bühnen* (literary cabarets), etc., in abundance.

The picturesque Innere Stadt, dating from the Middle Ages, has narrow streets, small squares, ancient buildings, and many monuments. From the centrally situated St. Stephen's Square, two main arteries run: the Kärntnerstrasse, with its fashionable shops (Vienna's Bond Street), joins the Ringstrasse at the Opernkreuzung, Vienna's busiest traffic spot; the Rotenturmstrasse leads to the Franz Josefs Kai on the Danube Canal. The Graben (trench), with its Pestssäule (a column to commemorate the plague), built on the mass graves of the victims of the plague in the Middle Ages, is a fashionable thoroughfare.

There are very few bus routes in Vienna, though the tram network is well developed. Vienna also has an electric rly., partly underground, round the town. Once upon a time *Fiakers* (two-horse cabs) were popular.

Vienna is a 2 hrs.' run by train or car from the Alps; in the immediate neighbourhood are lovely resorts, e.g. Baden bei Wien, Vöslau, Gumpoldskirchen. On a dead branch of the Danube (Old Danube) rowing, yachting, swimming, fishing, and all water sports flourish. Within easy reach are the Danube swimming places of Klosterneuburg and Kritzendorf. Bathing and sunbathing are very popular. Dianabad in Vienna is certainly the largest and probably the most luxurious bath house in the world.

HISTORY. Vienna's German name, Wien, is derived from the name of a small trib. of the Danube. In the pre-Christian era, the Celtic settlement Vindomina stood on the banks of this stream. When the Romans fought their way to the north and captured Vindomina they renamed it Vindobona and built it up as a fortified camp. It was in Vindobona that Marcus Aurelius died in 180. Vienna's Hungarian name, Bécs (*pron. Batsch*), is probably of Slavonic origin. After the fall of the western Roman empire, Vienna was occupied first by the Huns and then by the Avars, and remained in obscurity for several centuries. When Charlemagne created the Ostmark (eastern district), nucleus

of future Austria, as a bulwark against the Avars, and made it a fief to the dukes of Babenberg, Vienna was so insignificant that Melk - an - der - Donau, and not Vienna, became the capital of the district and seat of the ruling house. However, the Babenberg Duke Heinrich Jasomirgott transferred the capital to Vienna in 1156, and during the crusades, the city, lying conveniently on the European crossroads from N. to S. and from W. to E., expanded in size and population.

In 1276, it became the seat of the Hapsburg dynasty, and capital first of the German and then of the Austrian empire. Hungarians besieged it, unsuccessfully, in 1480; but five years later, led by Mathias Corvinus, they captured and held Vienna for a short time. The Turks in their drive towards western Europe besieged Vienna in 1529 and 1683. That second siege would have been successful had it not been for the heroic stand of the garrison, under Duke Rüdiger von Starhemberg, and the help brought by the Polish King John III Sobieski, who, at the head of Polish and German troops, descended on the Turks from the Kahlenberg hill outside Vienna and inflicted on them the greatest land defeat of their history. That battle not only saved Vienna, it stemmed the Turkish drive towards western Europe.

French forces, under Bonaparte, marched into Vienna in 1805 and again in 1809. After the collapse of Napoleon's empire, the task of reorganizing Europe and reshaping its map was carried out during the congress of Vienna, 1814-15 (*v.i.*). When, in 1848, risings against the ruling despots broke out in many parts of Central

it, Vienna, as the capital once more of a mighty empire, again grew in size, importance, and pop., until, in 1910, it was inhabited by 2,031,498. In Nov., 1918, the Austro-Hungarian empire fell to pieces, the Hapsburgs were deprived of their thrones in Vienna and Budapest, and Vienna became the capital of the truncated Alpine republic of Austria. This drastic change meant that in 1920 a country of barely seven million inhabitants had a capital with a pop. of 1,842,005. Antagonism grew between the countryside and Vienna, called derisively *Wasserkopf* (one suffering from hydrocephalus). To alleviate this situation, Vienna was declared by the Austrian republican constitution to be not only the capital, but also an autonomous prov. having the same position in the republic as the other provs. (Lower Austria, Upper Austria, Styria, Salzburg, Carinthia, Tyrol, Vorarlberg, and Burgenland). Between the two Great Wars, Vienna's town council enjoyed the status of a diet. In it, the Social Democrats had a majority, while in the local govts. of other provs., and the federal govt. of the republic, the R.C. and conservative Christian-Social party were in a majority. That duality gave rise to the special brand of Austrian fascism (*Heimatschutzbewegung*) which, during and after the revolt of Feb., 1934, destroyed the predominance of the Socialists in Vienna. That Austrian fascism, for some time supported by Mussolini, fought not only the Socialists, but also the Austrian Nazis, who staged a revolt in Vienna in July, 1934, suppressed by the armed formations of the *Heimatschutz* and the Dollfuss govt.; Dollfuss himself was killed by the Nazi insurgents. Austrian fascist rule in Vienna came to an end on March 11, 1938, when Hitler's army invaded the republic and proclaimed its union with Germany. Under Hitler, Vienna was lowered to the status of the main city of Ostmark, as Austria was once more called.

During the Second Great War, Vienna was bombed a number of times before its capture on April 13, 1945, by Tolbukhin after more than a week's street fighting during which the E. dists. of the city suffered heavily, the buildings above the Danube Canal being reduced to rubble. After the war Vienna, though lying in the Russian zone of occupation in Austria, was, like Berlin, divided into British, U.S., French, and

Vienna, Austria. Map showing sectors of Allied occupation in 1945. Dist. I was under four-power administration

Europe, a revolutionary govt. was for a short time established in Vienna. During the 19th cent., particularly in the second half of

Russian sectors, the Innere Stadt being under four-power administration. At the same time, Vienna became once again the seat of a republican Austrian govt.

Vienna, Congress of. Meeting of plenipotentiaries of the European powers at Vienna in 1814-15 after the defeat of Napoleon and the entry of the allies into Paris. The purpose of the congress, which began sitting Sept. 20, 1814, was to determine the boundaries of the various states and to decide numerous questions arising out of the general resettlement. Castle-reagh represented Great Britain; Metternich presided as Austrian chancellor; the tsar sent Nesselrode; Hardenberg came for Prussia; and Tallyrand for France. The final settlement embodying all the separate treaties was signed June 9, 1815.

The chief results of the congress were as follows: France reverted to her old frontiers of 1792; Austria gave up the Netherlands but received E. Galicia and territory in Bavaria, in Italy, and on the Adriatic coast; Prussia got Posen and a part of Saxony; Russia got a portion of Poland and Finland; Norway was joined to Sweden; the Austrian Netherlands (the modern Belgium) were joined with the Dutch provinces to form the kingdom of the Netherlands; the Spanish monarchy was restored; the neutrality of Switzerland was guaranteed; the German confederation was reconstructed; while Great Britain secured Malta and the Ionian Islands, the Cape, Ceylon, some W. Indian islands, and Mauritius. See Europe: History. Consult: The C. of V., C. K. Webster, 1919; H. Nicolson, 1946.

Vienna Award. Name given to two frontier decisions made in Vienna during the Nazi regime. Under the first, Nov. 2, 1938, Germany and Italy having been invited by Czecho-Slovakia and Hungary to arbitrate on their frontier disputes, Ribbentrop and Ciano awarded to Hungary 4,200 sq. m. of Czecho-Slovak territory—nearly all she demanded. Part of the area was returned to Czecho-Slovakia, part went to the Ukraine (q.v.), after the Second Great War. Under the second Vienna award, Aug. 30, 1940, Germany and Italy having summoned representatives of Rumania and Hungary to that city, Ribbentrop and Ciano awarded to Hungary more than half of Transylvania. This award was cancelled under the peace treaty with Hungary, 1947.

Vienne. River of France. It rises in the dept. of Corrèze, on Mt. Odouze, flows W. through the dept. of Haute-Vienne, N. through Charente and Vienne depts., and N.W. through Indre-et-Loire, to meet the Loire about 9 m. above Saumur. Its tributaries include the Taurion, Briance, Clain, Creuse. Of its 223 m. c. 50 are navigable.

Vienne. Department of France. Formed of parts of Poitou, Berry, and Touraine, it lies adjacent to the depts. of Charente, Deux-Sèvres, Maine-et-Loire, Indre-et-Loire, Indre, and Haute-Vienne. It consists generally of broad plateaux separated by deep river valleys, chalky formations covering the N. parts and granite in the S.W. The river Vienne traverses the dept. from S. to N., and among many streams are the Clain, Creuse, Anzon, Auzances, Vonne, Gartempe, and Charente. Agricultural products include cereals and vines. Poitiers is the capital, other towns being Châtellerault, Civray, Loudun, Montmorillon, Lussac, Mirebeau, and Pleumartin. Vienne is rich in megalithic monuments. Area 2,711 sq. m. Pop. 313,932.

Vienne. Town of France, in the dept. of Isère. It stands on a hill above the confluence of the Gère with the Rhône, 1½ m. by rly. S. of Lyons. There are lead and copper mines in the vicinity. Industries include metal foundries and engineering, textiles, leather, paper, and glass works, and there is a busy trade in the fruit grown locally. The cathedral, seat of the archbishop who until 1792 was primate of Gaul, is in the Gothic of the 12th-16th centuries. Roman remains include the temple of Augustus and Livia, dating from

c. A.D. 41. A suspension bridge crosses the Rhône to St. Colombe. Known to the Romans as Vienna Allobrogum, Vienne was for a time capital of Burgundy, and became French in 1349. In unoccupied France during the Second Great War until Nov., 1942, it was liberated by U.S. forces Sept. 2, 1944. Pop. 23,519.

Vienne, Council of. Fifteenth oecumenical council of the Church, convoked by Clement V, and held at Vienne, France, Oct. 16, 1311-May 6, 1312. The papal court had but recently moved to Avignon, and the council met under the pope's presidency to consider the charges against the Templars. That no influence should be lacking, Philip IV of France went to Avignon, and on March 22, 1312, the bull Vox Clamantis was issued, suppressing the Order for the sake of the public welfare. Disciplinary measures concerning other religious orders were taken, and resolutions passed on various ecclesiastical matters. See Council; Knights Templars.

Vientiane. Capital of Laos, Indo-China, French Union. Formerly an independent muong or principality, much of it was destroyed in 1828 by the Siamese, who made the surrounding territory over to France in 1893. Here is a well-equipped aerodrome. There is some small trade in timber, especially teak, and elephant, gaur, and tiger are hunted near by.

Vierge, DANIEL URRABIETA (1851-1904). Spanish artist. Born at Madrid, he studied at its academy, and going to Paris in 1867 obtained employment on *Le Monde Illustré*, and subsequently illustrated the works of Hugo, Michelet, and Francisco de Quevedo. His work was inventive and decorative at a time when book-illustration had sunk to a low level. Illustrations to *Don Quixote*, published in London in 1907, were especially noteworthy. He died in Paris, May 12, 1904.

Viersen. German town, in N. Rhine-Westphalia, on the Niers, 18 m. W. of Düsseldorf. It was an important rly. junction and a centre of the Rhenish textile industry, producing velvet, corduroy, and silk and cotton cloth, as well as machinery, furniture, and

1. Town hall, built 1872-82. 2. Houses of Parliament, dating from 1874. 3. Art and history museum, which houses one of the greatest art collections in the world. 4. Opera House, seating over 2,000 persons. 5. Votive church, built to celebrate Francis Joseph's escape from

assassination in 1853. 6. The New Hofburg, a former imperial palace. 7. Cathedral of S. Stephen, completed in 1230, from the south-west. 8. Church of S. Charles, dedicated in 1737, flanked with belfries resembling Trajan's column at Rome. 9. University, from Franzensring

VIENNA: ARCHITECTURAL FEATURES OF THE AUSTRIAN CAPITAL (Pre-War)

foodstuffs. Among four R.C. churches the fine late Gothic S. Remigius was much damaged during the Second Great War, when Viersen suffered heavily from air attack. The town was taken during the rapid U.S. advance at the end of Feb., 1945. Pop. 34,500.

Vierzon. Town of France, in the dept. of Cher. It stands on the river Cher, 49 m. by rly. S. by E. of Orléans, on the Canal du Berry, and is a busy industrial centre, famed especially for its manufacture of agricultural machinery. Pottery, glass, bricks, and tiles are other products. Pop. 26,017.

Vietnam. Associate state within the French Union. It is divided into the three *ky* of North Vietnam (Tongking), Central Vietnam (Annam), and South Vietnam (Cochin-China), each with its own administration. Total area, 124,000 sq. m. Pop. 22,000,000. Most of the people are of Annamite stock.

The history of Vietnam up to Sept., 1947, is given under Indo-China. In that month Bao Dai, emperor of Annam 1926-45, who had been living in Hong Kong since 1945, called Vietnamese leaders to a conference there. The result was an agreement with France, ratified Feb. 3, 1950, establishing the independence of Vietnam (Tongking and Annam) under Bao Dai's leadership and its adherence to the French Union. Cochin-China later voted for union with Vietnam. Bao Dai's govt. was recognized by the U.K. and the U.S.A.

The communist leader Ho Chi-minh ignored Bao Dai, and continued to harass both the French and the forces of Bao Dai's govt. On Jan. 14, 1950, his organization Viet-minh declared itself the govt. of Vietnam, and was immediately recognized, with Ho as president, by Russia and the Communist govt. of China. Viet-minh forces were in control of a considerable part of N. and Central Vietnam. In S. Vietnam, they had no real hold, though in detached areas there was heavy fighting. To combat Viet-minh, French troops in Vietnam were, during 1950, increased in number to more than 100,000; and in Dec. Gen. de Lattre de Tassigny was appointed c.-in-c., Indo-China.

Vigevano. Walled city of Italy, in the prov. of Pavia, in Lombardy. 24 m. S.W. of Milan. Macaroni, furniture, boots, and silk are chief products. Pop. est. 30,000.

Vigfusson, GUÐBRANDR (1828-89). An Icelandic scholar. Born March 13, 1828, he studied in

Copenhagen, where he lived until 1864. That year he made Oxford his home, and he remained there until his death, Jan. 31, 1889, having been university reader in Icelandic since 1884. Vigfusson's life work was to illuminate the early history of Iceland, and he compiled an Icelandic dictionary, edited various sagas, and, with his friend York Powell, was responsible for *Corpus Poeticum Boreale*, 1883.

Vigil (Lat. *vigilare*, to watch). Ecclesiastical term for the day of fasting before certain feasts. Originally the night was spent in watching and prayer. In the Church of England the festivals falling within the seasons of Christmas and Easter, apart from Christmas Day and Easter Day, have no vigils. In the R.C. Church matins and lauds and the midnight Mass before Christmas are the only survivals of the ancient custom. The term has also been applied to the practice of watching the bodies of the dead before burial. *See* Knighthood; Wake.

Vigilantes OR VIGILANCE COMMITTEES. Groups of men who, in the early days of frontier settlement in the western U.S.A., banded themselves together for mutual protection. They arose in districts where there were as yet no courts or officers of the law, and they inflicted summary justice upon persons believed guilty of crimes against person or property, especially horse-stealing. The punishments they inflicted ranged from lynching to driving an offender out of the township. After the normal legal processes became available, vigilance committees often continued to exist. *See* Lynching.

Vignette (Fr., little vine). Term used in the decorative arts in several senses. In the 16th century the word, often spelt *vinet*, meant a trailing border of grapes, leaves, branches, and tendrils of the vine, used in architecture, as borders for book pages, or adornment for dresses. In book decoration, a vignette is the group of ornamental flourishes round a capital letter, as in a MS., the engraved illustration on a title page, head and tail pieces and, in modern use, any illustration of which the background fades away to the tint of the paper. In a sense similar to the last, the term is also used in photography.

Vignola, GIACOMO BAROZZIO DA (1507-73). Italian architect and writer on architecture, also known as Barocchjo. Born at Vignola, near Modena, Oct. 1, 1507, he studied painting without success at

Bologna, and then addressed himself to the science of perspective. From 1550 he practised architecture in Rome,

Giacomo da Vignola,
Italian architect

where he was attached to the papal court, and in 1564 became architect of S. Peter's in succession to Michelangelo. His best design was the palace of Caprarola, near Viterbo, built for Cardinal Alexander Farnese. But his treatise on the laws of the five orders of architecture, 1563, is, perhaps, his most noteworthy work. He died in Rome, July 7, 1573.

Vigny, ALFRED VICTOR, COMTE DE (1797-1863). French poet, dramatist, and novelist. He was born at Loches, March 27, 1797, and in his youth spent some years in the army. One of the earliest leaders of Romanticism, he published his first poems in 1822. *Alfred Vigny*

His verse, characterised by weight of thought and nobility of style, ranks with the finest philosophical poetry of his time and is his chief claim to fame. His prose fiction comprises an historical romance, *Cinq-Mars*, 1826; *Stello*, 1832; and three fine *nouvelles*, collected under the title *Grandeur et Servitude Militaires*, 1835. In the drama he produced, besides translations from Shakespeare (*Shylock*, *Othello*), and a short comedy, two prose tragedies, *La Maréchale d'Ancre*, 1830, and *Chatterton*, 1835, designed to realize his ideal of a drama, the interest of which should be purely psychological. Vigny was a proud and lonely man, and all his work is coloured by his profound pessimism and stoical temper. He died in Paris, Sept. 17, 1863. *See* Works, 1883-85; *Lives*, A. France, 1868; G. M. Paléologue, 1891; Dorison, 1892; Dupuy; 1910-12; Whitridge, 1933.

Vigo. Seaport of Spain, in the prov. of Pontevedra. It stands on Vigo Bay, 72 m. N. of Oporto, and on a branch rly. line 21 m. S. of Pontevedra. The fine harbour is a port of call for large steamers. The tunny and sardine fisheries, building of small steamers, and the manufacture of cordage are noteworthy. Foundries, machine shops,

Vigo, Spain. General view of the town showing the bay

paper and saw mills, petroleum and sugar refineries, chocolate and soap factories, tanneries, and distilleries are prominent industrial establishments. Wines, fish, cattle, and agricultural produce are exported. The port was twice attacked by Drake, in 1585 and 1589, and by a joint English and Dutch fleet in 1702, when the victors captured immense treasure and more was sunk with the Spanish galleons in the bay. It was also attacked by Cobham in 1719. Pop. 125,262.

Vihara. Dwelling for a Buddhist monk or image, in India and Ceylon. In European use the term commonly denotes also a monastery (*sangharama*). Of the great Brazen Monastery at Anuradhapura, Ceylon, built of nine storeys, about 100 B.C., and re-erected with five storeys about A.D. 400, only 1,600 stone pillars remain. Rock-cut viharas comprised at first unadorned rectangular meeting halls surrounded by cells, one- or two-storeyed. Gradually the pillars increased in number, with sculptural enrichments and image-shrines. So numerous were the monasteries in the ancient Magadha kingdom that it retains to this day the name of Vihara-land (Bihar).

Viipuri (Swed. Viborg). Town of Karelo-Finnish S.S.R. It is situated on a bay of the Gulf of Finland, at the mouth of the Saima Canal, 75 m. N.W. of Leningrad. Founded by the Swedes in 1293, it was formerly the capital of Karelia. It was taken by Peter the Great in 1709, and annexed to Russia by the peace of Nystad, 1721. Part of Finland after the First Great War, it was ceded to U.S.S.R. in 1940, a position confirmed by the peace treaty of Sept. 19, 1944. Pop. est. 30,000. See Finland.

Vijanagara or **HUMPI**. Ancient city of India, in Madras province. It flourished from its foundation in 1336 as a Hindu bulwark against

the Mahomedans, who sacked it in 1564. The temple dedicated to Vitoba, now in ruins, had boldly executed granite sculptures, and is the chief architectural relic. The finest remains of the Vijanagara dynasty are at Tarpur, 100 m. S.

Vijose (Gr. Aoos). River of Albania. It rises E. of the Greek frontier and flows N.W. to enter the Adriatic Sea 14 m. N. of Vlonë. It is 120 m. long.

Viking. Name given to the Scandinavian sea-rovers and pirates of the 8th to 10th centuries. The Old Norse *vikingr*, Anglo-Saxon *wicing*, probably means a warrior, from *vig*, *wig*, war, although some derive the word from Old Norse *vik*, a creek. The Vikings sailed in colourfully decorated ships, and bore shields which were also brilliantly coloured. See Boat; Norman; Northmen; Norway. Consult A History of the Vikings, T. D. Kendrick, 1930.

Vilaine. River of France. It rises at Juvigné, dept of Mayenne, 17 m. N.W. of Laval, flows W. to

estuary in the dept. of Morbihan. The chief tributaries are the Ille, Meu, and Don, and towns on its banks include Vitré, Rennes, Mes-sac, Redon, and Laroche-Bernard. The Vilaine is met at Redon by the Brest-Nantes canal. Certain stretches of the river are navigable. Its length is 138 m.

Vilayet or **IL** (Turk., province). Name of the chief administrative divisions of Turkey. Each vilayet or *il* is governed by a vali (*ilbay*) or gov.-gen. and a provincial council. In the present republic there are 63 vilayets, each divided into *cazas*.

Vilcañota or **Cuzco**. Mountain mass of Peru, on the boundary between the depts. of Puno and Cuzco. It forms a connecting height between the E. and W. Cordilleras of the Andes. Alt. 19,500 ft.

Vill. Early English form of the Latin villa. It was used for a township or small rural settlement, the village of later times, and from it are derived also the words villein and villeinage. The Anglo-Saxon word *tūn* was usually translated as vill. Consult Township and Borough, F. W. Maitland, 1898.

Villa. Latin word meaning a country house, but now used in England for a residence of moderate size, usually a suburban one. Most wealthy Romans had their villas, and Latin literature contains frequent references to them. Perhaps the most magnificent was the one built by Hadrian at Tivoli. The name and idea were carried by the Romans into France, Britain, and elsewhere. In England the remains of several hundred are known. The normal type enclosed an open court, access to the dwelling apartments and offices being gained by a covered corridor. Villas were the unfortified residences of romanised British squires rather than of alien officials. Outstanding examples are at Woodchester, Winchcombe, and Chedworth, Glos; Bignor, Sussex; Mansfield Woodhouse, Notts; Brading, I.O.W.

Viipuri, Karelo-Finnish S.S.R. Gothic castle, dating from 1293, an ancient Swedish stronghold on the Russian frontier

Rennes, S. through Ille-et-Vilaine down a picturesque, hilly, and wooded valley, and in the marshy dist. of the Lac de Morin turns S.W. to enter the Atlantic at the deep

estuary in the dept. of Morbihan. The chief tributaries are the Ille, Meu, and Don, and towns on its banks include Vitré, Rennes, Mes-sac, Redon, and Laroche-Bernard. The Vilaine is met at Redon by the Brest-Nantes canal. Certain stretches of the river are navigable. Its length is 138 m.

Villa, FRANCISCO PANCHO (1877-1923). Mexican soldier. Born at Las Nieves, he was originally known as Doroteo Arango. His early life included banditry, and he became so notorious for his robberies

that President Diaz offered a large reward for his capture. Pardoned by Madero on the outbreak of revolution in 1910, in return for his services, Villa speedily gained fame as a guerrilla general. Exiled to the U.S.A., he came back after the murder of Madero, and in 1914 he sided with Carranza against Huerta. Then he changed over, defeated Carranza at Torreon, and made himself c.-in-c. and virtual dictator. Being outlawed, he invaded U.S. territory in 1916 in order to discredit the Carranza govt., and when the latter was recognized by the U.S.A., Villa resumed guerrilla attacks on it. Bought off in 1920, on July 20, 1923, he was assassinated. *Consult Viva Villa!*, E. Pinchon, 1933.

Francisco Villa,
Mexican soldier

Villach. Town of Austria, in Carinthia. Situated at the head of raft navigation on the Drave, 25 m. by rly. W. of Klagenfurt, it is a centre for the timber trade and makes articles of lead from the nearby mines. S. Jacob's church is 15th century Gothic. Pop. 30,788.

Villa de Cura. Town of Venezuela, in the state of Aragua. It is 56 m. by rly. S.W. of Caracas near the N.E. shore of Lake Valencia. Cotton goods are made. Fire destroyed most of the town in 1900.

Villafranca. Town of Italy, in the prov. of Verona. It stands on the Tartaro, 14 m. by rly. N. of Mantua, and 11 m. by rly. S.W. of Verona. In the 12th century castle, now in ruins, the preliminary treaty which ended the war between France and Austria was signed July 11, 1859, after the battle of Solferino. There are manufactures of silk goods.

Village (Lat. *villa*). Name given to a settlement smaller than a town. The typical village, found all over England, consists of a number of houses grouped round a church. The manor house stands near, and around there are usually farms. *Consult The English Village Community*, F. Seebohm, 1884; *The Medieval Village*, G. G. Coulton, 1925.

Village Community. Term applied to a group of settlers who built their houses close together and cultivated the surrounding land in common. Much research has been given to the subject, and scholars differ as to whether it was composed of free men or of serfs,

and on other matters connected with its origin and development, such as its relation to the mark and the manor. It is almost certain that something of this kind was found at an early date over a good part of Europe, and in Asia. *See Manor; Mark System.*

Villa Maria. Town of Argentina, in the prov. of Cordoba. This place, 343 m. N.W. of Buenos Aires, was in 1872 selected by the Argentine congress as federal capital of the country, but the decision never took effect. It is a rly. centre and has interests in dairying, cattle, timber, and grain, with a pop. of approx. 35,000.

Villani, GIOVANNI (c. 1275-1348). Italian historian. Having filled various public offices in his native Florence, including those of prior and master of the mint, Villani wrote a chronicle of the city, accompanied by a review of events from the building of the Tower of Babel down to 1348. This is particularly valuable for its survey of contemporary politics, commerce, and arts. When Giovanni died of the plague, his work was carried on by his brother Matteo (d. 1363), and continued to 1364 by Matteo's son Filippo, much inferior as an historian. Portions were translated into English by R. E. Selfe, 1896.

Villanueva de la Serena. Town of Spain, in the prov. of Badajoz. It is near the left bank of the Guadiana river, 180 m. by rly. S.W. of Madrid, in the middle of the plain of La Serena. Wheat, fruit, wine, are produced. Pop. 16,000.

Villanueva y Geltrú. Coast town of N.E. Spain, in the prov. of Barcelona. It is 31 m. by rly. W.S.W. of Barcelona city. Textiles form the chief manufactures, and there is considerable trade in the excellent local wine. Pop. 14,300.

Villa Real. Dist. of Portugal, the W. part of the prov. of Tras os Montes. It lies between the Douro and the Spanish frontier. The Paiz do Vinho, along the Douro, is the richest wine-producing area in the country. Cattle-rearing is the chief occupation elsewhere in the dist. Its area is 1,640 sq. m. Pop. 289,114.

Villa Real. Town of Portugal, capital of the dist. of the same name, in Tras os Montes. It is on the Corgo river, 18 m. by rly. N. of Regoa on the line from Oporto to Salamanca. Pop. 8,900.

Villari, PASQUALE (1827-1917). Italian historian. Born at Naples, Oct. 3, 1827, he removed to Florence after the failure of the anti-Bourbon rising of 1848, in which he

shared. He there devoted himself to a *Life of Savonarola*, published 1859-61, and was appointed professor of history at Pisa in 1859, and at Florence in 1862. As a publicist Villari had some part in expelling the Bourbons from Naples. The valuable *Machiavelli and His Times* came out 1877-82, new ed. 1912-14; and *First Two Centuries of Florentine History* in 1893-94. In 1867 Villari became a member of the chamber of deputies, and in 1884 of the senate, and was minister for education, 1891-92. He lived until Dec. 7, 1917. Most of his historical writings were translated into English by his wife Linda, an Englishwoman.

Villarreal. Town of Spain, in the prov. of Castellón. It is near the mouth of the Mijares river, 4 m. from the coast and 33 m. by rly. N.N.E. of Valencia. Near by is the Canal de Castellón, a Moorish engineering work which still supplies irrigation water to the neighbouring huertas. Woollens, spirits, and paper are manufactured. The town has declined since 1609, when the Moors were expelled. Population 19,700.

Villarrica. Capital of the dept. of Guaira, Paraguay. About 90 m. S.E. of Asuncion, to which it is joined by rly. and road, it lies in an agricultural region watered by the Tropicuary, and trades in tobacco and fruit. Pop. 31,081.

Villars, CLAUDE LOUIS HECTOR, DUKE OF (1653-1734). French soldier. Born of a noble family at

Duc de Villars,
French soldier

Moulins, May 8, 1653, he entered the army in 1671 and performed distinguished service in the Netherlands and against the Turks. His reputation made, he was given a cavalry command in 1690, and during the next 25 years was almost constantly in the field. One of the chief French generals in the War of the Spanish Succession, he was sent in 1702 to assist the Bavarian ally, gaining a signal victory at Friedlingen which brought a marshal's baton.

All other commanders having failed against Marlborough, Villars in 1709 was given the main army in Flanders, where on Sept. 11 he was beaten and wounded at Malplaquet. But he defeated Eugene at Denain in 1712, and two years later signed as plenipotentiary the peace of Rastatt. During the regency for

Louis XV, Villars was a prominent politician. He took the field again in the War of the Polish Succession, dying at Turin, June 17, 1734. His Memoirs were finally edited by the marquis of Vogüé, 1884-92.

Villarsia. Genus of marsh-herbs of the family Gentianaceae. They are natives of S. Africa and Australia. They have long-stalked, oval, roundish, or kidney-shaped leaves, and yellow or white bell-shaped flowers, in clusters.

Villaviciosa. Port of N. Spain, in the prov. of Oviedo. It stands on the Ría de Villaviciosa where a small stream enters the Bay of Biscay, and is 18 m. by road E. of Gijón. The sea fisheries and coasting trade provide the chief occupations. The Gothic church is of architectural interest. Pop. 24,000. At a village of this name 12 m. by rly. W. of Madrid, the French defeated the Austrians, Dec. 11, 1710.

Villefranche. Town of France. In the dept. of Rhône, it stands on the Morgon, near the right bank of the Saône, 21 m. by rly. N.N.W. of Lyons. It is a centre of cotton and clothing manufacture. There is trade in Beaujolais wine. The Gothic church of Notre-Dame-des-Maraîs was completed in 1518. Founded in 1212, Villefranche became capital of Beaujolais in the early 14th century. In unoccupied France 1940-42, it was liberated from the Germans Sept. 3, 1944. Pop. 20,017.

Villegas, ESTEBAN MANUEL DE (1589-1669). Spanish poet. Born Feb. 5, 1589, and educated at Salamanca, he became known by his translations of Horace and Anacreon, which, together with verse of his own, he published as *Las Eroticas*, 1617. He settled at Najera as a lawyer, but his outspoken opinions and liberal views attracted the notice of the Inquisition, and he was exiled for some months in 1659. He died Sept. 3, 1669.

Villehardouin, GEFROI DE (c. 1155-1213). French chronicler. Born at Villehardouin, near Troyes, he joined the Crusade in 1199 and took part at Venice in the complex negotiations for transport facilities in 1201. He showed fine soldierly qualities at Adrianople, 1205, supported the emperor Henry I, and in 1207 retired to Thessaly, where he had received certain fiefs, and held the title of marshal of Romania. In his retirement he wrote his story of the conquest of Constantinople, the first great historical work in French.

Villein (Lat. *villa*). Originally, one who worked on a villa. In the 11th century it became, in its Latin

form *villanus*, the usual term for most cultivators of the soil, and as such is used in Domesday Book, which enumerates about 100,000 villeins. Later the word became villain, with a sinister meaning.

Villeinage. State of being a villain. In England, while the manorial system prevailed, i.e. roughly from the 11th to the 15th century, a large proportion of the population were in this condition. They formed a class intermediate between the freemen and the slaves. Their position as defined by the lawyers was quite servile. They could not leave the land to which they were bound, and there are examples of their lords selling them with it. Their children were villeins by birth. Villeins were obliged to perform certain services to the lord of the manor, working on his land at certain times, and they had to pay him fines of various kinds. In practice, however, their position was somewhat better than in theory. They had by custom certain rights, and gradually the courts of law began to recognize these. Residence for a year and a day in a chartered town made a villain into a freeman. The end of the system was due mainly to the economic causes that broke up the manorial system, the black death, the growth of money payments, the substitution of contract for custom, and the greater mobility of labour. See *Manor*; consult also *Villeinage* in England, P. Vinogradoff, 1892; *History of English Law*, F. Pollock and F. W. Maitland, 2nd ed., 1911; *History of English Law*, W. S. Holdsworth, 1903-38.

Villena. Town of Spain, in the prov. of Alicante, on the Madrid-Alicante rly. A Moorish castle standing on a hill dominates the town. Silk, olives, wine, and brandy are produced. Pop. 18,000.

Villena, ENRIQUE DE (1384-1433). Spanish author. He was husband of the mistress of Henry III of Castile, and wrote some pseudo-scientific works, including one in 1425, on the evil eye. He is, however, remembered as the author of the first translation of the Aeneid of Virgil, 1428.

Pierre Villeneuve,
French sailor

Villeneuve, PIERRE CHARLES JEAN BAPTISTE SILVESTRE (1763-1806). French sailor, born Dec. 31, 1763. He was a naval officer when the Revolution broke out, and, siding with

the new order, he rose to be admiral in the Republican navy, 1796. Saving his vessel at the battle of the Nile, he made his way to Malta. A favourite of Napoleon, he was given command of the Toulon squadron in 1804, but was defeated in 1805 at Trafalgar. Taken prisoner by the English, he was released the following year, and committed suicide at Rennes, April 22, 1806.

Villeroi, FRANÇOIS DE NEUVILLE, DUC DE (1644-1730). French soldier. Son of the marquis of Ville-

Duc de Villeroi,
French soldier

roi, a marshal of France and the governor of the youthful king Louis XIV, he spent much of his boyhood as the companion of his sovereign. He became a soldier, and, having been made a marshal, succeeded Luxembourg as commander of the army in the Netherlands in 1695. In the early days of the War of the Spanish Succession he served in Italy, but at Cremona he was taken prisoner. He led the French to defeat at Ramillies, 1706. He died July 18, 1730.

Villers-Bocage. Village of France, in the dept. of Calvados. It lies in wooded country 15½ m. S.W. of Caen. Captured in the Second Great War, June 13, 1944, by the "Desert Rats," and lost to the Germans, June 15, after a violent tank battle in its streets, it had two houses standing after the R.A.F. dropped, June 30, 1,000 tons of bombs in 15 mins. on Panzer divs. moving up through it. The British captured the site Aug. 5. After the war Villers-Bocage was rebuilt in stone.

Villers-Bretonneux. Town of France, in the dept. of Somme. It is 10 m. E. of Amiens, and was the site of a Franco-German battle in 1870. In the First Great War the Germans captured it, April 23, 1918, but lost it next morning to British and Australian troops. A memorial to 10,866 missing Australians was later erected here.

Villette. The last novel by Charlotte Brontë, published as by Currer Bell in 1853. Based on the author's memories of Brussels, described as Villette, it contains much that is autobiographical. See *Brontës*, The.

Villeurbanne. Town of France in the Rhône dept. Though independently governed, it is in fact a suburb of Lyons, about 3 m.

E. of that city. Its important industry comprises chemicals, soap, dyes, varnishes, woollen and other textiles, engineering, and metal goods. There are no remarkable buildings, but a number of charity institutions, e.g. homes for blind, deaf, and dumb. The pop. was 28,000 in 1900, and 82,399 in 1946.

Villi. Minute projections on the mucous membrane or inner surface of the small intestine. Exceedingly numerous, they serve to increase enormously the area of the intestine which is brought in contact with food, and thus facilitate digestion.

Villiers, BARBARA. Maiden name of the mistress of Charles II created duchess of Cleveland (*q.v.*).

Villiers, CHARLES PELHAM (1802-98). British politician. Born Jan. 3, 1802, he was educated

at St. John's College, Cambridge, and was called to the bar. In 1835 he was elected M.P. for Wolverhampton, and became associated with Cobden and Bright in the Free Trade agitation. He was president of the poor law board, 1859-66. When Villiers died, Jan. 16, 1898, he had sat as Liberal M.P. for Wolverhampton for 63 years.

Villiers, FREDERIC (1852-1922). British war artist and correspondent. Born in London, April 23,

Frederic Villiers,
British war artist
Russell

1852, he was educated partly in France. As artist for *The Graphic*, *The Illustrated London News*, and other papers, he had experience in many campaigns, beginning with the

Serbian War in 1876, and including the Russo-Turkish, Burmese, and Greco-Turkish Wars, Khartum Expedition, 1898, the S. African and Russo-Japanese Wars, the Italian campaign in Tripoli, the Balkan Wars, and the First Great War. His publications include *Pictures of Many Wars*, 1902; and *Villiers: His Five Decades of Adventure*, 1921. He died April 3, 1922.

Villiers de l'Isle Adam, PHILIPPE AUGUSTE MATHIAS, COMTE DE (1839-89). French poet and sym-

bolist. A Breton count, he was born at St. Brieuc, claimed descent from a grand master of the Knights of Malta, and on the death of King Otto

Villiers de l'Isle
Adam,
French poet

wanted to be a candidate for the throne of Greece. Impetuous, imaginative, influenced by Poe, Hegel, Wagner, and occultism, he lived for a time with the monks of Solesmes, and died of cancer in a Paris hospital, Aug. 18, 1889. Earliest of the symbolists, he wrote dramas (e.g. *Axël*, published posthumously); romances like *Isis*, 1862; short stories; and poetry. There are *Lives* by R. du Pontavice de Heussey, 1893, Eng. trans. 1904; V. E. Michelet, 1910; E. de Rougemont, 1910.

Villon, FRANÇOIS (b. 1431). A French poet of humble Parisian parentage. His own patronymic

was Montcorbier, and he called himself Villon after a priest who became his benefactor. After some irregular attendance at lectures in the university of Paris, he became associated with a company of reckless young gallants who sang and jested their time away in taverns, and on June 5, 1455, he mortally injured Sermoise, a priest, in a brawl. Through the influence of the Paris parlement he was respited after receiving a death sentence. On a second occasion he escaped the hangman at Meung in 1461 only through a general gaol delivery on the accession of Louis XI. After a feverish career chiefly punctuated by larceny and libertinism, he found a quiet sanctuary in the house of the abbé de St. Maixent in Poitou, where he presumably died.

François Villon,
French poet

Villon's was a new voice in French literature. Gay, witty, and humorous, at once a cynic and a sentimentalist, he sinned and loved and suffered with the intensity of a strong and masculine nature. Regret and melancholy, lament for fugitive joy and the passing of beauty, are his themes. His first considerable work was *Le Petit Testament*, a mocking list of bequests to his graceless companions, drawn up on the occasion of his departure from Paris to Angers in 1456 to cure himself of a grand passion. A satirical survey of himself and his friends, it is a kind of preparatory sketch for his masterpiece, *Le Grand Testament*, 1461, a treasury of ballades and rondeaux charged to the brim with purest poetry. Bitter and ingenuous self-revelations, the Testaments are as free from hypocrisy as they are from boasting. Self-examination and confession, even piety, are there, but they are not followed by repentance. There is also *Le Jargon*, a collection of verse in Parisian slang.

Bibliography. Works, Bibliothèque Elzévirienne, Paris, 1854; ed. L. Thuasne, 1923; Eng. trans. G. Atkinson, 1930; H. B. McCaskie, 1946; *Lives*, G. Paris, 1901; P. Champion, 1913; D. B. Wyndham Lewis, 1928; I. Siciliano, 1934; C. Mackworth, 1948.

Vilna (Lettish, Vilnius; Polish, Wilno). Russian, and usual English, name for the capital of Lithuania S.S.R. It stands at the confluence of the Vileika and Vilja, nearly 60 m. E.S.E. of Kaunas, and is a rly. junction for Leningrad and Warsaw. An ancient and irregularly built place, it is rich in historical association, and is commercial rather than industrial.

Before the Second Great War, in which it was badly damaged, the pop. was 207,750. S. Stanislas cathedral (R.C.) was built in 1387, restored 1801, and possessed the silver coffin of S. Casimir; S. Nicolas (Greek) dated from 1596-1604; the Orthodox cathedral, dedicated to the Virgin, was the seat of an archbishop. It had

Vilna, Lithuania S.S.R. The Palace of the Republic

other medieval churches and monasteries, and ruins of a castle of the Jagellon dynasty, as well as botanical gardens and a museum of antiquities. A university was inaugurated in 1940. In normal times grain and timber are exported, tobacco, candles, leather and knitted goods are produced.

First mentioned as an important fortified town in 1128, Vilna became the capital of Lithuania in 1323. It was united with Poland when its prince Casimir IV was elected king of Poland in 1447. A centre of Jewish as well as Polish culture, it had a printing press by 1519, but in the international wars of the 17th century it suffered disaster. Russia annexed it at the final partition of Poland, 1795. Seized by the Germans in 1915, it was a bone of contention when Poland and Lithuania were resurrected as nations at the Paris conference of 1919. Polish troops took the city in 1920 after the Bolsheviks had handed it to the Lithuanian authorities; and the treaty of Riga, 1921, assigned Vilna to Poland. At the outbreak of the Second Great War Russia occupied Vilna, Sept. 19, 1939, and transferred it to Lithuania, Oct. 10. On June 27, 1941, it fell to the Germans, to be liberated July 13, 1944, by Chernyakhovsky's 3rd White Russian army after five days' fighting in the streets which severely damaged the town and cost the Germans 8,000 slain and 5,000 prisoners. Chernyakhovsky, killed in E. Prussia, is buried here. See Lithuania.

Vimeiro. Village of Portugal. In the prov. of Estremadura, it is 7 m. from Torres Vedras and 31 m. northwards from Lisbon. Here on Aug. 21, 1808, was fought the first important battle of the Peninsular War. Wellington, with about 20,000 men, had pushed forward to Vimeiro when he was attacked by the French, whose numbers were somewhat fewer. His position was strong and the attack, although pushed with courage and resolution, was repulsed. The French fell back in disorder, but Sir Henry Burrard, who was in supreme command, refused to pursue.

Viminal or **VIMINALIS.** One of the seven hills of Rome, E. of the Quirinal and N.N.W. of the Esquiline. So called from the osiers (*vimines*) which grew on it, the name Viminus was given to Jupiter, who had a temple there. To the N. were the *thermae*, or baths, of Diocletian.

Vimy Ridge, France. Memorial to Canadians who stormed the height in the third battle of Arras, 1917. It was unveiled by Edward VIII, July, 1936

Vimy Ridge. Upland of France. In the dept. of Pas-de-Calais, it is 5 m. N. by E. of Arras, and 476 ft. in height, and is an E. spur of the Notre Dame de Lorette. In the First Great War the village was captured with Petit-Vimy by the British, April 13, 1917. The ridge, dominating the Arras sector, passed into the hands of the Germans early in the war. Unsuccessfully attacked by the French under Foch in June and Sept., 1915, it was stormed by Canadian troops, April 9-10, 1917, in the third battle of Arras, and thenceforth was held by the British. In July, 1936, Edward VIII unveiled here a memorial to 11,285 missing Canadians. See Arras, Battles of.

Viña del Mar. Seaside resort of Chile. Situated on the coast, 5 m. S.E. of Valparaíso, it has frequent buses and trains, which carry many city workers. It is a fashionable holiday resort, with a season from Dec. to Feb. It has a racecourse, swimming pool, and many other sporting facilities. Notable among S. American hotels is the O'Higgins Hotel at Viña del Mar. Pop. 70,013.

Vincennes. Town of France, suburb of Paris, in the dept. of Seine. It lies 5½ m. S.E. of Notre Dame, Paris, and 2 m. outside the fortifications, connected with the city by rly. There are distilleries, metal and engineering works, chemical, piano and organ, rubber, and fancy goods manufactures; market gardening is carried on. Among important military establishments are the school of military administration, founded 1875, and the arsenal. The Château of Vincennes dates from the 14th century.

The Bois de Vincennes is a park between the fortifications and the right bank of the Marne, which became the property of Paris in 1860. Louis VII built a hunting seat here in 1164, and here Henry V of England died in 1422. Louis XI

converted the keep of the château into a state prison; among famous prisoners have been Henry of Navarre, the Condés, Cardinal de Retz, Diderot, and Mirabeau. The chapel of Francis I's castle here was burned out during the Second Great War. Vincennes was the scene of the execution of the duke of Enghien, 1804, and of various spies and traitors during the First Great War. Pop. 49,226.

Vincennes. City of Indiana, U.S.A., the co. seat of Knox co. It stands on the Wabash river, 118 m. S.W. of Indianapolis, and is served by the Cleveland, Cincinnati, Chicago and St. Louis, and other rlys. Its industrial manufactures include shoes, paper, flour, canned food, and steel bridges. A French fur-trading post was established here in 1683; it became a centre of glass manufacture in 1837. Vincennes was the capital of Indiana Territory, 1800-14, and became a city in 1856. Pop. 18,228.

Vincent (d. 304). Spanish saint and martyr. He was educated by Valerius, bishop of Saragossa.

Vincennes, France. Ancient keep of the castle-fortress, which has held many famous prisoners

Apprehended during the persecution of Diocletian, and taken to Valentia, he died after tortures inflicted by the governor Dacianus. His day is Jan. 22.

Vincent, Sir Charles Edward Howard (1849-1908). British politician and police organizer. Born May 31, 1849, and educated at Westminster, he entered the army in 1868, but resigned five years later, and was called to the bar in 1876. He acted as correspondent for the Daily Telegraph at the beginning of the Russo-Turkish war of 1877-78. He studied the police systems of Paris, Brussels, Berlin, and Vienna, and was appointed the first director of the C.I.D. at Scotland Yard, 1878. Resigning in 1884, he entered parliament for Central Sheffield the following year, and was largely responsible for the First Offenders Act, 1887, the Alien Immigration Act, 1901, and for the appointment of the Public Trustee, 1906. He was knighted in 1896, and died at Mentone, April 7, 1908.

Vincent, John Heyl (1832-1920). Bishop of the American Methodist Episcopal Church. He was born at Tuscaloosa, Alabama, Feb. 23, 1832, began to preach at the age of 18, was elected bishop in 1888, and from 1900 to 1904 was representative of his Church in Europe. He was one of the founders of the Chautauqua (g.v.) Assembly and wrote *The Chautauqua Movement*, 1886; *The Modern Sunday School*, 1900; and *Family Worship for Every Day in the Year*, 1905. He died May 9, 1920.

Vincent, William (1739-1815). British divine. Born in London, Nov. 2, 1739, and educated at

Westminster School and Trinity College, Cambridge, he became assistant master at Westminster School in 1771, in which year he was ordained, and was appointed head-

master in 1788. In 1802 he became dean of Westminster, and did much useful work in restoring the fabric of the abbey. Famed as a scholar and educationist, Vincent wrote *A Defence of Public Education*, 1801, and *Commerce and Navigation of the Ancients in the Indian Ocean*, 1807. He died Dec. 21, 1815, at Islip, of which he had been rector since 1805, and is buried in Westminster abbey. He gave his name to Vincent Square, London.

William Vincent,
British divine

Vincent de Paul (1576-1660). French priest and saint. Born at Pouy, near Dax, in Gascony,

April 24, 1576, the son of a small farmer, he was educated at a Franciscan school at Dax, and later at Saragossa and Toulouse, earning his living as a private tutor.

In 1600 he was ordained priest, after which he continued his studies for four years. Captured at sea by Turkish pirates, he was sold into slavery at Tunis, but escaped to France, 1607. After a visit to Rome, he made his way to Paris, becoming almoner to Margaret of Valois in 1610, curé of Clichy in 1612, and in 1617 curé of Châtillon les Dombes. Here Vincent founded in 1624 the Order of Mission Priests, which was later established at St. Lazare, Paris, and became known as the Lazarist Fathers (g.v.). In 1632 he started the Daughters of Charity, the first order of unclioistered women devoting their lives to works of charity among the poor. He established the Foundling Hospital in Paris, and worked on behalf of galley slaves. In 1649 he sent out the first mission to the natives of Madagascar. He died in Paris, Sept. 27, 1660, and was canonised in 1737. *Consult Lives*, J. A. Adderley, 1901; H. Lavedan, Eng. trans. 1930.

Vincentians. Alternative name for the Congregation of the Priests of the Mission, better known as the Lazarist Fathers (g.v.).

Vincent's Angina. Ulcerative condition of the throat caused by two germs: the bacillus and spirillum of Vincent growing in symbiosis. The onset is accompanied by fever, malaise, and enlargement of the glands of the neck on the affected side. In due course the ulcer heals, generally without complication. Treatment consists in mild antiseptic applications, or, in suitable cases, the painting of the area with, and an intravenous injection of, one of the arsenical preparations.

Vinci. Village of Italy. On the Arno, 8 m. N.N.E. of San Miniato, it is famous as the birthplace of Leonardo da Vinci (g.v.). During the Second Great War the portico and tower of S. Ansano's church were destroyed by a bomb.

Vindelicia. One of the Danube provinces of the Roman empire. It

comprised roughly N. Tirol, a portion of N.E. Switzerland, and S. Bavaria and Württemberg. Its Celtic inhabitants were subdued by Tiberius in 15 B.C., when the country became a province, with Augusta Vindelicorum (mod. Augsburg) as capital. *See Rome*.

Vindhya. Hill range of India. It forms part of the N. edge of the Deccan plateau with a steep slope S. to the Narbada valley and a more gentle slope N. to the Malwa plateau. The E. end is continued across broken hill country by the Kaimur Range and the Rajmahal Hills to the Ganges near Bhagalpur.

Vindhya Union OR **VINDHYA PRADESH**. State of the Union of India, formed by a union of the 35 former Bundelkhand and Baghelkhand states of India, which joined together in 1948. The largest states were Rewa, Chhatarpur, Charkhari, Panna, and Orchha. The maharaja of Rewa was first rajpramukh. Pop. (1950 est.) 3,880,000.

Vindictive. British cruiser, famous for her part in the attack upon Zeebrugge (g.v.) in the First Great War, April 23, 1918. The Vindictive, then an obsolete ship of 5,700 tons, which had been specially fitted up for the purpose, went alongside the mole and landed a party of men in the face of heavy enemy fire. She got safely away from Zeebrugge on May 10, but was run into Ostend Harbour and sunk to block the channels. She lay there until raised and berthed in 1920; later the salvaged vessel was broken up.

Vine (*Vitis vinifera*). Climbing shrub of the family Vitaceae. It is believed to be a native of Asia Minor, but as grape stones have been found in European Bronze Age graves, it has been cultivated from the earliest times, and there is no certainty as to its origin.

Vine in the gardens of Hampton Court Palace, planted in 1768

It has slender woody stems of great length, which cling to trees by tendrils. The large, lobed leaves have toothed edges, and the small, green flowers are clustered in racemes. The five petals are united above and free below, so that the expansion of the stamens throws them off entire. They are succeeded by berries (grapes) containing two or four hard seeds. Numerous varieties have been produced with fruit varying in colour from purple to green.

The grape vine is believed to have been introduced to Britain by the Romans; and in Saxon times vineyards were numerous. But the climate of the U.K. is more conducive to production of foliage than to the ripening of the fruit. In the '60s and '70s of the 19th century European vines were almost exterminated by the attack of vine aphid (*Phylloxera vastatrix*) introduced from N. America. The trouble was afterwards reduced by grafting the vine on rootstocks of the American summer-grape (*V. aestivalis*) and fox-grape (*V. labrusca*). (See *Phylloxera*.) The genus *Vitis* includes about 40 species. See Australia; Douro; Grape.

Vinegar (Lat. *vinum*, wine; *acer*, sharp). Sour liquid originally obtained from wine by fermentation. The action was due to a micro-organism, the bacterium *Mycoderma aceti*, which in the presence of air promoted the oxidation of alcohol to acetic acid (*g.v.*); this scientific explanation being due to Pasteur. Until the 17th cent. vinegar was a by-product of wine making. Later a separate industry used alcoholic liquor specially prepared for the purpose. The original slow process consisted in exposing alcoholic liquor in casks to the action of air. These casks held 50 to 100 gallons, and were about half filled with beech shavings previously impregnated with vinegar. After about 6 months the alcohol was wholly converted to acetic acid.

In the quick process now generally used, the liquor is allowed to trickle through a layer of beech shavings supported on a false bottom in a large vat. Air is admitted below the false bottom and the temperature maintained at 41° C. Once started, the heat of reaction is sufficient to maintain this temperature. The liquor is returned to the top of the vat until conversion is complete in about 14 days.

Ordinary vinegar made from malt contains about 6 p.c. acetic

acid. In addition there are small amounts of other organic acids and esters, with sugar dextrin and traces of natural colouring matter. Wine vinegar has 6-12 p.c. of acetic acid and about 0.25 p.c. of tartar, which distinguishes it from malt vinegar. Cider and perry will also serve as bases for vinegar.

Vinegar Eel (*Anguillula aceti*). Minute nematode worm which sometimes occurs in vinegar.

Vinegar Hill. Eminence in co. Wexford, Eire, just outside Enniscorthy. In May, 1798, a force of rebels 15,000 strong gathered together in Wexford and formed a camp on Vinegar Hill, whence they carried on a series of outrages on the Protestant royalists in the neighbourhood. They were easily defeated by a force under Lake, their leader, Father Murphy, being slain. See Ireland; consult also History of the Rebellion, J. B. Gordon, 1803: History of England in the 18th Century, W. H. Lecky, 1878-90.

Vinegar Plant. Name given to a tough layer of a slimy character found on the surface of fluids, originally saccharine, which have become alcoholic through the breaking up of the sugar by the action of the yeast. Where this appears the alcohol is converted into acetic acid. The mass consists of numerous layers of minute threads of fungi and bacteria. The element in this heterogeneous mass to which the production of vinegar is due appears to be the bacterium *Mycoderma aceti*.

Vines, SYDNEY HOWARD (1849-1934). British botanist. Born in London, Dec. 31, 1849, and educated at Christ's College, Cambridge, and London university, he specialised in the botanical side of biology. He assisted Thiselton-Dyer in the S. Kensington botanical course of 1875, and, returning to Cambridge, became fellow of Christ's in 1876 and reader in botany to the university in 1883. In 1888 he migrated to Oxford, and was Sherardian professor of botany until 1919. F.R.S. In 1885, he was president of the Linnean Society, 1900-04. He lived till April 4, 1934. His publications include A Student's Text-book of Botany, 1895.

Vingt-et-un (Fr., 21) OR PONTOON. Card game played by any number of persons, four to six being best. The full pack is used, court cards each counting 10 and aces either 11 or one, at the option of the holder. Suits are immaterial. The dealer gives one card to each

player, including himself, the cards being face downwards. Each then places upon his card a stake, which the dealer may double or treble; and a second card all round is distributed, after which the hands are examined. The object of the game is to obtain 21 or as near that number as possible, but not above it, by the pips on the card. The dealer negotiates with each player in turn, and each may stand by the two cards received; or purchase another unseen; or take one free which the dealer sees ("twist"); and so on to a fourth or fifth card, but any score over 21 loses the stake. When all the players are either satisfied or "bust," the hands are exposed upon the table. Those nearer 21 than the dealer receive from him, while those with equal or inferior hands pay. If the dealer "busts" in taking extra cards he pays everybody still in. A natural, i.e. an ace and a ten dealt in the first two cards, entitles the recipient to double or treble stakes, as agreed, and to become dealer. A holding of five cards totalling less than 22, or any cards scoring 21 exactly, is paid double.

Vinh. Seaport of Central Vietnam (Annam). It is on the W. coast of the Gulf of Tongking and on the rly. between Hanoi and Hué, 200 m. N.W. of Hué.

Vinnitza. Town of Ukraine S.S.R., capital of a region of the same name. It lies 120 m. S.W. of Kiev, on the river Bug, at its junction with the Vinnichka. It dates from the 14th cent. and was formerly fortified. It had a Jesuit college founded in 1649, and under the Soviet regime developed into an industrial town of some importance, among its products being tobacco, vehicles, soap, and candles. Overrun by the Germans in Sept., 1941, it was recaptured by Zhukov's 1st Ukrainian army March 20, 1944, in a frontal assault combined with an outflanking movement. Pop. (1939) 92,868.

Vinogradoff, SIR PAUL (1854-1925). An Anglo-Russian scholar. Born at Kostroma, Russia, he became a professor of history at Moscow university. An enthusiastic educationist, his attitude brought him into conflict with the authorities in tsarist Russia, and about 1890 he

Sir Paul Vinogradoff,
Anglo-Russian
scholar

left for England. He devoted much study to the economic condition of early England, and in an article in the *English Historical Review* destroyed the old theory of folkland, substituting the notion that the manor grew out of a free village community—accepted as correct by practically all authorities. Villainage in England, 1892, was an exhaustive examination of this and other obscure problems. Other books include *The Growth of the Manor*, 1905; *English Society in the 11th Century*, 1908; and *Works in Russian*. In 1903 he went to Oxford as professor of jurisprudence, and in 1920–22 published *Outlines of Historical Jurisprudence*. Knighted in 1917, Sir Paul died Dec. 19, 1925.

Vintage. Literally the yield of a vineyard or vine-growing district for one season. The term specifically indicates the typical qualities of wine resulting from a notably good growth, maturing, and harvesting of grapes. *See* Wine.

Vintners' Company. London city livery company. Incorporated by charter in 1437, granted arms in 1447, and called originally the Merchant Wine-Tonnors of Gascoyne, it had two classes, wine importers and inn-keepers, and exercised powers over the imports and sale of wines

Vintners' Company arms

and the licensing of taverns. That part of the city known as the Vintry was once a centre where the vintners chiefly resided. The hall in Upper Thames Street is on land given by Sir John Stodeye; the original hall and adjacent almshouses were destroyed by the Great Fire of 1666, after which the new almshouses were erected in the Mile End Road, the hall being rebuilt by Wren, 1671, and largely altered in 1820–23. The oak carvings in council chamber and hall are attributed to Gibbons. The Vintners and Dyers are the only companies who may keep swans on the Thames. *Consult* *The Vintners' Company*, ed. T. Milbourn, 1888.

Vinyl Plastics. This class of synthetic materials is described in the entry on Plastics.

Viol. Name of a family of bowed instruments, dating from the 11th century. In general appearance it somewhat resembled the violin type, but there were really important differences. The back of the viol was flatter and

its ribs deeper, while the shoulders, instead of being round and meeting the neck at right angles, were

Viol, tenor 6-stringed instrument

sloping and met it at a tangent. The sound-holes were usually c-shaped instead of f-shaped, and the strings were five to seven in number instead of four, the tuning being in fourths and one third. There were several sizes, principally the Treble or Discant, the Viola da Braccio (or arm viol),

the Viola da Gamba (or leg viol), and the Violone (or double bass viol), the only one still in use.

Viola. Bowed instrument of the violin type. It is about one-seventh larger in size, and has its four strings a fifth lower in pitch, its tone being less brilliant. **Viola.** Leading female character in Shakespeare's *Twelfth Night*. Wrecked on the coast of Illyria, she becomes page to Orsino, the duke, under the name of Cesario, and, herself secretly in love with him, is employed in love-embassies to the countess Olivia, who, rejecting the duke's suit, makes court to his page.

Violaceae. Family of herbs and shrubs. Natives of the temperate and tropical regions, they have leaves undivided or cut in from the margins, and before expansion the edges are rolled in. The flower parts are in fives, the lower stamens with spurs which secrete nectar. The fruit is a three-valved capsule. The best known genus is *Viola* (violet and pansy). The bedding viola, a cross between *V. cornuta* and *V. lutea*, resembles a pansy, but grows more profusely, and is usually self-coloured.

Violet (*Viola*). Large genus of low herbs, mostly perennial, of the above family Violaceae, natives of all temperate regions. Eleven species are recognized as British, including such well-known forms as the sweet violet (*V. odorata*), the dog violet (*V. canina*), and the heartsease (*V. tricolor*)—the last an annual. The flowers are irregular, for five petals form two pairs of different size and an odd

petal. In many species, as in the sweet violet, the odd petal is lengthened behind to form a hollow tube in which nectar is produced. The anthers form a close ring around the style, and the dry pollen shed into the enclosed space cannot fall until a bee, seeking the nectar, dislocates the ring and gets its head dusted. The fruit is a capsule which splits into three valves, and these by their contraction hurl the hard, polished seeds to a great distance.

Violin. Bowed instrument of great importance in modern music. It dates back for some three and a half centuries, and since the early 18th century its form, as settled by the great Italian luthiers, has undergone no radical change. Its size, shape, and proportions are based (a) on the manner of holding and bowing the instrument; and (b) on the production of a full, powerful, and brilliant tone. The principal parts that make up a violin are: (1) a resonant body, consisting of an arched belly and back, united by ribs; (2) a finger-board; (3) a neck, terminating in a head or scroll; and (4) four strings carried from a tailpiece over a bridge on the belly to tuning-pegs in the end of the neck. The strings, tuned in fifths (E, A, D, G), are of gut, the lowest being covered with silver, silvered copper, or gold wire, and the highest being often of steel wire. The strings are set in vibration by a horse-hair bow held in the performer's right hand, the fingers of the left hand being pressed upon them as required. The violin's compass of about 3½ octaves is from G below the treble clef to C above the fifth ledger line above it; higher notes are obtained by harmonics (q.v.) *See* Position; Stradivari. *Consult* *Violin Making As It Was and Is*, E. H. Allen, 1946.

Violet-le-Duc, EUGÈNE EMANUEL (1814–79). French architect and author. Born in Paris,

Violet. Flowers and leaves of the British wild violet, *Viola canina*

Jan. 21, 1814, he studied architecture under Leclerc, and made a tour of investigation of classic remains in Italy and S. France. He was appointed architect of the abbey of S. Denis, and in 1853, when recognized as the leader of the Gothic revival in France, a govt. inspector-general of religious buildings. He spent ten years restoring Notre Dame. In the siege of Paris he acted as military engineer. He is remembered especially by his *Dictionnaire Rais-*

E. Viollet-le-Duc,
French architect

sonné de l'Architecture Française du XI-XVI Siècle, 1854-68, and *Histoire de l'Habitation Humaine*, 1875. He died at Lausanne, Sept. 17, 1879.

Violoncello. Bass violin tuned an octave below the viola (*q.v.*), but held between the legs of the performer as was the viola da gamba. It generally plays the bass part in orchestral music, but it is also valuable for sustaining a

Violoncello, bass
stringed instrument

sad or moving melody, especially in the tenor range.

Viotti, GIOVANNI BATTISTA (1753-1824). Italian musician. Born at Fontanetto da Po, May 23, 1753, he studied the violin under Pugnani at Turin, accompanying his master to Germany and Russia, 1780-81. Playing in London and Paris, 1782-83, he was acclaimed the greatest French violinist alive, but he discontinued concerts in order to compose and conduct at an opera house in Paris, 1789-93. Compelled by the

G. B. Viotti,
Italian musician

Revolution to flee, he helped to put on Italian opera in London. Director of the Opéra in Paris, 1819-21, he died in London, March 3, 1824. Viotti wrote 29 concertos for violin and orchestra, 18 sonatas, and quartets, trios, etc.

Viper. Large tribe of poisonous snakes. They are usually characterized by thick bodies, flat and triangular heads, vertical pupils to the eyes, and short tails. All are venomous, and most viviparous. The true vipers (*Vipera*) include some ten species, found in Africa, Europe, and part of Asia. The sand viper is found in S. Europe, where it preys upon small birds and mammals, lizards and snakes. Russell's viper occurs in the sub-continent of India, Ceylon, and Siam; its bite is almost as deadly as that of the cobra. The common viper or adder (*V. berus*), common in Europe and Asia, is the only venomous reptile occurring in Great Britain. See Adder; Horned Viper; Snake.

Viper's Bugloss (*Echium vulgare*). Biennial bristly herb of the family Boraginaceae. It grows native in Europe, W. Siberia, and N. Africa.

The stout stem is three or four feet in height, the lower part clothed with lance-shaped or oblong leaves, the upper crowded with short lateral sprays of flowers. The flowers are funnel-shaped, red-purple before they open, then a beautiful bright blue—occasionally white. The fruit consists of four wrinkled, angular nutlets.

Vipurī. Variant spelling of Viipuri (*q.v.*), on the Gulf of Finland.

Viracocha or **UIRACOCOA**. Ancient Peruvian deity. A creator-god, he was apparently the old tribal deity of the Colla people in the Titicaca basin. He was adopted by the Incas, when they subjugated that region, as a water deity.

Virangam. Town of India, in Ahmadabad dist., Bombay state.

It is a rly. junction 40 m. W. by N. of Ahmadabad. It has a large trade in cotton.

Virchow, RUDOLF (1821-1902). German pathologist. Born at Schivelbein, Pomerania, Oct. 13, 1821, he had a medical training in Berlin, and in 1847 was appointed lecturer at its university. The same year he was appointed to study the causes and cure of typhus. Professor of pathological anatomy at Würzburg, he moved in 1856 to the similar chair in Berlin. He was elected to the Prussian diet, 1862, and became leader of the opposition. In 1858 Virchow published his *Cellular Pathology*, which stamped him at once as one of the greatest and most original thinkers of his profession. In it he laid down the famous dictum "All cells from a cell." The pathological institute in Berlin was set up by the government at the instance of Virchow, who lived until Sept. 5, 1902.

Virgate (Lat. *virga*, rod). Old English measure of land. At the time of Domesday Book and probably later it was the fourth part of a hide, which was usually about 30 acres. See Hide.

Virgil or **VERGIL** (70-19 B.C.). Roman poet, whose full name was Publius Vergilius Maro. Born Oct. 15, 70 B.C., at Andes (mod. Pietole), near Mantua, the son of a small landowner, he was educated at Cremona, Milan, Naples, where he learned Greek, and Rome, where he studied rhetoric and philosophy. He then returned to his native place, but after the battle of Philippi in 42 his father's estate was made over to the veterans who had fought for Octavian against Brutus and Cassius.

On the advice of his friend, Asinius Pollio, Virgil journeyed to Rome, and made a personal appeal to Octavian. There is some obscurity as to the result, but, if Virgil did not finally recover his property, he received compensation in the form of an estate in Campania. His visits to Rome secured him the patronage of Maecenas, the friendship of Cornelius Gallus and other influential personages, and above all of Horace. Relieved from financial anxiety by the generosity of Maecenas, he was able to devote himself undisturbed to literary work. From 37 onwards his life was spent alternately in Rome and Naples. In 19 he visited Greece, but was obliged to abandon his tour owing to illness. He returned in the company of Augustus, whom he had met at Athens, but soon after

Viper's Bugloss.
Flower spike of
the British plant

reaching Brundisium he died, Sept. 21, and was buried near Naples.

Virgil lived in the respect of all classes, but disliked public praise. Horace pays tribute to his sincerity, piety, patriotism, and loyalty to friends. So conscientious was his workmanship that in his last illness he wanted to burn the unrevised *Aeneid*.

The poems universally recognized as the work of Virgil are: (1) Ten Eclogues (selections) or *Bucolics* (pastoral poems), written 42-37 B.C. Imitated from the idylls of Theocritus (*q.v.*), they lack the freshness and truthfulness to nature which characterize his

Virgil, Roman poet, from a bust in the Capitol, Rome

Sicilian model, and some of them can hardly be called pastoral poems at all. (2) The *Georgics* (37-30), or *Treatise on Agriculture*, a didactic poem in four books, dedicated to Maecenas. Prompted by the *Works and Days* of Hesiod (*q.v.*), and the *Phaenomena* of Aratus, book 1 treats of tillage, 2 of the cultivation of trees, especially the vine, 3 of cattle breeding, 4 of bee-keeping. (3) The *Aeneid*, an epic poem in 12 books. Undertaken at the request of Augustus, it took Virgil 11 years to complete the rough draft, revision of which was prevented by his death. In this unfinished state it was bequeathed to his literary executors, Varius and Tucca, on condition that it should not be published, but Virgil's wishes were overruled by Augustus. Imitated from Homer—the first six books based on the *Odyssey*, the last six on the *Iliad*—its purpose was the glorification of the Julian house represented by Augustus, the reputed founder of which was Ascanius, the son of Aeneas. Although possessing less artistic merit than the *Georgics*, it was enthusiastically received, and took its place as the national epic.

Several shorter poems, *Culex* (the gnat), *Ciris* (the name of a bird), *Moretum* (the salad), *Copa* (the hostess), and *Catalepton* (14 small poems of varied contents), are usually printed with texts of Virgil, but it is doubtful if any of them are really his work, with the possible exception of the *Moretum*.

Like the works of Homer, those of Virgil soon became a popular schoolbook, and the subject of grammatical and antiquarian research. In imperial times they were used as a method of divination, the

so-called *sortes Vergilianae*. They were held in special regard by Christians, who found in the fourth eclogue a Messianic prophecy. During the Middle Ages a number of legends, probably originating in Naples, gathered round the name of Virgil, who became transformed in popular belief into a magician and wonder-worker. See *Aeneas*; *Aeneid*; *Eclogue*; *Georgics*.

J. H. Freese

Bibliography. The best edition for the general student is that of J. Conington (rev. H. Nettleship), with English notes, 1881-83. Complete prose translation J. W. Mackail, 1904-15; of the *Aeneid*, J. Conington, 1872; complete verse translation, J. Dryden, 1772; of the *Aeneid*, W. Morris, 1876; J. Conington, rev. 1903; of the *Eclogues* and *Georgics*, R. C. Trevelyan, 1945. Consult also Virgil in the Middle Ages, D. Comparetti, 1895; Virgil, T. R. Glover, 5th ed. 1923; V. and His Meaning to the World of Today, J. W. Mackail, 1923; V.'s Mind at Work, R. W. Cruttwell, 1947.

Virgin. Term used for a woman who has not had sexual intercourse with a man. On this account it is a popular synonym for pure or untouched, *e.g.* virgin soil. In a special sense it is used for the Virgin Mother. See *Mary*.

Virginal. Name applied to the spinet and harpsichord in the 16th century, probably on account of its being the favourite instrument of ladies, whereas gentlemen preferred the lute. Queen Elizabeth was vain of her mastery over the virginal. See *Harpsichord*.

Virgin Birth. Term for the doctrine that Jesus Christ, alone of all the human race, was born of one human parent; that, by the miraculous conception of the Virgin Mary, no entail of birth-sin was passed on to Him, and that He was thus born perfect man. See *Immaculate Conception*.

Virginia. State of the U.S.A. Known as the Old Dominion, it is one of the 13 original states of the Union, and has a land area of 40,815 sq. m. The S.E. comprises part of the Dismal Swamp; in the W. the Allegheny Range and the Blue Ridge, a continuation of the Appalachian system, enclose the fertile valley of Virginia which is watered by the Shenandoah, James, and other rivers, and broken by many parallel

ridges. The central plain, Middle Virginia, a well watered expanse, is succeeded by the Piedmont country, an undulating region inclining towards the Blue Ridge. Chesapeake Bay, Hampton Roads, and the broad river estuaries contain excellent harbours. All the chief rivers—Potomac, Rappahannock, York, James, and Roanoke—follow an easterly or south-easterly course.

Agriculture is a leading industry, for in 1935 68 p.c. of the land was farmed, about half by negro tenant farmers. In 1945 there were 173,051 farms with an area of 16,358,072 acres, of which nearly a quarter was under crops—wheat, oats, maize, potatoes, and apples. Soil erosion having threatened to exhaust tobacco lands, in 1937 400,000 acres were marked for reclamation by cooperative farming. Such progressive measures in Virginia are usually federal projects. The tobacco crop amounted to 167,000,000 lb. in 1946, when the cotton crop covered 20,000 acres. National forests, over four million acres, yield an abundance of timber. Coal, granite, limestone, iron ore, and slate are worked, and there are valuable oyster fisheries. The total rly. mileage exceeds 4,000, and there are some 80 airports.

Richmond is the capital and biggest city, followed by Norfolk and Roanoke. Two senators and nine representatives are sent to congress. Negroes, forming about a third of the est. pop. of 3,019,000, are virtually disfranchised by the imposition of literacy and property qualifications. Standards in education and public health are comparatively low. The leading political issue is the poll tax; this amounts to only 1½ dollars a year, but as payment is set well in advance of voting, people often forget to pay; moreover the tax is cumulative. Many Virginian laws are backward; *e.g.* convicts may still be shackled and flogged.

Named after the popular appellation for Queen Elizabeth, Virginia was the first permanent settlement in America. In 1606 James I granted a charter for the planting of colonies in Virginia; Jamestown was founded in 1607, and the colony was soon organized under a governor and council. A representative house of burgesses was set up, and this system remained until 1776. Troubles with the Indians were frequent, as were disputes between social classes and religious parties, but the colony grew in population and wealth

by its tobacco industry. The planters, importing slaves for their plantations, became rich, and Virginia had a culture of its own. Its citizens, among them Washington, joined heartily in the struggle for independence. During the Civil War this was one of the seceding states, a course objected to by the western area, which set up a separate government and was admitted to the Union as West Virginia in 1863. Thackeray's tale, *The Virginians*, is reckoned a masterly reconstruction of the old colonial life by one who had never been in the country. Consult *Virginia: The Old Dominion*, M. P. Andrews, 1937.

Virginia. Largest municipality in the ironfields of Minnesota, U.S.A. The co. seat of St. Louis co., it is 77 m. N. by W. of Duluth, and is served by rlys. Education is heavily endowed by a tax on mining properties. The place engages in iron mining, manufacture of machinery, lumbering, and flour milling. Finns and Swedes are largely represented in a pop. of 12,264.

Virginia. Heroine of ancient Roman legend. Daughter of the centurion Lucius Virginius, her beauty inflamed the decemvir Appius Claudius with desire to gain possession of her. He suborned one of his supporters to claim her as his slave, and when the case came before him in his judicial capacity, declared her to be the man's property. Thereupon her father, to save Virginia from dishonour, seized a knife from a butcher's stall and plunged it in his daughter's breast. A popular revolution broke out against the tyrannical decemvirs, the old magistracies were restored, and Appius Claudius, while awaiting trial, committed suicide. The story is the subject of one of Macaulay's *Lays of Ancient Rome*.

Virginia Creeper (*Parthenocissus quinquefolia*). Climbing shrub of the family Vitaceae, a native of N. America. It has large digitate leaves and inconspicuous green flowers much like those of the

grape vine. It climbs with the aid of branching tendrils, the branches ending in adhesive disks which cling to brick or woodwork. Veitch's creeper (*P. tricuspidata*), with small glossy leaves and short leafstalks, is a native of Japan. Both species are remarkable for their foliage, which assumes glowing red autumnal tints. See *Vine*.

Virginian Deer (*Odocoileus virginianus*). Species of deer. Found in Canada, the U.S.A., and in parts of S. America, it is about 3 ft. high at the shoulder, and the coat is reddish brown in summer, slaty blue in autumn, and greyish in the winter. The antlers are comparatively large and well branched, and the bushy white tail, held erect when the animal is running, is characteristic. Shy and wary, this deer runs with great speed.

Virginians, THE. Novel by Thackeray, published originally in monthly parts, 1857-59. It tells the fortunes of two of Henry Esmond's grandsons who, born in Virginia, took opposite sides in the American War of Independence. As a literary presentation of a past period, it is perhaps less successful than Esmond (*q.v.*), to which it is in some sort a sequel.

Virginian Stock (*Malcolmia maritima*). Annual herb of the family Cruciferae. A native of the Mediterranean region, it was introduced to British gardens in 1713. It has erect, branching stems, 6-12 ins. in height, with alternate elliptical leaves and bright flowers ranging in tint from white to rose. It is a favourite edging plant in gardens, but

frequently becomes weedy owing to overcrowding of the plants. To obtain the best results seeds should be sown thinly on poor soil in autumn, and the seedlings transplanted in March where they are to flower, 4 ins. apart. They then form dwarf, bushy plants and have a longer flowering period.

Virginia Water. Artificial lake in Windsor Great Park, on the borders of Surrey and Berks, England. About a mile from Virginia Water rly. station, it is

Virginia Water, Windsor. Corinthian colonnade, brought from Tripoli by George IV

1½ m. long and about ½ m. across at its widest part, the surroundings having been much beautified by time since the original marshland was drained and the lake created in 1746 by the duke of Cumberland with the aid of Paul Sandby. Notable features are the cascade, cavern, Fort Belvedere, commanding a fine view of Windsor Castle, temples, and a colonnade brought by George IV from the ruins of Leptis Magna, in Tripoli. Near by are the Holloway Sanatorium, 1874-76, and Christ Church, 1838. Virginia Water was drained for security reasons during the Second Great War. In 1948 it was announced that bathing would be permitted in the lake.

Virginibus Puerisque (*Lat.*, for girls and boys). Volume of essays by R. L. Stevenson. Published together in 1881, most of the essays had previously appeared in *The Cornhill Magazine*. They include *An Apology for Idlers*, *Ordered South*, and *El Dorado*.

Virgin Islands. Group of the Leeward Islands, West Indies. It consists of more than 100 islands, all mountainous. The larger islands are Anegada, Virgin Gorda, and Tortola, belonging to Great Britain; and Crab or Vieques, Culebra, St. Thomas, Ste. Croix, and St. John, belonging to the U.S.A. Crab and Culebra were ceded to the U.S.A. by Spain in 1898, and the remainder of the American

Virginia Creeper. Hanging sprays of leaves

Virginian Stock. Leaves and cruciform flowers of this edging plant

Virgin Islands. Map of the group of British and American West Indian islands

group were purchased from Denmark in 1917 for £5,000,000. They cover 132 sq. m., with an est. pop. of 22,012. Bay oil comes from St. Thomas, bay rum from St. John, cattle and sugar-cane from Ste. Croix.

The British Virgin Islands form the E. extremity of the Greater Antilles. They have an area of 67 sq. m. and a pop. of 6,508. Vegetables, fruit, and charcoal are produced, cattle and poultry reared, and there are extensive fisheries. The bulk of the inhabitants are negroes. Road Town, on Tortola, is the British capital and port of entry. The Virgins were discovered by Christopher Columbus in 1494. The first British settlement was made on the island of Tortola in 1666.

Virgo (Lat., the virgin). Sixth sign of the Zodiac. It is one of the constellations known to the ancients. Gamma Virginis is a celebrated double star. Alpha Virginis is the star Spica, a double star of the first magnitude. The constellation is partly in a great nebulous region, and itself contains the spiral nebula Messier 99. *See* Constellation.

Viriathus (2nd cent. B.C.). Lusitanian herdsman who headed a revolt against the Roman rule in Spain. He defeated one Roman army after another, and in 141 the proconsul was forced to conclude a peace with him. Unbeaten in the field, he was eventually slain by assassins.

Viridian (Lat. *viridis*, green). One of the stable green pigments, it is the emerald oxide of chromium and is made by heating to dull redness three parts of boric acid together with one part of potassium bichromate.

Viroconium. Another form of the name of a Roman British town considered in this Encyclopedia under Uriconium.

Virtanen, ARTTURI ILMARI (b. 1895). Finnish biochemist. Born Jan. 15, 1895, at Helsinki, he was the son of an engine-driver, and went to a Viipuri public school and the universities of Helsinki, Zürich, Münster, and Stockholm. Having worked in an industrial laboratory and as chemist to the government butter control, from 1924 he taught organic chemistry at Helsinki, where in 1931 he was given charge of the chemical research laboratory and the chair of biochemistry at the technical university, and in 1939 made professor of the same subject at the university proper. Virtanen studied the biochemistry of bacteria, symbiotic nitrogen fixation, and the effect of micro-organisms upon the quality of food. He was awarded the Nobel prize for chemistry in 1945. His best-known book was *Cattle Fodder and Human Nutrition*, 1938.

Virton. Town of Belgium, in the prov. of Luxembourg. It is in the extreme S.W. close to the French border, 8 m. N.E. of Montmédy. The name of Virton is given to a battle in the First Great War fought Aug. 21-25, 1914, between the French and the Germans. It was intended by the French to be an advance on a front of 60 m. from the frontier between the Meuse and German Lorraine, but German strength was badly underestimated, and the result of almost every contact was a French defeat and withdrawal, with heavy losses.

Virus (Lat., poison). Term applied to minute agents which

cause disease in plants and animals. They are invisible under the ordinary microscope, but some have been photographed under the ultramicroscope and the electron microscope. Viruses can be transmitted from one organism to another and multiply in the diseased cells. This suggests that they are living organisms, a view which is supported by their variability, susceptibility to chemical agents such as alcohol and to relatively low temps. That they may not be organisms is perhaps indicated by their extremely small size and very rapid rate of increase, and by the knowledge that some may remain dormant for years in dried material. Some viruses pass through filters which ordinarily remove bacteria.

Among animal diseases resulting from their presence are infectious anaemia of horses; poxes of the fowl, sheep, goat, and pig; foot-and-mouth disease; dog distemper; and cattle plague. Human diseases due to viruses include measles, mumps, chicken-pox, small-pox, yellow fever, herpes, infantile paralysis, and the common cold. Diseased plants may exhibit various symptoms such as mottling of foliage (mosaic), streaks in stems or leaves, chlorosis, crinkling of foliage, wilts, and necrosis of tissues. Many viruses are known to be transmitted by sucking insects such as fleas, lice, mosquitoes, aphids, and thrips. Often it has been shown that only one species of insect will serve for a particular virus. In the body of the insect this may multiply and persist for a considerable period.

Vis. Yugoslav name of the island described in this work under its Italian name Lissa.

Visa (Lat. *visa*, seen). Official endorsement on a passport by the representative of the country to which the intending traveller is going. *See* Passport.

Wisby. Alternative spelling of the Swedish seaport Wisby (*q.v.*).

Viscacha (*Lagostomus*). Genus of small rodents. They belong to the chinchilla group, which occurs

Viscacha. Small nocturnal rodent of South America, allied to the chinchilla

W. S. Berriidge, F.Z.S.

in S. America. The animal is about 20 ins. long, and has grey fur mottled with black on the upper parts and white beneath, and black-and-white stripes on the face. It is found in warrens usually containing about two dozen individuals, is nocturnal in habit, and feeds upon grass and roots.

Visceroptosis. Dropping of the abdominal organs due to weakness of the abdominal and pelvic muscles. Discomfort, flatulence, spasm, constipation, diarrhoea, are all possible results, because of interference with the functions of the various organs. Relief lies in the wearing of a specially-fitted, firm belt which maintains the organs in place; massage and exercises are given.

Vischer, PETER (1455-1529). German sculptor. Born at Nuremberg, he was the son of Hermann Vischer, a master brassworker, and studied in Italy. His most famous work was the monument of S. Sebald in the church of that name at Nuremberg; it occupied him 13 years (1506-19), and he was assisted by five sons. The tomb of Archbishop Ernest at Magdeburg, 1497, may also be cited. The outstanding sculptor in bronze of his time, Vischer died Jan. 7, 1529, at Nuremberg.

Visconti. Name of a noble Lombard family, lords of Milan, 1277-1447. Apart from a Crusader named Ottone, who was at Milan in 1078, the first member of importance was Ottone Visconti (*q.v.*), archbishop of Milan in 1262. His career was stormy, and after his death in 1295 the temporal power was assumed by his grand-nephew Matteo (1255-1322), who was appointed vicar of Lombardy in 1310, with extensive power in N. Italy. Involved in a quarrel with the pope, shortly before his death he abdicated in favour of his son Galeazzo (1277-1328), who married Beatrice d'Este, and was succeeded by his son Azzo (1302-39). In 1349 the lordship of Milan passed to Galeazzo's brother Giovanni, archbishop of Milan, and a patron of learning and letters. On the latter's death in 1354 his territory was divided between three nephews Matteo, Galeazzo, and Bernabo. The next ruler of importance was Giangaleazzo (*v.i.*), and after him the family dwindled in importance until the male line expired in the person of his son Filippo Maria (1391-1447), who was succeeded by his son-in-law Francesco Sforza.

Visconti, GIANGALEAZZO (*c.* 1347-1402). Duke of Milan. On the

death in 1378 of his father, Galeazzo II, he shared the government with his uncle Bernabo, whom he deposed and murdered in 1385. A type of the strongest and best of the Italian despots, his reign was marked by advancement and prosperity. Art and letters flourished under his rule. Milan cathedral, the Certosa and other buildings at Pavia, and the university of Piacenza, are lasting monuments to his greatness. He extended his rule to Verona, 1387; Padua, 1388; and as far as Florence, 1399-1401. In 1395 he induced the emperor Wenceslaus to recognize him as an independent sovereign with the title of duke. He died of the plague during the siege of Florence, Sept. 3, 1402.

Visconti, OTTONE (1215-95). Italian prelate. Canon of Desio, he was a protégé of Urban IV, who in 1262 nominated him archbishop of Milan. Unable to enter into his see until fifteen years later, owing to the hostility of the Della Torre family, who were all-powerful in the city, in 1277 Ottone seized their stronghold, imprisoned six of the Della Torre in iron cages, and took possession of his spiritual cure.

Visconti - Venosta, EMILIO, MARQUIS (1829-1914). An Italian statesman. Born at Milan, Jan. 22,

E. Visconti-Venosta, Italian statesman

1829, he was one of Mazzini's most active followers until 1853, when he realized that the salvation of Italy lay rather with Cavour than with the republican party. In 1859 he was nominated royal commissioner with Garibaldi's army, and the following year became adviser to Farini in Modena, Parma, and Naples. Five times foreign minister between 1863 and 1901, his terms of office were marked by wisdom and tact, especially during the difficult situations created by the war with Austria, 1866, the Franco-Prussian War, 1870, the occupation of Rome the same year, and the Abyssinian disaster of 1896. He died in Rome, Nov. 28, 1914.

Viscose. Synthetic fibre of cellulose from which a type of artificial silk is spun. It is a viscous solution of cellulose xanthate; which is derived from cellulose, chiefly purified wood pulp, mixed with cotton linters, caustic soda, and carbon disulphide. Viscose was first made in 1892 and the

basis of the commercial processes was established at Kew in 1898. In 1905 the manufacture of viscose artificial silk or rayon was begun at Coventry by Courtauld's. The process of manufacture is described under Rayon.

Viscosity (Lat. *viscus*, bird-lime). Internal friction, or resistance, to the motion of molecules of a fluid body among themselves. If a liquid flows over a horizontal surface, the layer of liquid next to the surface tends to adhere to it by cohesion, and the velocity of the fluid particles above this layer becomes greater the more distant they are from the bottom. Different liquids have different degrees or coefficients of viscosity, and these may vary at different temperatures. The property has the natural effect of destroying wave motion. Highly viscous liquids are tar and treacle; highly mobile, water and ether. The viscosity of a liquid decreases with temp., whereas that of a gas increases. The unit of measurement is the poise; water has a viscosity of approximately a centipoise, *i.e.* 10^{-2} poise, at 20° C. Instruments for measuring the viscosity of a fluid are called viscometers. In magnetism the term viscosity is used to imply the lagging behind of the attainment of the full value of the intensity of magnetisation after the magnetising force has been applied.

Viscount (Lat. *vicecomes*). Title of nobility. In the British peerage it ranks fourth, being below earl and above baron. The feminine is viscountess. A viscount's children enjoy the honorary prefix Hon. The title came to England from France, where the vicomte was at first simply the deputy of the comte or count. The first creation in England dates from 1446. Oldest existing viscounties are, in Ireland, that of Gormanston (1478), and, in England, that of Hereford (1550). A retiring Speaker is usually created a viscount.

Visé. Town of Belgium, in the prov. of Liège. It lies on the right bank of the Meuse, 10 m. by rly. N.N.E. of Liège. The town was destroyed by German troops in the First Great War, Aug. 14-15, 1914. Visé was fortified in 1334, and dismantled by the French in 1675.

Vishinsky In this Encyclopedia the spelling Vyshinsky (*q.v.*) is preferred for the name of this Russian politician.

Vishne-Volochek. Town of the R.S.F.S.R. It lies in the govt., and 70 m. N.W., of Kalinin, on the

Tsna, and the canal connecting it with the Tvertsa and the Lenin-grad-Moscow rly. This is the centre of the obsolete Vishne-Volochek canal system, which unites the Neva with the Volga. The chief industry is cotton spinning. Pop. 63,642.

Vishnu (Skt., worker). One of the three chief gods of Hinduism. Originally of minor importance, and perhaps a sun-god, he came to be regarded by his worshippers as the supreme deity, and hence was associated with Brahma and Siva in the Trimurti or triad, in which his character was that of the preserver. He is the genial, kindly patron of the prosperous classes, and his rites, though often licentious, are free from bloodshed. Vishnu is represented as a man, painted black, with four arms, riding on the Garuda, half-man and half-bird. See Hinduism; *Consult also* Religions of India, E. W. Hopkins, 1895; Vedic Mythology, A. A. Macdonell, 1897.

Visibility. Term used to describe the transparency of the atmosphere: it is expressed by the maximum distance at which objects such as trees and buildings can be distinguished in daylight. As so defined, visibility is strictly not a direct measure of atmospheric transparency, i.e. the proportion of light transmitted through unit distance of the atmosphere. For the same degree of the latter the distance of visibility may vary between rather wide limits, but observations of visibility have the practical advantages over those of transparency that reasonably good estimates can be made without the use of instrumental equipment or special techniques.

Visibility depends upon the amounts of solid and liquid particles in the lower atmosphere, present as smoke, dust, water droplets, etc., and to a lesser extent upon the distribution of temp. and humidity along the path viewed. As a rule, the surface layers of the atmosphere are clearest when the air stream is of polar origin, although marked improvements can occur locally after heavy rain showers, because these wash some of the pollution out of the air. Smoke haze, carried by the wind from industrial areas, may form stratified layers at definite heights, thus rendering objects on the ground invisible from above.

During the daytime the scattering of light by molecules and nuclei increases the apparent

brightness of a distant object, e.g. on an overcast day objects viewed not far from the observer appear almost black in colour while those at greater distances are grey, the tone becoming lighter with increasing length of the path containing the light scattering sources. Hence visibility is largely a question of contrast, an object disappearing when its brightness becomes imperceptibly different from that of its background. Differences of form and colour are also important; with decreasing intensity of illumination red fades first, then green, etc., until a uniform grey is seen. The human eye is sensitive to light waves ranging from about 40μ to 75μ (i.e. $\frac{1}{10}$ to $\frac{1}{2}$ of a thousandth part of a millimetre) and is capable of detecting several hundred different colours. The faculty for distinguishing objects therefore depends partly upon the nature of the object and partly upon the observer's eyesight.

The international scale of visibility is given in the table below. At most meteorological stations a number of fixed objects or landmarks are selected as nearly as possible at the standard distances from the station, the objects either showing against the skyline or distinctly in contrast with their backgrounds, considerations of size being taken into account. The visibility on any occasion is then expressed by the code number of the most distant object of the series which can be recognized for what it is, i.e. a tree must show up as a tree, not merely as a vague shape.

Code Number	Object visible		Meteorological Description
	at	but not at	
0	—	55 yds.	Dense Fog
1	55 yds.	220 "	Thick Fog
2	220 "	550 "	Fog
3	550 "	1,100 "	Moderate Fog
4	1,100 "	$1\frac{1}{2}$ m.	Mist or Haze
5	$1\frac{1}{2}$ m.	2 $\frac{1}{2}$ "	Poor Visibility
6	2 $\frac{1}{2}$ "	6 $\frac{1}{2}$ "	Moderate Visibility
7	6 $\frac{1}{2}$ "	12 $\frac{1}{2}$ "	Good Visibility
8	12 $\frac{1}{2}$ "	31 "	V. Good Visibility
9	31 "	—	Excellent Visibility
	or more		

In Great Britain this international scale has been modified to include additional objects at 27 and 110 yards and $4\frac{1}{2}$ m. and $18\frac{1}{2}$ m., thus subdividing the range covered by numbers 0, 1, 6, and 8. Despite this, the spacing out of the visibility objects increases with the distance, and during the Second Great War it was found necessary in the British and dominions

meteorological services to introduce a supplementary scale.

In the British Isles throughout the year as a whole the best visibilities are reported on the N.W. coasts, e.g. at Blacksod Point on winter mornings and evenings visibilities below code figure 5 are seldom reported, there is little diurnal or seasonal variation, and the maximum of the curves is at visibility 7. On summer afternoons and evenings at such inland stations as Dalwhinnie and Armagh code figure 8 is the most frequently reported value. At most other times, seasons, and localities (e.g. winter mornings at Kew observatory), sea or land fog, with high humidity, causes a second maximum in the curves, generally at visibility 1.

Difficulty is experienced in judging visibility at night, and as far as possible the scale is used to denote the same degrees of atmospheric obscurity as in daylight observations. In practice the observer attempts to say how far he could see if it were daylight and the air equally clear. A series of lights at known distances is sometimes used to assist in the making of estimates, but again the visibility depends upon the light intensity and the darkness of the background. Instrumental aids include a visibility meter which makes use of the fact that the brightness of a fixed light at a fixed distance depends upon the transparency of the atmosphere, and can be measured by the density of a superimposed obscuring screen or filter which is just sufficient to reduce it to the limit of

visibility; in another type the electric current produced by the light from a fixed source falling upon a photo-electric cell is related to the visibility scale. See Condensation; Fog; Light; Pollution; Vision; *consult also* Meteorological Observer's Handbook, H.M.S.O., 1942; V. in Meteorology, W. E. K. Middleton, 1941.

A. J. Drummond, F.R.Met.S.

Visigoths or **WEST GOTHS**. Branch of the Gothic people which in the 3rd century A.D. lived W. of the river Prut. It separated from the Ostrogoths about 250, and at that time occupied a region approximately corresponding to the modern Rumania. The later history of the Visigoths, which closed with the overthrow of their Spanish kingdom by the Mahomedans in 711, forms part of that of the Goths (*q.v.*).

Vision. Act or sense of seeing. The mechanical aspect of vision is dealt with under the articles Eye, Sight Testing, and various defects of sight, *e.g.* astigmatism. The duration of any stimulus necessary to produce a visual sensation may be exceedingly short, and depends upon the intensity of the exciting source. An image persists for some time after the stimulus has been removed.

Colour vision presents many difficulties of explanation. By the Young - Helmholtz theory, there exist in the visual apparatus three sets of nerve fibres, a red, a green, and a blue or violet set. Each separately excited gives a sensation of red, green, or blue, and any other colours are obtained by suitable mixing, each set of fibres being more or less excited by the particular kind of light wave falling upon the eye. According to Hering's theory different light rays produce certain definite chemical changes, which stimulate the fibres in a distinctive way.

Among animals the response to light stimulus is widespread, though varying greatly from that of man. Many animals, *e.g.* the earthworm, which are eyeless, respond to light through the skin, and many are usually insensitive to red. Birds have as wide a range of colour vision as man, and fish respond most readily to green and yellow light.

The complex organic compound formed in the retina of the eye, enabling the latter to be more sensitive in dim light, is known as the visual purple. This compound is supposed to be formed with the aid of vitamin A. The minimum amount of light energy required to stimulate the eye is governed by the quantum properties of light. Each eye has a separate chance of collecting the required number of quanta; it has been argued therefore (and is approximately verified) that two eyes are better than one on a dark night. *See* Colour; Retina.

Vision. In occultism, term applied to things seen otherwise than

by normal sight. It includes hallucinations and phantasms of both the living and the dead. *See* Psychological Research; Spiritualism.

Visitation. Ecclesiastical term for the office of inquiry performed at intervals by bishops and archdeacons in dioceses and parish churches. The episcopal inquiry is made concerning the state of religion in the diocese, and the office includes the administration of confirmation and the delivery of an address which is called a charge. Archidiaconal visitations are directed more particularly to temporal matters, *e.g.* the repair of churches, etc. In England diocesan visitation was instituted by Grosseteste (1175-1253).

Visitation, ORDER OF THE. R.C. religious order for women. Founded by S. Francis de Sales and S. Jane Frances de Chantal, in 1610, at Annecy in Savoy, it was designed for the care of the sick and the relief of the poor; but is now a strictly enclosed order of nuns devoted to a life of contemplation. The Sisters of the Visitation are a separate congregation, supposed to have originated at Ghent about 1600. They conduct schools, workrooms for girls, and homes for the aged poor.

Visitation of the Blessed Virgin Mary. Feast instituted by Pope Urban VI in 1389 in commemoration of the visit paid by the Blessed Virgin to her kinswoman Elizabeth (Luke 1). In 1441 the council of Basel directed that it should be observed in all Christian churches. In the Church of England calendar it is fixed for observance on July 2. *See* Magnificat; Mary.

Visiting Card. Small strip of pasteboard inscribed with the owner's name and station, his ordinary address being generally added. Visiting cards possibly originated in the East. In ancient Egypt tablets of glazed ware depicting the owner were left when visiting temples. Visiting cards appear to have been used in Germany in the 16th century. In France they came into general use in the reign of Louis XIV. England adopted them later apparently from France. In the 19th century in England there was an elaborate etiquette about the styles, sizes, and functions of visiting cards as symbols of correct social behaviour; but this dropped out of knowledge in the 20th century, and in the Second Great War the printing of private cards (as distinct from the business card), was prohibited.

Visp or **VISPACH** (Fr. Viège). Village of Switzerland, in canton Valais. It stands on the river Visp near its confluence with the Rhône, 54 m. by the Simplon rly. E. of St. Maurice. Starting point of the rly. to Zermatt.

Visscher, ROEMER PIETERSEN (1547-1620). Dutch poet. This wealthy burgher of Amsterdam devoted himself to letters, and with Spieghel and Coornhert advanced Renaissance culture and purified the Dutch language. His house was the centre of the most important literary salon in N. Europe, and his beautiful and accomplished daughters, Anna (1584-1651) and Marie Tesselschade (1594-1649), were distinguished poets. Tesselschade translated Tasso, and in her poem *Songsters* rivalled the best poets of the day, including her intimate friends Vondel, Hooft, Brederoo, and Huygens.

Vistula. River of Poland. The largest river flowing into the Baltic, it rises in the Beskids, North Carpathians, 20 m. S.E. of Teschen and flows N., then N.E. past Cracow, forming the N. boundary of Galicia, turns N. again past Warsaw, Plock, and Torun, and enters the Baltic by several mouths at Danzig (Gdansk) after a course of 630 m. Its chief affluents are the San, Bug, and Pilica. *See* Poland; Russo-German Campaigns.

Vital Statistics. Statistics relating primarily to the births, deaths, and marriages in a community. Such statistics are kept by all civilized peoples and have been developed so as to embody a great deal of knowledge of many kinds. In successive tables the figures are worked out in relation to various geographical subdivisions of the community; to groups of persons at various ages; to occupations; to causes of death, etc. They are valued by medical officers of health, and others concerned with the health of the community, for many reasons, *e.g.* as a means of testing the death rates from any particular disease among any section engaged in any particular occupation, or at any given age. *See* Birth Rate; Death Rate; Population; Statistics.

Vitamin. Word used to denote one of a group of essential nutrients that have nothing in common except the fact that most of them are present at relatively low concentrations in foods, either animal or vegetable, or both, and that each of them is necessary for the normal health of one species of animal or of several. In certain

instances the essential nature of this requirement is a matter of inference rather than fact, but there is no question about what happens when men, domestic animals, and certain smaller laboratory species are deprived of some of the best known vitamins. The word vitamin, originally spelt with a terminal e, was coined by the distinguished Polish scientist Casimir Funk when it was thought likely that only one such substance existed and that it was chemically an amine. It was soon found that there were at least two, and the family increased rapidly; J. C. (Sir Jack) Drummond suggested dropping the terminal e when some vitamins were clearly shown not to be amines. The word then replaced the phrase "accessory food factors," which had been introduced by Gowland Hopkins to describe the substance or group of substances shown by him to be present in milk and other foods and to be necessary for normal growth and health of laboratory rats. Hopkins strongly hinted that these substances would be found to be generally essential to animal life.

The vitamins can conveniently be divided into three groups representing their importance, or knowledge of their importance, to human health: (1) Vitamins in whose absence clear-cut deficiency diseases or conditions arise and can be recognized. Thus absence of vitamin D leads to rickets, of vitamin C (ascorbic acid) to scurvy, of vitamin B₁ (aneurine, thiamin) to beriberi, of nicotinic acid to pellagra, and of vitamin A to a characteristic group of symptoms which have no collective name, but include drying up and cornification of the mucous-secreting layers in certain organs (nose, trachea, intestinal tract, genito-urinary tract, etc.), and changes in vision ranging from loss of dark adaptation to night-blindness.

Of this group, vitamin D is known to exist as at least two different compounds, both of them equally active for man and the laboratory rat, but one of them almost inactive for chickens and other birds. The two vitamins D can best be regarded as vegetable and animal forms, the latter being utilised by birds as well as by mammals, the former not. Both occur naturally and both can be manufactured from pro-vitamins in the laboratory, by irradiation with ultra-violet light, a process that is also responsible in nature for the protection of children and

young animals against rickets when they are exposed to a bright sun or the mercury vapour lamp.

Vitamin C is chemically related to the sugars; vitamin B₁ is a fairly complex substance containing sulphur in the molecule. These last two are somewhat unstable in the presence of alkali, but fairly resistant to heat and oxidation in acid solution, vitamin B₁ more so than vitamin C. Nicotinic acid is a simple pyridine derivative (having none of the properties of nicotine, which is a more complex substance), distributed fairly widely in the same foods as contain vitamin B₁, such as liver, yeast, whole grain cereals. Vitamin B₁ is present in unusually large amounts in the flesh of pigs.

(2) Vitamins in the absence of which it is known, or there is very good evidence for believing, that deficiency conditions arise, though they are not associated with the name of any particular disease and may not, if uncomplicated by other deficiencies, alone lead to death. These vitamins include riboflavine, a complex pigment present in the cells of most plants and animals and, like aneurine and nicotinic acid, associated with the intracellular mechanism for the breakdown of carbohydrates and the release of energy; and vitamin K, like vitamins A and D a fat-soluble substance, occurring in a rather limited range of foods and tissues, but essential to maintaining a normal clotting mechanism in the blood. There are some who are convinced that vitamin E, another fat-soluble vitamin, is necessary for normal fertility in both male and female animals, including man, and also for the control of complex chemical processes taking place during muscular action.

(3) Vitamins that have been shown to be essential for some species of animals, but for which it has not been possible so far to prove that man has requirements. They include vitamin B₆, a group of substances called pyridoxine, pyridoxal, and pyridoxamine, which are fairly simple pyridine derivatives, though different in chemical structure as in physiological action from nicotinic acid; pantothenic acid, a derivative of two short-chain fatty acids and now believed to be associated with enzyme reactions in the body; biotin, of which a deficiency has been produced in human volunteers, thus suggesting its essentiality to man; and folic acid, fairly complex in structure and involved in fundamental processes of blood

cell formation. It contains in its molecule a substance called para-aminobenzoic acid, which appears to be a vitamin in its own right.

Most of the substances enumerated are fairly stable and will resist the ordinary processes of cooking and food manufacture, preservation, and storage. The amount of them present in different foods varies very widely from one food to another and from one vitamin to another. In general it is true to say that the more physiologically active are present in smaller amounts. Vitamin C, for example, is present in orange juice to the extent of $\frac{1}{2}$ to 1 part per thousand. Vitamin D in summer milk, on the other hand, is present only to the extent of about 1 part in 4,000 million.

Vitebsk. Town of White Russia S.S.R. The capital of a region of the same name, it stands on the Dvina and is a rly. junction for Leningrad, Riga, and Smolensk, 140 m. N.E. of Minsk. The town was known as early as the 10th century and formerly belonged to Lithuania, but was taken by the Russians in 1654, and finally annexed at the first partition of Poland. Pop. 167,424.

Taken by the Germans July 12, 1941, Vitebsk was made by them into an exceptionally strong defensive position, northernmost fortress of the "fatherland line" covering White Russia and the Baltic republics. It was outflanked on the N.W. by Yaremenco on Oct., 1943, but not until June 25, 1944, was it encircled when Bagramyan from the N. joined Chernyakhovsky from the S. Vitebsk fell to a joint assault next day after a heavy bombing by 700 Stormoviks; 6,000 German dead were found in the streets. The living retreated in such confusion that the principal bridges over the Dvina and the Luchesa were taken undamaged.

Vitellius, AULUS (A.D. 15-69). Roman emperor from Jan. 2 to Dec. 22, 69. He was born Sept. 24, 15. Vitellius was in command of the legions of Lower Germany when the news of Galba's accession reached him. His own troops and those of Upper Germany refused to acknowledge the new emperor, and

Vitellius was proclaimed emperor at Cologne. In the meantime Galba had given way to Otho, and it was

Aulus Vitellius,
Roman emperor

the latter's troops that the generals of Vitellius defeated at Bedriacum when they marched into Italy. Vitellius reached Rome and gave himself to gluttony;

during his brief reign he spent a huge sum on the pleasures of the table. But already the legions of Illyricum had declared for Vespasian as emperor. Advancing into Italy, they defeated the Vitellians in two battles, and put Vitellius to death Dec. 22, 69.

Viterbo. City of Italy, cap. of Viterbo prov. It is 54 m. by rly. N.N.W. of Rome, at the foot of Monte Cimino. With its well-preserved Lombard walls and numerous medieval buildings, it maintained until the Second Great War its ancient aspect, but the N. and E. sections of the wall were then destroyed. The Romanesque-Gothic cathedral of San Lorenzo and the church of San Francesco contain the tombs of popes; San Francesco, however, was shattered during Allied bombardments in the Second Great War. The Palazzo Municipale, 1264, had a museum of Etruscan antiquities, many of which were lost. The churches of Santa Maria della Salute and Sant' Angelo and the former church of Santa Maria della Verità, later a public hall, were of architectural interest, but were badly damaged. Many other noteworthy buildings were destroyed or heavily damaged in 1944, though attempts to rebuild were afterwards made. Near by are the warm sulphur springs and baths of Bulicame, and the pilgrimage church of S. Maria della Quercia. Leather, paper, soap, matches, and playing-cards are manufactured. Pop. 36,123.

Vitoria or **VICTORIA.** Seaport of Brazil, capital of the state of Espirito Santo. It is 300 m. by rly. N.E. of Rio de Janeiro on an island in the Bay of Espirito Santo, and

has a fortified harbour. Sugar, rice, coffee, and manioc are exported. The port has rly. connexions with Rio de Janeiro and Joanesia on the Rio Doce. Pop. est. 60,000.

Vitoria. City of Spain, capital of the Basque prov. of Alava. It lies among the spurs of the Cantabrian Mts., on the left bank of the Zadorra river, 30 m. direct S. of Bilbao. The upper or old town is gloomy, the new town at a lower level is more open. The cathedral of Santa Maria de Vitoria and the church of San Vicente are medieval fortress churches which have been restored. Chairs, iron bedsteads, woollens, crockery, chocolate, and chemicals are the principal products. In the 10th century the city was a fortress with extensive privileges. Here in 1813 Wellington defeated the French. Pop. 56,745.

Vitoria, BATTLE OF. Fought June 21, 1813, between the British and Portuguese under Wellington, and the French under Joseph

Viterbo, Italy. Cloisters of the church of S. Maria della Quercia, a resort of pilgrims from all parts of the country

Bonaparte and Jourdain. Wellington and Hill made a frontal attack, which was completely successful and cut off from the Vitoria-Bayonne road the French forces, who retreated in disorder towards Pampluna, abandoning 14 guns and great quantities of stores and equipment. The battle was decisive in freeing the Spanish peninsula from French domination.

Vitoria, TOMAS LUIS DE (c. 1535-1611). Spanish composer. Born at Avila, he became choir-master, 1573, of the Collegium Germanicum at Rome, where his name was Latinised to Victoria. During this period he was an intimate friend of Palestrina, whose influence on his work was marked. Victoria wrote motets, masses, psalms, hymns, and magnificats, but his greatest work was a requiem, 1605, on the death of the empress Mary. From 1589 until his death, Aug. 27, 1611, he lived at Madrid. His music, which stands with the greatest of the polyphonic

style, was long almost completely neglected, but was rediscovered during the romantic revival of the 19th cent. A completed. was pub. by Breitkopf and Härtel in 1896.

Vitré. Town of France. In the dept. of Ille-et-Vilaine, it stands on the Vilaine, 25 m. by rly. E. of Rennes, and is a rly. junction. There are quarrying and tanning industries, an agricultural trade, and manufactures of woollens and agricultural implements. Vitré is remarkable for its 16th-17th century streets and houses, and the restored 14th-15th century château is a fine example of the feudal stronghold. The estates of Brittany met here in the 17th-18th centuries. Pop. est. 10,000.

Vitreosil. Name given to a translucent form of silica (SiO₂) prepared from sand. It has a low coefficient of expansion, and so is useful in laboratory apparatus liable to undergo large and sudden changes of temp.

Vitrified Fort (Lat. *vitrum*, glass; *facere*, to make). Ancient stronghold whose defensive walls of loose stones were more or less consolidated by fire. Best developed in Scotland, about 50 remain between the Moray Firth and Wigtownshire. Fusible stones from a distance were deposited upon larger local blocks left unburned; vitrified walls were often less than half the thickness of those in ordinary hill-forts. Similar structures were erected in W. France and Central Europe.

Vitrina. Genus of small snails, nearly related to the slugs. As the shell is very thin and transparent, the animals are often known as glass snails. They have the peculiarity of being about in the winter when other species are hibernating.

Vitrina fasciata, a typical species of the small glass snail

Two species occur in the U.K., *Vitrina pellucida*, common under damp, dead leaves nearly everywhere, and *V. pyrenaica*, known in a few localities in Ireland.

Vitriol. General term for many metal sulphates. Sulphate of iron is known as green vitriol, sulphate of copper as blue vitriol or vitriol of Venus, and sulphate of zinc as white vitriol. See Sulphuric Acid.

Vitruvius Pollio, MARCUS. Roman architect and author of the 1st century B.C. A North Italian, he was probably employed by Julius Caesar as a military

engineer in the African war, 46 B.C., and worked as an architect under the patronage of Augustus, to whom he dedicated his work in ten books, *On Architecture*, about 16-13 B.C. The work of Vitruvius, practically the only surviving original authority on classical architecture, exercised enormous influence when the style was revived.

Vitry-le-François. Town of France. In the dept. of Marne, it stands on the river Marne, in the W. of the Perthois plain, 30 m. by rly. W. of Bar-le-Duc. The Marne-Rhine and Marne-Saône canals start here. Industries are concerned with chalk and cement, paper-making machinery, and malt, and there is trade in cereals, wood, and woollens. The church of Notre Dame was begun in 1629. Vitry takes its suffix from Francis I, who aided the townsfolk of Vitry-en-Perthois, destroyed by Charles V, to rebuild their town on this site, 1545. In German occupation from June, 1940, Vitry-le-François was entered Aug. 29, 1944, by the U.S. 3rd army after the Germans had withdrawn. Pop. 8,500.

Vittoria. Town of Italy, in the Sicilian prov. of Ragusa. Situated 45 m. direct and 95 m. by rly. W.S.W. of Syracuse, it has an extensive trade in locally produced wine. Its port, Scoglitti, lies 8 m. S.W. Nearby are the ruins of the ancient Camarina. Pop. approx. 32,000.

Vittoria. This Spanish city, and the battle fought there, are described as Vittoria.

Vittorio Veneto. Town of Italy, in the Venetian prov. of Treviso. It lies at the foot of the Venetian Alps, at the entrance to the valley of Santa Croce, 44 m. by rly. N. of Venice, and is a summer resort with saline and sulphur springs. It was formed in 1879 by the union of the towns of Ceneda and Serravalle, and is a bishopric. Silk manufacture is the main industry, and woollens, paper, cement, and lime are also produced. Vittorio figured prominently in the Italian campaigns of the First Great War, being captured by the Austrians on Nov. 7, 1917, and regained by the Italians on Oct. 30, 1918, in what is sometimes called the third battle of the Piave. Pop. 24,000.

Vitus. Christian martyr and saint of the 4th century. He is said to have been born in Sicily, of a noble family, and to have been converted to Christianity by his nurse, Crescentia. Enraged by this, his father handed the boy

over to Valerian, the governor, who tried in vain to change his faith. Vitus escaped to Italy, and was martyred either in Lucania or in Rome under the Diocletian persecution. He is the patron saint of dancers, and his name was formerly invoked against various complaints, notably chorea, which was known as S. Vitus's dance. Regarded as patron saint of Saxony, he has a festival on June 15.

Vivaldi, ANTONIO (d. 1743). Italian composer. Son of a violinist, he was born at Venice, and having entered the service of the landgrave of Hesse-Darmstadt (then resident in Italy), returned in 1713 to his native place, where he became director of concerts at the Ospedale della Pietà—a founding hospital for girls—until his death. A remarkable violinist, he wrote chiefly for that instrument, but in his love of bravura deviated from the classical style initiated by Corelli. Vivaldi's concertos displayed variety of form, and Bach arranged 16 of them for the clavier, four for the organ, and developed one into an extensive work for four claviers and a quartet of strings.

Vivandière (from Ital. *vivanda*, food). Woman attached to French or other Continental armies to sell provisions, etc. The dress was formerly a modification of the uniform of the unit to which she was attached.

Vivarini. Name of a family of Italian painters belonging to Murano, near Venice. Among the most notable was Antonio (c. 1420-70), the founder of the Muranese school. In his earlier work he was influenced by Gentile da Fabriano. The best period of his artistic career was that in which he was associated with a younger brother, Bartolommeo (c. 1423-99). No work by the latter is traceable before the great altar-piece of the Madonna and Child with Saints (Bologna museum), which was the joint production of the brothers. Bartolommeo is said to have been the first Venetian to use the new oil medium, though his most successful works are frescoes.

Alvise or Luigi Vivarini (c. 1446-c. 1502) was the son of Antonio, and probably the pupil of Bartolommeo, whose influence is visible in his early work. He was employed by the Venetian senate in the decoration of the great council chamber, and paintings by him are preserved in Venice and other Italian cities. All

the family are represented in the National Gallery.

Vives, JUAN LUIS (1492-1540). Spanish humanist. Born at Valencia, March 6, 1492, he was educated there and in Paris. In 1519 he was made professor at Louvain, and in 1523 he was in England, acting as tutor to Mary Tudor and lecturing at Oxford. The rest of his life was passed at Bruges, where he died May 6, 1540. A friend of More and Erasmus, Vives was one of the greatest scholars of his time. He wrote a number of books, chiefly philosophical, which in part anticipated Bacon's *Novum Organum*. Some have been translated into English, notably the *Introduction to Wyndome*, 1540.

Viviani, RENÉ (1863-1925). French statesman. Born in Algeria, Nov. 8, 1863, he entered the French chamber as a Socialist in 1893. After holding minor gov't. offices 1906-1913, he became prime minister shortly before the outbreak of the First Great War, but resigned in 1915, subsequently accepting office as minister of justice under Briand. After the war he became France's permanent representative at the League of Nations. He died Sept. 7, 1925.

Vivianite. In mineralogy, a hydrated iron phosphate. The mineral, usually associated with iron, copper, or tin ores, is blue to green in colour with a pearly lustre. Alternatively known as blue iron earth, it is named after J. H. Vivian, a mineralogist.

Vivien. Character. In Tennyson's *Idylls of the King*. Jealous of the fame of the Knights of the Round Table, she initiates ill rumours about them, vainly tries her blandishments on Arthur himself, and then cajoles the wizard Merlin, following him to Broceliande, where she learns his magic and, making him the victim of it, leaves him.

Vivisection (Lat. *vivus*, alive; *secare*, to cut). Operation on a living subject for the purpose of advancing science. The vast majority of experiments, however, which fall under the head of vivisection are not operations but inoculations, blood tests, feeding experiments, etc. Vivisection was first practised by Herophilus about 300 B.C., and for many years criminals were vivisected at Pisa. In the 19th century it was taken up on a much larger scale; Pasteur carried out elaborate experiments on sheep and other animals. The development of vivisection led to an agitation

against it, especially in Great Britain, and societies were founded to check it. Supporters of vivisection replied in 1908 by establishing the Research Defence Society. In 1906 a royal commission was appointed to inquire into the matter.

In the U.K. experiments on animals are restricted by the Act of 1876, which is administered by the Home secretary, with the assistance of a special advisory body.

In general the animal must be under an anaesthetic, but experiments may be performed without anaesthetics on a certificate by the president of certain scientific societies, e.g. the Royal College of Surgeons, that their use would defeat the object of the experiment. When experiments without anaesthetics are performed on dogs or cats it must also be certified that the object of the experiment will be frustrated if any other animal is substituted. On an average some 300,000 experiments are performed annually, a third of them relating to sera, vaccines, and drugs. See Anti-Vivisection.

Vizagapatam. Dist. and seaport of Madras state, India. The dist. is in the N.E. of the prov. on both sides of the E. Ghats. Rice and food grains are the chief crops; manganese is mined. The town, which is connected by a branch with the Madras-Calcutta main rly., is a noted centre for carving. The E. India co. had a factory here in the early 18th century, but in 1757 surrendered it to the French, who two years later were finally driven out. This is the only protected harbour on the Coromandel coast. Plans for enlarging it were actually drawn up in the days of the co., but not until 1925 was the project taken up. In 1933 the modernised harbour was opened for sea-going vessels and special rly. construction linked it with the Central Provinces for transport of manganese to the sea. A suburb of Vizagapatam is Waltair, standing on high red rocks above the sea. Dist. area 9,107 sq. m.; pop., 3,845,944; town, pop. 70,243.

Vizcaya. Spanish name for one of the three Basque provs. of Spain. See Biscay.

Vizeu or Viseu. Dist. of Portugal, in Beira Alta prov. It lies between the rivers Douro and Mondego. It is mountainous in the N. and W., and is watered by the rivers Vouga, Paiva, and Dão. Its area is 1,933 sq. m. Pop. 465,563.

Vizeu or Viseu. City of Portugal, capital of the dist. of the same name. It stands on the Asnos river,

31 m. N. of Dão, at an alt. of 1,770 ft., the terminus of a branch of the Figueira-Guarda rly. The church of São Miguel contains the tomb of Roderick, last king of the Visigoths. It is the seat of a bishopric. Pop. est. 10,000.

Vizianagram. Town of Madras state, India, in Vizagapatam dist. It is situated 40 m. N.E. of Vizagapatam, and its station links the Bombay-Calcutta with the Calcutta-Madras main rly., and is the junction for Parratipuram. Manganese is mined near. The maharaja of Vizianagram (b. Dec. 28, 1905) captained the Indian cricket team which toured England in 1936. Pop. 51,749.

Vizier (Arab. *vazir*, from *va-zara*, to support). Oriental title held by the minister of the Abbasid caliphs. In Turkey, under the sultanate, the head of each department of the council was styled vizier, and the sultan's chief minister was known as the grand vizier. The title was held by the chief officer of the Mogul emperors.

V.J.-day. Name given to Aug. 15, 1945, day kept, with Aug. 16, as a public holiday in the U.K. to celebrate victory over Japan in the Second Great War. The Japanese minister in Switzerland had handed formal acceptance of the Allied terms of unconditional surrender to the Swiss foreign office at 8.10 p.m. on Aug. 14.

Vlaardingen. Town of the Netherlands, in the prov. of S. Holland. It lies on the Maas estuary, 6 m. by rly. W. of Rotterdam, and is a busy centre of the herring and other fisheries. Vlaardingen is one of the oldest towns in the country, and at one time was capital of the co. of Holland. Pop. 42,987.

Vlach or WALLACH. People of mixed stock, mostly in the Balkan peninsula. The name, applied by their neighbours, is sometimes considered a variant of Welsh, foreigner. Estimated at some 10,000,000,

they have called themselves Ruman, and apparently represent the Neolithic long-headed Balkan population, affected by pastoral nomads immigrant from the E., possibly by the Romanised Dacian stock, and by Greek and Slav infiltration.

Vladikavkaz. Former name of the Caucasian town of Orjonikidze, entered under the latter name.

Vladimir. Town of the R.S.F.S.R. and capital of the region of the same name. It stands on the Klyazma, 110 m. E.N.E. of Moscow. It is famous for its linen and cotton goods, and cherries. Founded in the 12th century, it became the chief seat of Russian rule, and united with Suzdal, the capital of the principality, which was afterwards absorbed by Moscow. The ancient cathedral of the Assumption contains rich treasures, tombs of bishops and princes, and many relics. The Golden Gate is a triumphal arch with a gilded dome erected in 1158 and restored in 1810. Pop. 66,761.

Vladivostok. City and harbour of the Far Eastern region of the R.S.F.S.R. It stands on the S. end of the Muraviev Peninsula, between the Amur and Ussuri bays. It is the terminus of the Trans-Siberian and Ussuri rlys. and is connected with Khabarovsk and the Manchurian system. The town was founded in 1860, and does a considerable trade, having also shipbuilding yards. There is a fine harbour, but an ice-breaker is required to keep open a channel for three months in the year. Its old name was Port May; Vladivostok means ruler of the east. It is the principal Pacific naval base of the U.S.S.R., and headquarters of the army of the Far East. There is a university here. Pop. 206,000.

During the Russo-Japanese War a Russian squadron was based on the port, but this was defeated by Kamimura, and took no further

Vladivostok. General view of the town and harbour of this city and Pacific naval base of S.E. Siberia, terminus of the Trans-Siberian railway

part. After the Russian revolution, 1917, and the formation of the Bolshevik government, Vladivostok became of great importance for the Allies as the only base for the Czechoslovak army, and it was occupied by British, Japanese, Americans, and Italians. After the Czechoslovaks had been withdrawn the Japanese remained for a time.

VlonĚ (Ital. Valona; Turk. Arlonya). Town and harbour of Albania. Anciently known as Aulon, it lies on the Adriatic, 60 m. S. of Durazzo. It has an excellent harbour, protected on the N.W. by the island of Sasseno, and on the S.W. by Cape Linguetto. It exports oil, wool, and tortoiseshell. It belonged to Turkey from 1464 until the Balkan Wars, and was the site of the declaration of independence by Albania, Nov. 28, 1912. In 1915 it was occupied by the Italians, who made it a naval and military base against the Austrians. Pop. est. 6,500.

Vitava (Ger. Moldau). River of Czechoslovakia, in Bohemia. It rises in the S. of the plateau in the Bohemian Forest, near the Austrian frontier, and flows 265 m. northwards to join the Elbe (Labe) at Melnik, passing Budejovice (Budweis), to which it is navigable, and Prague. Its tributaries are the Watawa and Berounka on the left, and Luschnitz and Sazava on the right; the valley drops in terraces from 2,500 ft. in the S. to below 400 ft. at Melnik. Between Prague and Budejovice the Vitava flows through a deep and narrow gorge; this limits the navigability of this section, which has been canalised. From Budejovice leads a canal to the Danube. Vitava is the title of the most frequently played of Smetana's. group of tone-poems, *Ma Vlast* (My Country).

Vocalion. A harmonium invented in the last quarter of the 19th century by James Baillie-Hamilton. Its broad free reeds were acted upon by high wind-pressure, and it possessed great purity and variety of tone, but notwithstanding its merits it never became a commercial success.

Vocative (Lat. *vocare*, to call). In grammar, the form of a word used in addressing a person or thing. In Indo-European, Greek, and Latin such forms were little used; in most modern European languages the nominative supplies their place. The vocative is not really a case.

Vodena. Town of Greece. It is in Macedonia and lies 41 m. S.E.

of Monastir (Bitolj). It has some manufactures, and carries on a trade in wine. Vodena is on the site of Edessa (q.v.), the earliest capital of Macedonia. Pop. 25,000.

Vodka. Russian alcoholic drink. A spirituous liquor, it is distilled from rye, barley, oats, potatoes, or maize. A crude, strong spirit, it contains up to 95 p.c. of alcohol, although for consumption this percentage is diluted down to 50 or thereabouts.

Vogel, HERMANN KARL (1841–1907). German astronomer. Born at Leipzig, April 3, 1841, and educated at Leipzig and Dresden, he became assistant at the Leipzig observatory in 1865. Observer at the astrophysical observatory at Potsdam, 1874, he was director by 1882, and in 1892 a member of the Berlin academy. Vogel carried out valuable astrophysical investigations, especially on the spectrographic determination of the radial motion of the stars, and published the first spectroscopic star catalogue, 1883. He died Aug. 13, 1907.

Voghera. Town of Italy, in the prov. of Pavia. It stands on the left bank of the Staffora, 18 m. by rly. S. of Pavia city. The fortifications constructed by the Visconti (q.v.) have been replaced by boulevards. There is a trade in wine, wheat, and silk. Pop. 21,000.

Vogler, GEORG JOSEPH (1749–1814). German musician. Born at Würzburg, June 15, 1749, he

Georg Vogler,
German musician

studied music and theology in Italy, and, ordained priest in Rome, 1773, was generally known as Abbé or Abt Vogler. His life was spent in almost continuous travel over

Europe, with sojourns of some duration at Mannheim and at Stockholm, where he established music schools. He was royal kapellmeister at Stockholm, 1786–99. In 1790 he visited London to give organ recitals. In 1807 he became court kapellmeister at Darmstadt, where he opened another music school, Meyerbeer and Weber being among his pupils. He died there, May 6, 1814. Noted for performances on a type of organ of his own invention, Abt Vogler is made the speaker in a poem, Abt Vogler, by Browning.

Vogul. Nomadic people of Ugrian stock on the N. Ural slopes, W. Siberia. Only a few thousands, they are long-headed, and allied in

culture, speech, and shamanist belief to the Ostyak.

Voice (Lat. *vox*; Fr. *voix*; O. Fr. *vois*). Sound produced by the vibration of the vocal cords in the larynx by a current of air driven against them from the lungs. The tones of the voice are lower in men than in women and children, because of the greater length of their vocal cords. In the falsetto voice, part of the cords are held rigid, and only part allowed to vibrate. Loss of voice may be due to hysteria or paralysis of the larynx, or to cancer and other diseases of the vocal cords or adjacent structures. See Larynx; Speech.

Voice. In English grammar, forms of the verb expressing certain relations between the subject and the action of the verb. The active voice, in which the subject performs the action, is contrasted with the passive, in which it is the object or recipient of the action (he beats the boy; the boy is beaten).

Voicing. In organ building, the method of securing a desired quality of tone in an organ stop. The basic quality of flue pipes depends on their shape and scale, among other things, but the voicer is a skilled finisher, who by various means renders that quality more distinctive and more even throughout the compass. See Organ; Stop.

Void. Term used in English law to describe a contract or obligation that has, from the beginning, no legal force or effect. For example, a contract by an infant to repay borrowed money is void. A voidable contract, document, or obligation is one which can be declared void by one of the parties to it, on such grounds as fraud, or undue influence, or duress. Sometimes a voidable contract or transaction is ratified by silence for a long period.

Voigt, WILHELM. German impostor who called himself the captain of Köpenick (q.v.).

Voil, LOCH. Lake of Perthshire, Scotland. Situated in the parish of Balquhiddier, it lies 8 m. S. by W. of Killin, and over 400 ft. above sea level. Its maximum length is 3½ m.; it is linked with Loch Doine. See illus. in facing p.

Voile (Fr., *veil*). Fine, open-meshed fabric. Usually of cotton, though occasionally wool or silk, it is made from hard twisted yarn, and is either plain or printed in colours.

Voiron. Town of France, in the dept. of Isère. It stands on the left bank of the Morge, 17 m. by

Voil, Scotland. The picturesque Looh Voil situated in the Perthshire mountains, viewed from near Balquhider

ry. N.W. of Grenoble. It is noted for its fine linen and the high-grade paper made close by at Paviot, where the paper-making industry has been carried on since 1547; silk and liqueurs are also produced. Voiron was disputed by the episcopal sees of Vienne and Grenoble, later by the Viennois and Savoy, the latter granting a charter, c. 1266. It passed to France with Dauphiné in 1349. Pop. 12,598.

Voisin. Firm of French aeroplane builders. It built the first practicable aeroplane made in Europe, and that in which Henry Farman first flew. Voisin bombing biplanes were used throughout the First Great War by the French. In 1937 the plant became a unit of the French national aircraft industry, and during the German occupation of 1940-44 built training aircraft for the Luftwaffe.

Vojvodina. Autonomous prov. of Yugoslavia brought into being by the constitution of 1946. It lies in the N. of Serbia, towards the borders of Hungary and Rumania, being roughly coterminous with the Yugoslav part of the Banat. The city of Novi Sad is the capital. A regional parliament is elected for three years; there is a supreme court; and the various nationalities, including many Hungarians, may use and give instruction in their own languages. This territory was seized by Hungary after the Axis attack on Yugoslavia in 1941.

Volans (Lat., flying). Southern circumpolar constellation placed by Bayer below Carina, the keel of Argus. Known also as the Flying Fish, it contains no bright stars. See Constellation.

Volapük (corrupted from English *world-speak*). Name given to a system of universal language, invented in 1879 by J. M. Schleyer, a priest of Constance, Baden. The

alphabet consists of 26 letters, 8 long vowels, and 18 consonants. There is one declension and one conjugation, subject to no exceptions. Adjectives are derived from substantives. All words are accented on the last syllable. The vocabulary consists of some 15,000 words, mostly monosyllabic. About a third of the words are of English, a quarter of Latin or Romance, and a fifth of German origin. See Esperanto; Universal Language.

Volcano (Lat. *Volcanus*, god of fire). Vent in the earth's crust up which molten rock and gases escape from the earth's interior. Volcanoes may mark the top of a pipe or of a fissure. Often they occur in groups which show a regular alinement or pattern indicating location along a line of fracture, or at the intersections of two fracture systems. Present-day volcanoes are closely associated with recent earth movements and the younger mt. ranges of Tertiary or later age. The volcanoes which ring the Pacific Ocean and form the "circle of fire" are all connected with such ranges. Another area of recent movement and volcanism is that of the Rift Valley of E. Africa.

At depth the pressures are great, and gases are dissolved in the rock-melt (magma, *q.v.*). As the magma ascends the volcanic pipe hydrostatic pressure decreases and the gases come out of solution as bubbles. The melt, now partly robbed of its gases, is termed pyromagma, a hot active form of lava. The liberated gases are now capable of reacting chemically with each other and with oxidised old lava that has fallen back or land-slipped into the crater, and great heat is generated in the upper parts of the lava column or in the lava lake at the top. The violence of the eruption depends upon the relative ease with which the gases

escape from the lava column. Where the lava is fluid the gases can bubble away quietly, and the lava flows out, building broad, gently sloping, volcanic shields which form the greatest of modern volcanoes. *e.g.* Mauna Loa, Hawaii, which rises more than 28,000 ft. above the ocean floor on which it stands. Similar quiet outflows of lava occurred in Iceland at the Laki Fissure (*q.v.*); in N.W. Scotland; the Deccan, India; Snake River Plateau, U.S.A., and other areas, where the lava rose up numerous fissures and flooded the entire region. Volcanic eruption becomes less continuous and more violent with increasing viscosity of the melt in the volcanic conduit. This is not necessarily due to the effect of cooling of the melt, but is more probably the result of changes in chemical composition; silica-rich lavas are more viscous than basaltic ones. Hence certain types of volcanic eruption are recognized: (1) fissure and (2) Hawaiian, in which lava emission is relatively quiet; (3) Strombolian, in which gases explode at short, more or less regular, intervals, and throw out bombs of viscous lava; (4) Vulcanian, in which the explosions are more violent and at longer intervals; the lava in the crater has had time to solidify between outbursts, and solid blocks, ashes, and black clouds of dust are ejected; (5) Vesuvian, in which long periods of quiescence or mild eruption and lava outflow, during which gas pressure may build up, are followed by violent paroxysmal eruption: the escape of lava through cracks in the mt. side lowers the level of the column in the crater, and the hydrostatic pressure in the reservoir below is reduced; this allows the gases to come out of solution at depth, and the exploding lava froth is ejected, forming great luminous ash clouds; (6) Peléan, called after Mont Pelée, in which stiff viscous lava retains its gases, explodes as it escapes through cracks in the plug in the crater, and forms a *nuée ardente* (*q.v.*).

Explosive volcanic eruptions project into the upper layers of the atmosphere enormous quantities of dust in so fine a form that it may take more than a year to settle. It has been estimated that between 4 and 5 cu. m. of dust were thrown into the air from Krakatoa (*q.v.*) in 1883, the explosive wave carrying the dust $3\frac{1}{2}$ times round the earth, *i.e.* a distance of c. 26,000 m. This pre-

sence of volcanic dust causes a reduction in the intensity of the solar radiation received at the earth's surface; another effect is the production of brilliant sunsets and optical phenomena, e.g. Bishop's ring, due to diffraction of the light rays.

Several examples of the birth of new volcanoes are known, but none outside a pre-existing volcanic field. The Laki Fissure opened in 1783; Monte Nuovo, on the shores of the Bay of Naples, rose to a height of about 400 ft. in a few days in 1538, and then became inactive. Mt. Paricutin in Mexico was born on Feb. 20, 1943, and continued violently erupting ashes and lava.

The shapes of volcanoes depends upon the type of eruption and the nature of the material thrown out. Dome-like shield volcanoes are formed by fluid basaltic lava; conical volcanoes like Fujiyama in Japan are stratified, being built of alternating beds of ashes and lava flow. As the life of the volcano is prolonged, small parasitic cones develop on the mountain flanks, so destroying its symmetrical shape. Where there have been very violent eruptions with the discharge of pumice to such an extent that the magma chamber below the volcano has emptied itself, the whole volcanic edifice may collapse and a caldera (q.v.) be formed.

Once activity ceases erosion rapidly attacks volcanoes, and the unconsolidated ashes of the cone are washed away; but the congealed lava plug in the original conduit is hard and resistant, and so stands up as a hill or isolated craggy knob. Edinburgh Castle is built on such an ancient volcanic plug.

Volcanoes erupt not only on land, but also beneath the sea, and submarine lava flows have been observed. They often show pillow structure (see Pillow Lava). Volcanic products and lavas are often found interbedded with ancient sediments; and old volcanic plugs or necks testify that there were once periods of volcanic activity in areas which have since been tranquil for millions of years. In Great Britain the roots of huge volcanoes of Tertiary age are found in Skye, Rum, Ardsamurchan, Mull, and Arran. Ben Nevis, Glen Coe, parts of the midland valley of Scotland, and the Cheviots were volcanic areas during and after Old Red Sandstone times. The mts. of the Lake District and N. Wales are com-

posed chiefly of Ordovician lavas and ashes, and evidence of Pre-Cambrian volcanicity can be seen in the Malvern hills. The international union of geodesy and geophysics undertook in 1949 the compilation of a 1,500-page catalogue of the world's volcanoes. See separate entries on famous volcanoes, e.g. Etna, Krakatoa, Vesuvius. Consult Volcanoes, G. W. Tyrrell, 1931; Volcanoes as Landscape Forms, C. A. Cotton, 1944; Volcanoes, New and Old, S. N. Coleman, 1950.

Gilbert Wilson, Ph.D.

Volcano. Group of three small islands in the N. Pacific Ocean, S.W. of the Bonin Islands. Iwojima (q.v.) is the central island of the group.

Vole. Genus of small rodents. Voles are commonly confused with rats and mice, from which

Vole. Two specimens of the British bank vole

they can be distinguished by their short tails, blunt heads, and comparatively bulky bodies. Three species occur in England and Scotland. The field vole (*Microtus agrestis*), commonly called the field mouse, is a little larger than a house mouse and has brown fur on the back and greyish white beneath. The bank vole (*Clethrionomys glareolus*) is slightly smaller, and has yellowish red hair on the back with grey under parts and whitish feet. It is found locally in England and the S. of Scotland, and lives in crevices in banks. The water vole (*Arvicola amphibius*), commonly known as the water rat, is about 8 ins. long in body, and has soft yellowish brown fur.

Volga (ancient Rha). River of European Russia, the longest in Europe. It rises in a small lake in the Valdai Plateau in the Kalinin region, flows from W. to E. as far as Kazan, turns S.W. from Kuibishev, and after Stalingrad finally turns S.E. to enter the Caspian Sea through a delta with about 200

mouths. It is from 2,000 to 2,500 m. in length, and is navigable for nearly the whole of its course. Its waters are full of fish, especially salmon and sturgeon. Various canals, uniting its tributaries to those of the Neva, form a medium of communication between the Caspian and the Baltic, and others with the Black and White Seas. Chief tributaries of the Volga are the Oka and Sura on the right, and the Tvertsa, Kama, and Samara on the left. The most important towns by which it passes are Kalinin, Rybinsk, Yaroslavl, Kostroma, Gorky, Kazan, Ulyanovsk, Stavropol, Kuibishev, Saratov, Stalingrad, and Astrakhan. The prolonged battle of the Second Great War in 1942 on the right bank of the Volga is described under Stalingrad, Battle of.

Volhynia. Region of Ukraine S.S.R. Lying between Kiev and the Polish border, it is a flat and fertile dist., the soil in great part consisting of the famous black earth. The chief mineral products are iron, saltpetre, pyrites, sandstone, and lignite. In the Middle Ages Volhynia was a separate principality, with Zhitomir its capital.

Völkischer Beobachter (Ger., people's observer). Principal and earliest Nazi newspaper. In the main it was the property of Hitler through a firm in which he was associated with his one-time co. sergt.-maj. Amann. Based on a small local periodical which Hitler bought with funds furnished by Roehm, it began to appear as his party organ in 1921; was suppressed after the "putsch" of 1923; and reappeared Feb. 26, 1925, as a large-scale, ambitious paper, first weekly, then from March daily. Its editor from 1932 was Alfred Rosenberg. In 1933 a N. German edition was started in Berlin, and both editions soon reached a circulation of about 750,000, subscription being expected as a proof of loyalty from civil servants, etc. It ceased to exist with the collapse of the Nazi regime.

Volkssturm (Ger., people's assault). Body raised in Germany during the Second Great War, somewhat analogous to the British Home Guard. Hitler proclaimed the formation of this last emergency levy in a broadcast on Oct. 18, 1944. It was modelled closely on Nazi party lines, all bn., co., and group commanders being trusted party men. Himmler was at its head. Every man from 16 to 60 not in the army had to register for the Volkssturm; members all

over Germany took the oath of allegiance on Nov. 12, 1944. Their "uniform" was a white armband inscribed *Deutscher Volkssturm-Wehrmacht* (German people's assault force), though every effort was made to provide a full uniform of some kind, if only a tram conductor's or fireman's, members being afraid that in civilian dress with only an armband they might be taken by the Allies for franc-tireurs. Their duty was to defend the town or village where they lived. They took part in the defence, e.g. of Trier in the W., Danzig (Gdansk) in the E. The Salzkammergut area of Austria was chosen as their h.q. Their efforts made little difference to the campaign in Germany.

Volley (Fr. *volée*, flight). Simultaneous discharge of their firearms by a body of troops. Volley firing finds its greatest use when a body of enemy troops are surprised. The term is also applied to the firing of salutes.

Volo or **BOLOS**. Town of Greece. It is situated at the head of the gulf of the same name, at the foot of Mt. Pelion (q.v.), in Thessaly. It is 35 m. S.E. of Larissa, with which it is connected by rly., has a general trade, and is the seat of a Greek metropolitan. During the First Great War it was occupied by British and French troops in 1917. Pop. approx. 30,000.

Vologda. Town of the R.S.F.S.R. In the region of Vologda, which formerly comprised an immense forested district, it is 110 m. N. of Yaroslavl, and has rly. communication with Leningrad and Moscow. Manufactures include leather goods, cloth, candles, and soap. Pottery, glass, and cement factories were started under the Soviet regime. In the Middle Ages Vologda was a centre of the fur trade. Its importance rose when Archangel was opened as a port, but declined with the founding of St. Petersburg (Leningrad). Pop. 95,194.

Volpi, GRUSEPPE, COUNT (1877-1947). Italian politician and industrialist. A Venetian, born Nov. 19, 1877, he abandoned legal studies to represent Italian commercial firms in the Balkans, and was one of the negotiators of the treaty of Ouchy, 1913, which ended the Italo-Turkish war. This led to his being appointed vice-president of the Balkan financial conference in Paris. He negotiated a settlement with Yugoslavia over the Fiume dispute, 1920, and was governor of Tripolitania 1921-25, being made a peer. As finance minister during 1925-28 he negotiated Italy's war debt with Great

Britain and the U.S.A. Control of 42 companies connected with the hydro-electric industry gave him wealth and power. Dismissed by Mussolini in 1943 from his post as president of the fascist chamber of manufacturers, Volpi fled to Switzerland, but later returned to Italy, where he was arrested by the Germans and again escaped. After the war he was acquitted on a charge of carrying on fascist activities. He died Nov. 16, 1947.

Volpone or **THE FOX**. Comedy by Ben Jonson. It was first produced at the Globe, Southwark, 1605, and then at Oxford and Cambridge universities (to which it is dedicated). A tremendous satire on avarice and one of Jonson's greatest dramatic works, it retrieved his position in the theatre, and remained a popular piece until the end of the 18th century. With-in recent times it was first revived at the Lyric, Hammersmith, 1921. A fine interpreter of the title part was Donald Wolfitt.

Volsci or **VOLSCIANS**. People of ancient Italy, of unknown origin. Their territory, the extent of which varied from time to time, lay on both sides of the river Liris (Garigliano), in central Italy. Their language was more nearly related to Umbrian than Oscan. The Volscians were subdued by the Romans in 338.

Volturni. Metropolis of the 12 communities of ancient Etruria. Situated on a hill at the confluence of the Chiana and Paglia, after several wars with the Romans it was captured and destroyed about 280 B.C. The inhabitants were removed to a new site about 8 m. to the S.W. See Bolsena; Orvieto.

Volstead, ANDREW J. (1860-1947). American politician. Born of Scandinavian parents in Goodhue co., Minn., he was educated at St. Olaf's college and Devonah institute, and called to the bar in 1884. At Granite Falls, Minn., he became president of the board of education, city attorney, and mayor. A Republican with some leaning to the Left, he was elected to congress in 1903, retaining his seat until 1923. He died Jan. 20, 1947. This ardent teetotaler is known as the author of the Volstead Act, which in 1919 became the 18th amendment to the constitution and enjoined prohibition (q.v.) throughout the U.S.A. until it was reversed by the 21st in 1933.

Völsunga Saga. Heroic tale written in Iceland in the 13th century. The story is common to the Teutonic peoples; it is given in the German *Nibelungenlied*,

and part of it is in the English *Beowulf*. It sets forth the adventures of Völsung and his descendants, the chief hero being Sigurd, slayer of the dragon Fafni and lover of Brunhild the Valkyrie; he being treacherously given a draught of forgetfulness marries Gudrun, which leads to the deaths of Sigurd and Brunhild. The second part of the saga relates the tragic lives of Gudrun and her children. A translation of the *Völsunga Saga*, by Eiríkr Magnússon and William Morris, was published in 1870, and Morris issued in 1876 his own poetical version of the story, *Sigurd the Völsung*. See *Brunhild*; *Nibelungenlied*; *Siegfried*.

Volt. In electricity, the unit of electromotive force, pressure, tension, or potential difference. One volt is the electrical pressure which, if steadily applied to a conductor whose resistance is 1 ohm, will produce a current of 1 ampere. It is equal to 10^8 electro-magnetic units of E.M.F. It is so named from Alessandro Volta (q.v.). See *Electricity*; *International Units*.

Volta or **LA VOLTA** (Ital., the turn). Round dance of Italian origin. Of the same measure as the courante (q.v.), it was danced in England in Shakespearean times, and is sometimes regarded as the forerunner of the waltz (q.v.).

Volta. River of W. Africa. It originates in the French Sudan in two headstreams, the Black and Red Volta, and flows through the jungle forest of the Gold Coast Colony S.E. and S. to the Bight of Benin at Adda. Navigation is impeded by the bar at the mouth and by numerous rapids. Its total length is about 900 m., and the lower 250 m. are navigable by small vessels during the floods.

Volta, ALESSANDRO, COUNT (1745-1827). Italian physicist. Born at Como, Feb. 18, 1745, he became professor of physics there, 1774, and at Pavia, 1779, retiring 1804. He died at Como, March 5, 1827. Volta made many important discoveries in electricity. In 1794 he brought out his condensing electroscope, and in 1800 the electric pile, followed closely by the first voltaic battery by which his name is commemorated. The friend of Buffon, Galvani, and Lavoisier, he received the Copley medal of the Royal Society, 1791. In 1801 Napoleon saw his experiments and struck a medal in his honour.

Voltaic Cell. Primary cell in which chemical energy is converted into electrical energy. See *Cell*, p. 1883.

Voltaire. Assumed name of the French writer, François Marie Arouet (1694–1778). He was born in Paris, Nov. 21, 1694, the son of a notary, and was educated by the Jesuits at the Collège Louis-le-Grand. He reluctantly studied law for a while, but subsequently lived on an allowance, dabbling in literature and making his way in society by his wit and manners. His wit, however, being exercised at the expense of established institutions and persons of importance, repeatedly got him into trouble, and he was often punished, sometimes by being sent to the Bastille, and sometimes by being exiled from the capital. Yet he already began to make his mark as a dramatist; *Oedipe*, produced in 1718, ran 45 nights at the Comédie Française.

In 1725 Voltaire's talent for epigram gave dire offence to the Chevalier de Rohan-Chabot, whose lackeys chastised him in their master's presence. In vain he sought redress, and when it became known that he was taking lessons from a fencing-master with a view to a duel, he was again confined in the Bastille. On his release he obtained permission to go to England, where he remained from May, 1726, until the early spring of 1729. Voltaire's acquaintances in England included Pope, Bolingbroke, Gay, Swift, Lord Chesterfield, and Samuel Clarke, the expositor of Newton's philosophy. He became an admirer, not only of Newton and Locke, but also of the British constitution, and his subsequent attitude towards the French political system was much influenced by his observation of its working. While in England he published his epic, the *Henriade*, and wrote his *History of Charles XII* and *Letters on the English*.

Soon after his return to France, Voltaire amassed a fortune by speculation. He secured a share in some profitable army contracts, acquired a large interest in a commercial house at Cadiz, and lent money at a high rate of interest to the duc de Richelieu and other aristocratic friends. For the rest of his life he was rich, and could write without regard to pecuniary considerations. In 1734, however, the French government, enraged by the appearance of his *Letters on the English*, issued an order for his arrest, but left him unmolested when he took refuge in the country house of Mme. du Châtelet, at Cirey. This friendship, though punctuated by frequent quarrels, continued until her death in 1749. During nearly the whole of that

period Voltaire made his home with her, working diligently all the time. Written during those years were the plays *Mérope*, and *Mahomet*, *Dialogues on Philosophy*, the scandalous *La Pucelle*, and *The Age of Louis XIV*. Voltaire was in 1746 elected to the French Academy.

After the death of Mme. du Châtelet, Voltaire was persuaded to take up his residence at the court of Frederick the Great, who had conceived a boundless admiration for his talents. He was received almost as a demigod, but his relations with his royal patron gradually became strained, and they parted with mutual anger in 1753. The breach was afterwards partially repaired by correspondence, but the two great men never met again. Voltaire, after some wanderings in Alsace and Switzerland, finally settled at Ferney (*q.v.*), on French soil, but close to Geneva. There, with his niece, Mme. Denis, keeping house, he resided until nearly the end of his long life.

The years left to him were well filled, and his fame continually grew. He was the wealthiest, most celebrated, and most active man of letters in the world. He kept open house for distinguished strangers from all countries; he established important industries on his estate; he wrote books of all kinds, including that brilliant satirical tale *Candide*, 1759; he combated the puritanical objections of the Genevans to the theatre; he conducted a voluminous correspondence, and he acquired a new reputation as a pamphleteer, bent upon overthrowing the tyranny of superstition, and compelling the redress

of judicial errors. *Écrasez l'infâme* (lit. crush the infamous one) was the watchword of his campaign against the Jesuits. Victims of injustice whose cases he caused to be reviewed and revised included Calas, Sirven, la Barre, and Lally (*q.v.*). In 1778 Voltaire was persuaded to revisit Paris. His journey thither was a triumphal progress, but the strain and excitement were too much for him; after attending a performance of his last play, *Irène*, he was taken ill, and died May 30. His remains were transferred to the Panthéon in 1791.

Voltaire's genius is incontestable, yet his fame cannot be said to rest upon any particular piece of constructive work. He was not a great dramatist, though he wrote successful plays. He was not a great historian, though his contributions to history are always luminous and readable. His name is not associated with any specific political or metaphysical system. His rôle, in short, was mainly critical and destructive, and he may be said to have been the incarnation of the critical and destructive forces of the 18th century. The fact that many of his works date is a tribute to the efficiency with which he attacked abuses now ended. In that sense he was a forerunner of the Revolution. His deadly wit and indefatigable energy cleared the ground on which a new structure could be built. He was not an atheist, but a deist. With outstanding wit and intellect, with a passion for justice and liberty, he yet emerges as an unlovable man, quarrelsome and unscrupulous.

Bibliography. Works, 72 vols., ed. M. Beuchot, 1829–40; 52 vols., 1883–85; Bibliography, 4 vols., G. Bengesco, 1882–90; Lives, F. Espinasse, 1892; S. G. Tallentyre, 1903; J. Morley, repr. 1913; J. M. Robertson, 1922; R. Aldington, 1925; C. E. Vulliamy, 1930; A. Maurois, 1932; A. Noyes, 1936; *The Spirit of Voltaire*, N. L. Torrey, 1939; *Voltaire, Myth and Reality*, K. O'Flaherty, 1945.

Voltameter. In electricity, an instrument for measuring the quantity of electricity passing through a circuit, by the decomposition of an electrolyte. The voltameter in general use consists of a platinum dish supported on a metallic tripod, and containing a solution of pure nitrate. A silver plate is suspended in the dish and connected with the positive side of the circuit, as anode, the dish itself being the cathode. Passage of current causes silver to be dissolved from the plate into the solution and deposited on the dish, the weight of

which, before the experiment, is known. When an observed time has elapsed the dish is emptied, dried, and re-weighed. The weight in grammes of the deposit divided by the constant '001118 gives the total quantity of electricity (in coulombs).

Volterra. City of Italy, in the prov. of Pisa. It stands at an elevation of 1,800 ft. on a hill, encircled by its massive ancient walls, 51 m. by rly. S.E. of the

Volterra, Italy. West front of the cathedral, consecrated by Pope Calixtus II in 1120, and enlarged in 1254

city of Pisa. Principal buildings are the cathedral (1120), the Palazzo Municipio (1208), the Palazzo Tagassi with a national museum, and the citadel, now a prison. Volterra, the Etruscan Velathri, was one of the 12 cities of the Etruscan League. During the Second Great War it was captured July 9, 1944, by U.S. troops, the Germans having evacuated it after fighting hard in the environs. The roof of the cathedral was partly damaged, the church of S. Addolorata had its roof tiles blown off; other churches and the palaces were less harmed.

Voltmeter. Electrical instrument to measure potential difference or electromotive force in volts. The type commonly used for engineering work is a sensitive, graduated galvanometer similar in principle to an ammeter (*q.v.*). In the moving-coil voltmeter the current traverses a fine coil pivoted in the field of a permanent electro-magnet, and sets up a second field which reacts against the first and causes the coil, and a pointer attached thereto, to move in opposition to light springs. The resistance of the voltmeter circuit is purposely made high so that the current shall be too small to affect the P.D. or E.M.F. between the points in contact with the terminals of the voltmeter. This instrument is suitable for continuous currents only, as a reversal of current-direction would reverse the travel of the pointer.

In moving-coil voltmeters for alternate currents, an external electro-magnet takes the place of the permanent magnet of the D.C. voltmeter, and the two being in series, reversal of direction has no effect. Moving-iron voltmeters have an armature of this metal attached to the pointer and passing into the centre of a solenoid or hollow coil. Current traversing the solenoid in one direction only, or both directions alternately, draws the armature further into the coil and deflects the pointer. Measurement of very high voltages requires electrostatic instruments based on the principle of the quadrant electrometer. See *Electrometer*.

Volturno. British emigrant vessel. While going from Rotterdam to America she caught fire during a hurricane in the Atlantic, Oct. 9, 1913. Out of the

654 persons aboard, 133 were lost. The remainder were saved by the eleven vessels which came in response to wireless calls.

Volturno. River of Campania, Italy. It rises in the Apennines, and flows S.E., then W. past Capua to the Gulf of Gaeta in the Tyrrhenian Sea. It has a length of about 105 m. and its main affluent, the Calore, is almost as long. On its banks Garibaldi defeated the army of Naples in Oct., 1860.

In their retreat N. through Italy in the Second Great War, the Germans formed a defensive line on the Volturno river with the object of halting the Allied 5th

army. On the night of Oct. 12-13, 1943, Gen. Clark, Allied 5th army commander, launched a full-scale assault across the river. One U.S. infantry brigade in rubber boats was over it by dawn and consolidated a bridgehead to allow a pontoon bridge to be constructed. The attack in the British sector was less successful until the 15th, when the Guards crossed by one of the U.S. bridges. Further crossings were made at Grazzanise, and a landing on the coast just N. of the river, and by Oct. 16 the Germans had been forced back from the river line.

Voluntary. Generic name given to an organ piece before, after, or in the course of a church service, and probably so called because it does not form an integral part thereof. During the 18th century the term was often used by composers to designate pieces specially written for that purpose. The voluntary still flourishes in church music under a variety of other names. See *Organ*.

Voluntary Aid Detachments.

Bodies of civilians, some of men and some of women, numbered and registered at the War office, and organized under the Haldane scheme by the British Red Cross Society, the territorial county association, or the St. John Ambulance association or brigade, in every county of the U.K. to render first aid in case of emergency. Before the First Great War, the detachments of the British Red Cross and Order of St. John were organized to be ready at a moment's notice, and in Oct., 1914, the women decided to work together as a joint committee known as the Joint Women's Voluntary Aid Detachments, popularly V.A.D.s. During the war thousands of women were attached to the military hospitals as V.A.D.s or auxiliary helpers, and a large number of V.A.D. hospitals were established.

Shortly before the Second Great War, the ancillary nursing services of the British Red Cross, St. John ambulance brigade, and St. Andrew ambulance corps (Scotland) were incorporated into the V.A.D. At the outbreak of war the organization was mobilised, members serving both full and part time as civil defence auxiliaries. The setting up of nurseries to take children from evacuated areas widened the scope of V.A.D. activities. There was a council of representatives of the Admiralty, War office, Air ministry, and the orders of St. John, St. Andrew, and British Red

Voltmeter. Hot-wire type. Current entering at F heats the wire E, which expands against the tension of the spring A, D, C, connected to the pointer B. The movement of the pointer is in direct proportion to the voltage, since it measures the expansion of the heated wire. G is the return terminal

Cross, until in 1944 it was replaced by the V.A.D. standing committee to form an official link between the original voluntary organizations and the services to which members were mobilised under the National Service Act. *See* Red Cross Society.

Voluntarism. Opinion that a church should depend for support entirely on voluntary contributions, and not be maintained by endowments guaranteed by the state, or controlled in the conduct of its affairs by the authority of the state. In Great Britain this is the view of nonconformists, and of a small section of the Church of England. *See* Church of England; Disendowment; Disestablishment.

Voluntary System. Organization of public service on a basis of free will. The term is particularly applied to the system of raising men for the armed forces by voluntary enlistment, and is thus the opposite of compulsory military service or conscription. In elementary education the voluntary system, partly maintained by voluntary subscriptions, prevailed in Great Britain until 1870, after which date the proportion of board or council schools rose rapidly.

Volunteer (Lat. *voluntarius*, of free will). One who offers his services, particularly for any arduous or dangerous work, without compulsion or thought of substantial reward. The term is applied in a special sense to those who offer to serve the state under arms.

In Great Britain voluntary training for home defence on a national scale dates from the Napoleonic Wars, though the train-bands of Stuart times were largely a volunteer force; and in 1794 and 1803 the threat of invasion brought about 400,000 men into the ranks of the volunteers. From the first the adjustment of relations between part-time soldiers imbued with the civilian spirit of independence and the military authorities was a difficult matter, and full recognition of the movement was always given grudgingly, owing to disbelief in the value of half-trained men, and to the belief that the movement deprived the regular army of valuable recruits. Nevertheless, in 1859 the renewed fear of invasion brought about the formation of volunteer rifle corps throughout the country, and the National Rifle Association was founded in the same year. An Act of 1863 defined the conditions of service of the new force, and authorised a capitation grant of 30s. a year in respect of each efficient volunteer.

The volunteer rifle corps and the yeomanry became in 1907 the Territorial Force and in 1921 the Territorial Army (*q.v.*).

Until the First Great War, the British regular army was recruited on a voluntary basis, in both peace and war, but in 1916 compulsory service was introduced. In 1914 semi-military volunteer organizations came into existence: *e.g.* Home Defence League, Athletes' Volunteer Force; these soon were recognized by the War office and developed into the Volunteer Force, which provided preliminary training for men ultimately called up for military service.

After the war the regular army reverted to voluntary enlistments. Some time before the outbreak of the Second Great War, the newly formed A.R.P. (later civil defence) organizations were on a strictly voluntary basis, but later such services became compulsory according to the direction of the ministry of Labour and the military authorities. Similarly the Local Defence Volunteers (later Home Guard)

Volvox globator. Entire colony, highly magnified, enclosing several daughter colonies

From *The Cambridge Natural History* (Macmillan)

were enlisted on a voluntary basis but ultimately became compulsory. When service in the armed forces was compulsory according to age and reservation groups, men could anticipate their call-up by volunteering. Although the R.A.F. absorbed large numbers of conscripts, all air crew personnel were volunteers, and no conscript could be compelled to fly as a member of an operational crew. In the army, commandos, parachute troops, and other specialised fighting units were composed entirely of volunteers. After the war, conscription was retained for the three services; but the Royal Navy was able to maintain establishment on long-term voluntary enlistments. *See* Army, British; Civil Defence; Home Guard; National Guard.

Volute in architecture

Volunteers, IRISH. Name given to volunteer forces raised in Ireland. The first units were raised in 1779 for home defence, and it

was the existence of this considerable armed force which compelled the British government to grant free trade with Ireland. The example of Ulster in raising volunteers in 1913-14 was promptly followed by the Nationalists in the rest of Ireland, and after the Dublin rebellion, 1916, the Irish volunteers developed into the guerrilla force known as the Irish Republican Army (*q.v.*). *See also* Sinn Féin.

Volute. In architecture, the spiral scroll forming the principal feature of the Ionic capital, and of the Roman composite capital. *See* Composite Order; Ionic Order; Rome: Architecture.

Volvox. Genus of small flagellate protozoa, common in many ponds. It lies so nearly on the border line between the animal and vegetable kingdoms that most botanists class it as a green alga. It consists of a hollow sphere of unicellular individuals, each possessing two flagellae, and the whole united together by a gelatinous envelope. In the common pond species, *Volvox globator*, there may be 10,000 individuals in the colony, which progresses by rolling along in the water. As with plants, the cells contain chlorophyll, and build up starch granules. Reproduction is of two kinds. Sometimes the cells divide up and thus form fresh colonies; while in other examples certain cells are specialised for reproductive functions.

Volvulus. Physical condition in which a coil of intestine becomes twisted on itself, thus interfering with the supply of blood and the passage of its contents. This may give rise to the dreaded intestinal obstruction if it does not free itself, or is not diagnosed and freed.

Vomiting. Return and expulsion from the mouth of part or whole of the stomach contents. The stomach walls contract, the diaphragm is pushed downward, and the abdominal muscles contract strongly. The cardiac orifice of the stomach relaxes and the pressure of the abdominal muscles expels the contents. The vomiting nerve centre in the brain may be excited to action by influence from the stomach itself or from other parts of the body, or by

poisons acting upon it directly. The causes of reflex vomiting include pharyngeal and gastric causes; intestinal, peritoneal, and general visceral causes; and disorders of the nervous system.

Von. German word meaning of, used as a prefix to surnames, the equivalent of the French *de*. First used indiscriminately, the *von* gradually became a mark of distinction, and its use was confined to those of noble birth. Rulers exercised the right of ennobling others, and this took the form of allowing them to use the prefix *von*. In alphabetising German names in this work, the *von* is disregarded, e.g. Leopold von Ranke appears under Ranke.

Vondel, Joost van den (1587-1679). Dutch dramatist and poet. He was born Nov. 17, 1587, at

Joost van den
Vondel,
Dutch dramatist

Cologne, son of an Anabaptist exile from Antwerp, and became a hosier at Amsterdam, and afterwards a government official. Strongly influenced by French and Greek poetry, he became a

member of the literary circle in the house of the Visschers. His drama, *The Pasha*, 1612, was followed by lyrics and a series of adaptations of Sophocles and Euripides. His original tragedies include *Jerusalem Laid Waste*, 1620; *Palamedes*, 1625, written in protest against the execution of Oldenbarnevelt; *Gijsbrecht van Aemstel*, 1637; and his masterpiece, *Lucifer*, 1654 (Eng. trans. 1898), which is thought to have influenced Milton's *Paradise Lost*. Vondel died at Amsterdam, Feb. 5, 1679. *A Life*, by A. J. Barnouw, appeared in 1925.

Voodoo or Vaudoux. Superstitious cult current in some W. Indian islands, especially Haiti. Introduced by early slaves recruited from Dahomé, its secret rites, performed by a priest and priestess, are based upon the worship of the green snake.

Voortrekker (Dutch, forward rider). Name given to the Dutch colonists who migrated in 1836 from the Cape to the areas that became the O.F.S., Transvaal, and Natal. After Napoleon's final defeat the British in 1814 paid the Dutch £6 million for the Cape, of which they had taken possession when the Netherlands was under French control. There were then

some 27,000 Dutch in the country; the first British settlers arrived in 1819. Disagreement between Dutch and British arose; and in 1836 about 10,000 Boers (Dutch farmers) set out in small groups on what is called in S. Africa the Great Trek. They travelled by ox-wagon across the trackless veld. The going was not difficult, but water was hard to find. An average day's journey was 12 m. On the way many died, and all suffered hardship. Those who reached the new lands had to defeat the semi-nomadic tribes inhabiting them before they could make secure settlements. Legally the voortrekkers remained British subjects. The Voortrekker memorial at Pretoria, consisting of a monument and an amphitheatre, was dedicated in 1949. See Kruger; South African War.

Vorarlberg. Austrian province. The name means the land beyond the Arlberg Pass, given to it in the 18th century when certain small areas were united under this name. The prov. adjoins Bavaria, Switzerland, Liechtenstein, and Austrian Tirol; parts of its boundary are formed by the Rhine and Lake Constance. It is drained by the Ill, and is almost wholly mountainous. Bregenz is the capital. Area, 1,005 sq. m. Pop. 183,266.

Voronezh. A city of the R.S.F.S.R. Chief city of the region of the same name, it is an administrative centre of the black earth area. Built along the Voronezh river, 5 m. above its confluence with the Don, 125 m. E. of Kursk, it is a large rly. centre, and has machine-making and engineering works, aeroplane factories, steam flour mills, and makes bricks, paint, and alcoholic drinks. A centre of silk growing, it has an agricultural institute. There are a university and several museums.

The site was occupied in the 11th century by a Khazar town, abandoned in the later Middle Ages. A fort was built in 1586, burned by the Tartars in 1590, but rebuilt. Here Peter the Great started the first Russian shipyards in 1695, when he constructed a flotilla to send to the Sea of Azov to fight the Turks. The town was destroyed by fire in 1703, 1748, and 1773, and suffered from chaotic building during the 19th century. During the Second Great War the city was 85 p.c. destroyed in violent fighting during July, 1942, when 100,000 Germans, Hungarians, and Rumanians were said by the Russians to have been killed in an effort to take Voronezh at any cost. The

Don ran with blood, the Germans used tanks, aircraft, smoke screens, flame throwers, as well as masses of infantry. They succeeded in establishing themselves in the W. suburbs, but could get no farther. In Aug. the weight of the fighting shifted away to the S. The Russians freed Voronezh entirely Jan. 25, 1943. After the war, the principal buildings were restored in the early 19th century style. The pop. in 1939 was 327,000.

Voronoff, SERGE (b. 1866). Russian surgeon. Born July 10, 1866, and educated for the medical profession in Paris, he became a surgeon there. He worked in a military hospital and later was made director of a biological laboratory and of experimental surgery in the Collège de France. Voronoff's name is prominently associated with attempts at rejuvenation by transplanting the sexual glands of young animals. In the lower animals those of an animal of the same species are used; in man those of one of the higher apes. Numbers of these experiments have been successful, the animal or man into whose body the vigorous gland is transplanted losing to a large extent the characteristics of senility, and manifesting for a short time the mental, physical, and sexual vigour of a much younger individual. Voronoff wrote on *Articulation Grafting*, *Ovarian Grafting*, and *Thyroid Grafting*.

Voronov, NIKOLAI NIKOLAEVICH (b. 1899). Russian soldier. He joined the Red army in 1918, then studied at a military academy at Leningrad. After serving as commandant of the senior artillery school there, he became chief of artillery to the army, reorganizing the system of training and starting special gunnery schools. He fought against the Finns in 1939-40, on the Moscow front, 1941, and at the battle of Stalingrad, after which he was promoted marshal of artillery. He received the Order of Suvorov, 1943, and that of Lenin, 1945.

Voroshilov. Town of Primorskaya, Far Eastern Region, R.S.F.S.R. Formerly Nikolsk, it is about 45 m. N.W. of Vladivostok, on the main rly. to Harbin. It is built on the river Yug, and was greatly developed during the 1930s. Pop. 70,628. Another town of the same name is in Ukraine S.S.R.: pop. 54,794.

Voroshilov, KLEMENTI EFREMOVICH (b. 1881). Russian soldier. Son of a workman, he was born at Verkhnyi, Ukraine, and in 1903 joined the Social Democratic party. Having been exiled to Si-

beria in 1907 for revolutionary activities, he escaped to Baku, and during the First Great War worked as a revolutionary organizer, accepting military service after the Bolsheviks seized power.

K. E. Voroshilov,
Russian soldier

He was a pioneer of the Red army cavalry, and a member of the Communist party central committee from 1921. People's commissar of the army and navy, 1925, Voroshilov became vice-premier in 1940. After the German invasion of Russia in the Second Great War, he was in command of the N.W. front and helped to form new Russian armies. A member of the state committee of defence (war cabinet), he accompanied Stalin to the Teheran conference, Nov.-Dec., 1943. He was Russian c.-in-c. and chairman of the Allied control commission in Hungary, 1945-46. He was awarded the Order of Lenin, 1945.

Voroshilovgrad. City of Ukraine S.S.R., in the region of the same name. Formerly Lugansk, it is about 180 m. E. of Dnepropetrovsk, on the Lugan, a tributary of the Donetz. The town makes locomotives and armaments, while mines in the neighbourhood yield great quantities of iron, coal, and anthracite. Lugansk owed its importance to ironworks established by an Englishman on behalf of the Russian govt. in 1795. After the revolution of 1917 it greatly developed industrially. The scene of bitter fighting during the Second Great War, it was captured by the Germans, July 19, 1942, in their drive towards Stalingrad, and recovered by the Russians under Gen. Vatutin, Feb. 14, 1943, after a fierce 2-day battle through elaborate defences and anti-tank traps constructed by the Germans. Pop. 213,000.

Voroshilovsk. Russian city, in the North Caucasian area, R.S.F.S.R. Formerly Stavropol, it is 150 m. E. of Krasnodar, and N. of the Central Caucasian mts. The centre of a district rich in minerals, it has oil refineries, and is an important rly. junction. During the Second Great War it was captured by the Germans in their Caucasian campaign of 1942, and retaken by the Russians, Jan. 21, 1943. Pop. 85,100.

Vortex. In hydrodynamics, a portion of fluid in rotational mo-

tion. The motion is by supposition perfectly continuous, so that when the axes of rotation of neighbouring particles are joined, they form a curve which returns into itself, or reaches both bottom and top of the rotating fluid. These lines or curves are called vortex lines. The long filament of rotating fluid which forms an eddy must either be a closed ring or end on the boundary walls of the system.

Vorticella OR BELL ANIMALCULE. Small protozoon, common in ponds. It resembles a bell with a ciliated mouth, and is attached to water plants and other objects by a slender stem. It occurs in colonies, and the stem can be contracted like a spiral spring, drawing all the bells together into a little jelly-like mass.

Vorticism. Art movement. Initiated by Percy Wyndham Lewis shortly before the First Great War, this style of painting was an offshoot of Cubism (*q.v.*). Its tenets were set forth in the founder's short-lived periodical, *Blast*, but it had few disciples among English painters.

Vortigern (*fl.* 450). British king. Reigning in the S. and E. of England when Hengist and Horsa came to Britain, he enlisted the Saxons against the ravaging Picts and Scots, and granted them part of Kent as the price of their service; but eventually he waged war against them and was compelled to cede large portions of territory in Essex and Sussex.

Vos, JAN (1620-67). Dutch dramatist and poet. A follower of Vondel, he supported himself in Amsterdam as a glazier. His tragedy, *Aaron and Titus*, produced in 1641, gave him immediate fame, and Medea followed in 1662, but Vos did not live to fulfil the promise of his youth.

Vos, MARTEN DE (1531-1603). Flemish painter. Born at Antwerp, he studied under Frans Floris and in Rome and Venice. He became a fine and facile colourist, painted portraits of the Medici family and other illustrious Italians, and executed important decorations for churches at Antwerp, where he was dean of S. Luke's guild in 1572. He died at Antwerp, Dec. 17, 1603. His Crucifixion was placed in the Uffizi Gallery; The Raising of Lazarus is at Madrid.

Vosges. Mountain range of France. It forms the W. edge of the basin of the middle Rhine opposite the Black Forest, and is separated at its S. end from the Jura Mts. by the Gate of Burgundy. Mainly of granitic formation, the lower slopes are vine-clad, up to 3,600 ft. they

are forested with pine and beech, and above that they are pasture land. The rounded summits (ballons) attain heights exceeding 4,000 ft.—Ballon de Guebwiller, 4,667 ft.; Ballon d'Alsace, 4,083 ft. Lead, silver, copper, rock salt, and coal are mined. The range forms the W. edge of the Rhine rift valley, and presents a steep scarp to the E.

Vosges. French department. Chiefly formed of the prov. of Lorraine, it is adjacent to the depts. of Meurthe-et-Moselle, Meuse, Haute-Mayne, Haute-Saône, Haut-Rhin, Bas-Rhin, Moselle, and the territory of Belfort. It includes the S. part of the Vosges Mts. (*q.v.*) and the Monts Faucilles, the valleys and forests making it one of the most picturesque districts of France. Rivers include the Moselle, Meurthe, Meuse, Vologne, Durbion, and Rupt; while Lakes Gérardmer, Longemer, and Retournemer are of glacial origin. The Vosges pine forests are some of the most notable in France. Cereals are grown, and vineyards, livestock, and dairy produce are important. Lead, copper, iron, and coal are found, and there are famous mineral springs at Contrexéville, Plombières, Bussang, Vittel, etc. Metal working and cotton and lacemaking are among the industries. Épinal (*q.v.*) is the capital, towns include Neufchâteau, Mirecourt, Remiremont, St. Dié, Rambervilliers, Vittel, Gérardmer, and Châtenois. Area, 2,303 sq. m. Pop. 342,315.

Vossius OR VOSS. Name of two Dutch scholars, father and son. Gerhard Jan Vossius (1577-1649), the son of a refugee from the Netherlands, was born near Heidelberg, and studied at Leyden, becoming director of the theological college there, 1614, and afterwards professor of rhetoric, chronology, and Greek. From 1632 he held the chair of history in the Athenaeum at Amsterdam. He died March 19, 1649. He was one of the first to view theological questions from a historical standpoint.

His son Isaac (1618-89), born at Leyden, became professor of history at Amsterdam at the age of 15, and afterwards librarian to Christina of Sweden. In 1670 he settled in England. Given by Charles II a prebendal stall at Windsor, he died there Feb. 21, 1689.

Votan OR ITZAMNA. Sun god of Mexico in the mythology which preceded the Maya civilization. He was supposed to have introduced laws and the earliest culture to the primitive peoples of Central America. See Mexico.

Vote (Lat. *vorere*, to vow). Act of indicating a preference at elections for representatives to parliament and other bodies. A vote is usually cast by ballot, *i.e.* marking a paper, a method which has the advantage of secrecy, although voting by show of hands, with the right of claiming a ballot, is still usual for company meetings and parish councils. Voting was known among the Greeks and Romans, but its widespread presence in the civilized world of today is due to the growth of representative institutions. Usually a bare majority is sufficient to elect a representative or decide an issue, but sometimes a larger majority is required. *See* Ballot; Election; Franchise; Proportional Representation; Women's Suffrage.

Vote of Credit. Sum of money voted by the British house of commons in a time of exceptional emergency. Usually the chancellor of the exchequer asks for a certain amount, and moves that a sum not exceeding the one named be granted to his majesty "beyond the ordinary grants of parliament." A vote of credit differs from an ordinary money vote, inasmuch as the purposes for which it is required are not stated except in the most general terms. If it were refused the government would leave office. *See* Parliament.

Voting Machine. Instrument for recording, registering, and counting votes at an election. Modern examples usually consist of a combined registering and adding mechanism. In the U.S. standard voting machine a separate key is provided for each candidate, the keys being arranged in rows and lettered and numbered. Each key is pointed and extends through the keyboard, swinging downwards to point to the name of a candidate. The voter, by the actuation of a lever, moves a curtain to screen the machine and unlock it for voting. The operation of one of the voting levers records a vote and resets the machine.

Vouet, SIMON (1590-1649). A French painter. Born in Paris, Jan. 9, 1590, he studied there under his father, and in 1627 was appointed principal painter to Louis XIII, who took lessons in pastel from him. Vouet was engaged on the decoration of the Louvre, the Luxembourg, the

Simon Vouet,
French painter

Palais Royal, and the palace of St. Germain. His Diana is at Hampton Court. He died in Paris, June 30, 1649. *Pron.* Voo-ay.

Vow (Lat. *rotum*). Generally any solemn promise; in a religious sense, any voluntary and solemn promise made to God which may be physically but not morally violated. For examples in the O.T., *see* Gen. 28; Num. 6; Deut. 23; Judges 11; Ps. 61 and 132; N.T., Acts 18 and 21. As the Christian Church developed two classes of vows were recognized (1) concerning gifts; (2) affecting conduct, as of chastity, pilgrimage, and vows of the religious orders. The R.C. Church recognizes temporal, perpetual, conditional, absolute, simple, and solemn vows; and holds that the pope alone has the solemn authority to dispense from any but minor vows. The Church of England formally recognizes only the baptismal and marriage vows, though those of brotherhoods and sisterhoods are recognized by bishops at their discretion.

Vowel (Lat. *vocalis*, sounding). Modification of voice produced by different configurations of the mouth passages due to the action of the tongue, lips, and cheeks. Always there is a certain amount of obstruction, but not enough to cause the audible rustling or stoppage characteristic of consonants.

Writers on phonetics divide vowels into back (guttural) or front (palatal), according as the

consonant are relative terms, distinguishing open and closer utterances. Vowels indicate the maximum, consonants the minimum of opening of the mouth passages. *See* Consonant; Phonetics; Pronunciation.

Vranja, VRANJA, VRANJE, OR VRAJE. Town of Yugoslavia, in Serbia. It stands on the Morava, about 45 m. N.E. of Skoplje, has a rly. station, and was a flourishing commercial centre before the First Great War, in which it was captured Oct. 19, 1915, by the Bulgarians.

Vrsac (Magyar, Versecz; Rum. Varset). Episcopal town of Yugoslavia. In the Banat, and formerly part of Hungary, it lies near the Rumanian frontier, 47 m. N.E. of Belgrade. The seat of a Greek bishop, it is also a rly. junction and locally celebrated for wine and brandy. Pop. 29,411. *Pron.* Vershats.

Vryburg. Town of British Bechuanaland, South Africa. It stands at 3,890 ft. alt., 145 m. N. of Kimberley by rly. The surrounding country is dry, but contains good pasturage. Stock-rearing is the main industry. Butter and soap are made. Pop. 5,300.

Vryheid. Town of Natal, S. Africa. It is 53 m. N.E. from Dundee and 290 m. N. from Durban, being connected by rly. with both. It stands at an alt. of 3,920 ft. and is the centre of a district in which coal and gold are mined. After being in Zulu-

Vrynwy, Wales. Reservoir for the water supply of Liverpool, formed by a dam across the Llanwyddyn valley

back of the tongue approaches the soft palate, or its upper surface approaches the roof of the mouth; high, middle, low, according to the height of the tongue; close (shut, narrow) or open (wide), according to the greater or less convexity of the tongue; rounded or unrounded, according to the position of the lips or cheeks. *A*, as in father, is a back, *i* a front vowel; *i* is a high, *e* a middle, *a* a low vowel; *a* is open, *u* is shut. The highest vowels are the most rounded. Vowel and

land, Vryheid was given in 1884 to a group of Boers who made it into a little republic. This lasted until 1888, when it became part of the Transvaal. In 1902 it was transferred to Natal. Vryheid is the seat of the bishop of Zululand, and has a Dutch Reformed church. Livestock, cereals, tobacco, and sugar are raised in the vicinity. Pop. 7,000.

Vrynwy. River and artificial lake of Montgomeryshire, Wales. The river rises in that county and

flows S.E. and N.E. to the Severn on the Shropshire border. Its upper valley has been made into a lake to supply Liverpool with water. The work was carried out between 1890 and 1905, and the water is conveyed by pipes to the destination, 68 m. away. The length of the lake is nearly 5 m. and it covers nearly 2 sq. m. Its capacity is more than 12,000 million gallons.

Vulcan. In Roman mythology, an old Italian deity, the god of fire. He was identified with the Greek Hephaestus (*q.v.*).

Vulcan. Hypothetical planet supposed to exist between Mercury and the sun. Leverrier calculated from perturbations of Mercury the position of the supposed planet. These perturbations have since been explained as an effect of relativity.

Vulcan. Pass in the Carpathian Mts., in the Transylvanian Alps, Rumania. It rises to a height of 3,090 ft., and connects Targul Jiu in Wallachia with the colliery dist. of Petrozseny.

Vulcanite. Form of rubber made by mixing with sulphur. It is also known as ebonite (*q.v.*).

Vulgate (Lat. *vulgatus*, common). Name sometimes applied to the Septuagint (*q.v.*), but specifically to the Latin version of the Bible prepared by Jerome in the 5th century. Jerome's version was revised by order of Sixtus V, and issued in Rome in 1590, and revised again by order of Gregory XIV and issued in 1592. Contributions towards a revised text were made by Robert Étienne, 1528. In 1907 Pius X appointed a commission, of which Cardinal Gasquet was president, to prepare for another official version. See Bible.

Vulpecula (Lat., little fox). Small constellation placed by Hevelius parallel and near to the Arrow. A meteor stream radiates from it in June, and it contains the famous dumb-bell nebula, Messier 27.

Vulture (Vulturidae). Large birds of prey, which differ from the eagles and hawks in having the head and neck—except in one genus—more or less bare of feathers. They all have long, hooked beaks; the plumage is often loose and untidy, and the

claws are long and curved. They feed on dead animals and carrion.

The Griffon vulture (*Gyps fulvus*) is common in S. Europe, Asia, and N. Africa. It is about 40 ins. long, and has grey and brown plumage with a large white ruff round the throat. It is usually found in open country, and it nests among rocks.

Vulture. 1. The Egyptian species. 2. Griffon vulture. 3. The Black or Cinereous vulture. All these species are common to the Mediterranean shores and are found in parts of southern Asia. The Griffon is also found in S. Europe, while the Egyptian vulture occurs in most parts of Africa. W. S. Berridge, F.Z.S.

The Egyptian vulture (*Neophron percnopterus*) occurs around the Mediterranean, in most parts of Africa, and in S. Asia. It is about 2 ft. long, and has white plumage with a little brown and black. The Cinereous or Black vulture (*Aegypius monachus*) is a larger bird, having a length of over 40 ins. and black plumage. The head and neck are partly covered with white down, the bare skin of the rest being dull red. It occurs around the Mediterranean and in S. Asia.

The American vultures are classed in a separate family—Cathartidae—being distinguished by having the nostrils connected and by the contour feathers having no after-shaft. The bill is less admirably fitted for attack; the claws are less curved and not so sharp. They include the condor, king vulture (*Sarcorhamphus papa*), and Californian vulture (*Gymnogyps californianus*). See Condor; Lämmergeier; Secretary Bird.

V-Weapon. English abbreviation of German *Vergeltungswaffe*, reprisal weapon, of the Second Great War. V1, the flying bomb (*q.v.*), and V2, the rocket (see Rocket Propulsion and Weapons), were used to bombard London 1944–45. V3 was to have consisted of barrels 400 ft. long and 16 ins. in diameter, sited deep in the Channel cliffs on the French coast; incapable of elevation or traverse, the barrels were trained directly on London and designed to fire a projectile 16 ins. in diameter and 92 ins. long. The projectile was fired initially by

rocket discharge, and its barrel velocity boosted by the explosion of auxiliary charges contained in chambers. V4 would have been a rocket-propelled piloted missile discharged vertically from the ground and designed to attack bombers with cannon, rockets, or ramming, after which the pilot

would eject himself mechanically and come to earth by parachute.

Vyatka. This town and region of the R.S.F.S.R. are now called Kirov (*q.v.*).

Vyshinsky, ANDREY JANUAREVICH (b. 1883). Russian politician. Of Polish descent, he was born at Odessa and studied law at Kiev university. In 1902 he joined the Mensheviks, and for his part in the revolution of 1905 was imprisoned for a year. When the Bolsheviks seized power in 1917, he joined the Red army and was in the Communist party by 1920. Professor of jurisprudence at Moscow, 1925–27, he was deputy public prosecutor, 1933–39, and became prominent at the treason trials of 1936–38. He was promoted, 1940, vice-chairman of the council of peoples' commissars and deputy commissar for foreign affairs, and in 1949 foreign minister.

A. J. Vyshinsky, Russian politician

Vyshinsky became a formidable opponent in debate at inter-Ally and U.N. conferences from 1945, for he had vast knowledge of legal and parl. technicalities. He voiced Soviet opposition to the western Allies and used the veto on many important issues brought before the security council, including the Berlin blockade by Russia, 1948. Vyshinsky won the Stalin prize, 1947, for his work in legal science.

THE name of the letter W reveals its origin.

Neither the Greek alphabet nor the Latin knew it. It emerged with the development of early Latin cursive scripts as, indeed, a double u, that is to say, uu, to distinguish the consonantal sound of u from the vowel sound as represented by a single letter. As explained in the introduction to the letter U, there was originally no capital U, the letter V being used both for the vowel sound of u and for the consonant sound of v. The third con-

sonantal sound represented by uu in minuscule had as its capital letter a double V, and the form VV appeared in many of the earliest printed books, especially in France. English printers had taken a hint from the decorative and space-saving practice used by the writers of medieval MSS., of crossing the two capital letters (as was frequently done with a double o), and evolved the W as a distinct monogram, with a smaller version for the lower case. But handwriting still recalls the uu form.

W Twenty-third letter of the English alphabet. It has the value of both a vowel and a consonant. It is called double u, being in form VV (UU). Its phonetic relation to u is the same as that of y to i. At the beginning of its utterance it resembles a vowel, but when the sound is being completed it inclines more to the consonantal value. It is sometimes mute, as in *two, sword*, and always before r, as in *wrath, wrong*. Before h its articulation is reversed, *what, which* being more correctly, though not universally, pronounced as if written *hwat, hwich*; or it is mute, as in *who, whole*. It never has a consonantal value when final, in which case it is always combined with another vowel. In Welsh it is a vowel, e.g. *cwm, pron. approx. coom*. See Alphabet; Phonetics.

Wa. Aboriginal hill-tribes of Mon-Khmer speech, E. of the northern Shan states, Burma. They number about 15,000.

Waal. River of the Netherlands, a branch of the Rhine. Nine miles E. of Nijmegen, the Rhine divides into the Neder Rijn and the Waal, the latter, the larger branch, flowing W. until, 2 m. E. of Gorinchem, it is met by the Maas or Meuse (q.v.) and becomes the Merwede. The chief towns on the Waal are Nijmegen, Tiel, and Zalt-Bommel. See Rhine.

Wabash. River of the U.S.A. Rising in Mercer co., Ohio, it flows S.W. across Indiana, forming in its lower course the boundary of that state and Illinois, and joins the Ohio river after a course of about 550 m. The Wabash and Erie Canal connects it with Lake Erie. It is navigable to Lafayette.

Wabash. City of Indiana, U.S.A., the co. seat of Wabash co. It stands on the Wabash river, 90 m. by rly. N. of Indianapolis, and is served by the Wabash and the Cleveland, Cincinnati, Chicago and St. Louis rlys. Industrial establishments include rly. workshops, a foundry, a cannery, paper mills, and engine and motor works. In the courthouse square is a 35-ton bronze statue of Abraham

Lincoln. Settled in 1883, Wabash was incorporated in 1854, chartered as a city in 1866. Pop. 9,653.

Wace, ROBERT (c. 1100-c. 1175). Anglo-Norman chronicler. Born in Jersey, he received favours from Henry I and Henry II of England, and was given a prebendal stall at Bayeux. The author of two rhyming chronicles, *Roman de Brut* and *Roman de Rou*, he gives valuable information on the history of England and Normandy. *Consult* Maistre Wace, Philpot, 1926.

Waco. City of Texas, U.S.A., the co. seat of McLennan co. It stands on Brazos river, 95 m. S. of Dallas, and is served by rlys. It is the seat of Baylor university, and is a leading cotton market. Waco was settled in 1849, and incorporated in 1856. Pop. 58,000.

Wad. In mineralogy, impure hydrated oxide of manganese of very variable composition, but resembling psilomelane, and occurring in black amorphous, earthy encrustations, or stains. Earthy cobalt or asbolan is a cobalt-rich variety, while lampadite contains copper. Wad results from the decomposition of other manganese minerals, and is sometimes used in the manufacture of chlorine and in umber paint.

Wadai. Dist. of French Equatorial Africa. Lying E. of Kanem, between Bagirmi and Darfur, in the Anglo-Egyptian Sudan, it forms a part of the Chad Territory. At one time a powerful native state, it accepted a French protectorate in 1903, although the French occupation of the country was not completed until 1913. Area, 170,000 sq. m. Pop. (est.) 1,000,000.

Waddington, CONRAD HAL (b. 1905). British biologist. He was born Nov. 8, 1905, and educated at Clifton and Sidney Sussex College, Cambridge. At first a geologist, he studied philosophy before becoming lecturer in zoology at Cambridge in 1932. During the Second Great War he was scientific adviser to the c.-in-c. of R.A.F. Coastal Command. In 1947 he was appointed professor of animal genetics at Edinburgh, and elected

F.R.S. Apart from many contributions to the scientific press, he wrote *The Scientific Attitude*, 1941, and edited a controversial work, *Science and Ethics*, 1942.

Waddington, WILLIAM HENRY (1826-94). French statesman. Son of an English manufacturer, he was born at St. Rémy-sur-Avre, Dec. 11, 1826, and educated at Rugby and Trinity College, Cambridge. He rowed in the 1849 university boat race, taking French nationality the same year. He was minister of education, 1873 and 1876-77, and as foreign minister attended the congress of Berlin (q.v.). Premier in 1879, he was ambassador in London 1883-93, and died in Paris, Jan. 13, 1894. He published works on numismatics and archaeology.

Wade, GEORGE (1673-1748) British soldier. Born in Westmeath, he served in Flanders, 1692, and under Marlborough, 1702-03. Then he went to Spain, distinguishing himself at the battles of Almansa, 1707, and Saragossa, 1710. After the Jacobite

George Wade, British soldier

rebellion of 1715, he held command in the Highlands, and from 1726 performed admirable work for ten years in the construction of military roads. Made a field-marshal in 1743, Wade commanded the British troops in Flanders. During the Jacobite rebellion of 1745 he was c.-in-c. in England, but superseded by Cumberland. He died March 14, 1748.

Wade, THOMAS (1805-75). British poet. Born at Woodbridge, Suffolk, he published a volume of poems before he was 21. His first play, *Woman's Love*, was produced successfully at Covent Garden by Charles Kemble in 1828, but a later piece, *The Jew of Arragon*, was a failure. He translated Dante. Wade died Sept. 19, 1875.

Wadebridge. Market town and river port of Cornwall, England. It is on the Camel estuary, 38 m.

W.N.W. of Plymouth and 7 miles N.W. of Bodmin, and has rly. stations. A stone bridge of 15 arches, dating from about 1485, crosses the river here. The chief market town of N. Cornwall. Wadebridge has a fair agricultural trade, a foundry, and some shipping. Pop. 2,460.

Wadelai. Village of Uganda. It stands on the Bahr-el-Jebel portion of the Nile and is 206 m. S. of Gondokoro and 35 m. N. of the Albert Nyanza. It was occupied by the British in 1894.

Wadham College. College of Oxford university. It was founded in 1612 by Nicholas and Dorothy

Wadham College arms

Wadham of Merifield, Somerset, and is governed by statutes dating from that year. The head is the warden and the buildings are in Parks Road. The chapel, dating from the early 17th century, is a fine piece of work, and the garden is beautiful. Richard Congreve, Edward Beesly, Frederic Harrison, and other members, founded the English Positivist Society. Famous Wadham men include Robert Blake, Wren, Speaker Onslow, 1st Lord Westbury, 1st earl of Birkenhead, Viscount Simon, C. B. Fry, and Humbert Wolfe. See Oxford; Royal Society.

Wadhwan. Small state in E. Kathiawar, Bombay province, India, merged since 1948 in the Saurashtra Union. The walled city, 3 m. from a main line rly. junction of the same name, has an ancient temple of Ranik Devi—a Rajput lady who committed sati. The ruler is a Jhala Rajput.

Wady OR **WADI** (Arab.). River course which is dry except for a short time during or immediately after rains. The term is confined chiefly to N. and E. Africa.

Wady Halfa OR **WADI HALFA.** Frontier town of the Anglo-Egyptian Sudan, just S. of the Egyptian border. It is on the E. bank of the Nile, 949 m. by rly. N. of Khartum and 811 m. S. of Cairo. A few miles S. is the second cataract.

Wady Musa OR **RIVER OF MOSES.** Stream of Transjordan. It is said to have originated when Moses struck the rock (Num. 20, vv. 7-13). On it are the ruins of Petra (q.v.).

Wafid. Egyptian political party. Nationalist in outlook and suspicious of the British connexion with Egypt, the Wafidists first became prominent by winning the elections of 1926. Through the rest of King Fuad's reign they were alternately in and out of office, under the leadership of Nahas Pasha (q.v.). Their party uniform was the blue shirt, until King Farouk in 1938 made private armies illegal. Nahas and Wafidists gained an overwhelming electoral success in 1942, but gave wholehearted support to Great Britain during the Alamein campaign. They went out of office in 1944 and boycotted the elections of 1945; but secured 225 out of 319 seats at the 1950 elections. See Egypt: History.

Wafer. Adhesive disk for fastening down envelopes, holding papers together, or as a basis for or in the place of seals. In medicine wafers of paste are used to enclose powders for ease in swallowing. The ecclesiastical wafer used in the Holy Eucharist consists of a thin disk of unleavened bread (see

Wadham College, Oxford. Quadrangle and hall, over the entrance of which are figures of the founders and of James I Frith

Host). From this use has arisen the term wafer for any thin biscuit, e.g. one eaten with ice cream.

Wager (Fr. *gager*, to pledge). Something that is pledged or staked, as in the phrase wager of battle, when life is the stake. The word now used chiefly as a synonym for a bet (see Betting). Wager of law was an Anglo-Saxon method whereby a defendant might discharge himself of the plaintiff's claim by swearing to his innocence. It was abolished in 1833.

Wages. Payment made to an employee for placing his skill and energy at the disposal of an employer, for him to use at his dis-

cretion within the terms of a contract of service. The term wages logically includes salary, fee, commission, stipend, etc.; but it usually denotes the remuneration of non-clerical workers, most of whom are paid weekly.

Wages may be stated as (a) rate for each unit of time (hour, day, week, month, year); (b) rate for each unit of work done (piecework wages); (c) rate for each unit of work varying according to the amount of work done (output bonus, premium bonus, differential piece-rate, etc.). In addition, by custom or express agreement special rates of wages may exist for work done on any day in any week in excess of a stated number of hours or that done on specified days (Sunday, bank holidays, etc.). Such special work is called overtime; the remuneration, overtime rates (pay).

The actual rate of wages may be determined by individual agreement between the worker, e.g. a gardener, chauffeur, night-watchman, and the employer; but most contracts of employment of wage-earners conform to a pattern decided by a statutory body (e.g. a wages council) or by agreement between trade unions and employers' federations. Wages rates of more than 10 million workers in the U.K. are determined by agreements with trade unions which normally define overtime and the rates of pay for it (time and a quarter, time and a half, double time, etc.) and provide a minimum hourly rate that shall be paid to a worker engaged on piecework who fails to attain a rate of output entitling him to a larger payment. Many piece-rates are associated with a standard time or a standard output: thus, if the standard time for a job is 4 hrs. and the worker completes it in 2½ hrs., he may be credited with 50 p.c. of the time saved (1½ hours), and thus receive for his 2½ hrs. work wages for 3½ hrs. Some wage agreements vary rates according to, e.g., the price of pig iron, and many are based to some extent upon the govt. index of retail prices.

Under the Truck Acts, 1831 to 1896, wages are payable in money, not in goods, and a stipulation concerning the place or the manner in which wages are to be spent is illegal. The employer is responsible for stamping the employee's insurance card and may deduct the employee's insurance contribution; similarly, under P.A.Y.E., he is responsible to the inland revenue authorities for the employee's pay-

ment of income tax on his wages ; must maintain records showing the gross wages, the tax due, and the tax deducted ; and must send details to the inspector of taxes and furnish periodical tax certificates to the employee. *See* Economics ; Minimum Wage ; Piecework ; Trade Board ; Wages Council.

Wages Council. Body set up in the U.K. in 1945. The Wages Councils Act, 1945, transformed the trade boards into joint wages councils and gave the minister of Labour authority to make the findings of a wages council binding upon all the employers in the industry concerned. It also empowered the minister to establish wages councils in trades or industries where voluntary machinery was not adequate or was likely to become inadequate. He could appoint a commission of inquiry to consider the establishment of a wages council in any industry where, in his opinion, conditions required it.

Wages councils exercised in two main respects wider powers than those of the trade boards. They could recommend the fixing of statutory minimum remuneration (instead of minimum rates of wages), and make recommendations with regard to paid annual holidays beyond one week. A wages council includes representatives of employers and workers with not more than three independent persons chosen by the minister. *See* Trade Board.

Wagga Wagga. Town of New South Wales, Australia. It stands on the Murrumbidgee, 310 m. by rly. S.W. of Sydney, where the main line from Melbourne crosses the river. It is the centre of a pastoral and mining dist. Pop. 7,400.

Wagner, (WILHELM) RICHARD (1813-83). German composer. Born at Leipzig, May 22, 1813, the youngest son of a municipal official, he was mainly self-taught, and afterwards studied music at Leipzig. In 1833 he was appointed chorus-master at the theatre of Würzburg, and during the next few years held small posts at Magdeburg, Königsberg, and Riga ; in 1839 he went to Paris and stayed till 1842, when he removed to Dresden, and was appointed Hofkapellmeister. Driven from Germany by the political upheavals of 1849, he passed the next twelve years in exile in Switzerland, England, Italy, and France ; from 1861 to 1864 he was mainly in Vienna and Mainz, in increasing financial distress, from which he was relieved by the gift of a pen-

sion from Louis II of Bavaria. From 1864 he was at Munich, and subsequently in Switzerland till 1872, when he removed to Baireuth (q.r.), which remained his home till his death, at Venice, Feb. 13, 1883. He was twice married, first to Minna Planer, an actress, and secondly to Cosima von Bülow, daughter of Liszt.

The great bulk of Wagner's music was written for the stage. His operas are *Die Feen*, 1833 ; *Das Liebesverbot*, 1835-36—these two were not published during his lifetime ; *Rienzi*, 1838-40 ; *The Flying Dutchman*, 1840-41 ; *Tannhäuser*, 1844-45 ; *Lohengrin*, 1846-48 ; *Der Ring des Nibelungen*, a tetralogy consisting of *Das*

Rheingold, 1853-54, *Die Walküre* (Valkyrie), 1854-56, *Siegfried* (begun in 1857, abandoned for some years, and completed 1869), and *Götterdämmerung*, 1870-74 ; *Tristan and Isolde*, 1857-59 ; *The Mastersingers of Nuremberg*, 1862-67 ; and *Parsifal*, 1877-82. He also composed some orchestral music, of which the only important pieces are a *Faust* overture and the *Siegfried Idyll*, a serenade to his second wife on the birth of their son ; a handful of pianoforte and choral pieces of slight value ; and some songs to French and German words. His literary output is considerable ; he was his own librettist, and also wrote on philosophical aesthetics and other musical subjects.

Wagner developed his real powers comparatively late in life ; in general, it may be said that all his mature work was written after his fortieth year. To this rule there are exceptions, such as some of the French songs of 1839, the overture

and sea-music in *The Flying Dutchman*, and some portions of *Tannhäuser* and *Lohengrin*, particularly the prelude to the latter and the *Venusberg* music in the former—though in its original shape this is still a pale forecast of the Paris version of 1860. But from *Das Rheingold* onwards there is, whatever the passing inequalities, an extraordinary advance both in inspiration and in technique ; and it is in virtue of the splendours of his later work that Wagner ranks among the supreme composers. During his lifetime he suffered more than any other musician in history the extremes of both abuse and adulation. Since his death the proper perspectives have become clearer. Incomparably greater as a musician than as anything else, he failed to realize his elusive idea of the necessary interaction of the arts, but his all-round influence has been colossal. His vast musical conceptions flowed with equal ease in channels so diverse as the love-passion of *Tristan and Isolde*, the warm-hearted comedy of *The Mastersingers*, the tragedy of *Götterdämmerung*, and the mysticism of *Parsifal* ; and in the *Siegfried Idyll* he showed an equally wonderful power of painting a small canvas with the utmost sympathy and grace. Harmony, orchestration, and perhaps most of all counterpoint, were enormously advanced by him ; and no other composer has done so much to destroy that selfish predominance of the solo singer that was formerly so prevalent, particularly in the operatic world.

His son *Siegfried* (1869-1930) was known as a conductor, and married Winifred Williams (b. June 23, 1897), who directed the Baireuth festival during the Hitler regime. In 1947 she was sentenced to 450 days' special labour service and the loss of 60 p.c. of her fortune. Ernest Newman's exhaustive four-vol. biography of Wagner (1933-47) has superseded all other works in English.

Ernest Walker, D.Mus.

Wagner von Jauregg, JULIUS. Austrian psychiatrist, considered in this work as Jauregg.

Wagram. Village of Austria. It stands on the Rorsbach, 11 m. from Vienna. Here a battle was fought between the French under Napoleon and the Austrians under the archduke Charles, July 5 and 6, 1809. Napoleon advanced from Vienna against the Austrian positions at the village. The first French attack in the afternoon of

the 5th was repulsed, and on the next morning the Austrians took the offensive. They succeeded in forcing back the French for some distance, but in a counter-attack the French caused the Austrians to withdraw, though the victors were too exhausted to follow. The French lost about 30,000 out of 180,000 engaged, and the Austrians 25,000 out of 130,000.

Wagtail (*Motacilla*). Genus of insectivorous birds. It is allied to the pipits, but distinguished by the

Wagtail. Black-and-white pied wagtail, a sprightly, insectivorous bird

greater length of the foot-bones, wings, and tails. Wagtails are restricted to the Old World, except that the blue-headed species has been found in Alaska. They are running birds. Three species breed regularly in the British Islands: the pied wagtail (*M. alba yarelli*), the grey (*M. cinerea*), and the yellow (*M. flava flavissima*). In addition the white wagtail (*M. alba*) visits Great Britain in autumn and spring. The blue-headed wagtail (*M. flava flava*) is a rare visitor to the E. and S. coasts. The pied wagtail or dish-washer is a sprightly black-and-white bird. The white wagtail is similar, but its upper parts are grey instead of black. The grey wagtail is blue-grey above. See Eggs colour plate.

Wahabi or **WAHHABI**. Name of the members of a Mahomedan sect. Founded early in the 18th century by Mahomed ibn Abdul Wahhab (1704-92), the son of a Nejd shepherd, it sought the simplicity of early Islam. It deprecated pilgrimage to holy places, invocation of saints, luxury in dress, and sepulture, and prohibited tobacco.

This reform was embraced in 1742 by Mahomed ibn Saud. He and his successors, making Daraiyeh their capital, gradually established dominion over Arabia. During 1801-04 the holy places at Kerbela, Mecca, and Medina were despoiled. In 1811 Mehemet Ali, viceroy of Egypt, organized an expedition which, after desperate struggles, broke the Wahabite power in 1818, its chief, Abdulla, being executed at Constantinople. In 1824 his son re-

established the sect at Riyadh, its present capital.

Before the old Wahabite empire fell its tenets reached N. India. Sayyid Ahmed (1782-1831) embraced them and fought the Sikhs, but the sect is now of dwindling importance. See Senussi.

Wahsatch Mountains. Division of the Rocky Mts., U.S.A. It extends from the S.E. part of Idaho southward to the S.W. part of Utah, constituting the E. border of the Great Basin. Largely covered by forests of pine, it is a rugged range, having a mean elevation of about 10,000 ft., with peaks exceeding 12,000 ft. The Uinta mts., an E. branch, rise to 13,688 ft. in Gilbert Peak.

Wahuma (Northerners). Swahili form of the name of the Hima people, mostly in the Uganda protectorate, British E. Africa. Of Hamitic descent, in the Tanganyika Territory, they are the more negriified Batusi. See Bahima.

Waif. Term applied to a homeless person, particularly to a child abandoned by its parents. The Church of England Incorporated Society for providing Homes for Waifs and Strays (now C. of E. Children's Society) was established, 1881, in London, to rescue neglected or crippled children and care for them in special homes. Its headquarters are at Old Town Hall, Kennington Road, S.E.11.

Waihi. Town of North Island, New Zealand. It is situated in the E. of Ohinemuri co., has rly. connexions with Thames and Auckland, and is the centre of a gold-mining area. Pop. 3,916.

Waikato. River of North Island, New Zealand. Rising in Ruapehu, it flows through L. Taupo, and N.W. through Auckland prov. into the Tasman Sea, 25 m. S. of Manukau Harbour. Its length is 220 m.

Wailing Wall. Portion of the Temple of Herod in Jerusalem which escaped destruction by the Romans in A.D. 70. It is the S.W. section of the Turkish mosque, Haram esh Sherif, and is about 60 ft. high. Here devout Jews have been accustomed for centuries to gather on Fridays at sunset and on eves of feasts and fasts to lament the departed glory of Israel. Incorporated as it is in a Muslim building, it has been the scene of disputes, sometimes violent, between Jews and Muslims over its use and care. See illus. p. 4681.

Waimate. Town of South Island, New Zealand. It is 130 m. S.W. of Christchurch by rly., in Canterbury prov., and its industries include flour and saw mills.

Wain, **LOUIS WILLIAM** (1860-1939). British artist. Born in London, Aug. 5, 1860, he was

Louis Wain, British artist

educated by the Christian Brothers, and studied at the W. London school of art. In 1882 he joined the Illustrated Sporting and Dramatic News, and was later attached to the Illustrated London News and the New York American. His drawings were at the height of their popularity at the turn of the century and for the following decade. The greater part were humorous representations of cats and dogs, especially the former. His work in this line in many magazines, on picture postcards, in posters, and in Louis Wain's Annual, dating from 1901, made "Louis Wain's cats" familiar to everyone. He also took a

practical interest in their welfare, becoming president of the National Cat Club, and a committee-member of the society for the protection of cats. Unfortunately he flooded his own peculiar market and in later life had to face comparative poverty. Also his last years were clouded by poor health. He lived until July 4, 1939.

Wainwright, **THOMAS GRIFFITHS** (1794-1852). British poisoner. Born at Chiswick, he became an art critic and was an associate of Hood, De Quincey, and Lamb. Left an annuity of £200, in 1826 he forged an order upon the Bank of England to obtain the capital sum. In 1828 he went to live with a bachelor, uncle, Griffiths, who died suddenly and left Wainwright all his property. In 1830 his mother-in-law, who had objected to his insuring the life of her unmarried daughter, died as suddenly; immediately afterwards the daughter Helen, now insured for several thousand pounds, also died. The insurance company disputed Wainwright's claim, and he fled to Boulogne in 1831. On his return in 1837 he was arrested for the forgery of 1826, and transported for life to Van Diemen's Land. He died in hospital at Hobart.

A Louis Wain cat

There is little doubt that Wainwright poisoned his uncle, mother-in-law, and sister-in-law with strychnine, but legal proof was lacking. Dickens has drawn a picture of Wainwright under the name of Slinken, in *Hunted Down*, and in Bulwer Lytton's *Lucretia the poisoner* appears as Varney. W. C. Hazlitt edited Wainwright's *Essays and Criticisms*, with memoirs, 1880. Wilde wrote of him in an article, *Pen, Pencil, and Poison*. Consult also *Lives of Twelve Bad Men*, T. Seccombe, 1894.

Wainfleet. Former market town of Lincs, England. In the parts of Lindsey, it is on the railway, 18 m. N.E. of Boston. The river Steeping is noted for angling. There is an ancient butter cross. A grammar school was established here in 1484 by William of Wainfleet, founder of Magdalen College, Oxford. The town once had its own token coinage, known as the Wainfleet halfpenny. Pop. 1,322.

Wainganga. River of the Madhya union, India. It is a tributary of the Praluta, itself a tributary of the Godavari. Rising near Seoni, it flows at first due N., then E., and then almost due S. across the Nagpur plain. Rice and sugar-cane are the chief crops in the valley, the Kohlis and Ponwars being capable cultivators. The lower valley is being colonised as irrigation works are being extended. Length, 350 m.

Wainscot. In joinery, a special quality of oak used for panels to cover the whole or part of a wall surface, hence the panels themselves used for this purpose. The term is derived from the Dutch *wagenschot*, the name of an oak species grown in Germany, at one time exported through Holland.

Waitangi. Village of North Island, New Zealand, a few miles inland from the Bay of Islands. Here in 1840 the Maori agreed to a treaty by which they accepted Queen Victoria's overlordship.

Another Waitangi is the chief town of the Chatham Is., 530 m. S.E. of New Zealand, to which they belong.

Waits. Term now applied to Christmas street musicians. In the 14th and 15th centuries the waits were watchmen, who sounded the hours on some musical instrument. In the 16th and 17th centuries waits were employed by most corporations, and appear to have been minstrels rather than watchmen. The London waits wore blue gowns and silver collars, and played their instruments at the lord mayor's

show, and at City banquets. In the 18th and 19th cents. their musical functions were taken over at Christmas by the watchmen, and by private performers. See *Carol*.

Waiver. In English law, the non-enforcement of a legal right in such circumstances that the court will infer an intention to give up the right altogether. Consideration may be necessary before a waiver is effective.

Wakamatsu. Town of Japan, in the island of Honshu. It is 60 m. S.E. of Niigata, on a coast-to-coast rly. line. It has a state works for producing steel, iron, steel rails, and plates, and an important lacquer industry. In the Satsuma rebellion of 1868 the city was razed to the ground. Pop. 58,517.

Wakatipu. Lake of South Island, New Zealand. One of the most beautiful of the Cold Lakes in the Alpine region, Otago prov., it is 1,016 feet above sea level, 1,242 feet deep, and 25 m. long, being chair-shaped. The outflow is by the river Kawarau to the Clutha.

Wakayama. Town of Japan, the capital of Wakayama prefecture of Honshu Island. It stands on Kii Strait, the E. entrance to the Inland Sea, and is connected by rly. with Kyoto, Kobe, and Osaka. Trade in cotton is carried on in normal times. Pop. 112,560.

Wake. Annual church vigil, also the all-night watching by a corpse before burial. The church wake was an all-night service commemorating the completion or dedication of a church, and was usually held on the patron saint's day, or on the Sunday after the day of dedication. Booths were erected in the churchyard for the supply of food and drink on the following day, which was a holiday, and the wakes soon became little more than uproarious fairs. Lancashire was long noted for its wakes, and the Bradford wakes were known as tides. The corpse wake is apparently of Celtic origin, and survives in Ireland. It consists in mourning the dead person, and reciting stories of his life. Candles

are lit round the bed. (See *Burial Customs*.) Annual holidays taken together by workers in towns of Lancashire are called wakes.

Wakefield. City and co. bor., and capital of the W. Riding of Yorks, England. It stands on

Wakefield arms

the Calder, 9 m. S. by E. of Leeds, and is well served by road, rly., and water. In 1888 the parish church of All Saints became the cathedral church of the new diocese of Wakefield. Its eastward extension, built as a memorial to the work of the first bishop (Dr. Walsham How), was consecrated in 1905. The cathedral is well-known for its fine spire. Other buildings include the town hall, county hall, administrative buildings of the county council, and the sessions house. On the old bridge over the Calder stands the chantry chapel of S. Mary, restored in the 19th century. The grammar school was founded in 1591.

Wakefield is an industrial centre but has many advantages of a country situation. Industries include woollen manufacture, worsted spinning, chemical works, wire-drawing, engineering and machine-tool works, sheet metal working, boiler-making, and coal mining. Wakefield was of some importance in the Middle Ages, and in the 16th century a centre of the cloth trade. In 1848 the town was granted its charter as a mun. bor., to be created a city in 1888. Co. bor. status was conferred in

Wakefield, Yorkshire. Cathedral church of All Saints, enlarged from the 15th century parish church
The Wakefield Express Series

1914. It had its own M.P. from 1832; it now gives its name to a bor. constituency. Market day, Fri. Pop. est. 58,040.

Wakefield, BATTLE OF. Fought between the Yorkists and the Lancastrians, Dec. 30, 1460. Richard of York was at one of his strongholds, Sandal Castle, near Wakefield, when he was attacked and defeated by a host gathered by Margaret, queen of Henry VI. Richard, his son Rutland, Salisbury (father of Warwick, the King-maker), and many others were slain.

Wakefield, CHARLES CHEERS WAKEFIELD, VISCOUNT (1859-1941). British business man and philanthropist. Born Dec.

Viscount Wakefield, British business man

12, 1859, he studied at Liverpool Institute. In 1899 he inaugurated the vast organization of C. C. Wakefield and co., makers of Castrol oil, with himself as governing director. He received a knighthood in 1908, baronetcy 1917, barony 1930, and viscountcy 1934. In 1915 he became lord mayor of London. When he died, Jan. 15, 1941, there was no heir to the title. Wakefield was known to the public for his practical interest in hospitals and charities, enthusiasm for speed records by land and air, and knowledge of pictures. He purchased and endowed Talbot House at Poperinghe; gave sums of several thousands to the Imperial Institute, Tower Hill improvement trust, Bridewell and Bethlem hospitals; guaranteed £50,000 to the British Museum for purchase of the Codex Sinaiticus; gave to the nation Nelson's log-book, the Thomas à Becket cup, the Armada Jewel, Newton's papers, and portraits by Orpen and Sargent; helped to finance flights by Sir Alan Cobham, J. A. Mollison, and Amy Johnson; owned the three speedboats Miss England, in which Segrave raced; and awarded the Wakefield gold trophy for speed. He wrote a helpful book, *On Leaving School*, giving advice on choosing a career.

Wakefield, EDWARD GIBBON (1796-1862). A British colonial statesman. Born in London on May 20, 1796, and educated at Westminster and Edinburgh high school, he was attached to the British embassies at Turin, 1814-16, and Paris, 1820-26. For ab-

ducting an heiress in 1826 he was imprisoned, and a diplomatic career was ruined. In 1830 he wrote a book on capital punishment, which helped towards amelioration of the English criminal law. Having made a close study of colonization, he was secretary to the 1st earl of Durham in Canada, 1838; and as manager first of the S. Australian co. and then of the New Zealand Association, inspired the annexation of these territories. Besides writing his *View of the Art of Colonisation*, 1849, Wakefield edited Smith's *Wealth of Nations*. He died at Wellington, N.Z., May 18, 1862. There are studies by R. Garnett, 1898; A. J. Harrop, 1928; I. O'Connor, 1929.

Wakefield, GILBERT (1756-1801). British scholar. Born at Nottingham, Feb. 22, 1756, and educated at Jesus College, Cambridge, he took orders, but soon adopted Unitarian doctrines. An advocate of the principles of the French Revolution, he came into conflict with the authorities in 1798, for seditious writing in a reply to the bishop of Llandaff's defence of Pitt and his policy, and was imprisoned for two years. Wakefield was a classical scholar of great repute who published editions of Horace, Bion and Moschus, and Lucretius. His other works include *Internal Evidence of the Christian Religion*, 1789; and *An Examination of Thomas Paine's Age of Reason*, 1795. He died Sept. 9, 1801.

Wake Island. Island of the Pacific Ocean. Situated in about 166° E. long. and 19° N. lat., it is one of a group of three islands, the other two being Wilkes and Peale, and is approx. 3,000 m. E. of Hong Kong and 2,000 m. W. of Hawaii. The group is 4½ m. long and 1½ m. wide, Wake Island covering 1 sq. m. A U.S. possession since 1898, it remained uninhabited and undeveloped until 1935, when an airfield was established as a staging point for Pan-American Airways. Wake Island was garrisoned by 400 marines and 12 fighter aircraft. On Dec. 8, 1941, the Japanese attacked, but desperate resistance prevented capture until Dec. 22. The Japanese lost a light cruiser, a destroyer, and several aircraft. The island was developed by them as a naval and air base for attacks on Allied convoys. The

first U.S. attack on the occupied island came on March 25, 1942, when warships shelled Wake and carrier-borne planes dropped 219 bombs. There were a number of other attacks by land-based and carrier-borne aircraft, but the most violent assault was on Oct. 5 and 6, 1943, when a strong naval force bombarded Wake, and carrier-borne and land planes dropped 320 tons of bombs. The island remained in Japanese hands until after the general surrender, a U.S. force taking the local surrender Sept. 4, 1945.

Wake Robin, CUCKOO PRINT, OR LORDS AND LADIES (*Arum maculatum*). Perennial herb of the family Araceae. A native of Europe and N. Africa, it has a tuberous rootstock, renewed annually, from which are produced the large, spear-shaped leaves, often blotched with purple-black. The short flowering stem is surmounted by a large cowl-like wrapper (spathe), yellow-green with a purple edge, and sometimes spotted with the same colour. Within this is the thick, dull purple, club-shaped spadix, around the lower half of which are clustered the simple flowers. The lowest of these are pistils, the upper stamens. The two groups are separated by a ring of hairs, and the stamen cluster is roofed by other hairs, which partially close the lower portion of the spathe. The pistils develop into fleshy scarlet berries, which become conspicuous in autumn, when the spathe has withered. This whole plant is acrid and poisonous, yet, properly treated, the corms yield a nourishing starch called Portland arrowroot. See illus. under Botany.

Wakkerstroom. Town of the Transvaal, S. Africa. It is 18 m. by rly. W. of Volksrust, standing near the frontier of Natal at an alt. of 5,900 ft., and is an agricultural and administrative centre. It is partially surrounded by mts., which rise to 7,500 ft., and stands in a plain drained by the river Slang. Pop. est. 1,500. It is also the name of one of the dists. of the Transvaal, this having been formed in 1859.

Wakley, THOMAS (1795-1862). Founder of *The Lancet*. A native of Wembury, Devon, he was born

July 11, 1795.

Apprenticed to an apothecary, he studied medicine at the Borough hospitals, and in 1817 qualified for the Royal College of Surgeons. Estab-

Thomas Wakley, British surgeon

lishing a practice in Regent Street, London, in 1823 he founded *The Lancet*, in which he set himself to remedy various abuses in the medical world. M.P. for Finsbury 1835-52, Wakley died May 16, 1862.

Walbrook. Narrow thoroughfare of the City of London running S.W. from the Mansion House to Cannon St. It contains Wren's church of S. Stephen Walbrook, the cupola of which is said to have been a trial model for S. Paul's cathedral dome. Wren lived at No. 5 for a time. Roman remains were revealed when the street was destroyed and the church damaged by German bombs, Dec. 29-30, 1940. Rebuilding began in 1950.

Walcheren. Island of the Netherlands, in the prov. of Zeeland. About 12 m. from W. to E., 10 m. from N. to S., it lies in the Schelde estuary, W. of N. and S. Beveland, and is connected with the mainland at Woensdrecht by a rly. which runs across S. Beveland. Its motto, *Luctor et Emergo* (I struggle and emerge), is highly appropriate to an island nearly all of whose surface is below sea-level, protected by dykes. Before the Second Great War it was a famous orchard country, and the good soil grew excellent crops of cereals and sugar beet. Cattle were also reared, and dairy products made. Flushing, still out of service at the end of 1948, was a flourishing port. The capital is Middelburg (*q.v.*); Veere, Domburg, and Westkapelle are fishing ports.

During the French occupation of the Netherlands a British expedition consisting of 264 ships of war, 352 transports, and more than 30,000 troops, under Lord Chat-ham, was dispatched in 1809 to seize Walcheren, possession of which gives command of the Schelde estuary, and thus of the entry to the port of Antwerp. After the landing on July 30 Flushing was invested and fell on Aug. 16. The intended attack on Antwerp was abandoned; but 15,000 men were left to garrison Walcheren. These soon succumbed to malaria, caused by the mosquitoes of the island, to which the inhabitants had become immune; some 7,000 died and half the remainder, brought home during Dec., were permanently incapacitated.

During the Second Great War, after bombing Middelburg, Flushing, and Veere, the Germans gained control of Walcheren in May, 1940. The need to open Antwerp led the Allies in 1944 to decide to capture Walcheren. On Oct. 3, after a warning to the inhabitants, R.A.F.

Walcheren. War damage and reconstruction on this island of the Netherlands. 1. Part of the floods which covered large areas of the island, following the breaching of the sea dykes. 2. Town Hall of Middelburg partly destroyed in 1940, showing reconstruction work in progress. 3. Rebuilding the old church of Zoitelande, one of the victims of the sea water

bombers attacked the sea dyke at Westkapelle with 12,000-lb. bombs, breaching it for 120 yds. and letting the sea into large areas of the island, including Westkapelle itself. On Oct. 7 the dykes on either side of Flushing were breached, German strongpoints in the area being marooned or flooded. But the Germans fought stubbornly—a captured order of the day of Oct. 7 said, "We must hold the Schelde fortifications at all costs to the last man. It is a decision for the future of our people." On Nov. 1 British and Canadians advancing from the mainland secured a bridgehead across the causeway connecting S. Beveland with Walcheren; troops of the 52nd (Lowland) div. (then serving with the Canadian 1st army) crossed the Schelde from Breskens (captured Oct. 22) to Flushing, much of which was in their hands by nightfall; and a commando force of Royal Marines from Ostend attacked at Westkapelle, meeting much heavier fire from German batteries at Domburg than had been anticipated, in view of severe preliminary aerial bombardment; but they effected a

landing, capturing Domburg in falling snow on the 3rd.

Flushing was cleared, except for snipers, by Nov. 4; the port and its installations had been wrecked by the Germans. Middelburg and Veere were occupied on the 7th; the troops advancing to take them fought through the worst terrain encountered in W. Europe, sometimes waist deep in mud. The last German troops were taken off Walcheren on Nov. 10 and the shores of the W. Schelde were clear.

For a year the tides washed over Walcheren, rising and falling in the flooded houses. After the sealing of the breaches in the sea dykes, with the help of Mulberry harbour concrete pontoons, in Oct., 1945, pumping out of salt water began. The land proved less badly impregnated with salt than had been feared; but every tree was dead, and the soil had been shifted so that areas formerly fertile had become poor, while some poor areas had been improved. A harvest of sorts was raised already in 1946; work on replanting trees, rebuilding houses, etc., and replacement of lost stocks proceeded steadily.

Waldeck. Former state of Germany. It was ruled by counts 1139-1712, thereafter by princes. In 1918 it became a republic associated with Prussia, with which it was incorporated 1929. Situated between Westphalia and Hesse-Nassau, it had an area of 433 sq. m., its pop. being 58,000. The climate of the dist. is inclement, and chief crops from the infertile soil are oats, with some rye, potatoes, and flax. The capital was Arolsen (pop. 3,000).

Waldeck-Rousseau, PIERRE MARIE RENÉ ERNEST (1846-1904). French statesman, born at Nantes, Dec. 2, 1846. He became a barrister and mayor of Nantes, 1870. Entering the chamber in 1879, he was minister of the interior, 1881-85. He opposed Boulanger, 1889, defended de Lesseps in the Panama trial, 1893, unsuccessfully contested the presidency of the republic, 1894, and became premier, 1899, his administration being marked by the revision of the Dreyfus trial, 1899. His most important measure was the Associations Act, 1901, which provided a foundation for the French trade union movement. He resigned in 1902, dying at Corbeil, Seine-et-Oise, Aug. 10, 1904.

Waldegrave, EARL. Title borne by the Waldegrave family since 1729. The founder of the family was Sir Edward Waldegrave (d. 1561), a royalist baronet who was M.P. for Sudbury. His grandson Henry was created a baron in 1686, and on his death, three years later, was succeeded by his son James, who was ambassador in Vienna and Paris and was made an earl in 1729. His eldest son, James, who succeeded as 2nd earl in 1741, held several court appointments, and was governor to George III when prince of Wales. On his death in 1763 the title passed to his brother John, and through his descendants to Geoffrey Noel (b. Nov. 21, 1905), the 12th earl. The country seat is at Chewton House, near Bath, and the eldest son is known by the courtesy title of Viscount Chewton.

The family of Waldegrave also bears the title of Baron Radstock, conferred in 1800 upon William (1753-1825), 2nd son of the 3rd earl, for his naval services. Montague (b. 1867) became 5th baron in 1934. *Pron.* Wallgrave.

Waldemar OR VALDEMAR. Name of four kings of Denmark. The third of this name (1314-64) came to the throne in 1326 in succession to Christopher II, but was deposed after four years. The others receive separate entries.

Waldemar I (1131-82). King of Denmark, 1157-82, known as the Great. Son of Canute Lavard and the Russian princess Ingeborg, he was elected king after the country had passed through 120 years of chaos following on the death of Canute the Great. He finally defeated and forcibly converted the pagan tribes of the Baltic shores, suppressed piracy, and left the country in a state of great prosperity with the feudal system well established. His chief minister was Bishop Absalon.

Waldemar II (1170-1241). King of Denmark, 1202-41, known as the Legislator. He was a younger son of Waldemar I, and on Nov. 12, 1202, succeeded his brother, Canute VI, on the throne. He brought under his rule all the German and Wend territories along the Baltic, and in 1219 Estonia as well. In this last campaign, according to a legend, he was saved by the descent from heaven of a red banner with a white cross (the Danish flag). In 1223 he was captured by one of his vassals and taken to Germany, and released only after paying a heavy ransom and surrendering his German conquests. His attempt to recover these losses was defeated at Bornhöved, July 22, 1227, which ended Danish domination of the Baltic. Thereafter Waldemar devoted himself to the codification of the laws. He died March 21, 1241.

Waldemar IV (1320-75). King of Denmark, 1340-75, known as Atterdag (Again a Day, his maxim being that a man should bide his time.) He was the youngest son of Christopher II, and when elected king his realm consisted of little more than N. Jutland. During 1343-47 he recovered Copenhagen, Zealand, and the southern islands, and in 1346 he sold Estonia to the Teutonic Order. Conquest of Gothland in 1361 led to a war with Sweden and the Hanse towns which was closed by an ignominious peace at Stralsund in 1370. Waldemar regained the authority of the crown by calling in demesnes and rents, and issued a famous charter at Kalundborg in 1360. He died Oct. 24, 1375.

Walden OR LIFE IN THE WOODS. Volume of papers (1854) by Henry Thoreau. Mostly written during his stay on the shore of Walden Pond, Concord, Mass., they express his philosophy of existence, exalting the untrammelled natural life and the joy of contemplation, in a style that is often poetic.

Waldenses OR VAUDOIS. Religious sect founded by Peter

Waldo of Lyons in the 12th century. Their doctrines were based upon a literal interpretation of the moral precepts of the Bible, to which the fundamental objections on the part of the authorities were that they placed the moral law as interpreted by themselves above the civil law.

The sect was widespread in Provence, Piedmont, and the intervening mountain districts. They were subjected to periodical persecutions, and in the 16th century became attached to the Calvinistic branch of the reformers. The persecution of the Vaudois subjects of the duke of Savoy in 1655 induced Cromwell to intervene, an episode commemorated in Milton's sonnet: *Avenge, O Lord, thy slaughter'd saints, whose bones lie scatter'd on the Alpine mountains cold.*

Active persecution ceased in the 18th century, but the Waldenses continued to be excluded from civil rights till 1848. A recognized Protestant church, the Waldenses are still vigorous. In Italy they made progress in the early 20th century, despite bitter opposition from the R.C. church.

Waldstein, FERDINAND ERNST GABRIEL, COUNT (1762-1823). German aesthete. This youngest son of the Count Waldstein and Wartemberg von Dux was born March 24, 1762, and from 1786 belonged to the German Order until he left it at 50 to marry. At Bonn in 1787 he became a close friend of Beethoven, who dedicated to him the famous piano sonata, op. 53. The count also suggested the air on which twelve variations were composed in 1792. He died Aug. 29, 1823. *Pron.* Valt-shtine.

Waldteufel, EMIL (1837-1915). French composer. Born of Alsatian stock at Strasbourg, Dec. 9, 1837,

Emil Waldteufel,
French composer

he later settled in Paris, where he studied the piano and composition at the conservatoire. Employed at a piano factory, he was in 1865 appointed pianist to the empress Eugénie. His first waltzes, *Joies et Peines*, and *Manola* (published at his own expense), proved so popular that he devoted himself exclusively to writing hundreds of others, the best-known being the *Skaters Waltz* and *Estudiantina*. He died in Paris, in Feb., 1915. *Pron.* Valt-toyfel.

WALES AND THE WELSH

See the articles on the Welsh counties, towns, mountains, and rivers ; also Celt. and biographies of eminent Welshmen. See also England ; English History, etc., for matters in which the affairs of England and Wales are intermingled, and for various maps

Wales forms a peninsula in the west of the island of Great Britain. With a very irregular coast-line it

Wales arms

is bounded by the sea on the N., W., and S., and its land frontiers are the English counties of Cheshire, Shropshire, Hereford, and Monmouth. Wales is in the main a land of mountains. The central ridge begins in the N. at Snowdon, the highest peak S. of Scotland, and follows the curve of the coast of Cardigan Bay almost to St. David's Head; W. from Snowdon it forms the backbone of the Lleyn peninsula. W. of the main ridge short streams drain to Cardigan Bay, the chief being the Teifi, Ystwith, and Dovey.

This district, a sparsely populated one, caters for tourists on its shores and in its mountain hamlets; rears sheep within stone-walled scraps of rough pasture, and fattens swine for the markets of the English midlands. Cardigan, Lampeter, Aberystwyth, Barmouth, and Portmadoc are connected by rly. lines, with few connexions E. to more populous areas. N.E. the valleys lead to the N. coast, the Conway, Clwyd, and Upper Dee being the chief. This district includes the low island of Anglesey. The modern rly. and the earlier road to Holyhead, the port for Dublin, avoid the ridges. The coalfield of Flint in the E. is responsible for small industries. Bala is the largest lake. The Dee leads E. to the Cheshire Plain.

From the main ridge N.E. of Tregaron a water-parting goes first S., then E. along the Brecknock (Brecon) Beacons, and S.E. to Newport. This is the limit of the area drained to the Bristol Channel to include S. Wales and W. Monmouthshire. The mountain valleys of the Taff, Neath, and Tawe, served by numerous rlys. which give connexion with the great coal port of Cardiff, lie within the S. Wales coalfield, one of the largest deposits of anthracite coal in the world. To the N. deposits of iron ore caused the growth of ironworks at Merthyr Tydfil.

S. of the highlands is the low, wide, fertile Vale of Glamorgan, a wide coastal lowland continued

across Swansea Bay in the Gower peninsula, and farther W. in the lowlands of Pembroke. The broad Vale of Carmarthen, the valley of the Towy, and the Pembroke lowlands are farm lands.

The Central Welsh uplands on the E. drain to the Severn estuary, across the English lowlands of Shropshire, Worcester, and Gloucester. From the central knot of Plynlimon the Severn and Wye, and farther S. the Usk, each with many small affluents, dissect the highlands of Montgomery, Radnor, and Brecknock; within Wales they are mountain torrents.

Few rlys. cross the bleak moorlands. Sheep-rearing is the main

occupation, and in Newtown and Welshpool are woollen factories.

Wales comprises twelve counties with a total area of 7,466 sq. m., of which Glamorgan occupies almost a ninth. The pop. (est. 1941) is 2,100,000, with more than half the people in Glamorganshire. The capital is Cardiff. Important industrial towns are Merthyr Tydfil and Swansea. Other urban centres with pops. of over 20,000 are Aberdare, Barry, Caerphilly, Gelliger, Llwchwr, Maesteg, Mountain Ash, Neath, Ogmore, Pontypridd, Port Talbot, and Rhondda (all in Glamorgan), Colwyn Bay and Wrexham (Denbigh), and Llanelly (Carmarthen). Rhyl, Prestatyn, Colwyn Bay, Llandudno, Llanfairfechan, and Bangor are holiday resorts on the N. coast, the last-named being a centre for exploring the Snowdon region. There is slate quarrying in the district.

Wales. Map of the principalities showing the railways and principal roads

Barmouth and Aberystwyth are holiday centres of the W. coast, and Tenby of the S. Llandrindod Wells and Builth Wells have been developed as small inland spas. The constituent colleges of the university of Wales are situated at Cardiff, Swansea, Bangor, and Aberystwyth.

In general the government of Wales is associated with that of England. In one or two matters, however—for instance, education—Wales and Monmouthshire have a distinct organization.

The patron saint of Wales is S. David. From its association with princes of Wales the country is frequently spoken of as the principality.

No survey of the Welsh people would be complete without a word on their great love of song, and on not only the many great soloists produced there but the many famous choirs.

GEOLOGY. Wales forms one of the ancient massifs of Britain around which lie younger strata of Mesozoic age. It forms the nucleus of an old land mass referred to technically as St. George's Land. The oldest rocks are those of Anglesey and St. David's Head which are Pre-Cambrian in age. In Anglesey they consist of gneisses overlain by ancient sediments and volcanics, all strongly folded and metamorphosed. In early Palaeozoic times the present site of Wales, together with N.W. England, S.W. Scotland, and Scandinavia, formed an elongated basin of deposition or geosyncline in which were deposited sediments, lavas, and volcanic tuffs of Cambrian, Ordovician, and Silurian age. These deposits were involved in the Caledonian mountain building movements at the end of the Silurian period; they were folded and locally changed to slates which are quarried in N. Wales. The denudation of the Caledonian ranges provided detritus which was washed down into lakes where it formed the coarse sediments of Old Red Sandstone or Devonian age. These deposits occur in the Welsh Borderland and in S. Wales. The Carboniferous sea then transgressed over the area, and in it were laid down the limestones which are found locally in Anglesey, at Gt. Orme's Head, in Denbigh, around the S. Wales coalfield, and in Pembrokeshire. In S. Wales this sea gradually shallowed and estuarine conditions became established during which the forests that went to form the S. Wales coal seams flourished.

These conditions terminated in another period of mountain building. These earth movements are considered to be responsible for the metamorphism of the coal in the S. Wales field from soft bituminous to anthracite; the grade of coal changes gradually as the field is crossed from S.E. to N.W. This folding, termed the Armorican system, only affected S. Wales. Similar folding occurred in S. Ireland, Cornwall and Devon, and thence through Kent it can be traced to France and Belgium. The Armorican Mts. were eroded away in the desert conditions which succeeded their formation, and their truncated folds can now be seen covered by nearly flat lying Mesozoic strata which dip gently outwards from the Welsh block. The rivers of S. Wales were probably initiated on this gently sloping surface and their original courses can in many cases still be recognized, though often they have been deflected by local erosion along soft beds. Wales was a centre of ice accumulation during the Ice Age, and the mountains of Snowdonia owe much of their beauty to glacial erosion. All the present mountains have been carved by river and ice erosion out of the roots of the much more ancient Caledonian and Armorican Mts., the fold systems of which are now visible in the cliffs of the present day peaks and shore.

LANGUAGE AND LITERATURE. Welsh or Cymric, a tongue of the Brythonic branch of the Celtic family, nearly related to Cornish and Breton, has been spoken in Great Britain for over 2,000 years. Divided into Early, Middle, and Modern Welsh, in each period it went through a long battle with a foreign tongue before attaining its further development. The first was with Latin, during the Roman occupation, which added many Latin words to its vocabulary. The second was with Norman-French, which affected its art of poetry and, in a less degree, its literary vocabulary. The third was the long struggle with English.

Compared with English, Welsh has more vocal cadence, its gutturals are harsher, its vowel sounds broader and more Italianate. The alphabet has 27 letters, including the digraphs ch, dd, ff, ng, ll, ph, th, but lacks j, k, q, v, x, and z. By the mutation of consonants initial letters are changed by the preceding sounds. The language is still spoken extensively, but along the English border, throughout Rad-

norshire, S. Pembrokeshire, and S. Glamorgan, and in W. Monmouthshire only a minority speaks Welsh.

The number of Welsh-speaking people in Wales has long kept just below the million. The spread of education, which for a while appeared to threaten the old tongue, has not decreased that figure. In addition, there are several Welsh-speaking communities in America.

Early Welsh Books

After the earliest fragments of written Welsh that we can trace, a few glosses and verses of the 9th and 10th centuries, the true beginnings are found in the "Four Ancient Books of Wales."

Of these, the Black Book of Carmarthen, so called from the Black Friars of that town, contains verse dialogues, religious pieces, and odes. The Book of Aneurin and the Book of Taliesin contain poetry of equal power, elemental and direct; and from the Red Book of Hergest comes the one medieval Welsh prose work that has captured the outer world, the *Mabinogion* (q.v.). Among the poems in these early anthologies, Aneurin's *Gododin*, a war-lament for the battle of Cattraeth, 603, strikes a great note.

The earlier bards often insist on the letter and lose the spirit of poetry. Not so three poets of the late 12th century, Gwalchmai, whose battle-song Gray translated; Owain Kyveillio, who wrote the noble lay of the Hirlas Horn; and Howel ab Owain Gwynedd, Welsh prince and true love-poet. The greatest poet was very nearly Chaucer's contemporary, Dafydd ab Gwilym. He responded, like Chaucer, to an artistic impulse felt throughout Europe, and his favourite verse is a Welsh variant of a Romance model. Wind and snow, sea and forest creatures, give him his themes, and his love-songs have still the vagabond instinct in them. His odes are in *cywydd* form—a couplet tied in a double knot of assonance and rhyme.

Dafydd had many imitators, good and bad. To him succeed two good poets Iolo Goch (d. c. 1405), Owen Glendower's bard, and Rhys Goch Eryri. Tudur Aled, a Franciscan friar, was a *cywydd* writer during the Wars of the Roses.

At the Carmarthen Eisteddfod, 1451, the rules of poetry were made strict. With Elizabethan times, the "free measures" in verse and a freer melody came into vogue. The first translators of the Psalms began, like William Middleton, with the "close measures" governed by the metrical system called *cyng*-

unedd, but Edmwnd Prys (1541-1624) used the freer verse and gained the ear of the people. Bishop Morgan's Welsh Bible, 1588, did for that tongue what Cranmer's Bible did for English. A new literature sprang up in its wake. Rhys Prichard (1569-1644) in his *Canwyll y Cymry* put plain doctrine into good verse; Morgan Llwyd, one of Cromwell's chaplains, wrote an allegory, *Llyfr y Tri Aderyn*, or Book of the Three Birds.

Huw Morus (1622-1709) was a Royalist who masked his politics in allegory, and excelled in love-songs and carols. Elis Wyn's *Bardd Cwsc*, or Sleeping Bard (1703), is a masterly prose allegory of this world, death, and hell, based on Quevedo's *Visions*. Among scholars, Theophilus Evans, author of *Drych y Prif Oesoedd* (Mirror of the Chief Ages), 1716, was a Welsh historian and strong Church partisan who wrote excellent prose. Of 18th century poets, Goronwy Owen (1722-69) carried on the classic tradition with individuality and command of his art. William Williams of Pantycelyn (1717-91), an inspired hymn-writer at his best, became the living voice of his people.

Modern Literature

The 19th century produced two lyric poets of genius. Ceiriog (1832-87) wrote the love-songs of every young lover, and his Alun Mabon is a mountain idyll familiar wherever Welsh is spoken; Islwyn (1832-78), of more religious mould, was a nature poet with an exalted vision of his country. Dr. Lewis Edwards (1809-87) was a scholarly and thoughtful essayist. Gwilym Hiraethog (1802-83) gained a national audience by his *Llythyrau Hen Ffarmwr* (Letters of an old farmer). The founding of the university of Wales gave a new impetus to Welsh literature, which owes much to the influence of Sir Owen Edwards (1858-1920) and Sir J. Morris Jones. Revival of interest in the Eisteddfod has been a stimulus to poetry, fiction, and folk drama, and a new school of poetry, cordial and imaginative within the limits of correct traditional technique, has many adept contemporary exponents.

Meanwhile, the movement to extend the teaching and use of the Welsh language in the schools has been increasingly successful. Over 30 p.c. of the pop. is now bilingual.

HISTORY. The people known to the English as Welsh (A.-S. *Waelisc*), a term applied by the Teutons

to Romanised foreigners, call themselves *Cymry* (anc. *Combroges*), i.e. fellow-countrymen. A dark, pre-Celtic population of the Mediterranean race has been successively conquered and modified by Goidelic and Brythonic Celts. The latter gradually imposed their speech on the whole country.

Roman and English Conquests

Despite the stubborn resistance of the Silures in the S.E. under Caractacus, the country was subdued by Rome, A.D. 51-78. After the Roman evacuation, Cunedda Wledig, a British prince from S. Scotland, established himself in the N.W. district of Gwynedd, and founded a dynasty, a member of which, Maelgwn, c. 515-547, ruled all Wales and Cumbria. The national church, founded before 300, produced in the 5th-7th centuries many notable men, like SS. David, Asaph, Deiniol, and Kentigern. It submitted to Rome about 768.

The English conquests drove many fugitives into Wales, which was severed from Cornwall and Cumbria by the defeats at Deorham, 577, and Chester, 613. Offa of Mercia protected his conquests by his dyke. Wales, although thus isolated, failed to unite, except for brief periods, owing in part to its tribal institutions and in part to its physical configuration. Harassed alike by Norsemen and English, and frequently at war among themselves, the Welsh princes acknowledged the overlordship of powerful English kings.

Two able princes, Rhodri the Great (844-878) and Hywel the Good (c. 904-949), author of a famous law code, consolidated their rule, but disruption, as usual, followed their deaths. Gruffydd ap Llywelyn (1039-63) again united Wales and conquered some English districts, but Harold retaliated.

The Norman conquest of England was quickly followed by attacks on Wales. The march, organized by William I, was the scene of constant warfare. The earl of Gloucester, Robert FitzHamon, conquered all the S., which was held down by a chain of strong castles. Henry I planted Flemings in Pembrokeshire, and most of N. Wales was overrun. These disasters awoke the dormant spirit of Cymric nationalism. The Normans were heavily defeated at Cardigan, 1136, and Owain Gruffydd (1137-69) strove for national union and defied Henry II. With the greatest Welsh monarch, Llewelyn (*q.v.*) or Llywelyn the Good (1196-1240), the house of Gwynedd became supreme, and Wales seemed at last

to have become a stable political state under English suzerainty. The S. accepted Llywelyn's rule, and a national council met at Aberdovey in 1215.

The end, however, was near. Llywelyn ap Gruffydd (1244-82), grandson of his great namesake, foolishly intrigued against Edward I. Resolved to assert his supremacy, the English king marched against him, and forced him to submit. Joining a rising which his brother David had instigated, Llywelyn was slain, 1282, and the next year David was captured and beheaded. Wales was annexed, 1284, and Edward's infant son, born at Carnarvon, was made prince of Wales. Welsh law was allowed to remain in the country parts, but boroughs were formed, settled with English, and placed under the law of England. Trade was encouraged, and prosperity increased. The revolt of Owen Glendower (*q.v.*) was a brief episode.

Religious Secession

The Welsh supported Henry VII, who was of Welsh descent, and the Tudors favoured the principality. The Act of Union in 1536 made English law general, and admitted representatives of Wales to parliament. In 1542 the Council of Wales was formed. The Reformation was quietly accepted, Puritanism was slow in developing, and the country was Royalist in the Civil War. The people, however, were gradually alienated from an Anglicised, apathetic, and often corrupt Church. Religious and educational reform was inaugurated by a Carmarthenshire rector, Griffith Jones (1683-1761), and carried on with remarkable results by Howell Harris of Trevecca, Daniel Rowland and Thomas Charles of Bala. There was a great secession from the established Church in 1811, that of the Calvinistic Methodists, while the Congregationalists and Baptists became powerful bodies. Thus a cleavage arose between the conservative, Anglican gentry and the radical, Nonconformist masses. Nonconformity displayed great zeal for disestablishment, which came in 1920.

Between the two Great Wars the unemployment and distress in the S. Wales coal districts became notorious. They formed one of the worst of the depressed areas.

Welsh nationalism was kept alive by the revival of the Eisteddfod (*q.v.*) from 1798 onwards; by the development of Welsh literature and the press; by the influence of the university of Wales,

by the cultivation of national music, and the use of the Welsh language in schools; and by the establishment of a separate region of the B.B.C. for Welsh broadcasting. Yet this nationalisation has tended usually to be cultural rather than political. Movements to introduce home rule or its equivalent have been put forward from time to time but with only slight support. The Welsh Nationalist vote in the 1950 general election was only 19,091, and seven of the eight candidates were at the bottom of the poll. A proposal for a separate ministry for Wales was rejected in 1945.

Bibliography. Highways and Byways of N. Wales, 1888, of S. Wales, 1903, A. G. Bradley; Manual of Welsh Literature, J. C. Morrice, 1909; History of Wales, Sir O. M. Edwards, 1920; The Land of Wales, E. and P. Lewis, 1937; My Wales, R. Davies, 1937; Wales, a Study in Geography and History, 1941.

Wales, CHURCH OF. Popular term with two meanings. (1) The Anglican Church in Wales, which was disestablished in 1920 and has six episcopal sees—Bangor, Llandaff, Monmouth, St. Asaph, St. David's, Swansea and Brecon—the bishop's meeting to choose one of their own number as archbishop of Wales. (See Church of England; Diocese, map; Disestablishment.) (2) The Calvinistic Methodist Church of Wales, described under that heading.

Wales, PRINCE OF. Title borne by the eldest son of a British sovereign. See Prince of Wales.

Wales, UNIVERSITY OF. Welsh national university. It dates from 1893, and consists of colleges at Aberystwyth, Bangor, Cardiff, and Swansea, with the national school of medicine at Cardiff. The college at Aberystwyth dates from 1872, that of S. Wales and Monmouthshire at Cardiff from 1883, and that of N. Wales at Bangor from 1886. University College, Swansea, formerly Swansea technical college, was admitted to the university in 1920. The school of medicine was incorporated by royal charter in 1931. The university leaves teaching to the colleges, but prescribes courses of study and conducts examinations for degrees. The colleges are provided with museums, laboratories, and libraries, as well as hostels for residence. Degrees can

be taken in almost all subjects, and university extension courses are provided. There are over 4,000 students and a teaching staff of some 424. Theological colleges at Aberystwyth, Bala, Bangor, Brecon, Cardiff, and Carmarthen are affiliated to the university, which up to 1930 was represented by one M.P. See Gowns colour plate.

Walewski, ALEXANDRE FLORIAN JOSEPH COLONNA, COUNT (1810-68). French diplomatist. Born at Walewica, Poland, May 4, 1810, son of Napoleon I by Marie Walewska, he was educated at Geneva and Warsaw. Espousing the Polish nationalist cause, he took part in the insurrection against Russia, 1831, and, returning to France, was naturalised and entered the French army, 1832-37. He was ambassador successively in Florence, Naples, Madrid, and London, 1849-54, and as foreign minister 1855-60, was at the Paris conference of 1856. During 1860-63 he was minister of fine arts. Walewski, who had been ten years a senator and then president of the *corps législatif*, 1865-67, died at Strasbourg, Sept. 27, 1868. *Pron.* Val-yef-ski.

Waley, ARTHUR DAVID. Contemporary British scholar. Taking as his field the art of China and Japan, he achieved the reputation of an unexcelled translator. His own poetic gifts helped him to render Oriental verse into English; he dealt also with the Japanese *Nô* plays, the *Analects of Confucius*, and the *Tale of Genji*. He wrote an *Introduction to the Study of Chinese Painting*, and *Three Ways of Thought in Ancient China*. A product of Rugby and King's College, Cambridge, Waley was sometime assistant keeper of prints at the British Museum.

Walvisch Bay. Bay of S.W. Africa, also called Walvis Bay (*q.v.*).

Walham Green. District of London. Long since built over, it is in the met. bor. of Fulham, with a station on the District rly. line to Wimbledon between West Brompton and Parsons Green. It was known formerly as Wendon Green, from the old manor of that name. It is now a busy centre for various bus routes, and the station is the nearest to Stamford Bridge, the ground of Chelsea A.F.C.

Count Walewski,
French diplomatist

Walker, DAME ETHEL (b. 1867). British painter. Born at Edinburgh, she studied art at the Slade School under Frederick Brown, and was elected a member of the New English art club in 1900. She exhibited for many years at the R.A., being elected A.R.A. in 1940. Works by her were purchased by the Tate Gallery, the Contemporary Art society, and many provincial galleries. She held exhibitions at London galleries and her paintings were shown all over the world, including the British Council exhibition at the World's Fair (New York) in 1939. Her subjects were portraits, seascapes, flowers, nudes, and large mural decorations.

Walker, SIR EMERY (1851-1933). British printer. Born in London, April 2, 1851, he helped to found the Arts and Crafts exhibition society, 1888, and was associated with William Morris in setting up the Kelmescott press in Hammersmith, 1890. Well known as a printer, process engraver, and photographer, and an authority on fine art printing, he established the business of Emery Walker, Ltd., and was a founder of the Doves Press, 1900-09. He became master of the art workers' guild, 1904, and trustee of the Wallace Collection, 1924. In the latter year he was also chosen Sanders reader in bibliography at Cambridge. Walker's collection of printed books included a complete set of the Kelmescott press publications. He was knighted in 1930, and died July 22, 1933.

Walker, ERNEST (1870-1949). British musician. Born at Bombay, July 15, 1870, and educated privately, he was director, 1900-25, of music at Balliol College, Oxford, of which he became an honorary fellow in 1926, and lecturer in harmony at Oxford, 1918-22. Well known as a pianist, he also composed a large number of works, including string quartets and quintets, sonatas for violin and piano, works for chorus and orchestra, and many pianoforte pieces; his songs, probably his best known works, include vocal quartets from England's Helicon. Walker also made a name as a writer on music, his books including *Beethoven*, 1905, and *A History of Music in England*, 1907, revised edition, 1923. He died Feb. 21, 1949.

Walker, FREDERICK (1840-75). British artist. Born in London, May 24, 1840, he studied at Leigh's academy and the R.A. schools, afterwards becoming ap-

University of Wales
arms

prentice to J. M. Whymper, the wood engraver. Illustrative work occupied him till 1866, when he was elected a member of the Water Colour Society; he became A.R.A. in 1871. His pastorals, e.g. *The Harbour of Refuge*, and *The Vagrants*, were based on a profound study of Greek design.

Frederick Walker,
British artist
Self-portrait

He died at St. Fillans, Perthshire, June 5, 1875.

Walker, GEORGE (1618-90). Irish clergyman and defender of Londonderry. Born in Tyrone and educated at Glasgow university, he was ordained, and in 1688 was holding the livings of Lissan and Donaghmore, near Londonderry (q.v.). Responding to the call of the troublous times, he raised troops to defend Londonderry, and despite his advanced age held the place against James II for 105 days until its relief, July 30, being granted £5,000 by the king as a reward. On William's arrival in Ireland Walker joined his colours, and fell in the battle of the Boyne, July 1 (o.s.), 1690.

George Walker,
Irish clergyman
After Kneller

Walker, JAMES J. (1881-1946). American politician. Born in the Greenwich Village district of New York, June 19, 1881, he became a barrister in 1912, and, entering municipal politics as a Democrat, was elected mayor of New York as a representative of the Tammany Hall organization in 1925. He was re-elected in 1929, but soon came into conflict with F. D. Roosevelt, then governor of New York, the more sober members of the Democratic party objecting to the gaiety with which he filled his office. In 1931 a petition to Roosevelt was organized, but "Jimmy" Walker won an appeal to the Supreme Court against its presentation; a year later he resigned. He died Nov. 18, 1946.

Walker, THOMAS DAWSON (1850-1934). An English clown. Known as Whimsical Walker, he was born at Hull, son of a circus manager, and became a clown at the age of 10. He worked at Astley's, Sanger's, Barnum's, and Hengler's circuses, and was for

many years the chief figure in the harlequinade at the Drury Lane pantomime. Famous as a trainer of animals, he gave a performance with his singing donkey before Queen Victoria at Windsor in 1886, and from 1928 appeared annually at the Olympia circus. The last clown of the Grimaldi tradition, he died at Gorleston, Norfolk, Nov. 12, 1934. His reminiscences, *From Sawdust to Windsor Castle*, appeared in 1922.

T. D. (Whimsical)
Walker,
English clown

Walker, WILLIAM (1824-60). American adventurer. Born at Nashville, Tennessee, May 8, 1824, he tried law and journalism, and then embarked on the series of expeditions which made him famous. The scenes of these included the Mexican province (now state) of Sonora (1853), which led to his being charged with a violation of neutrality; Nicaragua (1855), where he made himself president and c.-i.-c., but was driven out by a coalition of the Central American states; and Honduras. Soon after landing there he was forced to surrender to the captain of a British man-of-war, who gave him up to the government. He was tried, condemned, and shot at Trujillo, Sept. 12, 1860.

Walker Cup. Trophy, presented by G. H. Walker, president of the U.S. golf association, and competed for by amateur golfers representing Great Britain and the U.S.A. The first competition was in 1922. It takes place, usually at two-year intervals, alternately in the two countries, and the result is determined by singles and foursomes. In the 1938 competition the cup was won by Great Britain.

Walker, London. A comedy by J. M. Barrie. It was produced Feb. 25, 1902, at Toole's Theatre, London, where it had a run of 511 performances. The cast included J. L. Toole, Irene Vanbrugh, G. Shelton, Seymour Hicks, and Mary Ansell.

Walking. Slow movement, i.e. not running, on foot. Walking for pleasure, especially in the countryside, was a recreation which became very popular in most countries during the 1920s and 1930s, when it was often called hiking. Walking races, on the other hand, are a very strenuous

sport, the official definition of walking issued by the A.A.A. being "progression by steps so taken that unbroken contact with the ground is maintained." If this rule is broken the competitor is disqualified and must at once retire from the race. Among records are the following: 1 m., 6 min. 21.2 sec. (P. Bernhardt, Latvia); 20 m., 2 hours 41 mins. 7 sec. (H. Olsson, Sweden); 1 hour's walking, 8 m. 1025 yards (J. F. Mikaelsson, Sweden). In the 1948 Olympic Games the 10,000 metre walk was won by J. F. Mikaelsson in 45 mins. 31.2 sec., thus setting up a new Olympic record, and J. A. Ljunggren (Sweden) won the 50,000 metre walk in 4 hrs. 41 min. 52 secs.

Walkley, ARTHUR BINGHAM (1855-1926). A British dramatic critic. Born at Bristol, Dec. 17, 1855, he was educated at Corpus Christi College, Oxford. In 1877 he entered the post office and, having been assistant secretary since 1911, retired in 1919. During much of this time Walkley was the dramatic critic of *The Times* and he made himself, by his witty and learned writings, one of the foremost critics of his day. His books include *Drama and Life*, 1907. He died, Oct. 7, 1926.

Walküre, DIE. German title of the opera by Wagner known in English as *The Valkyrie* (q.v.).

Wall. Structure of solid material, e.g. brick, stone, and concrete, or of sheeting, such as plaster-board, on framing, forming an enclosure. (See *Plaster*.) Solid walls without framing support upper floors and roofs and are called load-bearing walls. Framed walls carry superimposed loads on beams and columns, the walling material being in the form of non-load-bearing panels or of sheeting. A cavity wall has comparatively thin sections separated by a 2-in. cavity and held apart by rustless metal ties, the purpose of the cavity being to prevent the passage of damp. External walls of houses of normal brick construction are 9 ins. thick if solid and 11 ins. thick if with a cavity. Partition walls are usually 4½ ins. thick.

Walls of large modern buildings are mostly framed and panelled, as this avoids the very thick solid walls which are necessary if heavy loads are to be carried by the walling material. See *Aurelian's Wall*; *Bricks and Brick-making*; *Britain*; *Building*; *Great Wall*; *Hadrian's Wall*; *House*; *London Wall*; *Party-Wall*; *Roman Wall*; *Wailing Wall*.

Wall, Sir Frederick Joseph (1858-1944). Secretary of the Football Association. Born April 14, 1858, he was educated at St. Mark's College, Chelsea. A keen footballer as a young man, he became interested in the organization of the game, and having served on various regional committees and acted as secretary for the amateur cup competition, he was in 1895 appointed secretary of the football association. He held that position till 1934, raising the membership of the association from 1,000 to 750,000. Upon retiring he published *Fifty Years of Football*. He was one of the founders of the British Olympic association. He died March 25, 1944.

Sir F. J. Wall,
Secretary of the
Football Association

He held that position till 1934, raising the membership of the association from 1,000 to 750,000. Upon retiring he published *Fifty Years of Football*. He was one of the founders of the British Olympic association. He died March 25, 1944.

Wallaby. Name given to several of the smaller species of kangaroos. They are smaller in size and brighter in colour than the typical kangaroos, and there is a slight difference in the incisor teeth and the palate. They occur in the dense scrub of Australia, Tasmania, and New Guinea. See Kangaroo.

Wallace, Alfred Russel (1823-1913). A British scientist. Born at Usk, Mon, Jan. 8, 1823, he became acquainted in youth with H. W. Bates, through whose influence he became interested in natural history. Wallace spent 1848-52 collecting in the Amazon region, and 1854-62 in the Malay Archipelago, publishing valuable accounts of the expeditions and drawing the dividing line between Lombok and Bali, which separates Asia from Australasia. This is still known as Wallace's line. While in Borneo he wrote his famous essay on the law which has regulated the introduction of new species, in which he independently formulated Darwin's theory. A man of broad and often controversial views. Wallace was honoured by many scientific institutions and universities and was given the O.M. in 1910. He died Nov. 7, 1913. His many books include *Travels on the Amazon*, 1853; *The Malay Archipelago*, 1869; *Natural*

A. Russel Wallace,
British scientist

Selection, 1870; *Miracles and Modern Spiritualism*, 1874; *Darwinism*, 1889; *Studies, Scientific and Social*, 1900; *Man's Place in the Universe*, 1903; *My Life*, 1905; *Social Environment and Moral Progress*, 1912. See Darwinism.

Wallace, Edgar (1875-1932). British novelist and playwright. Born in London of unknown parents, he was found as a week-old baby by a Billingsgate fishporter who adopted him. With only a primitive education, Wallace became a newspaper seller at Ludgate Circus, and later took menial posts. At 21 he joined the army and was drafted to S. Africa. In his spare time he did some freelance journalism, and on the out-

Selection, 1870; *Miracles and Modern Spiritualism*, 1874; *Darwinism*, 1889; *Studies, Scientific and Social*, 1900; *Man's Place in the Universe*, 1903; *My Life*, 1905; *Social Environment and Moral Progress*, 1912. See Darwinism.

Wallaby. A mother and her young of this smaller species of the kangaroo family

break of the S. African War was appointed war correspondent by Reuter's. S. African representative of the *Daily News*, 1900, and the *Daily Mail*, 1901-02, he became the first editor of the *Rand Daily Mail*, but soon returned to Fleet Street to become a reporter.

Meanwhile, he had tried his hand at fiction, and first attracted notice in 1906 with *The Four Just Men*, a sensational mystery story of a new type, for which Wallace soon became world-famous. Having now discovered where his talents lay, he turned

out more than 150 novels, as well as 14 plays, several film scenarios, and much incidental journalism, including at one time a daily article on racing, in which he was always interested. He died suddenly in Hollywood, Feb. 10, 1932.

The detective and mystery stories which were Wallace's most typical works were, at their best, ingenious and well constructed and, at their worst, readable, though they often showed signs of over-hasty writing. Among the most successful were *The Man Who Knew*, *The Mind of Mr. J. G. Reeder*, *The Green Archer*, *The Melody of Death*, and *The Angel of Terror*. Better polished, though less characteristic, were the early stories of Africa, introducing such well delineated characters as Sanders, the commissioner, and Bosambo, the native chief. In his later years Wallace turned to the theatre and scored noteworthy successes with *The Ringer*, *The Terror*, *The Squeaker*, and *On the Spot*. These, like the best of his novels, showed a great power of creating exciting situations and maintaining suspense, as well as a salty humour. In 1930 he unsuccessfully contested Blackpool as a Liberal. In 1934 a memorial tablet to "Edgar Wallace, Reporter," was erected at Ludgate Circus, above the spot where he had once sold newspapers. His autobiography, *People*, appeared in 1927, and his *Hollywood Diary* in 1932. A biography by his daughter-in-law, Margaret Lane, was published in 1938.

John Rowland

Wallace, Henry Agard (b. 1888). American politician. Born Oct. 7, 1888, and educated at Iowa state college, he became associate editor, 1910-24, and editor, 1924-29, of Wallace's *Farmer*, which, founded by his grandfather, enjoyed great prestige in mid-western states. As a farmer he worked out the first corn

(maize) hog ratio charts, and in 1933 became secretary of agriculture in the Roosevelt cabinet, a post he retained until elected in 1940 vice-president. In 1944 H. S. Truman was preferred by Roosevelt as vice-president, and Wallace became secretary of commerce next year, when he published *Sixty Million Jobs*.

H. A. Wallace,
American politician

Resigning in 1946 after his attack on the administration's attitude to Russia, he soon launched a crusade to reverse what he believed the mistaken direction of U.S. foreign policy, touring Europe and holding meetings. As candidate of his newly founded Progressive party for the presidency in 1948 Wallace polled 1,157,172 votes only (out of 48,836,579).

Wallace, LEWIS (1827-1905). American soldier and novelist. Born at Brookville, Ind., April 10,

Lew Wallace,
American novelist

1827, he served in the Mexican War, became major-general in the Civil War, and was governor of New Mexico, 1878-81, afterwards going to Turkey as minister for four years. He died Feb. 17, 1905. Lew Wallace is remembered for Ben Hur, 1880, a story of Palestine and Rome in the time of Christ. This was a success when adapted for the stage, and an even greater one on the screen.

Wallace, NELLIE (d. 1948). British variety artist. Eleanor Jane Wallace was born of English parents at Glasgow, on March 18, 1882, according to books, though allegedly at least ten years earlier. She first appeared as a juvenile clog-dancer at the Steam-Clock music hall, Birmingham, in 1888, came to London in 1903, and in 1910 was in the programme of the Palladium at its opening. Billed as The Essence of Eccentricity she created a new style of burlesque; her ludicrous tripping gait was set off by a thin feather boa, minute hat with feather, tight skirt, and elastic-sided boots. Her songs usually dealt comically, and sometimes cruelly, with the girl who was jilted in her love affairs. She was renowned as a dame in London pantomime, and toured in revue as late as 1945, in That'll Be the Day. After figuring in the royal command variety programme of 1948, she was taken ill, and died Nov. 24.

Wallace, SIR RICHARD (1818-90). British art collector. Born in London, July 26, 1818, perhaps a natural son of Maria, marchioness of Hertford, he was brought up in Paris. In 1870 he inherited Hertford House (*q.v.*), together with its pictures and other works of art. During the siege of Paris he spent large sums on the organization of ambulances and

the endowment of a British hospital, for which services he was rewarded with a baronetcy, 1871. He was M.P. for Lisburn, 1873-85, and died in Paris, July 20, 1890. His widow at her death in 1897 left to the nation the Wallace Collection (*q.v.*).

Sir Richard Wallace,
British art collector

Wallace, SIR WILLIAM (c. 1270-1305). Scottish hero. Supposed to have been a son of Sir Malcolm Wallace, a knight of Renfrewshire, according to the history of Blind Harry, he spent his early years in Stirlingshire and Dundee. The tale goes that he killed an Englishman in revenge for a slight, and was outlawed. He fled into the hills, gathered a force of malcontents and desperadoes, later joined by nobles and ecclesiastical dignitaries who wished to use Wallace against their common enemy the English, and carried on guerrilla war. Such wild deeds as the attack on the English court of justice at Scone, and the burning of the soldiers' quarters in the barns of Ayr, attracted to Wallace more followers, but also the notice of Edward I of England, who dispatched a large army against him. At Irvine, in July, 1297, a treaty was drawn up by which Wallace lost the support of his wealthier supporters, and he fled.

Within two months Wallace had a considerable army, recaptured most of the forts N. of the Forth, and invested Dundee, when he heard news of a large English force moving to attack him. Marching quickly to Stirling,

Sir William Wallace. The statue of the Scottish hero erected in Aberdeen

he stationed himself at Abbey Craig above the Forth: as the English crossed the river on Sept. 11 he fell upon and almost annihilated them, pursuing the remainder to Berwick. Wallace then advanced into England and laid it waste as far as Newcastle. He was chosen guardian of the Scottish kingdom, but was hindered by the jealousy of the nobles, though he effected important reforms in military organization. Edward hastened home from Flanders and arrived in Scotland at the head of a large force, which on July 22, 1298, came up with Wallace at Falkirk. The battle ended in the rout of the Scottish army and the flight of its general. For years he lived in obscurity, an outlaw and a rebel. Eventually he was hunted down and captured, possibly through treachery, Aug. 5, 1305, near Glasgow. He was taken in chains to London, tried as a traitor at Westminster Hall, and on Aug. 23 executed, his body being barbarically maltreated.

Wallace possessed all the qualities of a national hero; a man of great strength and height, he had infinite courage and a personality which drew men. His career was, of course, romanticised by later generations, but his influence on them never failed. He had the makings of a wise statesman, and restored order and unity for the only time for centuries. Wallace's life was written by A. F. Morison, 1898, and his name has been immortalised in Burns's poem, Scots wha hae.

Wallace, WILLIAM VINCENT (1813-85). A British composer. Born at Waterford, July 1, 1813, the son of a regimental bandmaster, he became well-known as a violinist in Dublin, and in 1834 began a roving career in Australia, India, and S. America, which lasted ten years and included escapes from violent death. In 1845 he settled in London, to produce immediately his popular opera, Maritana, which enjoyed great success. Lurline, 1860, another opera, was equally admired at the time. Wallace's piano pieces and operas, many composed on the Continent, are little known. He died Oct. 12, 1865.

Wallaceburg. Town of Ontario, Canada. It is in Kent co. in the S.W. corner of the province, on the Sydenham river, which is navigable for the largest lake vessels. It has bus connexion with the C.P.R. and C.N.R., at Chatham, and is on Père Marquette rly. Chief industries

are carried on at glass works, flour and flax mills, machine shops, shipyards, and a sugar refinery. Pop. 4,986.

Wallace Collection. Gallery of works of art in London. The collection made by the 3rd and 4th marquesses of Hertford and Sir Richard Wallace, was bequeathed by Lady Wallace (d. 1897), widow of Sir Richard, to the English nation. Hertford House, Manchester Square, was bought, and the gallery was opened to the public in 1900. French masters of the 18th century are represented, while the Italian and Spanish works include fine examples of Titian, Velazquez, and Murillo; Rembrandt, Rubens, and the English portraitists are represented. Besides sculpture and other *objets d'art*, there is an armoury, and the assembly of 18th century French furniture and porcelain is unique. See Hertford House.

Wallace's Line. Division, coinciding with Lombok Strait, between the W. islands of the Malay archipelago (having Asiatic fauna) and the E. islands (with Australasian). It was first noted by Alfred Russell Wallace (q.v.) on his travels in the region 1854-62.

Wallach, Otto (1847-1931). German chemist, born March 27, 1847, at Königsberg, now Kaliningrad. Professor of chemistry at Göttingen, 1876-1915, he specialised in the chemical and analytical treatment of terpenes and camphor, and helped to give volatile oils and scents industrial importance. He was awarded the Nobel prize for chemistry in 1910. His chief book was *Terpene und Kampfer*, 1909. He died Feb. 26, 1931.

Wallachia or **WALACHIA** (Rum. Muntenia). Prov. of Rumania. It lies in the S. of the country and includes the capital Bukarest. Covering an area of 29,960 sq. m., it is a plain of great fertility and the principal agricultural area of Rumania. It takes its name from the Wallachs, a nomadic people of the Balkans of Roman or partly Roman descent and speaking a language of Latin origin. An independent principality from the Middle Ages, Wallachia was, however, at least after 1343, compelled to pay tribute to the Turks, and later was ruled by Turkish appointees. In 1861 Wallachia was united with Moldavia to form Rumania.

Wallaroo. Seaport of South Australia. It stands on the E. side of Spencer Gulf and is 120 m. N.E. of Adelaide by rly. It is the port

for a very extensive agricultural area. Copper, lead, barley and wheat are exported, machinery and phosphate rock being the chief imports. Wallaroo, Kadina, and Moonta form a group of closely connected townships. Pop. 10,000. The mining areas close by have a pop. of 5,000.

Wallas, GRAHAM (1858-1932). English sociologist. He was born at Sunderland May 31, 1858, and educated at Shrewsbury, and Corpus Christi College, Oxford. Lecturer at the London School of Economics from 1895, he was one of the founders of the Fabian Society and played a prominent part in civic affairs as a member of the L.C.C. and of the London school board. Appointed in 1914 professor of political science at London university, where he stayed nine years, he wrote books advocating a view of international cooperation that influenced many contemporaries and students. His best-known works were *Life of Francis Place*, 1897; *Human Nature in Politics*, 1908; *The Great Society*, 1914; *Our Social Heritage*, 1921; *The Art of Thought*, 1926. Wallas died Aug. 9, 1932.

Wallasey. Co. and mun. bor. and seaside resort of Cheshire, England. It is situated on the

Wallasey arms

Wirral peninsula at the mouth of the Mersey and is separated from Birkenhead by a channel called the Great Float. It is a railway terminus. The old parish church of S. Hilary was rebuilt, after fire, in 1859. The bor. of Wallasey comprises New Brighton, Egremont, Seacombe, Liscard, and Poulton, residential suburbs of Liverpool and connected with that city by ferry and the Mersey Tunnel. The corporation maintains parks, recreation grounds, boating lake, golf links, schools, and libraries. The borough has a sea and river front 7 m. long, and one of its open-air swimming-baths is the biggest in the world. The holiday resort area centres on New Brighton. Wallasey sends one member to parliament. Pop. est. 100,300. See Wirral.

Walla Walla. City of Washington, U.S.A. The co. seat of a co. with the same name, it stands on the Oregon border, 208 m. E.N.E. of Portland. There is a station on the N. Pacific rly. Prosperity set in soon after the opening of the

Idaho gold mines, but the place was long disorderly and looked after by Vigilantes. It has flour-milling and meat-packing establishments. Pop. 18,109.

Wallenstein, ALBRECHT WENZEL EUSEBIUS VON (1583-1634). German soldier. Born to a noble Lutheran family at Hermanic, Bohemia, Sept. 15, 1583, he was educated at Olmütz, and became a professing but never devout R.C. He next went to the university of Altdorf, thence to Bologna and Padua, became a believer in astrology, and went on a tour of western Europe. Having fought for the emperor, Rudolph II, in Hungary, he married a widow, who brought him great wealth and, after her death in 1614, large estates in Moravia. He raised, equipped, and commanded a company of horse in the service of the Emperor Ferdinand against Venice in 1617, and then married another heiress. In high favour at the imperial court, he refused to listen to the revolutionaries on the outbreak of the Bohemian revolt, 1618. Instead he got together a regiment of cuirassiers, saving Vienna from disaster by taking command of the imperial forces after the death of Buquoy. He was made a prince of the empire in 1623, and duke of Friedland in 1625.

A. von Wallenstein, Bohemian soldier

Wallenstein defeated Mansfeld at Dessau, 1626, and having outmanoeuvred both him and Bethlen Gabor, forced upon them a truce. Next he pursued Christian of Denmark through to the sea. Within two years the Catholic cause had been made supreme: Wallenstein was given the duchy of Mecklenburg. He desired a Germany united under the emperor and enjoying religious toleration, but in 1629 came the Edict of Restitution, a fatal blow at Wallenstein's policy.

For two years the successes of Gustavus forced the emperor again to ask his aid in 1632, and he raised another army, which cleared Bohemia of the Saxons, and forced the Swedes to withdraw from Nuremberg. The emperor promised to cancel the Edict of Restitution; he failed to implement the promise, and Wallenstein planned to desert him. He made overtures to the Protestant powers,

upon which the emperor charged him with treachery, and Wallenstein was murdered by a party of his own soldiers at Eger (Cheb), Feb. 25, 1634.

Wallenstein developed from a brilliant soldier of fortune into a man of wide intellect, ambitions, and schemes. Instead of allowing his armies to live on the country, he provided his own train of supplies, derived, with the pay of his mercenaries, from prescriptions on imperial authority. To accuse him of treachery to the emperor is not altogether fair. He was cold, calculating, and judiciously cruel. Utterly unprincipled, he stands out from his contemporaries as soldier and administrator, and his death removed the one man capable of giving either side in Germany a decisive victory. Schiller wrote a great tragedy on his career. *Pron.* Vahlenshtine.

Waller, EDMUND (1606-87). English poet and politician. Related to both Cromwell and Hamp-

den, he was born March 9, 1606, at Coleshill, now in Bucks. After education at Eton and King's College, Cambridge, he sat in parliament from

1624. Inheriting the Beaconsfield estate on his father's death in 1616, Waller in 1631 married a London heiress, Anna Banks (d. 1634), paid unsuccessful court to Lady Dorothy Sidney, the Sacharissa of his verse, and later wedded Mary Bracey (d. 1677), of Thame. Involved in a plot to secure London for Charles I in 1643, he was fined £10,000 and banished, but was pardoned by Cromwell in 1651. Father of the house at his retirement in 1677, he died at Hall Barn, Beaconsfield, Oct. 21, 1687.

Waller was renowned for lyric verses in his own day, and the exquisite *Go, Lovely Rose*, survives in very many anthologies, while some lines written in extreme old age should be remembered for their depth and sincerity. But his importance for poetry is as a reformer who pruned away the luxuriant conceits of the metaphysical school and developed afresh the heroic couplet. *Consult* Works, ed. G. Thorn-Drury, 1893.

Waller, LEWIS (1860-1915). British actor. William Waller Lewis, who was born at Bilbao,

Lewis Waller,
British actor

Hotspur, Henry V, and Brutus, and became the popular romantic hero of the day in such costume plays as *The Three Musketeers*, *Robin Hood*, and *Monsieur Beaucaire*. He was manager successively of the Haymarket, Shaftesbury, Imperial, and Lyric theatres. He died Nov. 1, 1915.

Waller, SIR WILLIAM (c. 1597-1668). English soldier. Son of the lieutenant of Dover, he was sent to Magdalen Hall, Oxford. He fought in the Thirty Years War, being knighted 1622. On the outbreak of the Civil War he served as a parliamentarian colonel of horse in the West, but after gaining successes was defeated at Lansdown and Roundway Down, 1643. Having captured Basing House and Arundel, he again lost a battle, at Cropredy Bridge, 1644. A strong Presbyterian, Waller proposed the formation of the new model army, and retired from the field under the Self-Denying Ordinance. At the close of the protectorate he took part in negotiations for the restoration of Charles II. He died Sept. 19, 1668.

Wallflower (*Cheiranthus cheiri*). Perennial herb of the family Cruciferae, native of N. and Central

Spain, Nov. 3, 1860, first appeared at Toole's Theatre in 1883. He played leading Shakespearean parts under Tree's and his own management, especially

Sir William Waller,
English soldier

Europe. It forms a small bush a foot or two in height, with alternate lance-shaped leaves and racemes of fragrant flowers, which in the natural state are orange-yellow, but under cultivation vary from a clear yellow through blood-red to dark brown. The plant was introduced to British gardens in the latter half of the 16th cent. In many places it has become naturalised on ancient walls, and these escapes have reverted to the natural yellow of the flowers.

Wall Game. Football match peculiar to Eton College. The most completely original variant, unlike any game of football seen elsewhere, it has been played since time immemorial every S. Andrew's day (Nov. 30) between Collegers and Oppidians. The teams, eleven a side, line up at the middle point of a wall 120 ft. long. Some distance on each side of this point is a calx (chalk mark). Play is restricted to a distance of 6 yds. from the wall. Five of the players on each side, the bullies, keep close to the wall and form the nucleus round which a scrummage is concentrated. Players endeavour to push the ball behind their opponents' calx, and there touch it on the wall with the hand. If anyone succeeds, his side is allowed to shy at goal—at one end a garden door, at the other a marked space on a large elm. As it is almost impossible to get the ball beyond the

Wallflower. Leaves
and flowers

goal's defenders, the game is decided by shies; one goal counting as 10 shies.

Wallingford. Mun. bor. and market town of Berks, England. On the Thames, here crossed by a long, stone bridge, the town is 15 m. N.W. of Reading, and the terminus of a branch rly. There are three parish churches, of which the oldest is that of S. Leonard

Wall Game. The football game peculiar to Eton College, played annually on S. Andrew's day

(11th century). In the church of S. Peter Sir W. Blackstone is buried. The castle, containing Roman and Danish remains, was the scene of a 16 weeks' siege by parliamentary forces during the Civil War, 1646, and was mostly demolished a few years later. The town occupies the site of a Roman camp. The treaty of Wallingford is the name of the peace made here in 1153 between Stephen and Matilda. Market day, Fri. Pop. est. 3,700.

Wallis, John (1616-1703). English mathematician. Born at Ashford, Kent, Nov. 23, 1616, and

John Wallis,
English
mathematician

professor of geometry at Oxford. His *Arithmetica Infinitorum*, 1655, contained the principles of the calculus, and became a standard work; it explains the method of arriving at the quadrature of a circle. Wallis introduced the principles of analogy and continuity into mathematics, explained negative and fractional indices, and his *Algebra*, 1685, contained the first systematic use of formulae. Also a logician and grammarian, he died Oct. 28, 1703.

Wallis Archipelago. French colony in the Pacific Ocean. The group lies N. of Tonga and N.E. of Fiji and consists of Wallis (Uvea) and Futuna islands: area, 40 sq. m.; pop., 4,243. It was placed under French protection in 1842.

Walloon (akin to Welsh, foreigner). Dominant ethnic stock in S.E. Belgium, with offshoots in the French frontier depts. Numbering under 3,000,000, they are of Alpine stock, descended from the ancient Gallic Belgae, with Teuton and Roman admixture. Their archaic Romance dialect is in colloquial use by a fraction of the Walloons, who commonly speak French.

In Elizabeth's reign, and in Stuart times, Walloon Protestant refugees settled at Canterbury and elsewhere in England, practising silk weaving and cloth manufacture; and in Canterbury cathedral crypt they maintained separate worship from 1561. See Belgium.

Wallpaper. The practice of covering walls with decorative paper is mentioned under Painting and Decorating.

Wall Pennywort, NAVELOWORT, OR PENNY PIES (*Cotyledon umbilicus*). Perennial herb of the

family Crassulaceae, a native of Europe, W. Asia, and Africa. It has a fleshy root-stock, from which spring the round fleshy leaves, one in. to three ins. across, depressed in the centre and with the leaf-stalk attached to the middle of the underside. On the flowering stem they are spoon-shaped and wedge-shaped. The stem, which varies from 6 to 18 ins., is covered with drooping, greenish-white cylindrical flowers. It commonly grows on rocks or in crannies of old walls.

Walls, Tom Kirby (1883-1949). British actor. Born at Kings-

Tom Walls,
British actor

thorpe, Northants, Feb. 18, 1883, he attended Northampton county school, and became a London policeman. He first appeared on the stage in pantomime in Glasgow, 1905, and made his London debut two years later. He played mainly in musical comedy, and in 1922 entered into management with Leslie Henson, presenting *Tons of Money* at the Shaftesbury Theatre. Walls then put on at the Aldwych Theatre (*q.v.*) a series of successful farces, with himself as a cynical foil for the simplicities of Ralph Lynn and Robertson Hare. In the 1930s he appeared in screen versions of the Aldwych farces. Walls then changed his style, becoming a serious actor of character parts in such films as *Halfway House*, 1944; *Johnny Frenchman*; *The Master of Bankdam*, 1947. Training his own horses, he won the Derby in 1932 with April the Fifth. He died Nov. 27, 1949.

Wallsend. Mun. bor. of Northumberland, England. On the N. bank of the Tyne, 4 m. E. of New-

castle, it stands on the site of the Roman camp of Segedunum, and is named from being the E. end of Hadrian's Wall (*q.v.*). The growth of the town is due to its collieries, opened in the late 18th century, and to shipbuilding and engineering works. It has a rly. station. Wallsend gives its name to a bor. constituency. Pop. 46,980.

Wall Street. Thoroughfare in lower New York City, in which the stock exchange is situated. The name is used as a synonym for the American stock market.

Wall Trees. Horticultural term for trees prepared and grafted for culture against walls; and specifically for fruit trees which have undergone training for this purpose. All pip or stone fruits may be grown against walls, but such protection is an absolute necessity for the ripening of peaches, nectarines, or apricots grown in the open air in Great Britain. They should be grown against walls with a S. or S.W. aspect. See Espalier; Gardening.

Walmer Castle. Official residence of the lord warden of the Cinque Ports (*q.v.*). About 3 m. S. of Deal, the original building, erected in 1539 as a coast block-house, has since been much altered and enlarged. Visitors are admitted.

Walney Island. Island off the N.W. coast of Lancs, England, forming part of the county bor. of Barrow-in-Furness, to which it is connected by means of the Jubilee Bridge, opened in 1908. The N. end of the island is joined to the mainland by a causeway accessible at low tide. The island includes the suburbs of Vickerstown N. and S.,

Wallsend arms

Wall Pennywort.
Spike of flowers
and leaves

Wall Trees. A horizontally trained espalier pear tree; right, a single cordon tree

Walmer Castle. Official residence of the lord warden of the Cinque Ports. See facing page

built in the early 20th century by the Vickers co. for the housing of their workpeople. On the W. side, abutting upon the Irish Sea, is a public pleasure ground known as Biggar Bank, a strip of grass nearly two miles long, with a broad foreshore. Bathing, boating, and other recreations are available. Pop. est. 9,100.

Walnut (*Juglans regia*). Large timber tree of the family Juglandaceae. It is a native of Asia, and

Walnut. 1. Cluster of nuts. 2. Leaf. 3. Male catkins. 4. The fruits which contain the nuts

reached Great Britain in the 15th century. It attains a height between 40 ft. and 60 ft., with a broad, spreading head and a short bole, the girth of which may exceed 20 ft., covered with yellow-grey bark which splits in a net-like pattern. The long leaves are broken into 5-9 lance-shaped leaflets, which give off a spicy aroma. The flowers are of two kinds: numerous pollen-bearing (male) blossoms in long, hanging green catkins, and small spikes of one to four female flowers at the tip of a shoot, which develop into the single-seeded fruits (walnuts) enclosed in a wrinkled, stony shell and invested in a green, fleshy coat. These ripen only in the S. parts of Great Britain. The tough, light wood, when mat-

ure, is of a rich brown colour, and though coarse-grained takes a high polish, making it suitable for cabinet-making.

Walpole, HORACE OR HORATIO (1717-97). English author and letter writer. Born in London, Sept. 24, 1717, 4th son of Sir Robert Walpole, 1st earl of Orford, he was educated

Horace Walpole, English author

at Eton and King's College, Cambridge. Made inspector of imports and exports, 1737-38, and usher of the exchequer, controller of the pipe, and clerk of the estreats, 1738, he travelled on the Continent, 1739-41, part of the time with Gray the poet. M.P. for Callington 1741-54; Castle Rising, 1754-57; King's Lynn, 1757-68, he succeeded to the earldom of Orford, Dec., 1791; and, dying in London, March 2, 1797, was buried at Houghton, Norfolk.

In 1747 Walpole had settled near Twickenham, where he built a kind of Gothic castle, collected furniture, pictures, curios, etc. (dispersed at auction, 1842), set up a private printing press, and formed a friendship with Agnes and Mary Berry. He is best remembered by his letters, in which the life of his time is vividly reflected. His *Castle of Otranto*, 1764, inaugurated the tale of terror in English literature.

Bibliography. Works, ed. Mary Berry, 5 vols., 1798; *Memoirs of the Reign of George III.*, ed. G. F. R. Barker, 4 vols., 1894; *Letters*, ed. P. Cunningham, 3 vols., 1857-59, and ed. Mrs. Paget Toynbee, 16 vols., 1903-05; *Horace Walpole and His World*, L. B. Seeley, 1884; *Lives*, L. Melville, 1930; S. Gwynn, 1932; R. W. Ketton-Cremer, 1946.

Walpole, SIR HUGH SEYMOUR (1884-1941). English novelist. The son of George Walpole,

Sir Hugh Walpole, British novelist

bishop of Edinburgh, he was born in New Zealand, March 13, 1884, and educated at King's School, Canterbury; Bede College, Durham; and Emmanuel College, Cam-

bridge. He was for a time a schoolmaster. His first novel, *The Wooden Horse*, 1909, made little stir, but foreshadowed the original symbolism which was to make many of his later stories popular, and with *Maradick at Forty*, 1910, he came to be accepted as a new force in fictional literature. Mr. Perrin and Mr. Traill, 1911, a forceful psychological study of a schoolmaster's life, and probably his best book, was followed by the series dealing with London life. These books were *The Prelude to Adventure*, 1912; *Fortitude*, 1913; and *The Young Enchanted*, 1922. *The Duchess of Wrexhe*, 1914, opened a new series, to which belong *The Green Mirror*, 1918, and *Wintersmoon*, 1928. *The Dark Forest*, 1916, described his war experiences with the Red Cross in Russia; *The Secret City*, 1919, on the 1917 revolution in St. Petersburg, won the James Tait Black prize.

In 1919 Walpole began a new trilogy dealing with the childhood of one Jeremy. Most of the Jeremy books, with *The Cathedral*, 1922, which was dramatised in 1932, dealt with the Cornish town of Polchester. This was also the scene of the *Old Ladies*, 1924, and *Harmer John*, 1926. Walpole also showed himself adept at the writing of "intellectual thrillers" with *Portrait of a Man with Red Hair*, 1925. Meanwhile he had begun his biggest series of novels, *The Herries Chronicle* (*q.v.*). His later novels included *Hans Frost*, 1929, and *Captain Nicholas*, 1934. He acted as adviser to the Hollywood film version of *David Copperfield*, and played a part as a clergyman in it.

As well as being one of the most popular and prolific novelists of his day and country, Walpole was a biographer and critic, writing studies of Joseph Conrad, 1916, and Anthony Trollope, 1923; and author of short stories. He also wrote *The Apple Trees*, *Four Reminiscences*, 1933. First chairman of the Book Society selection committee, he was knighted 1937, and died June 1, 1941. *Consult* H.W.: *A Study*, M. Steen, 1933.

Walpole, SIR ROBERT, 1ST EARL OF ORFORD (1676-1745). English statesman. Born Aug. 26, 1676, at Houghton, into a Norfolk landowning family, he was educated at King's College, Cambridge, inherited his father's estates, and entered parliament in 1701. A typical, coarse-minded, hard-headed, and capable country gentleman, lucid and forcible but not eloquent of speech, with a mastery of figures and a shrewd

judgement of men, marred by a cynical disbelief in their possible disinterestedness, he soon made his mark in the house of commons. He first held office in the Whig administration as secretary of war, 1708; was condemned for corruption in defiance of evidence by a partisan vote in 1712, and

Walpole

placed in the Tower; but returned to office with the Whigs on the accession of George I in 1714. Thenceforth the Whigs were overwhelmingly predominant in parliament, and there the battles were between Whig factions, not between Whigs and Tories.

The group to which Walpole belonged was practically in opposition from 1717 until 1721, when the collapse of the South Sea Bubble and his own reputation as a financier brought back Walpole and his brother-in-law, Townshend, as the heads of the government, from which Townshend retired in 1730. Walpole, who would endure no rival in the cabinet, dominated the nation for 18 years—the first and longest premiership in U. K. history. He refused a peerage in 1723, but accepted the Garter in 1726. His ascendancy was threatened for a moment at the accession of George II, 1727, only to be re-established more firmly than ever through the influence of George's able queen, Caroline of Anspach. Walpole, without a spark of idealism, directed his policy to the one supreme object of advancing the material prosperity of England, developing her commerce, keeping her at peace, and resisting all temptations to take part in European embroilments. He failed, however, to make any other preparation than the mere accumulation of wealth for the struggle which he himself knew to be almost inevitable. When the conflict with Spain was forced on him by the greed of the nation in 1739, England had a reserve of wealth, convertible into power, which ultimately gave her victory.

Walpole's government was destructive because it was morally debasing, founded on the belief that neither men nor nations are influenced by any but material considerations. Walpole employed the system of parliamentary cor-

ruption more methodically than his predecessors, though a good deal less profusely than his successors; he did not say that "every man has his price," but he acted on that doctrine as a general principle. After being forced to declare war he held on to office, although he was wholly unfitted to be war minister. Resignation was finally compelled in 1742, when he received the title of earl of Orford. He died March 18, 1745. Horace Walpole was his youngest child.

Walpole is supremely important in constitutional history as the first real prime minister, insisting on joint ministerial responsibility and the supremacy of the commons rather than depending for support on royal favour.

Walrus. A young Atlantic walrus. Top, the tusks of an adult male walrus
W. S. Burridge, F.Z.S.

Bibliography. Lives, W. Coxe, 1798-1800; A. C. Ewald, 1878; Lord Morley, new ed. 1921; Bolingbroke and Walpole, J. M. Robertson, 1919; The Endless Adventure, F. S. Oliver, 1930-31; R.W. and His Age, G. R. Stirling Taylor, 1931.

Walpurga (d. c. 779). English missionary and saint. Daughter of Richard, king of the West Saxons, she was sent to Germany by her brother, the bishop of Eichstätt, to help her cousin, S. Boniface, in his missionary work. She became abbess at Heidenheim in 754 and also superintended its monastery from 760. Her festival is on Feb. 25.

Walpurgis Night. Eve of S. Walpurga's day, which is celebrated in Germany on May 1. It coincided with the old pagan May festival, when witches were believed to assemble on mountains, especially the Blocksberg or Brocken, to riot in the company of demons, and worship the devil, in a witches' sabbath. A scene in Goethe's *Faust* and in Gounod's opera illustrates the legend. See Brocken; Witchcraft.

Walrus (*Odobenus*). Large fin-footed, carnivorous mammal. It is related to the sea-lion, from which it differs in certain details of its dentition, larger size, heavier and bulkier body, and the absence of external ears. When adult, the walrus is at once distinguished by the pair of huge tusks growing from the upper jaw. These often exceed a foot in length, and are used both in fighting and for digging molluscs out of the bed of the sea. A full-grown male walrus is 10 to 12 ft. long, and may weigh 3,000 lb. When young the body is covered with light brown fur, but this tends to disappear later.

There are two rather distinct races of these animals. The Atlantic walrus (*O. rosmarus*) occurs in Spitsbergen and other islands off the extreme N. of Europe, and has been seen as far S. as the coasts of Scotland. In America it occurs on the islands about Baffin Bay. The Pacific walrus (*O. obesus*) is found about Alaska and the N.E. coasts of Siberia. It has been exterminated in many districts by relentless hunting for its oil and hide. Walruses feed almost entirely on bivalve molluscs.

Walrus. Former British amphibious military aircraft. Put into service in 1935, it was adopted by the Royal Navy, as the first amphibian to be catapulted with full military load. A biplane with a wing span of 45 ft., the Walrus had a max. speed of 124 m.p.h. The aircraft, carried a crew of four, and was fitted to drop bombs or depth charges. It ceased to be operational in 1940.

Walsall, Co. and mun. bor. of Staffs, England. Situated 8 m. N.W. of Birmingham and 120 m. from London, it is served by rly. and canal and it possesses an aerodrome. Its geographical position is of great advantage for transport and trade. The parish church of S. Matthew, rebuilt in 1819, contains remains of an older building. Other edifices include the modern council house, town hall, free library, museum,

Walsall arms

institute of science and art, and theatres. There are several recreation grounds, and a memorial to Sister Dora (see Pattison, Mark). Queen Mary's school here was founded in 1554. "The town of a hundred trades" makes all kinds of metal and leather goods, especially hardware and saddlery. Walsall had a mayor in the 15th century, and was made a chartered town in 1627, when it was known for buckles and other iron goods. Since 1832 it has sent one member to parliament. Market days, Tues. and Sat. Pop. est. 111,010.

Walsh, JOHN HENRY (1810-88). British writer, A Londoner, born Oct. 21, 1810, he became a member of the Royal College of Surgeons in 1832. Taking to literature, he was for many years editor of *The Field*, and, under the pseudonym of Stonehenge, wrote books on various branches of sport. He was also founder of the National Coursing club and the All-England Lawn Tennis club. Walsh's many works included *Manual of British Rural Sports*, 1856; *The Horse in the Stable and the Field*, 1861; *Dogs of the British Islands*, 1867; and *The Modern Sportsman's Gun and Rifle*, 2 vols., 1882-84. He died at Putney, Feb. 12, 1888.

Walsingham. Town of Norfolk, England. It is situated on the Stiffkey, 5 m. S.E. of Wells, with a rly. station. The parish church of S. Mary, restored in 1861, contains a fine Perpendicular font enriched with carvings. The ruined Augustinian priory of Our Lady of Walsingham was a famous pilgrim resort of the Middle Ages. It was founded in 1061 and grew round the chapel of Our Lady of Walsingham, a copy of the *Sancta Casa* at Nazareth. The ruins include portions of the church, the two wishing wells, parts of the refectory and gatehouses. There are also ruins of a Franciscan friary and some almshouses. Pop. 800. See *Pilgrim*.

Walsingham, Sir FRANCIS (c. 1530-90). English politician and diplomatist. Born at Chislehurst, Kent, and educated at King's College, Cambridge, he was a student at Gray's Inn, 1552, then travelled on the Continent during Mary's reign. He acted as an agent for Burghley, was chief of secret service in London, 1569, ambassador in

France, 1570-73, then secretary of state for 17 years, being knighted in 1577. Walsingham settled in 1579 at Barn Elms, where he entertained Elizabeth. The trial and execution of Mary Queen of Scots was largely due to him. He was chancellor of the duchy of Lancaster in 1587, and was made a K.G.

Walsingham, a sturdy Puritan, developed a fine organization of domestic and foreign spies who betrayed the various R.C. plots against Elizabeth. He never lost her confidence, yet his advice on many important matters, e.g. the preparations to be made against the Spanish Armada, was rejected by the queen. He did much to encourage American colonisation. He died deeply in debt, April 6, 1590, and was buried in S. Paul's cathedral. His official papers and correspondence are preserved among the government archives and at Hatfield. A surviving daughter, Frances, married successively Sir Philip Sidney, Robert Devereux, 2nd earl of Essex, and Richard de Burgh, 4th earl of Clanricarde. Consult Mr. Secretary Walsingham and the Policy of Queen Elizabeth, C. Read, 1925.

Walsingham, THOMAS (d. c. 1422). English chronicler. A monk of St. Albans and prior of the monastery of Wymondham, 1394-1400, he was the compiler of a *History of England*, written in Latin, covering the years 1272-1422. He also wrote *Chronicon Angliae*, a history of the period 1328-88, and a history of the abbots of St. Albans.

Walter. Name of an English family, several of whom became controllers of *The Times* (q.v.)

John Walter,
British newspaper
proprietor

newspaper. John Walter I (1739-1812) was the son of a London coal merchant. He carried on his father's business, 1755-81; was an underwriter, 1770-82; became bankrupt through shipping losses; acquired Henry Johnson's logotype printing patent, and, with money presented by creditors on the settlement of his bankruptcy, 1784, bought Printing House Square (q.v.). There he started a printing business, and on Jan. 1, 1785, started *The Daily Universal Register*, the name of which was altered, on its third birthday, to *The Times* or *Daily Universal Register*, and March 18, 1788, to

The Times. Walter retired 1795, dying at Teddington, Nov. 16, 1812.

John Walter II (1776-1847), son of the above, was born Feb. 23, 1776, and educated at Merchant

John Walter II,
British newspaper
proprietor

Taylor's and Trinity College, Oxford. He became joint manager of *The Times* about 1797; sole manager, 1803; and editor, 1803-10. He recruited a brilliant staff of writers on whose anonymity he insisted. He bought Bear Wood, Berks, for which co. he was M.P., 1832-37. He also sat for Nottingham, 1841; and died July 28, 1847. His 3rd son, Sir Edward (1823-1904), founded the Corps of Commissioners.

John Walter III (1818-94), eldest son of the above, went to Eton and Exeter College, Oxford, and was called to the bar at Lincoln's Inn, 1847, in which year he became sole manager of *The Times*. He introduced the Walter machine, 1869; was M.P. for Nottingham, 1847-59, and Berks, 1859-65 and 1868-85; and died at Bear Wood, Nov. 3, 1894. Chief proprietary interest in *The Times* passed to a younger son, Arthur (1846-1910), during whose lifetime the control of the paper passed to Viscount Northcliffe (q.v.). The name John Walter continued to be known on the board, the fourth bearer of it (b. 1873), being a director from 1910.

Walter, BRUNO (b. 1876). German-born American musician. He was born in Berlin, Sept. 15, 1876, and received his musical education at the Berlin conservatory. An able pianist, he soon turned his attention to conducting, and was appointed conductor at the Cologne opera house in 1893. Later attached to other opera houses, e.g. those of Riga, Berlin, and Vienna, from 1913 to 1922

John Walter III,
British newspaper
proprietor

Bruno Walter,
American musician

he was musical director at Munich. His fame was by this time worldwide, and he conducted the first season of German opera to be given after the First Great War at Covent Garden, 1924. With the advent of Hitler to power, he dropped out of the musical life of Germany, and in 1938 he became a French and in 1946 an American citizen. In 1947 Walter became musical adviser to the New York Philharmonic orchestra. He continued to conduct in many parts of the world. His autobiography, *Theme and Variations*, appeared in 1947.

Walters, OR WALTER, LUCY (c. 1630-58). Mistress of Charles II when he was prince of Wales.

Lucy Walters,
Mistress of Charles II

Daughter of a South Wales squire, she came to London during the troubles of 1644 and went to The Hague, where she became the mistress of Prince Charles in 1648. Described by Evelyn as "brown, beautiful, bold but insipid," she lived with Charles until 1650, and after many disreputable adventures died as a Paris prostitute. She bore Charles a son, James, created duke of Monmouth (q.v.). Consult Lucy Walters, Wife or Mistress?, Lord George Scott, 1948.

Waltham. City of Massachusetts, U.S.A., in Middlesex co. It stands on the Charles river, 10 m. W. of Boston, and is served by the Boston and Maine rly. The biggest watch factory in the world was founded here in 1854. Waltham manufactures also church organs, motor vehicles, bicycles, aircraft, and iron and brass ware. It was settled in 1640, and became a city in 1884. Pop. 40,020.

Waltham Abbey. Historic church in the urban dist. of Waltham Holy Cross, Essex, England. Originally cruciform with central tower, it was set up in 1060 on an earlier foundation, by Harold, who is believed to have been buried here. Henry II converted it into a priory, dedicated to the Holy Cross and S. Lawrence, and it became an abbey in 1184. It was surrendered to Henry VIII in 1540, Tallis being then the organist. The existing building includes seven bays of the old nave, with triforium, clerestory, aisles, chapel, and crypt. The W. tower was built in 1556-58. Restoration was

carried out in 1860, 1876, and 1905. The church contains mural brasses and other monuments, as well as the stocks, whipping post, and pillory.

Waltham Cross. District of Herts, England. Part of the urban dist. of Cheshunt, it lies in the S.E. border of the co., 12½ m. by rly. N. of Liverpool Street, London. The Eleanor Cross erected by Edward I has been frequently restored. Close to it is the Four Swans inn, which originally belonged to the above abbey of Waltham, Essex, and is said to date from 1260.

Waltham Holy Cross. Urban dist. and town of Essex, England. An old market town, in the valley of the Lea, its history begins in the days of Canute. Its chief industries are concerned with horticulture under glass, plastics, chemicals, and scientific research. Its most notable feature is Waltham Abbey (q.v.). Pop. approx. 8,000.

Walthamstow. Borough of Essex, England. Part of Greater London, it is excellently served by rly. and bus. Its oldest church is the parish church of S. Mary, partly rebuilt in 1537, enlarged and restored 1817, 1843, and 1876, and containing old brasses. The new town hall is a handsome building. The grammar school was founded in 1527. William Morris was born in a house called The Winns, near

Waltham Cross, Herts.

Lloyd's Park, which, opened in 1900, is now a recreation ground. Walthamstow, made a borough in 1929, elects two M.P.s. Pop. est. 124,380.

Walther VON DER VOGELWEIDE (c. 1168-c. 1230). German poet. Born near Sterzing, in Tirol, he studied the minnesinger's or wandering minstrel's art under Reinmar the Old, at the ducal court in Vienna. From 1198 he wandered from court to court, living in extreme poverty, his bitter satirical

verses having earned him more enemies than friends. His patriotic poems, however, won the patronage of Frederick II, from whom he received a fief near Wurzburg, where he is buried. Walther's love lyrics are among the most beautiful in the language, and he also widened the repertoire of the subjects used by minnesingers. In his best political poems, together with ardent patriotism he expresses the feelings of the empire in the struggle against papal supremacy. Some poems were trans. by W. Alison Phillips, 1896.

Walton,
I Z A A K
(1593-1683).

English writer. Born at Stafford, Aug. 9, 1593, the son of a yeoman, he was apprenticed to a London ironmonger, and after a successful

After J. Huysman

business life in Fleet Street and Chancery Lane, he retired to Shallowford, Staffs, about 1644. He returned to London in 1650, lived with Bishop Morley at Farnham Castle, where he wrote his *Lives of Hooker and Herbert*, and then with his son-in-law, Canon Hawkins, at Winchester,

where he died Dec. 15, 1683, being buried in the cathedral. He was married first to Rachel Floud, a descendant of Cranmer, and later to Ann Ken, half-sister to Bishop Ken. London anglers erected a window to his memory in the church of S. Dunstan-in-the-West in 1895.

Walton's *Lives of Donne*, 1640; *Wotton*, 1651; *Hooker*, 1662; *Herbert*, 1670; and *Sanderson*, 1678, are among the most delightful of English biographies. He was himself not negligible as a poet. His *Compleat Angler* (*q.v.*), 1653, was the first and is still a most popular English nature book. The second part was added by Walton's friend Charles Cotton in 1676.

Bibliography. *Lives*, H. Nicholas, 1823; R. B. Marston, 1888; editions of *The Compleat Angler*, R. Le Gallienne, 1897; A. Lang, 1906; T. Balston and A. B. Gough, 1915; J. Buchan (*World's Classics*), 1935; *Walton's Lives*, ed. A. H. Bullen, 1884; G. Sampson, 1903; *The Compleat Walton*, ed. G. Keynes, 1929.

Walton, WILLIAM TURNER (b. 1902). British composer. Born at Oldham, March 29, 1902, he was

William Walton,
British composer

educated at Christ Church, Oxford, and, apart from composition lessons from Hugh Allen and advice from Busoni, wasself-taught. In 1923 his first string quartet was performed at Salzburg. Walton settled in London and collaborated with Edith Sitwell in the latter's *Façade*, pieces for declamation and chamber orchestra which were later arranged as two orchestral suites and as a ballet. In 1934 his symphony in B flat was performed in London before completion, the finale being added next year. With striking originality Walton blended a vigorous quality allied to all that was best in the English tradition. Important works include the overture *Portsmouth Point*, 1926; *Sinfonia Concertante*, 1927; *Belshazzar's Feast*, for chorus and orchestra, 1931; concerto for viola, 1929; another for violin, 1939; *In Honour of the City of London*, 1937; *The Quest* (ballet), 1943; violin sonata, 1950; music for the films of Henry V and Hamlet.

Walton-le-Dale. Urban dist. and parish of Lancs, England. It is situated on the Ribble, 2 m. S.E. of Preston, and served by rly. The parish church of S. Leonard was founded in the 12th century. The chief business of the town is cotton

spinning, ironfounding, and market gardening. Pop. 12,810.

Walton-on-Thames. Part of the urban dist. of Walton and Weybridge, in Surrey, England.

Walton-on-Thames arms

Built on the S. bank of the Thames, 5 m. S.W. of Kingston, Walton is largely a residential suburb of London, with which there is rly. connexion. The Norman church of S. Mary contains interesting monuments and a curiosity in the shape of a scold's bridle, bearing the date 1632. In the neighbourhood are Walton Manor, where Bradshaw the regicide lived, Oatlands (*q.v.*), and Ashley Park, built by Wolsey and for some time the residence of Oliver Cromwell. In the parish are the waterworks of the W. Surrey Water co. Pop. est. 29,230. See Weybridge.

Walton-on-the-Hill. Village in Surrey, England, 5 m. N.W. of Reigate. The ancient church dedicated to S. Peter, contains a remarkable 12th century lead font. In the 20th century the golf course laid out on Walton Heath began to attract residents, and numerous villas were built around it.

Walton-on-the-Naze. Urban dist. and seaside resort of Essex, England. Part of the dist. known as the Soken, it is 7½ m. S. of Harwich, and is a rly. terminus. Standing on the Naze, and almost surrounded by the sea, it has excellent bathing and boating facilities, while Walton Creek, a large expanse of water, affords excellent wild duck shooting. Formerly a town of some importance, Walton has been much reduced by the encroachment of the sea. The old parish church of All Saints with the neighbouring houses was engulfed in 1798. Besides catering for visitors, the main occupation is fishing. Pop. 3,171.

Waltz (Ger. *walzen*, to revolve). A dance, the music to which is written in 3/4 time, though, as two bars are necessary to complete the movement, the time really is not simply treble, but compound duple. Its origin is somewhat obscure, but probably came from S. Germany or Bohemia. It first appeared in the 18th century, and although fierce attacks were made upon

it in various quarters for its alleged indelicacy and lack of grace, it soon conquered the dancing world. The form was used by Chopin, Brahms, Tchaikovsky, and other composers as a medium for instrumental music, and the compositions of Johann Strauss and others of the Viennese school were intended to be more than the mechanical accompaniment to a dance. The modern waltz is played at half the speed of the original dance.

Walvis Bay. Seaport in the South-West Africa protectorate. It is 21 m. S. of Swakopmund, which it has now superseded, and forms the only good harbour on that coast, being the point of export for 95 p.c. of S.W. African trade. For political reasons it was retained by Great Britain when the Germans assumed a protectorate over the adjacent hinterland, and from 1878 until the First Great War it was a detached part of the Cape of Good Hope. A wall 3½ m. long protects the town (part of which is 4 ft. below sea-level). A 1,500-ft. wharf was constructed in 1928. Pop. 1,992.

Walworth. Dist. of London. It is in the bor. of Southwark (*q.v.*), E. of Newington and S.W. of Bermondsey. The church of S. Peter, 1825, is associated with the work of Canon Horsley (1845-1922). In the dist. is the Browning Settlement (*q.v.*). Walworth Road runs S. from the Elephant and Castle (*q.v.*) to Camberwell Road. Walworth, mentioned in Domesday, is believed to have been the birthplace of Sir William Walworth (d. 1385; see Tyler, Wat). An overcrowded, working-class district, it suffered heavy damage from German bombs in the air raids of 1940 and 1944.

Wampum (Algonquian *wompi*, white). Shell beads strung for ornament, currency, and tribal records by some N. American Indian peoples. Made of the perforated central column of several kinds of marine shells, they became the recognized medium of exchange with the early white settlers. The Iroquois preserved treaty records and the like mnemo-

Wampum. Two strings of shell beads used as money, and an ornamental wampum belt, made by Iroquois Indians
By courtesy of the Trustees, British Museum

nically on wampum belts up to 5 ins. wide. Longfellow's *Hiawatha* contains a reference to running shoes of wampum.

Wanamaker, JOHN (1838-1922). American merchant. Born in Philadelphia, July 11, 1838, he became a bookseller's errand-boy, and in 1856 a retail clothier. This business developing into a huge concern with a branch in New York. Wanamaker started the Bethany Sunday school in 1856, was a founder of the Christian Commission during the Civil War, and was president of the Philadelphia Y.M.C.A., 1870-83. He also founded colleges, and Y.M.C.A. branches in the Far East. In politics a Republican, he was postmaster-general, 1889-93. He died Dec. 11, 1922. *Consult* Lives, H. A. Gibbons, 1927; J. H. Appel, 1931.

Wand, JOHN WILLIAM CHARLES (b. 1885). British prelate. Born Jan. 25, 1885, he went to the King's School, Grantham, and S. Edmund Hall, Oxford. His first curacy was at Benwell, and in the First Great War he was vicar-choral of Sarum and a chaplain to the forces. He next held the vicarage of S. Mark, Sarum, and was a theological tutor there, and after 1925 at Oriel College, Oxford. In 1934 he went out to Queensland as archbishop. Returning to England, he was given in 1943 the see of Bath and Wells, whence he was transferred two years later to London in succession to Dr. G. F. Fisher. A zealous High Churchman, Bishop Wand published *Development of Sacramentalism*, 1928; *History of the Modern Church*, 1930; *History of the Early Church*, 1937; *New Testament Letters*, 1944; *God and Goodness*, 1947. *See* Bishop, illus.

J. W. C. Wand,
British prelate

Wandering Jew, THE. Legendary character condemned to wander about the earth until the second coming of Jesus Christ. According to the story told by Matthew Paris (d. 1259), the Jew, doorkeeper to Pilate, told Jesus to go faster when He was led out to be crucified, whereupon Jesus replied, "I go, but thou shalt wait until I return." The story reappears in the *Chronique Rimée* of Philippe Mouskes (d. 1283), bishop of Tournai. A German version, current at the beginning of the 17th century, gives the Jew the name of Ahas-

uerus, a shoemaker in Jerusalem, who, when Jesus desired to rest by his shop, bade Him move on, and to whom Jesus said, "I will stand here and rest, but thou shalt go on until the last day." There are other variations of the legend, which has Greek and Teutonic parallels, and has led to the appearance of more than one impostor. A play of this name, by E. Temple Thurston, in which Matheson Lang took the title-rôle, was produced at the New Theatre, London, Sept. 9, 1920. *Consult* The Wandering Jew, M. D. Conway, 1881; poetical versions by Goethe, A. W. von Schlegel, C. Norton, and R. Buchanan; novels by Croly and Sue.

Wanderoo. Species of langur, a long-tailed monkey found in Ceylon. It is greyish in colour, and is sometimes protected as sacred. The name is also applied to the lion-tailed monkey (*Macacus silenus*), a species of macaque found in W. India, with a huge grey ruff around the sides of its face.

Wandewash. Town of India, in N. Arcot dist., Madras state. It is situated in the S.E. of the dist. Here Eyre Coote defeated Lally on Jan. 22, 1760, and gained the most important victory ever won over the French in India.

Wandle. Small river in Surrey, England. Rising in the hills above Carshalton, it flows through Beddington and Mitcham into the Thames near Wandsworth Bridge. There are paper-making works on its banks.

Wandsworth. Largest met. bor. in the co. of London. Named after a Thames tributary, the

Wandsworth arms

Wandle, and covering an area of 14½ sq. m., with 20 wards, it includes the dists. of Wandsworth proper (with Southfields and Garratt), Putney, Tooting, Balham, Streatham, and part of Clapham. It touches Surrey on the W. and S. Part of Wandsworth Common, which covers 183 acres and was transferred from the conservators to the metropolitan board of works in 1887, is in Battersea (q.v.). Here are Wandsworth prison, 1851; Royal Victoria Patriotic school, transformed into a military hospital during the First Great War and now Wandsworth training college; and Emanuel school. Wandsworth Park, 20½ acres, on the right bank of the Thames, was opened in 1903.

An ancient suburb once called Wendelsworth, this was a resort of Huguenot refugees, whose burial ground on East Hill contains many notable names. Wandsworth and Putney Bridges connect with Fulham. Comparatively lightly damaged in raids by piloted aircraft, 1940-44, Wandsworth was hit by more flying bombs than any other London borough. Wandsworth is divided into four bor. constituencies. Pop. est. 338,000.

Wanganui. River of New Zealand, in North Island. It rises at the foot of Mt. Tongariro, and flows after a course of 200 m. into Cook Strait on the S.W. coast. Steamers can reach the port of Wanganui, 4 m. from the bar at the mouth, and smaller craft penetrate 140 m. upstream.

Wanganui. A city of New Zealand, in Wellington dist., North Island. On the Wanganui river, 134 m. by rly. N. of Wellington, it is the centre of an agricultural and pastoral area, and exports cattle, sheep, grain, and wool. Population 27,600.

Wangaratta. A town of Victoria, Australia, in Moira co. At the confluence of the Ovens and King rivers, it is an agricultural centre, 146 m. by rly. N.E. of Melbourne, on the line to Sydney. Pop. 5,700.

Wankie. A settlement of S. Rhodesia. It is 212 m. N.W. of Bulawayo by the Cape to Cairo rly., and is the centre for the Wankie coalfields situated on the Gwaai river. The discovery of coal here caused Rhodes to divert the rly. from the direct line to the N. Water is scarce, and is pumped from Deka, 7 m. W.

Wanlockhead. Highest inhabited village of Scotland, 1,380 ft. above sea level. It is in Dumfriesshire, 6 m. E.N.E. of Sanquhar, on the border of Lanarkshire. It was known for its lead mines, first worked about 1680, but closed down in 1934. In 1948 a master radar station for Scotland was built at an elevation of 2,403 ft. on the summit of the Lowther Hills near the village. Pop. 300.

Wanstead. Part of the urban dist. of Wanstead and Woodford, Essex, England. On the S. margin of Epping Forest (q.v.), it has rly. stations at Snarbrook and Wanstead Park. A park of 200 acres, acquired for the public by the City Corporation in 1880, contains several lakes and a heronry. Here during 1715-1822 stood Wanstead House, a mansion built by the

1st Earl Tylney, and for a time the residence of Louis XVIII and the prince of Condé. Wanstead Flats extend S. towards Forest Gate. The church of S. Mary was rebuilt in 1790. Pop., with Woodford, 60,000.

Wantage. Market town and urban dist. of Berks, England. It is 25 m. N.W. of Reading and 60 m. W.N.W. of London. Wantage Road is a station $2\frac{1}{2}$ m. away. The chief building is the church of SS. Peter and Paul, mainly Perp. in style; it retains some parts of an E.E. edifice, and has notable brasses and other memorials. There are a grammar school, and a gallery containing pictures of deeds that won the V.C., presented by Lord Wantage, who himself received that award in the Crimean War. During and after the Second Great War this gallery was a food ministry depot. Wantage is famous as the birthplace of Alfred the Great, to whom there is a statue in the market place, and in whose honour schools have been built. It has an agricultural trade. Near is the Vale of the White Horse. Pop. 5,355.

The town gave the title of baron in 1885 to Robert James Loyd Lindsay, Conservative M.P. for Berks, 1865-85, and during 1877-80 financial secretary to the War office. He died without an heir, June 10, 1901, and his monument stands on the Ridgeway.

Wanyambo. Primitive negroid people of Bantu speech in the Karagwe dist., Tanganyika Territory. They represent a widespread aboriginal stock allied to the Bahutu of Ruanda, and the Bairo of Ankole, Uganda. Of medium stature, dark, and full-lipped, they are an agricultural people who have been overrun and dominated by immigrant Batutsi. See Mpororo.

Wapentake (Old Norse *váp-natak*, touching of weapons). Name given to a division of certain English counties. It corresponds to the hundred (*q.v.*) elsewhere, and occurs in the shires of York, Lincoln, Leicester, Nottingham, Derby, and Rutland, although in some of these the word hundred is also used. The theory is that wapentake is the Danish equivalent for the hundred, as the word is found only in parts settled by this people. It was used for a meeting before it became the name of a district, and originated in the ceremony of touching the chief's spear as a sign of homage. Like the hundreds, the wapentakes vary in size, and in early times had their own courts of justice. See County.

Wapiti. Large Californian deer, showing the characteristic branching antlers and heavily built body
Gambier Bolton, F.Z.S.

Wapiti (*Cervus canadensis*). A species of large deer. Allied to the British red deer, but larger in size, it occurs in N. America, though rarely now outside reservations, and in Central and N.E. Asia. The body is a light reddish brown, the head and limbs darker. The wapiti is mainly distinguished by the fine development of its antlers (*q.v.*).

Wappers, EGIDE CHARLES GUSTAVE, BARON (1803-74). Belgian painter. Born at Antwerp, Aug. 23, 1803, he studied there and in Paris. He painted Flemish history in the Romantic manner, and became a leader of the artistic revolt in Belgium against classicism. Painter to the king and director of the Antwerp academy, he died in Paris, Dec. 6, 1874. Charles I Taking Leave of his Children is a well-known picture by Wappers.

Wapping. London dist. Part of the bor. of Stepney (*q.v.*), it lies between the London docks and The Pool, being connected with Rotherhithe by the Thames Tunnel. Near the High Street are the Old Stairs of Dibdin's ballad. The recreation ground, $2\frac{1}{2}$ acres, in Tench Street, was opened in 1891. Near the Tunnel Pier was Execution Dock, where pirates were hanged at low-water mark and left until three tides had flowed over them.

War (O.Fr. *werre*). State of conflict, the opposite of peace. It was defined by Clausewitz as "a continuation of political intercourse with a mixture of other means," such other means usually implying the use of arms and the taking of human life, but not invariably so. "Other means" may be taken as including the use of an economic blockade or such subtler means as are implied in the phrases "war of nerves" or "cold war." Historically

a war is the name given to a whole series of operations by the opposing parties (not necessarily nations) between two periods of peace, as distinct from a battle or even a campaign, which represent

only part of the operations. Such wars have usually been preceded by a declaration of a state of war by one or both of the parties; but the later tendency has been to dispense with this formality as did Japan in opening hostilities against China in 1931 and Germany in her successive invasions of Poland, Norway, and the Netherlands and Belgium, 1939-40. In Germany's

attack on the U.S.S.R., 1941, and in Japan's attacks on U.S. and British territory later the same year, hostile acts preceded the declaration. Various attempts have been made to draw up rules and conventions for fighting wars, but in "total" war, demanding the whole activity and energy of a nation or group of nations engaged in a life-and-death struggle, such rules and conventions tend to be observed only when it is expedient to do so; for example, all combatants of the Second Great War refrained from using poison gas, as its disadvantages might well have outweighed its advantages. Poison gas played the part of an effective surprise in the First Great War, as the flying bomb, rocket bomb, and atomic bomb did in the Second. Bacteriological weapons might have proved equally effective. One weapon is no less inhuman than another; indeed, any attempt to "humanise" war has been shown to be futile. War itself has become the great enemy of mankind, and the struggle to avoid it one of mankind's continuous pre-occupations.

Throughout this Encyclopedia the two wars of 1914-18 and 1939-45 are referred to respectively as the First Great War and the Second Great War; and full accounts are given under these headings. Other wars, ancient and modern, are dealt with under appropriate headings. See also Air Power; Army; Battle; Fortification; Sea Power; Strategy; Tactics, etc.

War, RULES OF. Rules under the law of nations relating to war can be traced back at least as far as the Middle Ages, but their main growth started about 1850. Their object has been to prohibit acts

of violence not necessary to the attainment of an object by a belligerent. Thus they prohibit killing prisoners or wounded. Until the middle of the 19th century the chief basis of such rules was custom and usage, but since then they have been laid down in international conventions. The declaration of Paris (1856) abolished privateering and regulated contraband; the Geneva convention (1864, revised 1906 and 1929) protected the wounded; the declaration of St. Petersburg (1868) prohibited explosive bullets; the Hague convention (1899, revised 1907) set out the laws of war on land; the Hague declaration (1899) related to dum-dum bullets and projectiles launched from balloons or containing gas; the Hague conventions (1907) concerned laying mines, naval bombardment, and rights of neutrals; the protocol of a conference convened by League of Nations (1925) related to poison gas; the Geneva convention (1929) further protected the wounded and prisoners; the London protocol (1936) discussed the use of submarines against merchant ships. See Geneva Convention in N.V.

War and Peace. Novel by Leo Tolstoy, one of the longest and greatest novels ever written. It is a narrative of the Napoleonic campaign against Russia, culminating in the advance to Moscow and retreat therefrom in 1812. Parallel with the sweeping course of great historical events runs the story of one group of imaginary individual Russians. The theme of the book, constantly stated and illustrated, is that success and failure in historic events depend not on the will and genius of individual leaders but on the conformity of those leaders to elemental truths expressed in those events. There are several English translations of the novel, notably that by Constance Garnett; and as the book appears to reflect something of the psychology of the Russian people it had a new lease of popularity in Great Britain when Russia became an ally during the Second Great War. A radio-dramatic version was broadcast serially in 1943, and in the same year an elaborate stage version by R. Lucas was produced at the Phoenix Theatre, London, where it had only a short run. Neither of these "potted" versions conveyed any sense of the epic grandeur of Tolstoy's work.

Waratah or Warratau (*Telopos speciosissima*). Shrub of the

family Proteaceae. A native of Australia, it has dense tufts of long oval leaves, springs a head of brilliant crimson tubular flowers. It shares with the wattle (*Acacia*) the distinction of being the national flower of Australia, and for this reason is in danger in some districts of being exterminated as a wild plant, so great is the demand for its flowers for decoration.

Waratah. British steamship, belonging to the Blue Anchor line. She left Durban for Cape Town, July 26, 1909, and was never heard of again. A board of trade inquiry two years later, which lasted 15 days, found that the vessel probably capsized in the gale of July 28, but no cause could be determined.

Waratah. Mining centre of Tasmania, Australia. In Russell co., it is 82 m. E. of Launceston, and is noted for its tin mines, especially the rich Mt. Bischoff mine. Gold and silver are also found in the neighbourhood. Another Waratah is a mining suburb of Newcastle, N.S.W.

Warbeck, PERKIN (c. 1474-99). Pretender to the English throne. Son of a Fleming named Wer-

Perkin Warbeck, pretender to the English throne

becque, he spent his youth at Antwerp. In the service of a silk merchant named Meno, he went to Cork in 1491, and next year proclaimed himself duke of York, the younger son of Edward IV supposed to have been murdered in the Tower. The Yorkist faction pressed his claim and he was acknowledged by the French, Imperial, and Scottish courts. In 1495, backed by the emperor Maximilian, Warbeck attempted landings in Kent and Ireland, and James IV of Scotland gave him to wife Catherine Gordon, daughter of the earl of Huntly and James's own cousin. Coming ashore again at Whitesand Bay, Cornwall, he proclaimed himself Richard IV, Sept. 7, 1497. Attended by an army of rustic malcontents, he marched inland, but was defeated at Exeter, surrendered, and in 1498 publicly

confessed his imposture at Westminster and Cheapside. After an attempt to escape from the Tower, he was hanged at Tyburn, Nov. 23, 1499. Some have held the theory that Warbeck was an illegitimate son of Edward IV (whom he seems to have resembled) born when that monarch had fled to Flanders.

Warble. Cyst formed in the back of the ox by the larvae of bot-flies (*Hypoderma lineata* and *H. bovis*). See Bot-fly.

Warbler. Popular name for insectivorous birds of several genera in the family Sylviidae. Eleven species breed in Great Britain, where nine others are occasional visitors. In general structure resembling the thrushes, they are distinguished from that family mainly by the nestlings being without spotted plumage. The true warblers of the genus *Sylvia*

Warbler. The Wood Warbler
W. S. Berridge, F.Z.S.

are represented in Great Britain by the whitethroat (*S. communis*), summer visitant to the British Isles, lesser whitethroat (*S. curruca*), blackcap (*S. atricapilla*), and garden warbler (*S. borin*).

The Dartford warbler (*S. undata*) is resident in the S. counties wherever there are heaths. The genus *Phylloscopus* includes the chiffchaff (*P. collybita*), the willow warbler (*P. trochilus*), and the wood-warbler (*P. sibilatrix*). The genus *Acrocephalus* has two British representatives, the sedge-warbler (*A. schoenobaenus*) and the reed-warbler (*A. scirpaceus*), water-side birds that nest among the reeds and sing through the night. The grasshopper warbler (*Locustella naevia*) is more a bird of the hedgerow whose song has suggested its name. A second species, Savi's warbler (*L. luscinioides*) bred regularly in the reed-beds of the East Anglian fens before their drainage. See Black Cap; Eggs colour plate; Nest.

Warburg, OTTO HEINRICH (b. 1883). German physiologist, born at Freiburg, Oct. 8, 1883, son of the physicist Emil Warburg (1846-1931). From 1914 a member, he was from 1930 director of the Kaiser Wilhelm Institute of cellular physiology. He specialised in the chemistry of the living cell and made fundamental discoveries as to breathing, fermentation, and the assimilation of carbonic acid; he found out vital principles of metabolism, and showed the biological characteristics of the cells of tumours. For these discoveries he was awarded the Nobel prize for medicine in 1931, and made a foreign member of the R.S. He dealt with heavy metals as affecting fermentation in a publication of 1946.

Warburton, WILLIAM (1698-1779). British divine and scholar. Born at Newark, Dec. 24, 1698, he was educated at the grammar school there. After a few years as a lawyer, he was ordained in 1723. Chosen rector of Brant-Broughton in 1728, he was made preacher at Lincoln's Inn in 1746, dean of Bristol in 1757, and in 1759 bishop of Gloucester, remaining there until his death, June 11, 1779.

William Warburton,
British divine
After Hoare

Deeply learned in theology, Warburton made a brilliant attack on deism in *The Divine Legation of Moses*, 1737-41; and a less successful one on Methodism in *The Doctrine of Grace*, 1762. He defended the principles of Pope's *Essay on Man*, and in an edition of Shakespeare corrected Pope's errors. Though a formidable controversialist, he sometimes spoilt his case by lack of restraint. Consult W. and the Warburtonians, A. W. Evans, 1932.

War Charities, LAW RELATING TO. By the War Charities Act, 1940, it is illegal, except in a place of public worship, to appeal for donations or subscriptions in money or kind for any war charity unless it is registered with the local authority or exempted from registration. This Act not only applied to the Second Great War, but may be extended by Order in Council to apply to any war.

War Correspondent. Name given to a reporter from a newspaper or a broadcasting organization delegated during a war to

collect and send home from day to day news of the fighting from the battlefield or its immediate vicinity. During the Second Great War the term was extended to include photographers. The problem for a war correspondent is to reconcile military need for secrecy with public demand for accurate news. H. C. Robinson (*q.v.*) is generally regarded as the first war correspondent. W. H. Russell (*q.v.*) reported the Crimean War and the American Civil War for British readers. Winston Churchill (*q.v.*) first earned fame as a war correspondent. Whitelaw Reid (*q.v.*), who reported the Civil War, and Richard Harding Davis, who reported every war from the Greco-Turkish war of 1897 to the First Great War, were notable American correspondents.

In both Great Wars reporters came under military control—in the Second as commissioned officers. Their dispatches were rigorously censored to prevent risk of a repetition of such a position as that of which Wellington complained in 1809 when, he said, the newspapers described "the position, numbers, objects, and means of attaining them, possessed by the armies in Spain and Portugal." Increasing restriction of freedom was accompanied by increasing personal danger, particularly in the Second Great War when broadcasting led to the call for eye-witness accounts of actions actually being fought. Notable war correspondents of the First Great War included H. Hamilton Fyfe, Philip Gibbs, H. W. Nevinson, Percival Phillips, Perry Robinson, Herbert Russell, and W. Beach Thomas, all of whom except Fyfe and Nevinson accepted knight-hoods in 1920.

In the course of the Second Great War the British War office gave facilities on many fronts to 1,450 correspondents of various nationalities. Reporters, photographers, newsreel men, and broadcasters (none of whom carried arms), went in with service personnel in infantry attacks, bombing raids, parachute and glider drops, commando operations, and naval engagements; 19 British and Commonwealth correspondents were killed, many others wounded or taken prisoner; more than 20 American correspondents were killed in battle, a dozen others in accidents. The radio war reporter, making a first appearance, became much better known to the public than the newspaper reporter, Richard Dimbleby, Godfrey Tal-

bot, and Chester Wilmut being among names familiar to every listener to B.B.C. wartime broadcasts. Stanley Maxted, a B.B.C. Canadian broadcaster, who landed with the airborne forces at Arnhem, gave a moving account of that operation from within it; Ed Murrow, the American commentator, sent over the air the unforgettable story of the entry into Belsen camp. Hundreds of other men ran similar risks to collect information for press and radio in the rapid and violent land, sea, and air activities of the Second Great War.

War Crime. Act committed by an individual for which he may be punished by his opponent. These crimes have long been held to include (1) acts by members of the armed forces violating the recognized rules of war—*e.g.* using poison or other prohibited weapons or ill-treating prisoners; (2) hostile acts by persons not in the armed forces—*e.g.* attacks by civilians; (3) war treason, *i.e.*, acts by persons in occupied territory injurious to the occupying power—assisting prisoners to escape, damaging lines of communication, supplying information; (4) marauding, looting, etc.; (5) spying.

The term was declared to have a wider meaning by the agreement of London in Aug., 1945, made between Great Britain, the U.S.A., France, and Russia, which recognized (a) crimes against peace, *e.g.* planning a war of aggression; (b) war crimes proper, *e.g.* violation of the laws of war; (c) crimes against humanity, *e.g.* inhumane acts committed against a civilian population even in time of peace.

All war crimes are punishable by death, though a lesser punishment may be inflicted. After the First Great War the treaty of Versailles provided that the German govt. recognized the right of the Allies to bring war criminals to trial; but when the Allies demanded the surrender of nearly 900 persons, including many of the most famous names in Germany, it was declared impossible to arrest and surrender them. In the end several persons were tried by the German supreme court in Leipzig. Many were convicted of ill-treating prisoners and sinking hospital ships, and sentences of imprisonment were imposed. The German emperor had been arraigned for a "supreme offence against international morality and the sanctity of treaties"; but as

he was in exile in the Netherlands and the Dutch govt. refused to surrender him, he was never brought to trial.

After the Second Great War the same difficulties did not arise, as all German and Japanese territory was occupied by the victors. In 1942 the Allied powers (excluding the U.S.A. and Russia) had placed among their war aims "the punishment, through the channels of organized justice," of those guilty of war crimes. Similar action was taken separately by the U.S.A. and Russia, and a joint declaration was made at Moscow in 1943 by Great Britain, the U.S.A., and Russia. The London agreement of 1945 set up an international tribunal for the trial of the major war criminals, which took place in Nuremberg. Similar trials of major war criminals in Japan ended in 1948.

Various objections both practical and legal have been raised to the trial of war criminals. It is pointed out that of necessity only the war crimes committed by members of the defeated state are punished; it cannot be expected that the victorious state will allow the defeated state to try members of the former. It has been questioned by some lawyers whether the acts committed by the Nazis, however morally wrong, were crimes by international law. It was never contended that the London agreement could make these acts criminal, for the acts alleged to be crimes were all committed before that time; and it is a fundamental principle of natural justice that a person cannot be punished for an act which was not a crime under the law in force when it was done. Further, the parties to the agreement did not claim to be an international legislature; they were declaring existing law, not making new law. It was questioned whether international law applied to individuals or only to states. One of the most difficult questions connected with war crimes generally is how far it is an answer for an accused person to prove that he committed the crime in pursuance of an order of his superior officer. The London agreement excluded this plea as a defence, while providing that it might be taken into account to mitigate punishment. See Nuremberg Trials; Tokyo Trials. See also Belsen; Genocide; Oswiecim.

Ward. In English law, a child under wardship or guardianship.

In certain circumstances an infant (in the legal sense) becomes a ward of court, i.e. under the protection of the high court.

Ward. In English local government, an electoral division of a municipal borough or parish. In each ward the electors whose names are inscribed in the ward rolls elect councillors.

Ward, SIR ADOLPHUS WILLIAM (1837-1924). British historian and critic. Born at Hampstead, Dec. 2, 1837, he was educated at Bury St. Edmunds and Peterhouse, Cambridge, of which he was a fellow. In 1866 he became professor of history and literature at Owens College, Manchester, where during 1890-97 he was principal. In 1900 he was made master of Peterhouse, and in 1913 was knighted. An authority on German history, Ward was one of the editors of the Cambridge Modern History. He wrote *History of English Dramatic Literature to the Death of Queen Anne, 1875*; *Lives of Chaucer, 1880*, and *Dickens, 1882*; and was part editor of the *Cambridge History of English Literature*. In 1911-13 he was president of the British Academy. He died June 19, 1924.

Ward, ARTEMUS (1834-67). Pseudonym of Charles Farrar Browne, American humorist. Born

Artemus Ward,
American humorist

at Waterford, Maine, April 26, 1834, he became a compositor and reporter. As Artemus Ward, Showman, he contributed to *The Cleveland Plain Dealer* a series of ungrammatical and misspelt letters describing the adventures of an imaginary travelling menagerie. These letters became so popular that in 1860 the author was invited to become editor in New York of *Vanity Fair*, a new comic paper. As this failed, Artemus Ward began in 1861 a career as lecturer, discoursing on the Indians and Mormons, and adding a panorama to the lecture. In 1866 he visited England and produced his panorama in London. He died at Southampton, March 6, 1867. His best-known works are *A. W.: His Book, 1862*; *A. W.: His Travels, 1865*; *A.W. in London, 1867*. They were collected with memoirs ed. M. D. Landon, 1875.

Ward, EDWARD MATTHEW (1816-79). British painter. Born in London, he studied under John

Cawse at the R.A. schools, and in Rome and Munich under Cornelius. He helped to decorate the house of commons, and painted scenes from 17th and 18th century history, especially the French Revolution. A.R.A. in 1846, and R.A. in 1855, he died by his own hand, Jan. 15, 1879. He was the father of Sir Leslie Ward (Spy). See Maclise.

Ward, ELIZABETH STUART PHELPS (1844-1911). An American author. Born in Boston, Mass.,

E. S. P. Ward,
American author

Aug. 31, 1844, daughter of Professor Austin Phelps, she wrote successful short stories as a girl, and achieved wide fame in 1868 with her semi-religious novel *The Gates Ajar*.

Later books were *Hedged In, 1870*; *Beyond the Gates, 1883*; *The Gates Between, 1887*; and *Within the Gates, 1901*. In 1888 she married the Rev. Herbert D. Ward, in collaboration with whom she wrote *Come Forth, 1890*. She died Jan. 28, 1911.

Ward, DAME GENEVIÈVE (1837-1922). British actress. Born in New York, Mar. 27, 1837, she

studied operatic singing in Italy, and, having married Count C. de Guerbel in 1855, made her début under the name of Ginevra Guerbelli, at Milan, in the part of Lucrezia Borgia, 1856. She then toured in England

Dame Geneviève
Ward,
British actress

and the U.S.A., but in 1862 lost her singing voice after an attack of diphtheria, and for a time taught singing in New York. In 1873 she first appeared at Manchester as *Lady Macbeth*. Her success as a tragic actress was immediate and lasting. In the part of *Stephanie in Forget-Me-Not, 1879*, she rose to the highest point of her art. In 1893 she joined Henry Irving's and in 1910 F. R. Benson's company. With Richard Whiting (*q.v.*) she wrote *Before and Behind the Curtain, 1918*, and in 1921 was created D.B.E. She died Aug. 18, 1922.

Ward, MRS. HUMPHREY. This British novelist is dealt with under her full name, *Mary Augusta Ward*.

Ward, JAMES (1769-1859). British artist. Born in London, Oct. 23, 1769, he studied engraving under

James Ward,
British artist

John Raphael Smith, but prompted by George Morland, his brother-in-law, took up painting. His animal pictures are ruggedly realistic. He became A.R.A. in 1807, R.A. in 1811, and lived until Nov. 23, 1859.

Ward, JAMES (1800-84). English pugilist. Born in London, Dec. 26, 1800, he won his first notable victory as a boxer in 1821, being nicknamed The Black Diamond. In the course of 10 years he won many fights, being recognized as English champion in 1825, and, having been beaten by Peter Crawley in 1827, again in 1831, he retired from the ring in 1832, becoming a tavern-keeper and, later, a painter in oils, his picture of the Sayers and Heenan fight, exhibited in 1860, attracting much attention. He died April 2, 1884.

Ward, JAMES (1843-1925). A British philosopher. Born Jan. 27, 1843, and educated at Spring Hill College and in Germany, he became a Congregational minister, but resigned, and in 1872 entered Trinity College, Cambridge, where, and at London university, he took the highest honours in philosophy. Fellow of Trinity, 1875, he became professor of mental philosophy at Cambridge in 1897, and in 1902 fellow of the British Academy. His chief work is *Naturalism and Agnosticism*, 4th ed. 1915. He also wrote *Heredity and Memory*, 1913, and *Psychological Principles*, 1918, in which he advanced new ideas of the meaning of experience. His view of knowledge approaches pragmatism. He died Mar. 4, 1925.

Ward, JOHN (1866-1934). British labour leader. After serving in the army he worked as a navvy, and became interested in labour questions, joining the Social Democratic Federation in 1885. He founded the Navvies' Union in 1899, and in 1906 was elected independent M.P. for Stoke-on-Trent, continuing to represent that division until 1929. In the First Great War he raised five labour battalions and became colonel of the 25th Middlesex Regiment, which he led against the Bolsheviks in Siberia. He was with this battalion on board the *Tyndareus* when it was mined. He wrote the story of the Far-Eastern campaign in *With the "Die-hards" in Siberia*, 1920. Created C.M.G. in 1918, he died Dec. 19, 1934.

Ward, JOHN QUINCY ADAMS (1830-1910). American sculptor. Born at Urbana, Ohio, June 29, 1830, he was one of the few American artists of his day trained entirely in the U.S.A. His first important statue was *The Indian Hunter*, 1864, now in Central Park, and other notable works are his *George Washington* and *Shakespeare* (New York), and *President Garfield* (Washington). He was elected a member of the National Academy in 1863, and was first president of the National Sculpture Soc. He died May 1, 1910.

John Q. A. Ward,
American sculptor

Ward, SIR JOSEPH GEORGE (1856-1930). New Zealand statesman. Born April 26, 1856, he entered politics and became minister of railways, commerce, finance, postmaster-general, minister of defence and of lands. He was prime minister, 1906-12, and 1928-30, and represented New Zealand at the Imperial Conference in London 1907, 1909, and 1911. He was a member of the imperial war cabinet, 1917-18, and one of New Zealand's representatives at the peace conference, 1919. He was created a baronet in 1911. He died July 8, 1930.

Sir Joseph Ward,
New Zealand
statesman
Bassano

Ward, SIR LESLIE (1851-1922). British caricaturist, better known by his pseudonym *Spy*. Born in London, Nov. 21, 1851, he studied architecture, but later developed a gift for caricature. He became famous in connexion with the periodical *Vanity Fair*, to which he contributed during 1873-1909 a remarkable series of caricatures of his distinguished contemporaries in every walk of life. Ward wrote *Forty Years of Spy*, 1915. He was knighted in 1918, and died May 15, 1922.

Sir Leslie Ward,
British caricaturist

Ward, MARY AUGUSTA (1851-1920). British novelist. Born June 11, 1851, at Hobart, Tasmania,

granddaughter of Thomas Arnold of Rugby, she married T. Humphry Ward in 1872 and in 1881 published her first novel, *Milly and Olly*. An admirable translation of Amiel's *Journal* followed, and in 1888 she published *Robert Elsmere*, a book which attracted much attention because of its portrayal of a religious man afflicted by doubt. Her other novels include *David Grieve*, 1892; *Marcella*, 1894; *Helbeck of Bannisdale*, 1898; *Lady Rose's Daughter*, 1903; *The Marriage of William Ashe*, 1905; *Canadian Born*, 1910; *Missing*, 1917; and *Fields of Victory*, 1919. She was keenly interested in social work, especially in the establishment of children's play centres, and founded the *Passmore Edwards*, later the *Mary Ward Settlement*. In 1918 she published *A Writer's Recollections*. She died March 24, 1920. Consult Mrs. Humphry Ward, S. Gwynn, 1917.

Mrs. Humphry
Ward,
British novelist
Lafayette

Ward, THOMAS (1810-58). British adventurer and Parmese politician, known as Baron Ward. Born at York, Oct. 9, 1810, and trained as a jockey, in 1827 he entered the stables of Charles Louis, duke of Lucca, becoming his valet and confidential servant. In 1846 he was created a baron and made minister of finance, in which capacity he arranged the transfer of Lucca to Tuscany. Upon Charles Louis's accession to the duchy of Parma, Ward became his prime minister. He negotiated the abdication of his master, and installed his son as Charles III, going to Vienna as minister plenipotentiary. On the assassination of Charles III in 1854, Ward was dismissed. He died Oct. 5, 1858.

Ward, WILFRID PHILIP (1856-1916). British author. Son of W. G. Ward (v.i.), he was born Jan. 2, 1856 and educated at S. Edmunds, Ware; Ushaw College; Rome; and London university. By

his writings and editorship from 1906 of *The Dublin Review*, he was known as a leading exponent of

Wilfrid P. Ward,
British author

contemporary R.C. thought. In 1896, with A. J. Balfour and Bishop Gore, he founded the *Synthetic Society* for discussion of religious belief. In 1913-14 he lectured in the U.S.A., and he died in London, April 7, 1916. Among his works are *W. G. Ward and the Catholic Revival*, 1893; *Aubrey de Vere*, 1904; *Ten Personal Studies*, 1908; *Life of Cardinal Newman*, 1912.

WARD, WILLIAM GEORGE (1812-82). British theologian. Born March 21, 1812, in London, he was educated at

Winchester and Christ Church, Oxford. When fellow of Balliol, Ward was won over to the Tractarians. He took orders in 1840.

His book, *The Ideal of a Christian Church*, 1844, brought him into disfavour with the university authorities, and in 1845, with Newman, he joined the Church of Rome. During 1851-58 he was lecturer at S. Edmund's College, Ware, and 1863-78 editor of *The Dublin Review*. "Ideal Ward" died July 6, 1882. Consult *W. G. W. and the Catholic Revival*, W. P. Ward, 1893.

War Damage, INSURANCE AGAINST. During the Second Great War schemes were introduced in the U.K. to protect persons against loss that might be caused through the destruction or damage of their property by war activities. In respect of land and buildings, compensation was provided by the War Damage Act, 1941, and later statutes, consolidated by the War Damage Act, 1943. The term covered damage occurring (1) as the direct result of enemy action or action taken in combating the enemy (including damage by an A.A. shell fired during a false air-raid alarm); (2) through measures taken to avoid the spreading of damage, e.g. destruction of buildings to check a fire; (3) accidentally as a direct result of precautionary measures. A contribution of 10s. in the £ on the net annual value was payable in respect of all land and buildings

assessed for income tax or rating. The rate for agricultural and some other land was 6d. in the £.

The owner of land or buildings was normally liable for this contribution; but where property was let or mortgaged, the tenant or mortgagee could in certain cases be compelled to pay part. The contribution of 10s. in the £ was payable by five equal instalments on July 1 in the years 1941-45.

The owner had to report damage to the war damage commission within a specified time and make a claim; if this was allowed, he became entitled to either a cost-of-work payment or a value payment. A temporary sum was granted in respect of first-aid repairs when necessary. In a cost-of-work payment the owner received the actual amount charged at the time repairs were carried out. In a value payment he became entitled to the difference between the value of the property before and after damage plus 45 p.c. because of the great rise in building costs during and after the Second Great War. A cost-of-work payment was usually much more beneficial to the owner. A value payment was normally due when a property was a total loss; but a cost-of-work payment could be claimed in respect of any houses built after March 31, 1914, or in certain circumstances even one built before. The amount due as a value payment carried interest at 2½ p.c. per annum, less income tax, from the date of damage.

The original intention was that the state (i.e. the taxpayer) should pay half the total cost of war damage to land, the other half being provided by war damage contributions. In the event, however, the state had to bear a much larger proportion, for contributions came to only £195 million, while claims approached £1,000 million.

Goods. There were three separate schemes to cover goods, all operated by the board of trade. Under the commodity insurance scheme, traders and manufacturers insured their stock; this was usually compulsory when the total value of goods was £1,000 or more. The premium was fixed quarterly and varied from time to time. Payments for losses were made as soon as possible after they occurred. Under the business chattels scheme, persons carrying on business insured goods in their possession, or owned by them, or over which they had a mortgage; this scheme covered such items as office fittings, furniture, tools, and

movable plant. With some exceptions, insurance was compulsory where the value of insurable goods was £1,000 or more. The premium was fixed periodically. Payments for losses were not normally made until the end of the war.

The third scheme was for private chattels. Without taking out any insurance a householder was covered in respect of his private chattels up to £200 for himself plus £100 for his wife and £25 for each child under 16. To cover goods valued in excess of these amounts he could if he wished take out additional insurance. This scheme covered articles not insurable under either of the other schemes, e.g. clothes and household furniture. The premium was fixed periodically and varied; payments for losses were not normally made until after the war.

The War Risks Insurance Act, 1939, gave the board of trade power to insure and reinsure ships, and cargoes in ships or aircraft, against war risks.

Special Acts relating to landlord and tenant provided that neither should be liable for war damage to the property let. Where it was rendered unfit by war damage, the occupier could end the tenancy by notice. Another Act exempted persons from liability for goods destroyed or harmed by war damage where the goods were held by them as bailees, or on sale or return, or as innkeepers or pawnbrokers.

Warden. Defender, head, or high official. In England the guardians of the Scottish and Welsh borders were known as lords wardens of the marches. The head of the Fleet prison was called the warden. The governor of Dover Castle is the lord warden of the Cinque Ports, and the lord warden of the stannaries is the head officer of the stannaries or tin mines of Cornwall. An air raid warden was an official in the civil defence organization of the Second Great War. Warden is the title of the heads of All Souls, Keble, Merton, New, and Wadham Colleges at Oxford university. See Civil Defence; Marches.

Warden, THE. Novel by Trollope. Published in 1855, it was the first of his Barsetshire stories, and his first publication to enjoy any degree of popularity. *Barsetshire Towers* was a sequel to it.

Wardha. Dist., town, and river of the Madhya union, India, in Nagpur division. The dist. is a cotton-growing area, owing to the black soil. Wheat and pulses are

the food grains; hemp is a valuable crop. Area, 2,435 sq. m. Pop. 519,330. The town has cotton-spinning factories, and is a rly. junction 40 m. S.W. of Nagpur. Wardha College is affiliated to Nagpur university. Pop. 12,500.

The river Wardha flows generally S.E. across the dist., picks up the Penganga, marks the boundary with Hyderabad, and joins the Wainganga at a point S.W. of Markandi.

Wardmote. Court or moot formerly held in each ward of an English town. It is still held in the wards of the City of London. The court's powers include the election of an alderman for the ward. See Moot; Plough Monday.

Wardrobe. Originally a closet for keeping wearing apparel. The large piece of furniture, with doors, and occasionally fitted with drawers, now so called, was introduced under Louis XV and somewhat later in England. See Furniture.

Ward-room. In British warships, a common mess shared by the commander (unless he is in command, when he messes in his own cabin) and all other officers down to and including the rank or relative rank of lieutenant. Junior officers mess in the gun-room (*q.v.*).

Wardship. In English law, a state of pupillage, guardianship. Under this feudal system wardship was the right to the custody of the body of an infant heir of a tenant, and to the custody of the ward's property. See Socage; Tenure.

Ware. Urban dist. of Herts, England. It is on the Lea, 2 m. N.E. of Hertford, and has a rly. station. S. Edmund's is an R.C. training college; a Franciscan priory goes back to the 13th century; S. Mary's is the parish church. The manor house was built c. 1540, and there are other old residences. Literary allusions are to the Great Bed of Ware, formerly

at the Saracen's Head inn and now in the Victoria and Albert museum; and to John Gilpin's involuntary ride here from Islington. Malting, milling, engineering, coach building, and plastic manufactures are carried on. Market day, Tues. Pop. approx. 8,000.

Wareham. Market town and mun. bor. of Dorset, England. It stands between the rivers Frome and Piddle, about 2 m. from Poole Harbour and 121 m. S.W. of London by rly. The church of S. Mary contains the coffin of King Edward the Martyr and an old font. S. Martin's is partly Saxon. There are ruins of a priory and extensive remains of some British earthworks, called the walls. The four main streets form a cross. Chief

Wareham arms

industries are working clay, lime, and stone. Wareham has two yearly fairs. The Normans built a castle here, which saw fighting under Stephen, John, and in the Civil War. In the Middle Ages it was a flourishing port. It is governed by a mayor and corporation. Pop. 3,000.

Warehouse. Building where goods are stored or for the sale of wholesale goods. A bonded warehouse (*q.v.*) is one for storing imported goods, on which duty has not been paid.

Wargla or **OUARGLA.** Town in the Algerian Sahara. Situated 26 m. S.E. of Ghardaia, on one of the chief routes to the Sudan and Timbuktu through In Salah, it is mentioned by Herodotus, and has traces of Roman occupation. The oasis contains thousands of date palms.

War Graves Commission. IMPERIAL. Body established by royal charter in 1917 to be responsible for the formation and maintenance of cemeteries in various parts of the world in which were interred the bodies of soldiers of British and Imperial units who lost their lives in war. The number of burial grounds containing war graves is over 15,000, of which 2,300 are in France and Belgium. The rest are maintained in 100 other countries of Europe, Asia, Africa, America, and Aus

tralia. By 1931 the total number of names on the register of the commission was 1,104,890, of whom 587,117 had been identified and buried in known graves, 517,773 recorded as missing, including 180,861 whose bodies had been found but not identified. They had been buried as "unknown." The names of all the missing appear on the many memorials erected by the commission (see War Memorials). By 1946 the number of graves had increased to 650,000.

The problem of burial in foreign soil was solved by the offer of the French govt., followed by those of Belgium and other Allies of the First Great War, to present to the British authorities the land on which the cemeteries are situated. The war cemeteries all follow the same general pattern, an enclosure with grass plots and flowers, separated by paths and flanked

Wareham. North Street, one of the four main streets of this ancient market town of Dorset

with trees and shrubs, and set with rows of headstones, with a "stone of remembrance" at the E. end. The latter is a massive block of Portland stone bearing the inscription, Their name liveth for evermore (chosen by Rudyard Kipling). Also prominent is a large "cross of sacrifice." The headstones are plain and rectangular, 2 ft. 6 ins. by 1 ft. 3 ins., inscribed with the soldier's regimental no., rank, name, date of death, symbol of his faith (*e.g.* a cross), the badge of his corps, and a text or other inscription chosen and paid for by his relatives, the only charge not borne by the commission. In each cemetery building is the register of each man's parentage, age, birthplace, etc.

More than 15,000 men were employed by the commission after the First Great War in the work of exhuming and reintering the bodies and laying out the cemeteries. The bulk of the work of locating, exhuming, and reintering was completed by the end of

Ware. The Great Bed of Ware, mentioned by Shakespeare. Now at the Victoria and Albert Museum
From a drawing by C. G. Harper

1921; but as late as 1939 bodies of British soldiers were still being discovered, especially on the former Somme battlefields. The commission's h.q. are at Wooburn House, Wooburn Green, High Wycombe, and its London office at 32, Grosvenor Gardens. See N.V.

Warham, WILLIAM (c. 1450-1532). English prelate. A Hampshire boy, he was educated at

William Warham,
English prelate
After Holbein

Winchester and New College, Oxford; entered the Church; and in 1494, being also a lawyer, was made master of the rolls. He was employed on various missions by Henry VII, who made him bishop of London and keeper of the great seal, 1502. Warham was translated to Canterbury in 1504, and was lord chancellor from then until 1515, when he made way for Wolsey. Warham took a subsidiary part in the divorce proceedings against Catherine of Aragon. Although he objected strongly to certain measures of Henry VIII's ecclesiastical policy, he remained archbishop and also chancellor of Oxford until his death, Aug. 22, 1532.

Warkworth. Village of Northumberland, England. Near the mouth of the Coquet, 32 m. N. of Newcastle-upon-Tyne by rly., it is famous for its church, its castle, and a hermitage of the 14th century. The origin of this last is described in Bishop Percy's ballad *The Hermit of Warkworth*. The castle, formerly belonging to the Percys, is a Norman building; it was presented to the nation by the duke of Northumberland in 1922. At the mouth of the Coquet is Amble, which exports coal and other products. Pop. 812.

War Loan. Money raised by public subscription to carry on war. The term is used particularly of loans raised to finance the Great Wars. The national debt of Great Britain originated in public subscription of £1,200,000 at 8 p.c. per annum in 1694 to finance the war conducted by William III against Louis XIV, and since then borrowing has provided much of the

money needed for wars. Liabilities of the U.K. on Aug. 1, 1914, totalled £710.5 millions. During the next five years this amount increased to £7,827 millions. More than 1,000 millions represented short-term loans secured by treasury bills and exchequer bonds; £1,300 millions was a loan from the U.S.A., Japan, and Argentina; the remaining £5,000 millions was composed principally of 4 and 5 p.c. war stock, national war bonds, and war (subsequently national) savings certificates. Interest on the national debt and the cost of its management grew from less than £20 millions in 1914 to £327 millions in 1919.

At the outbreak of war in 1939, the total debt was £8,163 millions. During the next six years there was raised by various forms of loan more than £11,000 millions, including tax reserve certificates (deposits as provision for taxes), 3 p.c. war loan, 3 p.c. defence bonds, 2½ p.c. national war bonds, 3 p.c. savings bonds, national savings certificates, treasury bills, Bank of England loans, and compulsory deposits by banks. Financial control was much more rigorous and money was borrowed at lower rates of interest than in the earlier war. Consequently, although the total debt had nearly trebled since 1919, the interest and the cost of management increased little more than a quarter.

Warkworth, Northumberland. The keep and ruins of the ancient castle, formerly a stronghold of the Percys

Warlock, PETER (1894-1930). British musician. His real name was Philip Heseltine, and he was born in London, Oct. 30, 1894. Founder and editor of *The Sackbut*, a musical journal, 1920, he did valuable work in editing Elizabethan music, of which he helped to bring about a revival. Orches-

tral arrangements of Tudor dances entitled *Capriol Suite* (1928), and of the string fantasies of Purcell.

He wrote fine contributions. A song-writer of genius, he set many lyrics, also Yeats's poem *The Curlew*; wrote a string quartet, 1923. Of his friend Delius he wrote the same year a biography. Warlock committed suicide, Dec. 17, 1930. Consult *Memoir* of Philip Heseltine, C. Gray, 1934.

Peter Warlock,
British musician

Warmbad. A settlement in South-West Africa. It is situated between Kalkfontein and Raman's Drift, on the Hom, about 30 m. N. of the Orange river, at an alt. of 2,360 ft. A missionary station was established here in 1807, the first white habitation in S.W. Africa. A German fort was built in 1893. Warmbad was occupied by S. African forces, April 6, 1915.

War Medal. (1) British medal issued in 1919 to all those who went on service overseas during the First Great War, from any part of the British Commonwealth and Empire. It was made of silver, with a design of S. George on the reverse side and the head of the sovereign on the obverse. The ribbon is: centre orange (watered) with stripes of white and black each side, and borders of royal blue. (2) British medal issued to all men and women who performed full-time service with armed forces of the British Commonwealth in the Second Great War. Authorised in 1946, the medal is of cupro-nickel and bears on the obverse the royal effigy crowned; the reverse, designed by E. Carter Preston, shows a lion standing triumphant on the body of a double-headed monster, the eagle's and dragon's heads symbolising respectively the principal occidental and oriental enemies. The medal is suspended from a ribbon having equal stripes of red, blue, white, blue, red, and a narrow red stripe through the white. Approximately 4,000,000 were issued. See *Medals* colour plate f. p. 6608.

War Medal. British medal issued after the Second Great War

War Memorial. Means by which a community pays perpetual public tribute to the memory of those of its members who were killed in war; distinct, therefore, both from memorials to individual members of the fighting forces and from monuments commemorating great victories. They vary in form from the plain tablet with inscribed names or the stained-glass window in a church to elaborate pieces of sculpture or architecture, while others combine with their function a more utilitarian purpose, e.g. public halls, clock towers, libraries, hospitals or hospital wards, gardens, playing fields, philanthropic institutions.

War memorials were first seen in Great Britain after the Crimean War, and the British dead of most of the wars that followed were usually collectively commemorated in some form or other both nationally and locally. But it was the First Great War, with its unprecedented toll of young life, which gave every city, town, and village in the country, as well as every church and school, every business office, every commercial and industrial undertaking, a direct personal interest in its own war memorial. The Cenotaph in Whitehall was the prototype for hundreds of similar structures in the cities and larger towns of the provinces, all commemorating the "glorious dead" who had belonged to a particular geographical region. Smaller towns and villages usually preferred small shrines, crosses, or Calvaries. Though the majority followed conventional lines, some were most arresting in design and moving in sentiment.

Regimental and Local

There were also many great memorials erected in honour of the men of particular branches of the fighting services, e.g. the naval memorials at Plymouth and Portsmouth, the memorial in London to the R.A.F. (on Victoria Embankment), the Guards (Horse Guards Parade), the cavalry (Hyde Park), the artillery (Hyde Park Corner), and the Merchant Navy (Tower Hill), and the Dover Patrol memorial at Dover.

Among the other remarkable examples may be mentioned the beautiful Scottish national memorial by Edinburgh Castle, with its hall of honour; the Welsh national war memorial at Cardiff, an impressive circular colonnade; the great hall of University College, London; Birmingham's hall of memory; Loughborough's carillon; the cenotaphs at Dundee and

Scarborough, notable if only because of their magnificent hill-top sites; that at Derby which emphasises the sacrifice made by mothers; the rosemary bushes flanking the road down to Folkestone harbour; a memorial milestone at Shooter's Hill; the Indian memorial on the S. Downs near Patcham; a memorial road at Purley; the memorial arch at Corfe, Dorset, bearing the inscription: "Do set men don't sheame their kind"; tapestries at Eton College; the cyclists' memorial at Meriden Green, Warwickshire, the reputed centre of England; the park and tower at Coventry; the old English garden at Kirkham, Lancs; various crosses cut out of the turf of chalk downs; the quaint memorial to a Yorkshire waggoners' battalion at Sledmere, Yorks, carved by a local mason, uncompromising in its depicting of German "frightfulness" and bearing verses in local dialect; avenues of trees at Colchester and at Horsforth, Yorks; the rock climbers' memorial, 3,000 acres of mountain heights in the Lake District; the G.W.R. memorial in Paddington station—a bronze figure of a soldier reading a letter; the Highlander on his granite cairn facing the Five Sisters of Kintail at Cnoc-a-Clachan, Ross and Cromarty; and the huge Freemasons' Hall in Great Queen Street, London.

The Canadian national memorial is a carillon tower at Ottawa. The Australian memorial is at Sydney (see Sydney illus.), the S. African cenotaph is at Durban, the Indian is at New Delhi (see Delhi illus., p. 2628).

France has many memorials on similar lines, notably at Verdun. One of the most striking is at Nice, carved out of the solid rock of the cliff overlooking the harbour. There are also the great memorials in France and Belgium to the thousands of British and Imperial soldiers who found unknown graves. These were set up between the two Great Wars at various points along the former western front. Of these the following are the most important; the number of men commemorated is given in brackets:

Arras (35,925)
 Beaumont-Hamel (Newfoundland: 820)
 Caterpillar Valley (New Zealand: 1,273)
 Cambrai (7,036)
 La Ferté-sous-Jouarre (3,888)
 Le Touret (13,448)
 Loos (20,633)
 Neuve Chapelle (Indian: 4,847)

Passchendaele (34,957)
 Ploegsteert (11,447)
 Pozieres (14,668)
 Thiepval, Somme (73,367)
 Villers-Bretonneux (Australian: 10,866)
 Vimy (Canadian: 11,285)
 Ypres, Menin Gate (54,396)

Similar memorials were erected in Italy, Gallipoli, Greece, Egypt, Palestine, Persia, Iraq, India, E. Africa. The chief Gallipoli memorial rises 100 feet against the sky on the highest ground above Cape Helles, overlooking the sea.

The Second Great War

Memorials occupied a comparatively small place in public thought after the Second Great War, and many communities were content to follow the example of the London Cenotaph which, by a simple addition to the inscription, was made to extend its commemoration to the dead of 1939-45 as to those of 1914-19. Ambitious schemes were mooted here and there, but there was no sign of that spontaneous impulse to commemorate which marked the years following the earlier war. Meanwhile the most remarkable war memorial in the world must surely be that near Hengyang, in Hunan prov., China, which consists of the skulls of 5,000 Chinese soldiers, killed in the siege of Hengyang, 1944, laid in a row across the hillside, and flanked by bare bones. See N.V., also Cenotaph; Unknown Warrior; War Graves; also illus. Neuve Chapelle; Vimy; Ypres.

Warm Front. Term applied to the boundary line, at the earth's surface, between a mass of advancing warm air and one of colder air (ooming from a different geographical source) over which the former is forced to rise along a gently sloping surface. The approach of a warm front can be detected by the appearance of the sky; high cirrus clouds are followed progressively by thicker altostratus and finally by low nimbostratus, with rain extending up to 200 m. ahead of the front. After the front has passed, the rain generally ceases or becomes very light. In the British Isles warm fronts chiefly occur in winter. See Cold Front; Weather.

Warminster. Market town of Wilts, England, 100 m. by rly. W.S.W. of London. Placed on the edge of Salisbury Plain, and on the little river Wylye, it is a market for agricultural produce, and has works for making machinery and gloves, and for weaving silk. The chief church is S. Denys, a cruciform building dating from

the 14th century. Here are a chantry dedicated to S. Lawrence, and the modern missionary college of S. Boniface. The latter houses part of the theological faculty of King's College, London. In 1937 permanent barracks and R.E.M.E. repair shops were set up at Westminster, which became the headquarters of the Imber battle training area. Pop. 6,500.

Warm Springs. Health resort of Georgia, U.S.A., in Meriwether co. It lies on a spur of Pine Mt., about 40 m. N.N.E. of Columbus, and is served by rly. Here F. D. Roosevelt was restored to health after poliomyelitis (infantile paralysis) in 1921, and hither he returned from time to time for treatment, dying here April 12, 1945. He helped in the formation of the Georgia Warm Springs foundation, a charitable corporation with h.q. at 120, Broadway, New York, N.Y., which opened here in 1940 the first sanatorium for the after-treatment of sufferers from poliomyelitis. Near by at Chipley is the Franklin D. Roosevelt state park. Warm Springs should not be confused with Hot Springs (*q.v.*).

War Museum, IMPERIAL. A British collection of exhibits relating to both Great Wars. Its formation was authorised in 1917, and a board of trustees appointed in 1920, when it was opened at the Crystal Palace by George V. In 1924 the tenancy there expired and the collection was removed to the western galleries in Exhibition Road, S. Kensington, where it stayed until transferred in 1936 to the present building, the old Bethlehem Hospital in Lambeth Road. On the outbreak of the Second Great War the trustees were authorised to collect further exhibits and records. The Museum was closed owing to bomb damage in 1940 and reopened in 1946.

The exhibits include relics, models, weapons, uniforms, badges, and medals, with exhibits illustrating the war effort and experiences on the home front. Models and panoramas illustrate such enterprises as the D-day landings, Pluto, Mulberry Harbour, and various warships. A reference library of some 65,000 vols. deals with all aspects of the military, social, political, and economic history of the two wars, and there are files of service journals. Galleries contain works by prominent British artists who recorded the wars in paintings, drawings, and sculpture. Another department contains all official war photographs, and official

cinematograph films are in the trustees' custody.

Warne, FREDERICK (1825-1901). British publisher, born in Westminster, Oct. 13, 1825. After being a partner in the firm of Routledge and co., he established in Bedford Street, Strand, the firm of Frederick Warne and co. In 1865, opened a branch in New York in 1881, retired in 1895, and died Nov. 7, 1901. The business was carried on by his sons. While the founder was in control it issued the Chandos Classics, the Lansdowne Poets, earlier books by Frances Burnett, Nuttall's Dictionary, and achieved success with coloured picture-books for children.

Warner, CHARLES (1846-1909). Stage name of Charles John Lickford, British actor. Born in

Charles Warner,
British actor

London, Oct. 10, 1846, and educated at Westbury College, Highgate, he was early associated with Phelps. His initial appearance on the stage was in Richelieu at Windsor Castle, 1861. He made his London debut at the Princess's Theatre, April 25, 1864, as Benvolio in Romeo and Juliet; was at Drury Lane, 1866-68; and created the part of Charles Middlewick in Our Boys, at The Vaudeville, Jan. 16, 1875. He achieved success in melodrama, especially as Coupeau, in Drink; Tom Robinson, in It's Never Too Late to Mend; and the title-part in Michael Strogoff. Warner toured Australia in 1888-90, and the U.S.A. in 1904 and 1907-09. He committed suicide in New York, Feb. 11, 1909.

Warner, HENRY BYRON (b. 1876). British actor. Son of Charles Warner (*v.s.*), he was born in London, Oct. 26, 1876, and educated at Bedford grammar school, first appearing on the London stage with his father in a revival of It's Never Too Late to Mend, 1898. He went to the U.S.A. in 1905 and was chosen to play the part of Christ (anonymously) in the film The King of Kings, 1927. Later he achieved

H. B. Warner,
British actor

great success in Sorrell and Son (silent film, 1928, sound version, 1934), playing minor parts when past 70, *e.g.* in Indian Summer, 1948.

Warner, SIR PELHAM FRANCIS (b. 1873). English cricketer. Born in Trinidad, Oct. 2, 1873, he was educated at Rugby and Oriel College, Oxford, and became a barrister. Having played cricket for his school, he was in the university eleven in 1895-96, and also appeared for Middlesex. He

"Plum" Warner,
famous captain of
M.C.C. teams and
writer on cricket

was captain of the M.C.C. team that went to Australia in 1903 and recovered the Ashes (*q.v.*); also of a team sent to S. Africa in 1905. In 1911 he again took a team to Australia, though illness kept him out of all the big matches. Captain of Middlesex, 1907-20, "Plum" was one of the best-known amateur cricketers of his day. In 1937 he was knighted, and in 1950 elected president of the M.C.C. He wrote on cricket in the Badminton library, and many books on cricket history, including a history of Lords, 1946; and was editor of The Cricketer.

Warner Brothers. Family of American film magnates. The eldest, Harry (b. Dec. 12, 1881), went to the U.S.A. as a child, and in 1900 opened a bicycle shop at Youngstown, Ohio, with his brother Albert (born in Baltimore). In 1903 they took into partnership the youngest brother, Jack (b. 1892), who was born in London, Ont., and was starting a career in minstrel shows. They opened at New Castle, Pa., one of the earliest theatres devoted to films. After experimenting as film distributors and producers, the brothers achieved success in 1917 with a screen version of My Four Years in Germany. Warner Brothers Pictures, Inc., became one of the most successful film organizations in the world. Jack, who became producer at the Burbank studios in Hollywood, sponsored the first biographical film, Disraeli, followed by The Story of Louis Pasteur, and The Life of Emile Zola. Harry was a pioneer in talking films with the Vitaphone co., of which he became president, with Albert as treasurer.

War Office. British department of state. At its head is the secretary of state for war, who is

ex officio president of the army council, which regulates the affairs of the whole British army. Its constitution is liable to change, but it has always hitherto contained four military and several civilian members, these last now including the parliamentary under-secretary, a financial secretary, and the permanent under-secretary, who exercises general control.

The four military members, whose relative status varies from time to time, except as regards the habitual pre-eminence of the chief of the imperial general staff, consist, in addition to the last-named, of the adjutant-general, the quartermaster-general, and the master-general of the ordnance. Among these four is distributed the work of preparing for war, maintaining the discipline of the army, feeding, quartering, and transporting the troops, each of their departments being divided into directorates, with large staffs of officers and clerical assistants.

The War office as an institution dates back to the Restoration, but its germ is to be found in the standing councils or committees of war which were in existence some forty years earlier. The lessons of the S. African War led to a complete overhauling, for which a reorganization committee was appointed. Its report recommended reconstitution of the office with the single aim of preparing the military forces of the crown for war. It also proposed the creation of an army council which was set up in 1904.

The headquarters of the War office, at one time at the Horse Guards (*q.v.*), and later in Pall Mall, on a site now covered by the Royal Automobile Club, are housed in an imposing structure between Whitehall Place and Horse Guards Avenue, designed by William Young and built in 1899-1906, at a cost of over £1,000,000. *See* Whitehall.

Warp. In geology, mud or clay of alluvial or glacial origin deposited in estuaries or lakes. Much was laid down during the retreat of the glaciers of the Ice Age, when muddy streams entered the sea in extensive estuaries. Tidal currents checked the outflow of sediment and may have carried it inland again to areas of still water where it was deposited, later forming valuable arable land. Mud and clay deposits of the old glacial lakes of Yorkshire are also referred to as warp. Some of these show laminations

due to seasonal deposition, i.e. varved clays. Artificial warping has produced much fertile land. *See* Ice Age; Varves.

Warp and Weft. Terms used in weaving. The warp threads run lengthwise through the piece of cloth, while the weft threads are transverse. *See* Weaving.

Warrantice. Term used in Scots law. It is a guarantee given by one who grants property to another that this shall not be taken from him by someone who has a better title to it.

Warrant. Name given to a document that authorises or assures. In English law it is a written order, given by a person in authority, to do some act. Warrants are issued for the arrest of alleged criminals and for searching premises. A distress (*q.v.*) warrant is one authorising the sheriff's officer to seize goods for arrears of rent. A general warrant was one directed against offenders generally, no name being mentioned. This practice was declared illegal after the arrest of Wilkes on one. Ordinary warrants are signed by magistrates, sheriffs, or other legal officials. Other warrants are issued by the sovereign and by govt. depts. The term is also used for documents authorising the payments of dividends or the delivery of goods out of bond. The term warranty is used for a guarantee that goods sold are what they are alleged to be.

Royal warrants, renewable every 10 years, are appointed to individual tradesmen and craftsmen (not to a firm as such) who supply the sovereign and certain other royal personages with goods. Such a warrant expires with the death of the grantor or the death or retirement of the grantee, or if the firm of which the individual is representative is wound up or materially changes character; and it may also be forfeited for other reasons.

Warrant Officer. Rank in the British armed forces. Intermediate between commissioned and non-commissioned officers, the warrant officer derives his title from the warrant signed by the secretary of state for war or air or by the first lord of the Admiralty.

Every branch of the Royal Navy has its quota of warrant officers, but until 1918 the rank was limited to boatswains, gunners, and shipwrights, all trades dating back to the beginning of the service. Warrant officers are promoted from the lower deck

and may go on to commissioned rank. On the sleeve is one thin gold stripe, backed by a cloth stripe in the colour appropriate to the branch of the service. Naval warrant officers are addressed as Mr. by superiors, as Sir by lower ranks, and entitled to a salute from the lower deck. (*See* Royal Navy colour plate.)

Army warrant officers are of two classes. Class 1 includes regimental sergeant-majors and the senior warrant officers of a regimental unit. Since 1936, a W.O. class 1 has been entitled to command a platoon. The R.A.S.C., R.A.O.C., R.E.M.E., R.A.M.C., and Royal Signals have a stated number. Regimental bandmasters are sometimes in this class, but are more usually granted honorary commissions. The W.O. class 1 wears the royal arms on the sleeve. He is addressed as Mr. by commissioned officers, as Sir by lower ranks, but is not entitled to a salute. Warrant officers class 2 are company sergeant-majors, whose distinguishing badge is a crown worn on the sleeve. They are not addressed as Sir and are always referred to by rank.

In the R.A.F. the W.O.1 is the senior warrant officer of a squadron or station, but the actual aircrew personnel of a flying squadron may include more than one such. A station warrant officer has authority over all W.O.1s on the station. He is addressed as Sir or Mr. Insignia of rank are the royal arms worn on the sleeve; dress includes officer's uniform and cap badge on forage cap or beret, but a special badge when wearing a peaked cap. A W.O. class 2 has the same sleeve insignia but other ranks' uniform and cap badge. R.A.F. and army warrant officers dine in the sergeants' mess, but those in the navy have their own mess.

Warre, EDMOND (1837-1920). British schoolmaster. Born in London, Feb. 12, 1837, he had a distinguished career at Eton and Balliol College, Oxford, becoming fellow of All Souls in 1859. He also rowed in the Oxford eight, 1857-59, and in later years wrote much on rowing. Returning to Eton as assistant master in 1860, he was ordained and made headmaster in 1884; retired in 1905; and in 1909 was elected provost. He was considered one of Eton's most notable headmasters, and a memoir by C. R. S. Fletcher appeared in 1922. He died Jan. 22, 1920.

Warren (Old French *warir*, to keep). Breeding place for rabbits. In artificial enclosures one acre, covered with good grass and planted frequently with furze and juniper, is sufficient to support about twenty rabbits. The word is also used for ground enclosed for the preservation and breeding of game, or for a fish preserve in a river. In legal terminology, free warren, or right of warren, is a franchise, obtained by prescription or grant of the crown, for the right of property in beasts and fowls of warren. These include rabbits, hares, pheasants, and partridges, and sometimes also woodcock, quail, and waterfowl, but not grouse.

Warren. City of Ohio, U.S.A., the co. seat of Trumbull co. Situated on the Mahoning river, 50 m. S.E. of Cleveland, and served by the Baltimore and Ohio and other rlys., it is an industrial centre, with manufactures of steel goods. The neighbourhood produces coal and iron. Warren was settled in 1799, and became a city in 1834. Pop. 42,837.

Warren. Bor. of Pennsylvania, U.S.A., the co. seat of Warren co. It is 65 m. E.S.E. of Erie, on the Allegheny river, and is a junction on the New York Central and Pennsylvania rlys. Warren was founded in 1795, and incorporated in 1832. There are oil refineries, metal works, and furniture factories. Pop. 14,891.

Warren, SIR CHARLES (1840-1927). British soldier. Born Feb. 7, 1840, and educated at Cheltenham, Sandhurst, and Woolwich, he entered the R.E. in 1857, and was engaged in survey duties, especially in Palestine. He commanded troops against the Bechuanas, 1878, was commander-in-

Sir Charles Warren,
British soldier
Russell

chief and administrator of Griqualand West and led an expedition against the Bechuanas, 1884-85, for which he was knighted. Having commanded in the Suakin campaign, he was commissioner of metropolitan police, 1886-88, and, commander-in-chief, Straits Settlements, 1889-94. In the S. African War, when in command of the 5th division, he incurred much criticism through his operations at Spion Kop. *Consult* Life, W. Williams, 1941.

Warren, SIR JOHN BORLASE (1753-1822). British sailor. Born Sept. 2, 1753, at Stapleford, Notts,

Sir J. B. Warren,
British sailor

he came into a baronetcy in 1775, and in 1777 entered the navy. Commanding a frigate squadron in 1793 he harried French shipping in the Channel, capturing many privateers and distinguishing himself at Quiberon Bay (*q.v.*). For intercepting and destroying a French squadron which was attempting a landing in Ireland, 1798, he was promoted rear-admiral next year. He was commander-in-chief of the N. American station, 1813-14, and died Feb. 27, 1822.

Warren, SAMUEL (1807-77). British novelist and lawyer. Born near Wrexham, May 23, 1807, he was educated at Edinburgh for the medical profession, but preferring the law, entered the Inner Temple in 1828 and practised as a special pleader before being called to the bar in 1837. Made recorder of Hull, 1852, and M.P. for Midhurst, 1856-59, he was appointed a master in lunacy, 1859, and died July 29, 1877. Warren's fame rests upon his novel *Ten Thousand a Year*, with its crude humour and caricatures of the great; this first appeared 1839-41 in Blackwood's Magazine. Popularity was also achieved by his melodramatic *Passages from the Diary of a Late Physician*, 1830-37.

Warren, SIR (THOMAS) HERBERT (1853-1930). British scholar. Born at Bristol, Oct. 21, 1853, he was educated at Clifton and Balliol College, Oxford, where he graduated in 1876. Fellow of Magdalen, 1877-85, he was elected president in 1885, was vice-chancellor of Oxford, 1906-10, and professor of poetry, 1911-16. He was made K.C.V.O. in 1914, and retained the

Sir Herbert Warren,
British scholar

presidency of the college until 1928. He died June 9, 1930. Among Sir Herbert's own poems may be mentioned *By Severn Sea*, 1897, and *The Death of Virgil*, 1907. His other works include *Oxford and Poetry*, 1911; *War and Poetry*, 1915.

Warrenpoint. Seaport and urb. dist. of Down, N. Ireland. At the head of Carlingford Lough, 6 m. S.E. of Newry, it is a rly. terminus and has steamer service to Liverpool. Pop. 1,900.

Warri or **WARI**. River port of Nigeria. It stands 80 m. S.S.E. of Sapele by creek, on the Forcados branch of the Niger estuary, and can be reached by vessels with a draught of 13 ft. The name is also that of a prov. of S. Nigeria, on the Bight of Benin.

Warrington. Co. and mun. bor. and market town of Lancs, England. Situated on the Mersey, between Liverpool and Manchester, it is 182 m. N.W. of London and has rly. and canal communication with all parts of industrial Lancs and Cheshire. The parish church of S. Elphin stands on the site of a 12th century building, and has a tower and spire 281 ft. high. The church was restored in 1860. Other buildings are the grammar school, founded in 1526, and the bluecoat school, 1665. There are also a town hall, free library (the first

Warrington arms

Warrington, Lancashire. Parish church of S. Elphin, built on the site of a 12th century building. The spire is 281 ft. high

in Great Britain to be supported (by the rates), museum, technical institute, and the Sankey Hall for concerts, etc.

Warrington makes many different types of industrial products, notably wire, pins, cotton ware, glass, and soap. Claiming to be built on the site of Veratunum, the Roman ford over the Mersey, Warrington was early an important place, and in the Civil War was the headquarters from which Lord Derby attacked the parliamentary stronghold of Manchester. The fairs and markets of Warrington date from the 13th century, but it did not become a chartered town until 1847. In 1900 it became a county bor. It elects one M.P. Market days, Wed., Fri., and Sat. Pop. est. 78,550.

Warriston, ARCHIBALD JOHNSTON, LORD (1611-63). Scottish statesman. Born in Edinburgh, March 28, 1611, he went to Glasgow university, and came into prominence in 1638, when he assisted Alexander Henderson (q.v.) to frame the Solemn League and Covenant, and was chosen clerk of the Glasgow assembly. A commissioner at the peace of Berwick, 1639, and

at the treaty of Ripon, 1640, he became a lord of session in 1641.

Warriston was a passionate opponent of Montrose, disagreed with the negotiations between the Scottish parliament and Charles I, 1648, and allied himself to the Puritan party. A zealot, "full

offire, of heavy energy and gloom," he protested against the subordination of kirk to state. Summoned to Cromwell's house of lords in 1658, he also acted as chairman of the committee of public safety. After the Restoration he was tried at Edinburgh and hanged July 23, 1663.

Warrnambool. City and seaport of Victoria, Australia. It is on the S. coast, 166 m. W.S.W. of Melbourne, with which it has rly. and steamer communication. Its good harbour and the agricultural land behind make it the chief western entrepôt of trade. It has freestone quarries. Population 9,997.

Warsaw. City and seaport of Victoria, Australia. It is on the S. coast, 166 m. W.S.W. of Melbourne, with which it has rly. and steamer communication. Its good harbour and the agricultural land behind make it the chief western entrepôt of trade. It has freestone quarries. Population 9,997.

Warsaw: CAPITAL OF POLAND

Simon Wolf, LL.D. (Vienna), and Others

The story of the tragic capital of a tragic country is here told. Warsaw, several times in its history badly damaged, was thought by the Germans to have been effectually destroyed during the Second Great War, but the Poles began immediately to construct anew the city by the Vistula

After Poland became an independent country once more in 1919, her capital Warsaw developed rapidly.

By absorption of neighbouring dists., and an influx of inhabitants from the provs., its area grew to nearly 50 sq. m., its pop. to 1,289,000 (1939),

30 p.c. Jewish, 66 p.c. R.C. Warsaw proper lies on the left bank of the Vistula, 90 ft. above and sloping steeply down to the river, along which were built new, low-lying quarters. On the right bank is the large suburb of Praga, linked with the left bank until 1944 by three road and two rly. bridges, all destroyed by the Germans during the Second Great War. Of Praga that war left substantial parts; of Warsaw perhaps 10 p.c. One of the first things to be rebuilt, in nine months, was the Poniatowski bridge; and between Jan., 1945, and Aug., 1947, with the help of

U.N.R.R.A. bulldozers and mixing machines, 20 p.c. of destroyed Warsaw was rebuilt.

The main thoroughfare, running N. to S., is a wide street called Krakowskie Przedmieście (Cracow suburb); its continuation is Nowy Świat (new world) street and the Aleje Ujazdowskie avenue, which adjoined the parks where the foreign embassies and legations lay, many housed in beautiful palaces. At the beginning of this road stood the Zamek (royal castle), seat of the president (reduced to a heap of rubble in 1944); at its far end was the Belvedere palace, for many years the home of Pilsudski, and converted into the Pilsudski museum after his death. The second main thoroughfare, running more or less parallel with the first, is Marszałkowska street, still Warsaw's Bond St. two years after the war when one-storey shops had sprung up on the sites of those destroyed. It begins at the Ogród Saski (Saxon gardens), passes the central rly. station, Warsaw's busiest traffic spot,

and ends at the square of the Lublin Union (Plac Unji Lubelskiej), where a monument to fallen airmen was erected. The old town, in the N.E. of Warsaw, with old burghers' houses and picturesque market square, was completely destroyed in 1944.

After 1920 the Russian Orthodox church in Saxon Sq. (Plac Saski), a pompous building in Byzantine style, was demolished. The large Saxon Sq. itself, in which a cenotaph with undying flame stood, was renamed Pilsudski Sq. The stucco façades which concealed the contour of houses of the time of Stanislas II were removed. The rough cobbled roadways, laid during Russian administration, were torn up and resurfaced. The streets were replanned and a more direct approach to the Vistula opened. Praga, roughly a third of Warsaw's total area, and Wola, another suburb, became centres of industry and workers' quarters; the former industrial dists. of Czerniaków and Mokotów developed into residential areas. Two new garden suburbs, Żolibórz, behind the old citadel, and Ochota, to the W. of the city, both built on almost waste land and governed by cooperative management, became residential dists. for professional men, artists, actors, officers, etc. (Workers' flats were put up in Żolibórz after the war.) Trees were planted along the streets. In the Łazienki park a monument was erected to Chopin; in the adjoining botanical gardens stood the astronomical observatory. A new park, named after the novelist Stefan Żeromski, was made on the site of the former Russian fortifications.

During 1919-39 education in Warsaw was greatly improved. In 1939 18,000 students were attending schools of university status, 8,000 of them, nearly half women, at the university itself. In 1937 Warsaw had 143 nursery schools, 380 primary schools, 100 secondary schools, 193 trade schools. A national library founded in 1927 contained half a million vols., 20,000 old MSS., 80,000 engravings. The university library had 800,000 vols. and 100,000 engravings. From the times of the partitions, there remained the formerly private libraries of the Zamoyiski foundation. The diet (*sejm*) and the senate had a good collection of literature on the history of parliament. Most of these books were destroyed during the war.

The diet building itself was reconstructed in record time, with

Warsaw arms

very little aid from machinery; and by the summer of 1947 many schools and govt., trade union, and newspaper offices had been rebuilt. Plans for further restoration included making a strip of gardens and sports grounds $\frac{1}{2}$ to $2\frac{1}{2}$ m. wide along the Vistula, in place of the vanished houses that formerly lined it; widening of the Marszałkowska from 30 to 120 yds.; concentration of light industry in the W., of heavy industry (wiped out in the war) in the N.; construction on the rubble-heap that was the former Jewish quarter of a garden city for workers; and reservation of space for later construction of theatres, cinemas, sports grounds.

Character of the People

The Warsaw that ceased to exist in 1939 has been called the Paris of the N. Vitality, drive, and temperament are characteristic of the people, who are, also progressive and of a lively humour which found expression in e.g. cabaret songs and satires criticising the country's rulers. In times of adversity, Warsaw's gaiety and lightheartedness give place to a patriotic spirit ready for boundless sacrifice. The people of Warsaw admire music, song, and the fine arts. They also enjoy good food, and had numerous excellent restaurants. Coffee-houses and coffee-house life have always flourished and were among the first institutions to be revived in 1945. Pastries served in these *cukiernias* were world famous, the chocolates made in Warsaw were among the best in the world. There were many night clubs and other places of entertainment. Driving in a horse cab along the avenues was a popular pastime, left over from the pre-motor era. Parks, old buildings, wide streets, luxury shops, and pleasant climate (hot summers and dry, cold winters), the river, and the agreeable, though flat, countryside made Warsaw one of the most lovable capitals of Europe.

The majority of the Jews lived in their own congested dist. called Nalewki after its main street. It embraced wealth and poverty, workshops in cellars and up-to-date flats, theatres and publishing houses, factories and coffee-houses. A town in itself, the Jewish quarter was nevertheless an integral part of the capital, and one of the most interesting communities in Europe. Not until the Nazi occupation was a wall built round it, turning it into a ghetto.

HISTORY. There is no satisfactory explanation of the name Warsaw (Pol. Warszawa); neither

is it known why her coat of arms bears a siren armed with a sword and shield; but her motto *Contemnit procellas* (she defies the tempests) does correspond to facts: the city has survived many storms. The first reference to Warsaw occurs in a document of 1251. At that time it consisted of a church, a castle, and a small settlement whose inhabitants made their living by fishing in the Vistula. These fishermen were Masurians (people of the duchy of Masovia, incorporated into Poland only in 1526). In 1339 two papal delegates reached Warsaw from Rome to conduct the trial of the Teutonic knights of the Cross. Conrad II, duke of Masovia, left the fishing village intact, but on the adjoining higher ground built a town surrounded by fortifications which was completed in 1379.

In the 15th cent., Warsaw grew rapidly, the new suburbs being given in 1414 the status of a town as New Warsaw; henceforth there were two towns with separate municipal authorities. Soon this double city developed into a lively centre of commerce, and kings of the Jagellon dynasty favoured it more and more. When that royal house died out, and the Polish throne became elective, the election meetings took place in the suburb of Wola. The Swedish king Sigismund Waza made Warsaw the capital, it being nearer to Sweden than Cracow, the former capital. In the middle of the 17th cent., during the wars with Sweden, the Swedish garrison in the city defended it, contrary to the will of the Polish burghers, against the besieging Polish forces; the resulting destruction caused a change in the layout of the city. In 1702, during another Polish-Swedish war, Warsaw was twice captured by the Swedish king Charles XII. Fire ravaged much of it; and the plague raged for two years, killing 30,000. The last Polish king, Stanislas II, himself drew plans for new parts of Warsaw, directed the rebuilding of the royal castle after a fire in 1769, and designed the beautiful Łazienki palace, with its lovely park. During the *Kościuszko* rising against the Russians in 1794 a Warsaw cobbler, Jan Kiliński, led the people of the old town into battle, and defeated the Russian garrison. By the autumn of the same year the tsarist army of Gen. Suvorov had captured Praga and, having massacred that suburb's inhabitants, crossed the river to the capital.

As a result of the third partition 1795, Warsaw was incorporated into Prussia, becoming simply the seat of a prov. govt.; the pop. fell from 200,000 to 60,000. In 1807 Warsaw became capital of the small, independent, short-lived duchy of Warsaw, created by Napoleon. The congress of Vienna, 1814-15, established "Congress Poland," with Warsaw as capital, where the Russian emperor was crowned as king of Poland. The first great rising against Russian rule began in Warsaw in 1830; it was the head and heart of the second rising against the Russians in 1863, also suppressed; and there was street fighting here in 1905 when the Russians lost the war against Japan.

Capital of New Poland

During the First Great War, Warsaw was in 1915 occupied by the Germans, who attempted to win the Poles to their side by allowing them a semblance of independence. When Poland was reborn in 1919, Warsaw became her capital. In 1920, when the Polish army was thrown back from Kiev, the Red army, after a lightning advance, appeared at the gates of Warsaw. The Poles won the ensuing battle, and saved the capital.

SECOND GREAT WAR. From Sept. 1, 1939, the day of the German attack on Poland, Warsaw was subjected to bombing from the air. Land attack on the city began on Sept. 7; the ring closed about it on the 14th. On Sept. 16 Warsaw rejected a German demand for capitulation; on the 24th the Germans threatened to use gas; during a heavy artillery bombardment on the 25th and 26th thousands of citizens were killed and large parts of the city laid in ruins. On the 27th an armistice was signed, and on Oct. 1 the Germans entered Warsaw. Hitler drove in triumph through the city on Oct. 14, over a route carefully selected for him so that he should not see the extent of the damage. Ludwig Fischer was appointed governor of Warsaw (after a trial in that city Nov. 28, 1946-March 3, 1947, he was hanged in Mokotów prison there, March 7, 1947); and the city became for five years the scene of searches, street round-ups, evictions, arrests, abduction of hostages, executions. There was always hunger and, in winter, cold. The best shops, parks, trains, tram cars were reserved for Germans.

Many thousands of men of military age escaped to join the Polish forces in the W.; tens of thousands fled E. to Russia; while refugees

Warsaw, Poland. The city as seen by the advancing Russian armies during the Second Great War from the eastern suburb of Praga, across the Vistula. Right, Post-war reconstruction in the capital

from W. Poland, annexed by the Germans, streamed into Warsaw. The Germans closed all higher and secondary schools; many of the dispossessed, including professional men, took to trading. From the early days of the occupation, clandestine liberation groups were formed; an underground press came into existence; sabotage was carried on.

In the walled-off ghetto, into which all the Jews of the city were herded in 1940, conditions were peculiarly hideous. Down the centre of the streets were passageways for "Aryans" only, should any wish to enter the Jewish area. Jews could cross the street only by bridges built across these passageways. Entrance and exit to the ghetto were by pass alone. Food inside the ghetto was so scarce that the death rate in the winter of 1941-42 rose to 13 p.c. (Warsaw figure in 1938 was 1.07 p.c.). Between July 22 and Sept. 1, 1942, a quarter of a million Jews were deported, of whom only 4,000 could be traced as living at the end of the year. Destruction of the Jews of Warsaw was completed between April 19 and 28, 1943. Using tanks, bombers, and artillery, the German army and S.S. troops attacked men, women, and children whose only arms were a few machine-guns and rifles smuggled in by the Polish underground movement; 26,000 were massacred, the remaining 14,000 were deported. About 300 Germans were killed, 1,000 wounded, in this unequal battle. For leadership in this action the exiled Polish govt. awarded posthumously to Michael Klepfisz the silver medal of the order *Virtute Militari*.

In the last days of July, 1944, Rokossovsky was approaching Warsaw. The Germans had made the Vistula into a defence line, and to defend Praga, a bastion bridge-head, they had concentrated a force too strong to be overcome by the advanced Russian troops, who

had to fight harder and harder as they approached Praga. Nevertheless, the Red army had had so many recent successes that Gen. Tadeusz Komorowski (otherwise Gen. Bor), c-in-c. of the Polish home army in Warsaw, and authorised by the Polish exiled govt. to use his own judgement as to the timing of a rising in the city, assumed Praga would fall to the Russians with little difficulty, and probably also Warsaw itself, and he decided to strike at 5 p.m. on Aug. 1. His forces achieved great initial success. The Germans, however, made counter-attacks of such violence against Rokossovsky's troops that they did not take Praga until Sept. 14.

The partisans in Praga were suppressed within a day; in Warsaw itself they were driven by the Germans from the old town, destroyed house by house, and then from the centre of the new town. Some outside help came to them in supplies, food, and weapons dropped by the R.A.F., and, after Sept. 14, by the Red air force; while on Sept. 16 a large force of U.S. bombers dropped supplies over Warsaw and flew on to land in Russia. But by the time the Russians had taken Praga the Germans had destroyed the bridges. The Russians failed in attempts to cross the heavily defended river, here 450 yds. wide, in the floats, rafts, and rubber boats by which they had contrived surprise crossings of other rivers, until Sept. 23 when Gen. Bor reported that some had succeeded in landing. Russian guns and aircraft, under partisan wireless guidance from inside Warsaw, bombarded the German positions. But the Russians did not get sufficient troops across to save the partisans who

held on until Oct. 3. When they surrendered, only 15,000 out of 80,000 originally engaged laid down their arms; and the capital had been almost totally destroyed. After the surrender the Germans drove the inhabitants to a concentration camp at Pręzków, whence many were sent to forced labour in Germany. The exiled Polish govt. believed the Russian failure to relieve the Warsaw partisans was deliberate; one reason for this belief being the Russian refusal of landing facilities for R.A.F. aircraft. There are, however, reasonable grounds for doubting it.

Not until Jan. 17, 1945, did the Red army at last reach Warsaw and clear the Germans from the rubble heaps that had been a great city. Next day, the provisional govt. set up at Lublin on Dec. 31, 1944, moved to Warsaw and set itself to rebuild Poland and the capital from the city's cellars.

Warship. Any vessel built for purposes of fighting. See Battleship; Corvette; Cruiser; Destroyer; Dreadnought; Frigate; Navy; Royal Navy; Sea Power; Submarine, etc.

Warspite. Former British battleship. Launched at Devonport in 1913, she was of the Queen Elizabeth class and displaced 27,500 tons on a length of 600 ft. and a beam of 104 ft. She had a main armament of eight 15-in. guns, and secondary batteries of eight 6-in., eight 4-in., and 20 A.A. guns. Serving with the Grand Fleet, she was damaged at Jutland. In 1937 she was reconstructed at a cost of £2,500,000, her displace-

ment being increased to 30,600 tons and her engines renewed to give a speed of 24 knots. Accommodation was also provided for four aircraft. In the Second Great War the Warspite took part in the attack on Narvik; was at Cape Matapan as flagship; and helped to cover the Allied landings at Salerno, where she was severely damaged by German glider bombs. She provided covering fire for the Royal Marine assault on Walcheren. In 1947 the Warspite was sold for scrapping, but in a gale was driven ashore at Prussia Cove, Cornwall, and became a total loss.

Wart Hog. Boar of the Ethiopian species *Phacochoerus aethiopicus*

Wart. An overgrowth of the horny layer of the skin, usually on the hands or fingers. Probably due to a virus, a wart may be destroyed by frequent application of caustics such as glacial acetic acid or solid carbon dioxide. Many types of wart come under the control of the nervous system, and can be "charmed" into departure by folk-medicine. Much fascinating investigation is being done on these mysterious growths.

Warta (Ger. Warthe). River mostly in Poland but in its lower course in Germany. It rises on the N. side of the Carpathians, N.W. of Cracow, and flows generally N., then W. It is navigable from Konin, and Poznan is the principal town on its banks. After some 450 m. the river reaches Küstrin, N. Germany, to join the Oder, of which it is the most important tributary.

Wartburg. Peak of Thuringia, Germany. It is near Eisenach, at the N.W. end of the Thuringian Forest, and is chiefly known because of the castle built here by a ruler of Thuringia about 1100. It became a resort of the Minnesingers, and here in 1207 took place the competition between them mentioned in Wagner's *Tannhäuser*. The castle passed later to the elector of Saxony, and hither Luther was carried by order

of the elector Frederick III in 1521, when his life was in danger. He remained there for ten months. The building was restored in the 18th century and until 1918 was a residence of the dukes of Saxe-Weimar. There are relics of Luther. See Eisenach; Luther.

Wart Disease (*Synchytrium endobioticum*). Tumorous fungus-like growth which affects potatoes upon both stem and tuber. It first obtains access to the potato through one or more of the eyes, and continues to expand in the form of a globular protoplasmic mass. The cells die, leaving only the cell wall, after the manner of coral formations, but the process of growth or building up continues indefinitely. There is no remedy for this fungoid disease, and all infected tubers should be dug up and burnt. All occupiers of land upon which the disease occurs must at once report its appearance to the ministry of Agriculture and Fisheries.

Wart Hog (*Phacochoerus*). Genus of two species of African swine (Suidae). Generally resembling the wild boar, they are distinguished by the large head, four huge tusks, and three flexible pads on each side of the long face. Except in the breeding season the old boars are solitary, but two or three sows with their litters will run together. The cheek pads or "warts" are believed to serve as shields for the rather prominent eyes during contests of the boars. Both species (*P. aethiopicus* and *P. africanus*) are much alike, and have a long mane of coarse, bristly hair on the neck and back.

Warton, JOSEPH (1722-1800). British poet and critic. Born at Dunsfold, Surrey, and educated at Winchester (with Collins) and Oriel College, Oxford, he was ordained and held several charges before returning to Winchester in 1755 as second master. During 1766-93 he was headmaster there. A familiar figure in the London literary circle of which Johnson was the centre, Warton is known for his *Odes*, 1746. These are artificial in style, but The

Enthusiast or The Lover of Nature, 1744, in its genuine feeling for scenery, marks a reaction from the prevalent artificial school and foreshadows the romantic revival. The classical school is criticised as lacking imagination in Warton's sensational Essay on the Genius and Writings of Pope, 2 vols., 1756-1782. He died Feb. 12, 1800.

Warton, THOMAS (1728-90). A British poet and critic. Born at Basingstoke, Jan. 9, 1728, brother of Joseph Warton, he was educated at Trinity College, Oxford, of which he became tutor and fellow, devoting himself to literature and becoming professor of poetry at Oxford in 1757. In 1785 he was made Camden professor of history, and the same year poet laureate. He died May 21, 1790. He wrote much verse in a light vein, but his fame rests on the scholarly *Observations on the Faerie Queene*, 1754, and on the uncompleted *History of English Poetry*, 1774-81, a landmark in English literature inasmuch as it focused attention on the imaginative literature of the past, provoked reaction from 18th century classicism, and was thus a factor in the romantic revival. Warton also edited Theocritus, and some of the shorter poems of Milton.

Warwick. Mun. bor. and co. town of Warwickshire, England. Situated on the N. bank of the Avon, it is 21 m. S.E. of Birmingham and is served by rly. Probably an ancient British settlement, the town became important with the erection in 915 of the castle, founded by Ethelfleda, daughter of Alfred the Great. The principal church is S. Mary's, largely rebuilt after a fire in 1694. Parts of the older building remain in the chancel and the Beauchamp chapel, which contains tombs of the earls of Warwick. Two old gates still remain, and near Westgate is the fine 14th century, half-timbered Lord Leicester's Hospital, an almshouse for 12 poor brethren.

Warwick Castle is a good example of 14th century fortification. It was largely strengthened in the early 17th century and was held against the Royalists at the start of the Civil War. In 1871 much of the interior was destroyed by fire. Other buildings of interest are the grammar school, said to have

Thomas Warton, British poet After Reynolds

Joseph Warton, British poet

been founded by Edward the Confessor and now called Warwick school; the shire hall; and the public library.

Gelatine and isinglass are made, and there are light engineering, plastic moulding, and carpet industries. Warwick and Leamington is the name of a co. constituency. Market day, Sat. Pop. est. 14,470. See Almshouses illus. p. 327.

Warwick, EARL OF. English title held by various families since the 12th century—at present by that of Greville. The 1st earl was the Norman, Henry de Newburgh (d. 1123). On the death in 1242 of Thomas, 6th earl, the title passed through two female descents to William de Beauchamp, 9th earl. Thomas (1313–69), 11th earl, was at Crecy and Poitiers, and was one of the original garter knights. On the death of Henry, 14th earl, 1445, the title was granted to his daughter Anne. At her decease four years later it passed to Henry's sister Anne, and so to her husband, the famous King-maker (v.i.). When Anne died, 1493, the title passed to her grandson, Edward Plantagenet, who was deprived of his title and executed in 1499 for alleged complicity in Warbeck's rebellion.

The family of Dudley held the title, 1547–90, one who did so being the duke of Northumberland of Edward VI's reign. In 1618 it was revived for Robert, 3rd Baron Rich, and remained in his family till the death of the 29th earl in 1759. Immediately the earldom was granted to Francis Greville, Lord Brooke, of Warwick Castle. From him was descended Francis (1853–1924), 5th earl of the new creation. He married Frances Evelyn, daughter of C. H. Maynard, who became known as a Socialist author and philanthropist. Charles, 7th earl, was born March 4, 1911, and succeeded his father in 1928. The eldest son is called Lord Brooke.

Warwick, RICHARD NEVILLE, EARL OF (1428–71). English soldier and statesman, called the King-maker. He was born Nov. 22, 1428, son of Richard Neville, earl of Salisbury, whose sister married Richard, duke of York. Young Richard became earl of Warwick by his marriage with the heiress to the earldom. When the Wars of the Roses broke out in 1455 he followed his uncle York, distinguishing himself at St. Albans. He was made governor of Calais, and in 1457 lord high admiral, winning a sea fight against the Spaniards. Having been nearly

killed in a brawl, he escaped to Calais, but came home to join in the English wars again in 1459. At the battle of Northampton, July 10, 1460, he captured Henry

VI and issued his famous order, summing up the whole struggle, to "spare the commons and slay the lords."

When the Lancastrians killed both York and Salisbury after their victory at Wakefield in Dec., Warwick gave uncompromising support to the claim of his cousin, Edward of York, to the throne. The pair crushed the Lancastrians at Towton, March 29, 1461, thereby securing Edward IV on the throne. The king left the government to Warwick, who was ostensibly permitted to pursue his own policy of an alliance with France. But Edward behind his back paralysed that policy, first by a secret marriage in 1464 with Elizabeth Woodville, whose relations, enemies to Warwick, were promoted; and then in 1467 by negotiating an alliance with Burgundy. The result was a breach which widened until in 1469 Warwick rose in arms, captured the king, and in effect assumed the supreme authority. Next year, during a revolt in East Anglia, Edward raised an army and suddenly turned the tables. Now Warwick had to flee to France, where he reconciled himself to the Lancastrians and, collecting a force, landed in Devon. Edward fled and Warwick restored the imprisoned Henry VI to the throne. But in March, 1471, Edward again landed in Yorkshire, and defeated and killed Warwick at the battle of Barnet, April 14.

If Warwick was the typical feudal baron with whom his own

Warwick. The 14th cent. castle. Left, the parish church of S. Mary, largely rebuilt after a fire in 1694

aggrandisement came first, yet he was probably the best administrator and most far-seeing statesman of his time. His life and character are well discussed in Lytton's *Last of the Barons* and in Oman's *Warwick the King-maker*. See *Roses*, *Wars of the*.

Warwickshire. Midland county of England. Its area is 976 sq. m. In the S. it contains spurs of the Cotswold Hills, Edge Hill rising to 826 ft., and in the N. is the forest of Arden, but the greater part of the surface is undulating. The Avon, Tame, and Leam are the chief rivers. The county has a large industrial area, including Birmingham and neighbourhood, also Coventry. Elsewhere agriculture is carried on, this being chiefly dairy-farming and the growing of oats and wheat, but there are orchards and market gardening. The county is served by main rlys. and several canals.

Warwick is the county town; other towns are Leamington, Rugby, Stratford-on-Avon, Nuneaton, Sutton Coldfield, and Bedworth, as well as the greater part of Birmingham; also Kenilworth, Maxstoke, and other places of historic or antiquarian interest. There are six co. and 16 bor. constituencies. Pop. approx. 1,535,000.

LITERARY ASSOCIATIONS. These primarily centre in Stratford-on-Avon, where Shakespeare was born; the country around is rich in Shakespearian associations. At Hartshill, Michael Drayton was born. Shakespeare's contemporary, John Marston, was born at Coventry; that city has given its name to one of the collections of medieval miracle plays, and is further associated with the drama, in that Sarah Siddons was married in Holy Trinity church and Ellen Terry was born in Market Street. Tom Brown's Schooldays tells of Rugby school and the country

Washington, D.C. Plan of the central district of the capital city of the United States of America

constitution, which divides and coordinates legislative, judicial, and executive functions of govt.

In 75 acres of grounds, the White House is a plain, two-storeyed edifice, 170 ft. long, with an Ionic portico, and resembles a country house rather than a state residence. The town house of the dukes of Leinster in Dublin was the model for the original building, which was burned by the British during the war of 1812.

Close to the White House are the principal departmental offices. The Treasury, a massive structure in the classical style, stands at the head of Pennsylvania Avenue, and on the other side of the White House grounds is the great building that houses the State dept. Between the State dept. and the Capitol Pennsylvania Avenue is flanked by govt. buildings, most of them built between the two Great Wars, when the functions of govt. assumed an importance hitherto unknown in the U.S.A. These vast structures are harmonised architecturally under rulings of the fine arts commission, established 1920.

Washington is rich in statues and memorials of the past, the

most remarkable being the Washington monument. This stands in its own grounds on the Potomac; clearly visible from both the White House and the Capitol, it is a plain square obelisk of white Maryland marble, 555 ft. high. Facing the Washington monument across lagoons a mile long is the white marble Lincoln memorial, in which a dramatic statue of Lincoln, seated and brooding, is flood-lit night and day. Behind this temple, the ornamental Memorial Bridge leads across the Potomac to the Virginia shore on which, 20 m. away over a 12-lane motor drive, stands George Washington's home at Mount Vernon.

Washington has three universities, the George Washington, the Catholic University of America, and Georgetown. The government employs many scientific experts, besides supporting such institutions as the national museum, the army medical museum, and the botanic gardens. Moreover, in the Corcoran gallery of art is a fine collection of American paintings. The Smithsonian institution, gift to the nation from a wealthy Englishman, is built in a graceful Victorian pseudo-Gothic style; it

is the only example of this style, common in the U.K., among Washington public buildings. The institution houses a scientific collection. Washington is the seat of a U.S. naval shipyard.

Pop. in 1940 was 663,091, of which about a third is negro. Washington dwellers have no vote, the city being governed by commissioners responsible only to congress. Coloured citizens may by law mix freely with whites in public places. The national theatre, largest in the city, was closed in 1948 because the white management would not maintain this equality. About one quarter of the city's pop. live in suburbs which extend into the states of Virginia and Maryland, in which states differing laws prevail as to the association of whites and negroes.

Washington. City of Pennsylvania, U.S.A., the co. seat of Washington co. In beautiful country on Chartiers Creek, 31 m. S.W. of Pittsburgh, it is served by the Pennsylvania and the Baltimore and Ohio rlys. The surrounding area is fertile; cattle and sheep are raised. The city is a centre of bituminous coal production, and there are oil and gas wells. Manu-

WASHINGTON: ARCHITECTURAL DIGNITY IN THE CAPITAL OF THE U.S.A.

factures include wool, glassware, steel for tools, tinplate, ferro-alloys, molybdenum, and also chemicals. Washington and Jefferson College and a girls' seminary are here. Historic sites include the house which was the headquarters of the whisky rebellion of 1794. A town was laid out in 1781 and lots were presented to George and Martha Washington. It was incorporated in 1810 and became a city in 1924. Pop. 26,166.

Washington, MOUNT. Loftiest summit of the White Mountains, New Hampshire, U.S.A. Mainly composed of granite, its lower slopes are well wooded, and its N. and E. sides are deeply cut by gorges. It is ascended by road and by rack-rly. Alt. 6,295 ft.

Washington, TREATY OF. Arrangement concluded at Washington in 1871 by the U.K. and U.S.A. Several differences existed between the two countries, notably the American claim for compensation for the damage done by the Alabama (*q.v.*) in the American Civil War. The treaty provided that the matter should be referred for arbitration to a special and partly foreign tribunal; that the North-Eastern fishery dispute be referred to a mixed commission to meet at Halifax; and that the North-Western boundary dispute be submitted to the arbitration of the German emperor.

Washington, BOOKER TALLA-FERRO (1858-1915). American negro educator. A plantation slave, he was born near Hale's Ford, Franklin co., Virginia, and after the Civil War removed to Malden, West Virginia, where he earned a living first in a salt furnace and then in a coal mine. He studied at the Hampton Normal and Agricultural Institute, 1872-75, and later took a course at the Wayland Seminary of Washington. During 1879-81 he directed the work of Red Indians at the Hampton Institute, and was principal of Tuskegee Institute, Alabama. Through his advocacy of new industrial skills as the salvation of the American negro, he became the most influential negro of his day. He died Nov. 15, 1915. His books include his autobiography, *Up from Slavery*, 1901, and *Working with the Hands*, 1904.

Booker T. Washington, American negro educator

GEORGE WASHINGTON

The life and achievements are here described of the Virginia squire who became first president of the United States of America, an entity of which he had been the chief creator. See American War of Independence

George Washington was born Feb. 22, 1732, at Bridges Creek, Westmoreland co., Virginia, the son of a prosperous planter whose family had emigrated from Northampton to Virginia in the 17th century. His father died while he was a child, and his schooling was irregular. At 16 he was appointed public surveyor of Culpeper co., and a little later adjutant-general, with the rank of major.

Having an ingrained love of adventure, he welcomed in 1753 the difficult mission of crossing some 600 m. of forests sheltering hostile redskins, and of serving notice on the French that their forts on the western lands were regarded as an encroachment. He was rewarded, 1755, by an appointment on the staff of General Braddock, who was sent to evict the French. Braddock's force was destroyed, but Washington's intrepidity in arresting the rout earned for him a high reputation.

Returning to Mount Vernon, the estate which he had inherited, Washington organized the Virginian forces for defence against the Indians. The colonists resented military service, and when, 1759, Washington married Martha Custis, a rich widow, he gladly resigned his command and devoted himself to the administration of her estates and to purely local politics.

In 1765 differences between the British govt. and the colonies became acute. Washington's plan to boycott all goods on which Great Britain levied taxes proved so successful as to cause their repeal with that of the obnoxious Stamp Act, though the tea duty was imposed. In 1774 he was elected to the first continental congress. At the outbreak of the War of Independence, 1775, he was given the chief command.

During the war he was forced to spend much of his own fortune to uphold an army to whose support the colonial exchequer was painfully unequal, and made the scapegoat for every other general's failure. Bewildered by the party hatreds which divided congress, he spent the first year in attempting to introduce order into the muddled organization of the army, and to check enemies on his own side. While so engaged, he was forced to order his troops to retreat; the passage of his army from Long

Island, whence he had been defending New York, through the British lines, although it was followed by a rout which turned his troops into a rabble, was an indication of his spirit; it was followed by a brilliant victory at Trenton, Dec., 1776, the battle that virtually saved the colonists from utter defeat, and by a master-stroke at Princeton, New Jersey, Jan., 1777. The defeats of Brandywine, Sept., and Germantown, Oct., 1777, however, compensated the British.

George Washington

From the painting by Gilbert Stuart in the Fitzwilliam Museum, Cambridge

The ascendancy which Washington possessed over his troops was demonstrated at Monmouth, June, 1778, where, though he was betrayed, Washington turned an inglorious defeat into a victory. The surrender of Burgoyne at Saratoga, meanwhile, seemed likely to change the course of the war, but was followed by a blow from which Washington barely recovered—the defection and treachery of Benedict Arnold, one of his most brilliant officers. Major André, who was associated with Arnold, was caught and hanged as a spy, and Washington was subjected to much odium for this action, which, however, had full military justification. Washington was encouraged by the alliance between the colonists and France, concluded in 1778, and later by the support of Spain against the British. Between Monmouth and Yorktown, 1781, where the surrender of Cornwallis

virtually ended the war, Washington was not engaged actively.

At headquarters, however, near New York, he had a task to which he would doubtless have preferred the utmost dangers of open warfare, for there he had to continue to combat the cabals formed against him, to hearten the frightened congressmen, to retain the friendship of rival foreign soldiers without offending the colonists, and to keep discipline in an undisciplined army. On Dec. 23, 1783, he resigned his commission and retired to Mount Vernon.

The retirement and peace for which he longed were of short duration. Returned as a Virginian delegate to the federal convention of May, 1787, which was called to set up the constitution, he was immediately elected president of the convention and found himself in the position of a dictator. His slightest suggestions were seized upon and made law; he had the largest part, unwillingly, perhaps, in the framing of the constitution, and was almost entirely responsible for its ratification. The office of president which it created was offered to him, and, unable though desirous to refuse, he took the oath of office on April 30, 1789, for four years dating from March 4, 1789.

The success of the first national American govt. was not due entirely to its president; the financial genius of Alexander Hamilton was responsible for the restoration of its credit, and other politicians had their share in building and upholding the new constitution. But Washington was more than a figurehead; to him are in large part due the wide powers which became characteristic of the U.S. presidency. Against the opinions and desires of many of his supporters he ruthlessly suppressed the whisky insurrection, acted with determination against the machinations of France, and showed no animosity towards Great Britain. His signature of a treaty of commerce with Great Britain was much criticised, though Washington was, in fact, laying the foundation of what later became the Monroe Doctrine (*q.v.*). His moderation, and his attempts, mainly successful, to arrange a compromise between the hostile parties of Hamilton and Jefferson alienated many, and though he was unanimously re-elected president in 1793, he had thenceforward to endure many scurrilous and calumnious attacks, especially from the Democratic-Republican party. He refused to stand for a third term in 1797, and

retired once more to Mount Vernon. He died suddenly, Dec. 14, 1799.

Assailed by all the weapons of party politics in his later years, he remained passionless and unmoved. This monumental quality it was that ensured Washington immortality; he represented to later ages an honest steadfastness of purpose which had died in American politics, he stood out as the victor of the only great war with foreigners fought on Union soil, and the chief creator of a constitution which achieved a stability and duration unequalled by any other written constitution.

Bibliography. The most popular and the most inaccurate biography of Washington is that of Mason Weems, 1866, which contains most of the apocryphal anecdotes concerning his childhood and character: other Lives are by J. Marshall, 1804-07; Washington Irving, 1855-59; H. C. Lodge, 1889; C. Sheridan Jones, 1920; W. R. Thayer, 1923; W. E. Woodward, 1926; Woodrow Wilson, new edition, 1927; Rupert Hughes, 1927; John Corbin, 1930; Shelby Little, 1931; Paul Van Dyke, 1931; Norwood Young, 1932; M. de la Bedoyere, 1935. His Writings were edited by W. C. Ford in 14 volumes, 1889-93; and his Messages and Papers were edited by J. D. Richardson, 1896.

Washington Declaration. Agreement signed in Washington Jan. 1, 1942, by the U.S.A., the U.K., Russia, China, Australia, Belgium, Canada, Costa Rica, Cuba, Czecho-Slovakia, Dominican Republic, Greece, Guatemala, Haiti, Honduras, India, Luxemburg, Netherlands, N.Z., Nicaragua, Norway, Panama, Poland, S. Africa, Salvador, and Yugoslavia in which they declared their adherence to the Atlantic Charter (*q.v.*), and pledged themselves to cooperate for the defeat of Germany, Italy, and Japan. Adhesion to this declaration was necessary for invitation to the San Francisco Conference (*q.v.*).

Washington Land. Dist. of N.W. Greenland. Its shore is indented by Kane Basin: to N. is Hall Land, to S. Prudhoe Land.

Washington Naval Treaties. Seven treaties and supplementary agreements resulting from the Washington conference of 1921. The conference was convened by the U.S.A. to consider political conditions in the Pacific. Chief participants were the U.S.A., the British Empire, France, Japan, and China; representatives of Italy, the Netherlands, Belgium, and Portugal also attended. The most important of the treaties were: (1) a five-power naval

treaty which laid down limits in number, size, and armaments of ships for the future navies of the British Empire, the U.S.A., Japan, France, and Italy; (2) a five-power treaty between the same signatories prohibiting the use of submarines as commerce destroyers, and of poison gases, in time of war; (3) a four-power treaty between the British Empire, the U.S.A., France, and Japan to respect the *status quo* in respect of possessions in the Pacific; (4) a nine-power treaty to guarantee the sovereignty, independence, and territorial integrity of China.

These treaties, of which (1) was to remain in force for 15 years and the rest for at least 10 years, were duly ratified by all the powers concerned except France, which rejected a provision regarding the use of submarines.

Washington Post. Round dance for the ballroom, popular in the 19th century, and unusual in that the man's position remained behind his partner throughout. It was danced to the Washington Post march, by J. P. Sousa (so called because it was dedicated to the newspaper of that name). The same march was afterwards often used for the two-step (*q.v.*).

Washita or **OUACHITA.** River of Oklahoma, U.S.A. It rises in the extreme W. of the state, flows S.E. and S. and joins the Red river above Denison, Tex. Length 550 m.

Wasp. Popular name for certain stinging insects of the order Hymenoptera that differ from bees chiefly in their habits. Unlike bees, they feed their brood mostly on premasticated portions of flies, caterpillars, and other insects. True wasps fold their wings into longitudinal creases.

The 290 British members of the family include the potter and mason wasps (*Eumenes* and *Odynerus*), solitary in habit, and seven social species of *Vespa*, the true wasp. The nest of *Vespa* is made in a hole in the ground or on trees or bushes; the hornet (*q.v.*) usually lodges in an old tree trunk. Only the queen wasps emerging in autumn survive the winter. These in spring construct the beginnings of a nest in form of a few hexagonal cells of "wasp-paper," made up of fragments of dry wood mixed and moulded with saliva. An egg is laid in each cell, and in about a month workers (sterile females) begin to hatch. These complete nest building, and feed and tend the larvae. Males and fertile females (queens) appear later and, after mating, these last hibernate.

Wasp. 1. Queen wasp hibernating. 2. Common wasp, *Vespa vulgaris*. 3. Red-banded sand wasp, *Ammophila sabulosa*. 4. German wasp, *V. germanicus*. 5. Combs of a tree wasp with outer covering removed. 6. Solitary wasp, *Eumenes coarctata*, enlarged, on its nest. 7. Wasps' nest that has been formed in a bee-hive

Wasps include the spider hunters or Pompilidae; ruby-tailed wasps or Chrysididae; digger wasps or Sphecidae. See Sting. *Consult* Hymenoptera Aculeata, E. Saunders, 1898.

Wasp. Name of several British warships. The first Wasp was a fire ship destroyed in Dunkirk roads while attempting to burn some French frigates, July 7, 1800. The second was a 16-gun brig which took part in the Syrian operations in 1840, and in the suppression of the slave trade on the African coast, 1844-46. During the Crimean War Great Britain had a 13-gun Wasp in the fighting line. The last two ships to bear the name both met with disaster. One, a steam gunboat of 465 tons, was wrecked on Tory Island, Sept. 22, 1884, when 52 lives were lost. Three years later a new Wasp, a steam gunboat of 670 tons, was put into commission. In Sept., 1887, she was caught in a typhoon whilst on passage from Singapore to Hong Kong and disappeared.

Wasps, THE. Comedy by Aristophanes, performed 422 B.C. Bdelycleon (Loathe-Cleon) induces his father, Philocleon (Love-Cleon), to forsake the law-courts and try his dog at home for stealing a cheese—an allusion to Cleon's vexatious prosecution of the general Laches. Philocleon, losing his Athenian mania for serving on juries, becomes a lover of the arts.

The chorus consists of wasps. Racine imitated the play in *Les Plaideurs*. R. Vaughan Williams wrote an overture to *The Wasps*.

Wassail. Term of Anglo-Saxon origin meaning "May you be in health!" It came to be applied to the salutation used in drinking a person's health, and then for the feast itself. It was also given to a liquor consisting of ale in which were roasted apples, sugar, nutmeg, and other spices. See Health.

Wassermann Reaction. Name given to a laboratory test used in the diagnosis of syphilis. Called after the originator, August von Wassermann (1866-1925), it depends upon a principle known as the fixation of complement. If a poison destructive to blood corpuscles is introduced into blood, the corpuscles are not destroyed until some of this so-called complement has been absorbed. In a

Wassermann reaction the suspected blood serum is mixed with an animal extract and a measured amount of complement. If upon examination the latter is fixed, the suspected serum must have held a substance capable

of joining it to the extract, and the diagnosis is positive for syphilis. There was no poison in the serum if the complement is unfixed.

Waste (Lat. *vastus*). Literally, something desolate or unproductive. The word has a number of allied senses and various compounds (see Desert). Legally it is either doing deliberate damage to land or buildings (voluntary waste), or permitting them to fall into decay (permissive waste). A waste book is a book used by business men for temporary and daily records. Wasting assets are those which are reduced in value as they are worked. Waste pipes are bath and sink outlets, etc.

In another sense waste is the by-products of textile manufacturing. Silk waste is pure silk not readily removable from the cocoon by the ordinary process of reeling, which is sold off and worked up by other methods. Waste cottons of distinct kinds are produced in the successive stages of manufacture, and these are distinguished as hard or soft, according as their nature is thready or fluffy. This waste is put to new purposes, suitable kinds being re-manufactured for the weft of cheap sheetings, to make flannel-ettes and cotton blankets or yarns for knitting. Cotton wadding as used for packing is made from soft classes of waste. Engine waste used for cleaning machinery is made from thread wastes, and clean, pure waste can be converted into guncotton and into artificial silk. Wastes are generated also in carding and spinning wool, and are saved principally to make new qualities of cloth. Rags are also known as waste; and pulled waste is woven stuff returned to its fibrous condition. Textile wastes are tangible articles, and the invisible losses occurring in manufacture are called not waste, but sinkage. See By-Products; Salvage.

Wastwater. Lake of Cumberland, England, in the S.W. of the Lake District. It is about 3 m. long and less than $\frac{1}{2}$ m. broad, and

Wastwater, Cumberland, situated among the wildest scenery of the Lake District

is the wildest and deepest of all the English lakes. On one side the Screes form an almost perpendicular wall of rock. The lake is best approached from Seascale, 14 m. away, but there is an hotel at Wasdale Head, a mile N.

Watch. One set to keep watch, usually over a building or the streets of a town during the night. A system of night-watching in cities and borough towns was first instituted in 1253 by Henry III. Watch and ward is the term applied to the uninterrupted guarding of property and persons from lawless violence. See Fire Guard; Firewatcher.

Watch committee was the name given to the committee of the bor. council which controlled the bor. police and concerned itself with prosecutions necessary to preserve public order. By the Police Act, 1946, a separate police force was allowed only to a co. bor. or to a non-co. bor. with a pop. more than half that of the co.

Watch. Naval term applied both to men and to time. In a commissioned ship the seamen are divided into two watches, starboard and port, and each watch is divided into two parts (1st and 2nd). When at sea one watch or part of a watch is always on deck. As regards time, the naval day is divided into seven watches, viz. 1st watch, 8 p.m. to midnight;

middle watch, midnight to 4 a.m.; morning watch, 4 to 8 a.m.; forenoon watch, 8 a.m. to noon; afternoon watch, noon to 4 p.m.; first dog watch, 4 to 6 p.m.; second dog watch, 6 to 8 p.m. The short dog watches are really "dodge watches," their purpose being to make an odd number of duties in the day, and so create an alternation of the watches kept by particular men.

Watch. Small portable machine for measuring time. Portable clocks were in existence as early as the 15th century in Germany (see Clock). But these were too large for the pocket, and the invention of the watch is really due to Peter

Watch. 1. Watch belonging to John Milton, made by W. Bunting, dated 1631. 2. Oliver Cromwell's watch, made about 1630. 3. Memento mori watch, given by Mary Queen of Scots to Mary Seaton. 4. 15-jewel lever movement Swiss-made wrist watch of the type that became popular in the 20th century

No. 4 by courtesy of G. M. Lane & Co., Ltd.

Hele, a clockmaker of Nuremberg, who about 1500 devised the mainspring. The latter was improved by Jacob Zech of Prague in 1525, by the invention of the fusee, a kind of conical pulley interposed between the barrel containing the mainspring and the train of wheels. The fusee helped to correct the unequal power exerted by the spring as the latter unwound.

In 1658 a great step forward was made by the discovery by Hooke of the balance spring for rendering the vibrations of the balance isochronous. Next Hooke introduced the anchor escapement, in 1695 Tompion patented a cylinder escapement, and early in the 18th century Graham brought out his dead-beat escapement. In the

same century compensation balances appeared. (See Escapement.)

The earliest forms of watches had little resemblance to the modern forms. A watch belonging to Mary Queen of Scots was made in the shape of a skull, and such grotesque and curious forms of watches were in vogue for many years. The decoration in enamel for watch cases and dials appeared in the 17th century and was of French origin. In 1820 Thomas Prest patented a keyless watch, and from 1851 the Swiss began to flood the market with watches of this kind.

The plates and wheels of a modern watch are made of brass or nickel; the cases of gold, silver, gunmetal, white metal, etc. The working of an ordinary watch is as follows. The centre pinion rotates once in an hour. On this pinion is fixed the centre wheel, which drives the third wheel pinion. This in turn has fixed on it the third wheel, which drives the fourth wheel pinion. On the latter is mounted the fourth wheel, which drives the escape pinion, and on the latter is mounted the escape wheel. As the centre wheel makes one rotation, the fourth pinion makes sixty, and the escape wheel six hundred. The pivots of the various wheels and pinions are mounted between two plates kept apart by pillars. Usually a portion of one plate is cut away, giving the name three-quarter plate, half-plate, etc. The centre wheel has connected with it wheels driving the hour and minute hands. The seconds hand is mounted on the fourth pinion.

Metallurgical research has recently developed types of nickel in an alloy in which elasticity is scarcely affected by changes of temperature; and some of these alloys (e.g. "Elinvar") are widely used for balance springs for watches. With such springs a special compensation balance is unnecessary, except for precision timekeeping.

The day of the individual hand-made watch is over. Watches are produced in factories in which delicate machinery is used. The fine screws used, weighing 30,000 to the lb., the hair springs and main springs, the tiny pallets, jewels, etc., can be made more accurately and with far greater speed than by hand, and the number of different machines in use runs into several hundreds. The toothed wheels and other parts are stamped out of metal and finished by cutters and milling

machinery. Provided design is good and the necessary care taken in the manufacture and assembly, the modern watch is extremely accurate.

Watchet. Urban dist. and seaport of Somerset, England. It is a rly. terminus, 17 m. N.W. of Taunton. The imports of wood pulp from Scandinavia and coal from S. Wales are used by local paper mills; which employ several hundreds. There are numerous historical associations with the town, which has existed from Anglo-Saxon times. Pop. 2,400.

Water. Chemical compound (H_2O) of hydrogen and oxygen, consisting of one part, by weight, of hydrogen to approx. eight of oxygen, and two, by volume, of hydrogen to one of oxygen. At normal temps. it is a colourless, tasteless, and chemically neutral liquid. In large quantities it has a slight bluish tinge; but the varying colours of water in bulk, as in lakes and the seas, are due to sky reflection, impurities, etc. Under standard pressure pure water boils at $100^\circ C.$ ($212^\circ F.$), and as the temp. is lowered its density increases slightly until $4^\circ C.$ ($39.2^\circ F.$) is reached, at which temp. one cu. cm. weighs one gram (i.e. 62.3 lb. per cu. ft.). From this point to freezing ($0^\circ C.$, $32^\circ F.$) the density decreases slightly. Simultaneously with freezing there is a considerable expansion, amounting to one-eleventh of the volume of water: hence burst water pipes during hard frost. It is this pronounced decrease in density which causes ice to float in water, and, provided the water is fresh and the ice clean and solid, one-eleventh of its volume will project above the surface. A greater fraction than this of an iceberg projects, owing to the saltiness of the water, and the presence in the iceberg of air, in cavities, and of earth.

Increase of pressure has the effect of raising the temp. of the boiling point and lowering, but less markedly, that of the freezing point, and vice versa; e.g. on mt. tops water boils at temps. below $100^\circ C.$ Water has a greater specific heat than any known substance except hydrogen. It is used as a standard for measurements of s.g., specific heat, etc. It is a poor conductor of heat and electricity, a powerful solvent of other solid, liquid, and gaseous substances, and is important in chemical action.

In the form of ice and water, the compound is one of the most

Water Buck. Long-horned antelope that herds in swampy places in S. Africa

W. S. Berridge, F.Z.S.

widely distributed in nature. It covers about 72 p.c. of the surface of the globe, constitutes some seven-eighths of animal life and more than 90 p.c. of many plants, and occurs in a large number of minerals. Natural spring waters contain varying amounts of salts and oxides of calcium, magnesium, etc. dissolved from the strata of soil or rock through which they have percolated; certain of these dissolved substances render the water valuable for medicinal and other purposes. River waters contain impurities which depend upon the nature of the surfaces over which they flow, and the uses to which the river is put. Sea water is called brine and contains up to 35 parts in 1,000 of dissolved matter, chiefly common salt. The purest form of ordinary water is that which falls as rain in country districts far removed from areas of industrial pollution. Pure water can be obtained from impure by distillation or freezing.

Water vapour is of great importance in meteorology; evaporation of liquid water from the seas, rivers, vegetation, etc., produces the vapour which is distributed throughout the lower regions of the atmosphere by convection, some of it eventually condensing to form cloud and rain. About three times the bulk of water vapour is required to saturate air at $60^\circ F.$ compared with a similar volume of air at $32^\circ F.$ In the atmosphere water can exist as liquid drops at temps. well below the normal freezing point. See Deuterium; Heavy Water, Ice; Steam; Water Supply.

Water Beetle. Name given to numerous species of beetles aquatic in habit. See Beetle: Dytiscus.

Water Boatman (*Notonecta glauca*). Aquatic bug, common in quiet ponds throughout Great Britain. See Water Bug.

Water Buck (*Cobus ellipsiprymnus*). Species of antelope, occurring in E. and S. Africa. It stands about 4 ft. high at the shoulder, and has a greyish-brown coat with white muzzle and a white ring on the buttocks. It is found in small herds in swampy places.

Water Bug. Aquatic insect of the order Hemiptera, comprising several families, of which many species inhabit ponds in Great Britain. Among these are the pond-skaters (Hydrometridae), with slender bodies and long, thin legs that propel them over the surface, where they live upon insects that have fallen into the pond. The Naucoridæ and Corixidæ are larger insects of oval form, that seek their prey among the submerged weeds. The Nepidæ are represented by the thin, flat water scorpion (*Nepa cinerea*), and the water stick-insect (*Ranatra linearis*); while the chief British member of the Notonectidæ is the well-known water boatman (*Notonecta glauca*), which rows its boat-shaped body under water. See Bug; Hemiptera; Insects.

Waterbury. City of Connecticut, U.S.A., one of the co. seats of New Haven co. It stands on the Naugatuck river, 34 m. S.W. of Hartford, and is served by the New York, New Haven, and Hartford rly. It contains the Silas Bronson library. The city has always been a chief centre of the American brassware industry—it began by making metal buttons—and is noted for the manufacture of watches and clocks; a cheap watch is known throughout the U.S.A. as a Waterbury. Settled in 1674, Waterbury became a city in 1853. Pop. 99,314.

Water Chestnut, WATER CALTROP, OR JESUIT'S NUTS (*Trapa natans*). Aquatic herb of the fam-

Water Chestnut. Rosette of leaves, flowers, and root. Inset, fruit

ily Onagraceae, a native of Europe, Asia, and Africa. It has a rosette of rhomboid floating leaves, their stalks having a spongy dilatation, which renders them more buoyant. The solitary, four-petalled flowers are white, and are succeeded by large, horned fruits which, from their general resemblance to the ancient metal caltrops intended for laming hostile men or their horses, have suggested the name of water caltrops. The contained seed is starchy, and is used for food, as are those of the related species *T. bispinosa* (singharra nut) in India, and *T. bicornis* (ling) in China.

Water Closet. Term, frequently abbreviated to W.C., used for a water-flushed closet con-

Water Closet. Fig. 1 (left). A wash-down pattern water closet. Fig. 2 (right). Double siphonic type

nected to drainage, as distinct from a commode, dry or earth closet, or chemical closet. Early patterns—many made substantially of metal, and incorporating lever-and-link mechanism—have been superseded by the one-piece pedestal-basin of glazed white or coloured vitreous china, a totally non-absorbent porcelain material, or earthenware.

Of several patterns the most important are the single-seal wash-down and the double-seal siphonic. In the first (shown in section in Fig. 1) the flush pipe connexion above the outlet is an extension of the hollow flushing rim that forms the top of the bowl. Wash-down basins are inherently noisy because the clearing of the bowl depends on the velocity with which the bulk of the flushing water is directed upon the inside of the water seal. The siphonic basin (Fig. 2) relies upon atmospheric air pressure to clear the bowl, and is consequently almost inaudible in operation. Another feature is the large area of water in the bowl; this materially reduces the surface exposed to fouling. Siphonage occurs when the first movement of flushing water withdraws air from between the two traps, through the small exhaust pipe. This reduces the air pressure between the seals, and causes the downward thrust of the atmosphere to empty the bowl.

Water Colour. Art and process of painting with colours compounded with an adhesive substance, such as gum or size, and

mixed with water. Water-colour pigments are supplied either in dry cakes or in moist form, in metal tubes or china pans, the moisture being preserved by glycerine or a similar compound. Paintings in this medium are executed either in transparent washes, or in opaque colours (body colour), or in a combination of the two; and owing to the quick drying of the pigments, the medium is the favourite one for rapid sketching.

Although processes akin to water-colour painting were employed by the ancient Chinese, Egyptians, and Greeks, the first use of the medium, as now understood, need not be traced farther back than the missal painters of the early Christian era, when it was used as an alternative to gouache. Late in the 15th century prints of engravings were often tinted with water colours.

Dürer made outline drawings with a reed pen, and filled in the spaces with water-colour washes. Rembrandt and Rubens employed water colour in much the same way. In their hands, however, and those of other Dutch, Flemish, and German masters, water colour was really a stain in monochrome, heightened only by a few local tints or dashes of strong colour; and this partly "stained" drawing lasted till well on in the 18th century, when it was ousted by the fully tinted type.

It was in the former way that water colour was used by the topographical English draughtsmen of the early 18th century, who lived their laboured productions with blue, grey, or brown tints in order to give them some faint resemblance to natural colouring. But Gainsborough's studies, in which he experimented with water colour as with nearly every other medium, foreshadowed greater pictorial possibilities. Paul Sandby (1725–1809), called the father of the English water-colour school, was a topographical draughtsman, who not only established the ascendancy of the completely tinted drawing over the monochrome and partly tinted type, but introduced a fair measure of personal expression into a hitherto mechanical style. Alexander and J. R. Cozens, W. Payne, and Nicholas Pocock were others of his school. But it was Thomas Girtin and J. M. W. Turner, at the beginning of the 19th century, who established the

full strength of British water colour.

In 1805 the first exhibition of the newly formed Water Colour Society was held; and within the next half-century David Cox, Peter De Wint, Copley Fielding, J. S. Cotman, R. P. Bonington, W. Callow, J. D. Harding, and W. H. Hunt had made their great reputations in water-colour landscape. The medium, in their hands, was made to appear peculiarly suitable for suggesting the soft atmosphere of the English scene; but the field was extended to every branch of painting.

In France, the example of Bonington stimulated water-colour painting among the Romantics, especially Géricault, Delacroix, and Decamps. German water colourists of a later date include Schwind, Hildebrandt, and Menzel. The modern Dutch school, particularly Israels and Anton Mauve, produced remarkable results in the medium. Fortuny in Spain initiated a crisp, sparkling manner that was largely followed in Italy. See Painting.

Water Colours, ROYAL SOCIETY OF PAINTERS IN. British art organization. Founded in 1804, this society confines its exhibitions to works by members and associates. Among early exhibitors were Cotman and Peter de Wint; later members included Sir D. Y. Cameron and Sargent. The president was Sir W. Russell Flint in 1948, when the society held its 230th exhibition. Its galleries are at 26, Conduit Street, London, W.1.

Water Crane. Hollow standpost connected to a water main. It has an overhead pipe arm, which projects outwards and can be swung over a locomotive or water cart. A valve is fitted either below ground in the connexion to the water pipe, or in the body of the standpost. The end of the crane arm is usually fitted with a few feet of canvas or leather hose, to allow for slight variations in the position of the tank to be filled.

Watercress (*Nasturtium officinale*). Perennial aquatic herb of the family Cruciferae. A native of Europe, W. Asia, and N. Africa, it has stout, firm, hollow, creeping stems, which root in the mud. The alternate leaves are divided into

Watercress. Edible leaves and roots.
Inset, spray of flowers and pods

from three to six pairs of somewhat heart-shaped leaflets, often of an olive tint. The small, white flowers are clustered in short sprays. The fruit is a small pod. It has a hot biting flavour, and has been esteemed from ancient times as a salad herb and anti-scorbutic.

Water Cure. Treatment of disease based upon the application of water to parts of the system. See Baths; Hydropathy; Spa.

Water Divining. This subject is treated under Divining Rod.

Water Dropwort or **HEMLOCK DROPWORT** (*Oenanthe crocata*). Perennial marsh herb of the family Umbelliferae, native of Europe. It has parsnip-like root-fibres an inch thick; a grooved, stout, hollow stem 2-5 ft. high; and large, wedge-shaped leaves, several times divided into small wedge-shaped segments. The minute white flowers are clustered in numerous little umbels associated in compound umbels. They give off a wine-like odour. The juice turns yellow on exposure. The plant is poisonous and accidents have been caused by its being mistaken for celery.

Water Equivalent. Physical term which expresses the heat capacity of a body in terms of a thermally equivalent mass of water.

Waterfall. Fall or perpendicular descent of the water of a river or a stream. Waterfalls are usually found in the upper or mountain courses of rivers, but they may occur at any point where the river flows from hard to soft layers of rock, or hard layers cover soft.

The top of Niagara Falls is of limestone, which is much harder than the softer beds of shale upon which the limestone rests. See Hydro-Electric Installations.

Water Flea. Popular name for the small crustacean, *Daphnia pulex*, found in ponds. See Daphnia.

Waterford. County of Munster, Ire. In the S., it has an area of 713 sq. m. and a coastline of 50 m.,

thereon being the harbours of Waterford (itself the estuary of the Suir, Nore, and Barrow), Dungarvan, and Youghal, and the natural harbour of Tramore Bay. The surface is chiefly hilly, the Knockmealdown range attaining a height of 2,609 ft. The land is generally more suitable for pasture than tillage, and cattle have supplanted sheep as the principal livestock. Wool is produced for home consumption. Chief industries include brewing and flour-milling, while salmon are caught. Some of the best Irish marble is quarried. Waterford is the county town; other places are Dungarvan, Lismore, Tramore, and Cappoquin. Overlooking the sea at Ardmore is a Gaelic round tower, 95 ft. high; this town was once a bishopric and has remains of a cathedral. Mount Melleray is a Trappist monastery. Ravaged by the Danes in the 9th century, Waterford was settled by the English in the 12th. It elects 4 members to the Dáil. Pop. 104,489.

Waterford. Municipal and co. bor. and chief city of co. Waterford, Ire. It is near the confluence of the Suir and Barrow, 94 m. S.S.W. of Dublin. A rly. junction, it has steamer connexion with Fishguard and Bristol. The rly. from Rosslare runs across a great viaduct, and a bridge goes across the Suir to the suburb of Ferrybank. Tramore, 6 m. S., is a seaside resort. Bacon, butter, and cattle are exported; industries include bacon curing, brewing, flour milling, shipbuilding, and ironworking. The chief buildings are Protestant and R.C. cathedrals, town hall, theatre, schools, and monastic establishments. Deep prismatic cut glass with early 19th cent. patterns is popularly called Waterford glass.

The city's past is recalled by the 11th century Reginald's Tower. Waterford was a Danish stronghold until its capture by Strongbow in 1171. In John's reign was built a leper house still functioning as an infirmary. Waterford resisted Cromwell in 1649, but surrendered to Ireton next year. James II embarked here as an exile for France; and William III sailed hence for England. Pop. 28,332.

Waterford, MARQUESS OF. Irish title held by the family of Beresford since 1789. The family was founded by Sir Tristram Beresford (d. 1673), M.P. for Londonderry, whose great-grandson, Sir Marcus (1694-1763), married the heiress of the La Poers, viscounts of Tyrone. He was created Baron Beresford, and in 1746 earl of Tyrone. His son George (1735-1800), who suc-

ceeded as 2nd earl in 1763, was created marquess of Waterford in 1789. From him the descent has been in direct male line to John (b. July 14, 1933), 8th marquess. The U.K. barony of Tyrone, granted in 1786, enables the marquess to sit in the house of lords. An eldest son is styled earl of Tyrone. The country seat is at Curraghmore, Waterford.

Water Gas. Gas made by passing steam over red hot coke or carbon. See Gas, p. 3665.

Water Gauge. External glass tube, communicating at both ends with the interior of a steam boiler, to indicate the level of the water inside. The connexions include cocks to cut off water and steam in case the glass bursts; and, in some gauges, automatic safety ball-valves as well.

Water-glass. Sodium silicate. It is known also as soluble glass, because it resembles glass in appearance, but by the prolonged action of water it can be dissolved. Double water-glass is a mixture of equal parts sodium and potassium silicates. As found in commerce sodium silicate is a thick liquid, which can be thinned by water. The method of manufacture is to fuse on the bed of a reverberatory furnace the following mixture: sodium carbonate 22 or 23 lb., white sand or powdered flints or quartz (prepared by heating to redness, quenching in water, and grinding) 44 or 45 lb., charcoal in powder 3 lb. After fusing the mass for eight or ten hours it is withdrawn, broken up, and dissolved by prolonged boiling in water. Potash water-glass is made by a similar process, potassium carbonate replacing sodium carbonate.

An early commercial use of water-glass was the Ransome patent process of preserving stone. The method is to coat the stone with water-glass and, when dry, apply calcium chloride solution. The calcium silicate forms a dense film over stone so treated. In soap-making sodium silicate confers hardness and durability, especially on coconut-oil soaps. The salt-glazing of earthenware is an example of the use of sodium silicate as a protective agent; the same substance is also used in dyeing and calico-printing, for the preparation of unflammable wood and paper, as a medium for fresco-painting, and for mending stone. A modern use of water-glass is as a preservative for eggs.

Water Hemlock (*Cicuta virosa*). Perennial marsh herb of the family Umbelliferae. See Cowbane.

Water Hen (*Gallinula chloropus*). British water fowl, also known as moor hen. Its plumage is dark olive brown on the upper parts, and dark grey on the head, neck, and underparts. Distinguished by the red frontal plate above the beak, it is common about water in most parts of the British Isles, and is an expert swimmer and diver. It nests among the reeds, and its food consists mainly of slugs, worms, and insects.

Waterhouse, ALFRED (1830-1905). British architect. Born in Liverpool, July 19, 1830, he studied in Manchester and abroad. He began to practise in Manchester, but in 1865 removed to London. In 1878 he was made A.R.A., becoming R.A. in 1885, and he died in

Alfred Waterhouse,
British architect

Manchester, Aug. 22, 1905. Waterhouse made his reputation by designing the assize courts and town hall in his native city. He was also responsible for Eaton Hall and other residences, and in London the Natural History Museum, New University Club, National Liberal Club, and various neo-Gothic buildings. He designed Girton College (*q.v.*) and did work on other colleges at Oxford and Cambridge, and was responsible for S. Paul's school and University College, Liverpool. Michael Theodore Waterhouse, P.R.I.B.A. 1948-50, was his grandson.

Waterhouse, JOHN WILLIAM (1849-1917). British painter. The son of an artist, from whom he received most of his training, he first exhibited at the R.A. in 1874. He became A.R.A. in 1885, R.A. after ten years, and died Feb. 10, 1917. Among his paintings, executed after the style of Burne-Jones, are *The Martyrdom of S. Eulalia* (Tate Gallery); *The Magic Circle*, purchased by the Chantrey Bequest; and *Hylas and the Nymphs*, purchased by the corporation of Manchester.

Water Hyacinth (*Eichhornia crassipes*). Perennial aquatic herb of the family Pontederiaceae. A

Water Hen. British diving bird that nests among the reeds

native of S. America, it has a thick rootstock and large, round, fleshy leaves whose stalks are swollen. The large, violet, funnel-shaped flowers are clustered. The plants often float on the surface of the water, and propagate to such an extent that they block the rivers.

Water Lily (*Nymphaeaceae*). Family of about 60 perennial aquatic herbs, natives of temperate and tropical regions. The flowers are white, pink, red, and yellow. The commonest water lily is the British *Nymphaea lutea*, and the finest the S. American *Victoria regia* (*q.v.*).

Water lilies thrive best in still water. The plants should be sunk

Water Lily. Opening flower of *Nymphaea alba*

to a depth of about 2-3 ft., in an old fish or game basket full of rich loam. If planted in the spring, the plants will flower during the summer of the same year. The cultivation of tropical species requires specially prepared tanks, in which the temperature of the water is never allowed to fall below 65° F. The lilies should be planted in large pots full of rich loam and well decayed manure, and plunged about one foot below the surface of the water. They require repotting annually in early spring. *See Leaf*; *Lotus*.

Waterloo. Town of Ontario, Canada, in Waterloo county. It is situated nearly 50 m. N.W. of Hamilton, adjoining Kitchener, on the C.P.R. and C.N.R. Chief manufactures are brooms and brushes,

furniture, boots and shoes, shirts, and hardware. Pop. 9,512.

Waterloo. City of Iowa, U.S.A., the co. seat of Blackhawk co. It stands on the Red Cedar river, 52 m. N.W. of Cedar Rapids, and is served by the Illinois Central and other rlys. The chief industries are canning and meat packing, and the manufacture of agricultural implements, petrol engines, foundry and machine-shop products, cigars, and bricks. There are also large rly. workshops. Settled in

Water Hyacinth. Cluster of flowers and fleshy leaves, showing the swollen leaf-stalks

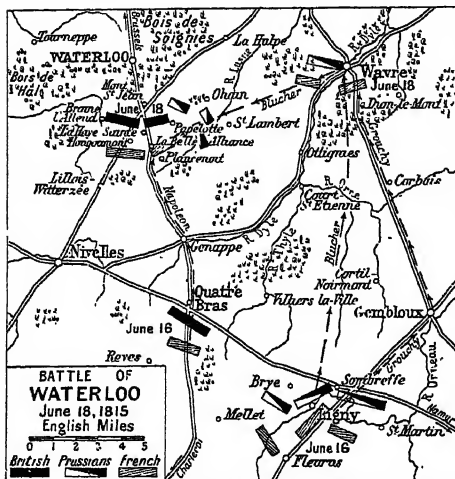

1850, Waterloo was incorporated in 1868. Pop. 51,743.

Waterloo, CAMPAIGN OF. Military operations between the British with their German and Dutch allies and the French that culminated in the battle of Waterloo, June 18, 1815. Waterloo is a village 11 m. S. of Brussels, in Brabant prov., Belgium. Near it is Mont St. Jean, after which height the French name the battle. Memorials mark its site.

On June 12 Napoleon had over 120,000 men on the Belgian frontier. Around Namur was a Prussian army under Blücher, about equal in strength. Wellington at Brussels in command of 90,000 men, of whom about a third were British, expected Napoleon to march upon that city. The first fighting took place on the 16th, the French attacking the Prussians at Ligny and St. Armand. The battle lasted until evening, when the Prussians, having lost 20,000 men, retreated towards Wavre. The French lost rather fewer. At the same time, in pursuance of Napoleon's plan of attacking the two hostile armies separately, the allies were also engaged at Quatre Bras, 6 m. away. There some Dutch and Belgian troops withstood furious French attacks, until a British detachment under Picton arrived from the neighbourhood of Brussels. This battle, too, was inde-

J. W. Waterhouse,
British painter

Waterloo. Plan showing the disposition of the opposing forces and the battlefields of the campaign against Napoleon in June, 1815

cisive, but the French fell back, their failure being ascribed to the fact that a corps under D'Erlon, having received contradictory orders from Napoleon at Ligny and from Ney at Quatre Bras, appeared to support neither. Each side lost about 4,000 men.

On the 17th, while Napoleon hesitated, the British concentrated at Waterloo, save 17,000 men at Hal and elsewhere. Napoleon, who had detached 33,000 men under Grouchy to follow the road he thought the Prussians would take, hurried with the remainder of both armies after the British. At Gemappe there was a skirmish, after which the two armies spent the night, a wet one, on the morrow's battlefield. Wellington had now 67,000 men under him; Napoleon had 74,000 and was stronger in both cavalry and artillery. The British infantry (18,847) were organized in 36 battalions, the British cavalry (7,448) in 21 regiments. The divisional commanders were Cook (1st), Clinton (2nd), Alten (3rd), Colville (4th), and Picton (5th). Uxbridge commanded the cavalry. The artillery under Wood formed 26 to 30 batteries of six guns each. Before the British were the farmhouses of La Haye Sainte and Hougomont. The divisions of infantry composed the line, with reserves and cavalry behind.

The French at 11.30 on Sunday forenoon opened the battle. On the British right a fierce struggle took place for Hougomont defended by the Guards; on the left, after a long cannonade, the Dutch and Belgians gave way, but the position was saved by a charge

made by Picton's division. The cavalry took advantage of this success and returned with many prisoners, although they suffered heavily in the exploit. The French strove hard around La Haye Sainte in the centre, but here, too, their efforts to pierce the British front were unavailing until about 6 p.m., when they seized the farmhouse; which they were soon forced to abandon. Meanwhile the French cavalry were

making their memorable series of charges upon the British squares. These failed, although the defenders paid a heavy price for their steadiness. In the afternoon, too, the Prussians, hurrying from Wavre, came in touch, but a force, detached by Napoleon to meet them, succeeded in forcing their leading troops back.

The emperor then made his final attempt at victory. The Imperial guard were ordered forward, and under Ney the veterans advanced, as did the remnants of the other troops. They were close when Wellington gave the word and the British guards, having fired, dashed forward with the bayonet. An advance of the whole line followed. The attackers were thrown into confusion just as the vanguard of Blücher's army came on the field. The British cavalry dashed forward to complete the victory; the whole army followed, and soon the French were in flight, pursued by the avenging Prussians. The losses of the British and their auxiliaries were 30,000: the Prussians lost 7,000 and the French 37,000, including prisoners.

This campaign and battle have been the subject of many studies, among which may be mentioned those by J. C. Ropes, 1893; H. Houssaye, Eng. trans. 1900; A. Pollio, 1906; S. C. Pratt, 1907. Their chief appearance in English fiction is in Thackeray's *Vanity Fair*. Byron in *Childe Harold's Pilgrimage*, and Hardy in *The Dynasts*, gave poetic treatment. See *Belle Alliance Farm*; Napoleon; Wellington.

Waterloo Bridge. London bridge across the Thames between Wellington Street, Strand, and Waterloo Road, Lambeth. The first bridge, designed by George Dodd, was built by a company of which John Rennie was chief engineer. The foundation stone was laid on Oct. 11, 1811, and the bridge was opened to traffic on June 18, 1817, the second anniversary of the battle of Waterloo. Built of granite, it consisted of nine elliptical arches, 35 ft. high and with a span of 120 ft., springing from piers 20 ft. wide and flanked by Doric columns. The bridge was 2,456 ft. long, including the Strand approach and the Surrey side causeway. In 1924 the roadway subsided owing to settlement of the central pier. The bridge was given timber supports, and its use was restricted to S-bound traffic, a temporary steel structure being built to carry N-bound traffic. After controversy it was decided to demolish the old bridge and construct a new one, the whole operation costing £1,500,000.

Designed by Sir Gilbert Scott, the new Waterloo Bridge follows the line of the old. Construction began in 1935, and one side of the bridge was opened to vehicular traffic on Aug. 11, 1942. The whole was formally opened on Dec. 11, 1945. It is built of steel and concrete and faced with Portland stone. The roadway, 58 ft. wide, accommodates six lines of traffic. The bridge is carried across the river on five

Waterloo Bridge, London. The up-stream side of the first Waterloo bridge, seen from the Victoria Embankment. The second bridge, opened in 1942, is shown among the illustrations of Bridges, p. 1422

Waterloo Station, London. Air view of the main Southern region rly. terminus. In the background is Waterloo bridge, and Second Great War air raid damage is visible here and there. The buildings between the station and the river on the left of the bridge were later demolished to provide the site for buildings of the 1951 Festival of Britain

spans of 238 ft. each, with a minimum height above water of 30 ft. Under the roadway on the S. side are incorporated columns and a small section of the parapet of the old bridge as a memorial to Rennie. The temporary steel structure, dismantled in 1943, was transported to the Netherlands after the Second Great War; parts of it were incorporated in temporary bridges across the Moerdijk, the Rhine at Oosterbeek, near Arnhem, the Maas at Venlo and at Dordrecht, and the Zwartewater at Zwolle, to replace bridges destroyed by the Germans. See Bridge illus. p. 1422.

Waterloo Cup. Coursing competition, the chief of its kind. It is held normally every year in Feb., at Altcar, near Liverpool. It originated in 1836 and owes its name to the fact that its leading promoter was landlord of the Waterloo Hotel, Liverpool.

Waterloo Place. A London thoroughfare. It crosses Pall Mall, S.W.1, and runs S. from Regent Street to St. James's Park. The N. section was once notable for its publishing houses; the S. has many monuments and statues, including the Guards' Crimean War

monument, Duke of York's column, and statues of Lord Herbert of Lea, Florence Nightingale, Edward VII, Captain Scott, Lord Clyde, Lord Lawrence, Sir J. Franklin, Burgoyne. On the S. side of the junction with Pall Mall are the Athenaeum and United Service club. See Column; Scott, R. F.

Waterloo Station. Principal station in London of the Southern region of British rlys. It was opened on July 11, 1848, as the London terminus of the London and South-Western rly., and had four platforms handling 68 trains daily. The station was enlarged in 1860 and 1885, and in 1922 was completely rebuilt as h.q. of the newly-formed Southern rly. It is the largest rly. station in Great Britain, covering 24½ acres; its 21 platforms (the longest 860 ft.) handle 1,550 trains and 120,000 passengers daily, for Waterloo is the terminus of electrified lines to the suburbs and beyond. From it depart the boat trains for Southampton Docks. The main archway forms a memorial to the 585 L. and S.W. rly. employees who lost their lives in the First Great War. The forecourt was damaged by German bombs in 1940.

Situated on the S. bank of the Thames, the station forms a triangle between Waterloo, York, and Westminster Bridge Roads, and is connected with the Waterloo and City and the Bakerloo underground lines. It still has a toll house where formerly rly. police collected tolls from all cabs entering the station. A centenary exhibition at the station in 1948 illustrated its history.

Waterloo-with-Seaforth. Former urban dist. now absorbed in the bor. of Crosby, Lanes, England. Waterloo is really a sea bathing resort for Liverpool people, being 6 m. N. of that city on the Mersey estuary.

Waterlow, Sir Ernest Albert (1850-1919). A British painter. Born in London, May 24, 1850, he was educated at Eltham and Heidelberg, and in 1872 entered the R.A. school, gaining the Turner gold medal in 1878. Member of the Royal Society of Painters in Water Colours, 1880, and in 1897 president,

Sir Ernest Waterlow, British painter

he was elected A.R.A. in 1890, and R.A. in 1903. He was knighted in 1902. His Galway Gossips was bought by the Chantrey trustees. Popular pictures were A Sussex Homestead, Green Pastures, A Moorland Road, Warkworth Castle, and Hemingford Mill. Waterlow died Oct. 25, 1919.

Waterlow, Sir Sydney Hedley (1822-1906). British merchant. Born in London, Nov. 1, 1822, he was the son of a stationer. He attended schools at Brighton and Southwark, and became a printer under his uncle. In 1864 he started a printing department in connexion with his father's business, and this became the firm of Waterlow and Sons. In 1857 Waterlow became a member of the city corporation, and was lord mayor in 1872-73. Knighted in 1867, he was made a baronet in 1873. He sat in parliament as a Liberal 1868-69, 1874-80, 1880-85, and died Aug. 3, 1906, having presented to the public his house at Highgate and the grounds which now form Waterlow Park. A great-nephew, Sir William Waterlow (1871-1931), was lord mayor of London 1929-30; his son, Sir (William) James (b. 1905), became a director of The Amalgamated Press, Ltd.

Waterman. One who plies for hire in harbours, on rivers, canals, etc., as ferryman or boatman, as distinct from a sailor who serves on the high seas. In the 17th century as many as 3,000 were employed on the Thames. The Thames watermen annually compete for Doggett's Coat and Badge (*q.v.*). Formerly the word was also applied to a man who provided horses with water at a cab rank and, in folklore, to a water demon. See Taylor, John.

Water Mark. Device produced in the manufacture of paper. It is made by pressure of a projecting design woven in the wire gauze on the dandy roll, so making the web of moist paper thinner where it comes in contact with the design. See Paper.

Water Meadow. Term used by agriculturists for a piece of land that is kept fertile by allowing the water from an adjoining stream to flow through it in irrigation channels. See Pasture.

Water Melon (*Citrullus vulgaris*). Trailing perennial plant of the family Cucurbitaceae. See Gourd; Melon.

Water Mite. Minute aquatic creature of the order Acarina, of the class Arachnida (*q.v.*). More than 200 species are British, many

being of a characteristic red colour. The genus *Hydrarachna* in its larval stage lives as a parasite attached to the skin of water bugs and other creatures. Water scorpions (*q.v.*), dragon flies, and others are often seen with these minute orange or red larvae attached to them. Adult mites are free living.

Water Moccasin. Venomous snake that haunts shallow waters of the southern U.S.A.
W. S. Berridge, F.R.S.

Water Moccasin (*Ancistrodon piscivorus*). Venomous aquatic snake of the southern U.S.A., also called cottonmouth. It is a

Water Moss. Branching stems of leaves and flowers. Inset, leaves

Bryaceae. It is attached to stones, chiefly in running water. It has long, branching stems, with leaves arranged in three series.

Water Music. Composition by Handel. This set of instrumental pieces composed in 1715 was scored for four violins, viol, cello, double bass, two oboes, two bassoons, two horns, two flageolets, flute, and trumpet. According to one account it restored Handel to George I's favour. Baron Kielmansegge arranged a picnic party on the Thames for the royal family on Aug. 22; the party proceeded in

barges from Whitehall to Limehouse, and the baron persuaded Handel to supply music to be played in a barge directly following. According to E. J. Dent, two different sets of music were composed. In any event, the pieces were collected for publication in 1740. Nowadays six are usually played in Hamilton Harty's arrangement.

Water Ousel. Popular name for the bird called the Dipper (*q.v.*).

Water Polo. Aquatic ball game. It is played with a ball not less than 27 ins. and not more than 28 ins. in circumference. Competitions are held in a swimming bath or open water. The distance between goals varies from 19 to 30 yards, width of the

playing space being not more than 20 yards. The goal is 10 ft. wide and 3 ft. above the water level. A team is 7 players, generally divided into three forwards, one half-back, two backs, and a goalkeeper. Only one hand may be used, and it is a foul to touch the ball with both hands at the same time. The duration of play is 7 mins. each way, the ends being changed at half-time.

With the coming of the Amateur Swimming Association rules were framed and the game was taken up by nearly every club in England. The first club water polo championship under the association rules was held in 1888, since which date district and county annual matches have been inaugurated. The sport also figures in the Olympic Games.

Water Power. The use of water power to provide electricity for industry is described under Hydro-Electric Installations. The greatest schemes of this kind are also described separately, e.g. Boulder Dam, Dnieper Dam, Grand Coulee Dam, Niagara Falls, Sennar Dam, Shannon, Tennessee Valley Authority. For details of the technical devices involved, see Hydraulics; Water Turbine; Water Wheel.

Waterproofing. The treatment of textiles, paper, and other materials to make them resist penetration by water, or even to be capable of holding water without leakage when made into a bag or similar object. On textiles waterproofings are of two types: water-repellent, in which the fabric resists penetration of water while still porous and thus allowing the passage of air; and impervious, in which the fabric

is completely covered by a continuous film of rubber or similar material, and neither water nor air can penetrate.

Under the heading of water-repellent treatments fall the various showerproofings used on gaberdine raincoats, etc., where (for a time at least) rain runs off in small droplets without wetting the fabric. The repellent effect is produced by treating the fabric with a solution of an aluminium salt either alone or in conjunction with soap; with an emulsion of wax; or with a combination of the two. A method frequently suggested for home re-proofing of raincoats is to soak in a mixture of lead acetate and alum solutions. This must be done with care, remembering that lead acetate is a dangerous poison.

In commercial proofing aluminium acetate or formate is used ready prepared, and special preparations containing both the aluminium salt and a stable wax emulsion are known. These proofings have the defect that when the garment is washed or dry-cleaned they are almost completely removed. In durable proofings, complex fatty chemical compounds are made to combine chemically with the textile material; these proofings resist washing or cleaning, but can be applied to cloth only before it is made up into garments.

In the impermeable type, fabric is coated with a film of rubber or synthetic rubber, on one side or on both; or (as in double-texture mackintoshes) the rubber layer is between two layers of cloth and cements these together (see Coated Fabrics). Another process is oil-proofing, where the fabric is soaked in linseed oil or special varnishes, and then baked; this is used for oiled silk, cycling capes, and for anti-gas clothing. Nylon can be impregnated with a plastic material. Still another type of process, used on cotton, is to treat it with a solution of a copper compound which softens and partly dissolves it. When the material is passed between heavy rollers the fabric interstices are closed, and after washing and drying the fabric is impermeable. Railway waggon covers are proofed with mixtures of bitumen and pigments.

Paper is waterproofed by coating or impregnating with wax, bitumen, linseed oil, varnishes, or synthetic resin lacquers; cellulose film by giving it a thin coat of nitro-cellulose lacquer. Some

compounds of silicon make the surface of materials, including glass, permanently water-repellent. See Silicones.

F. V. Davies, B.Sc.

Waterproof Paints. This term covers substances varying from paints of the ordinary type, to which materials have been added to improve water-resisting qualities, to compositions of materials of high resistance to water. The cheapest and most generally used materials are the pitches and bitumens. Coal-tar pitch is a frequent ingredient of paints and compositions alike. Natural asphalts and bitumens, including those obtained from petroleum distillation, are widely used, frequently blended together with the addition of waxes. Suitable varieties of bitumen can be introduced into oil paints and varnishes, though they darken the colours. Metallic soaps, especially the palmitates and stearates of aluminium, do not affect the colour of paint. Rubber and its derivatives may be used where chemical resistance as well as waterproofing is necessary. Rubber latex emulsified with waxes or mixed with casein in alkaline media forms the basis of a variety of preparations. Oxidised rubber is compatible with a variety of organic solvents and with the ordinary natural resin-oil varnishes, giving highly water-resistant coatings, particularly if tung oil (china wood oil) be used in the oil medium. Chlorinated rubbers are also used. Of the synthetic resins, the chlorinated diphenyls have high resistance to heat as well as water; they are compatible with the ordinary constituents of paint and varnish.

Water Rat. Popular but erroneous name for the water vole (*Arvicola amphibius*). See Vole.

Water Rights. Term in English law. By the common law, if one wishes to convey a pool or river, it should not be described as "water," but as "land covered with water," i.e. the grant of the land includes the water that is on it. A mere grant of water does not convey the ground on which the water is, though it would pass the right of fishing in the water named, and the right of navigation. Where a river or stream, in a well-defined

channel either above or below ground, passes through the land of several proprietors, those below have a right to the full and free, uninterrupted flow of the water, and an upstream owner must not divert the water, or dam it up so as to lessen the flow. Water which has no defined channel, but merely percolates through the land by the force of gravity, is not the subject of property. See Riparian Owner.

Water Scorpion. Family of water bugs (Nepidae), some of which are common in the ponds of Great Britain.

The curved fore-legs and the tail-like appendage to the abdomen gives this insect something of the appearance of a scorpion. The tail is really a breathing tube, and is raised above the surface when the insect comes up for air.

Water Scorpion, *Nepa cinerea*, about natural size

Watershed (Ger. *Wasserscheide*), **WATER PARTING**, OR **DIVIDE**. Height of land separating river basins. The Pennine Chain, for example, forms the watershed between the rivers draining the W. and E. slopes.

Watersmeet. Spot near Lynmouth, Devon, England, where the Combe Water joins the East Lyn river. The famous walk to this point is National Trust property.

Watersmeet, Devon. The confluence of the Combe Water and the East Lyn river near Lynmouth

Water Snake. General name for snakes of the genus *Natrix*. Natives of the temperate and tropical regions, they are distinguished by their coarsely keeled scales and the divided anal shield. The British grass-snake (*N. natrix*) is a typical example. The name is not due to specially aquatic habits, but to the fact that these

snakes are found mostly near water, their food consisting of fishes, frogs, etc. See Snake.

Water Softening. Domestic water can be softened by adding borax or sodium carbonate, or mixtures of the two salts, with perfume. These chemicals precipitate the dissolved salts which cause the "hardness" of water, so that it produces a good lather with soap. The zeolite system, which removes all hardness, uses permutites or artificial zeolites. These are hydrated aluminosilicates of sodium, similar in composition to naturally occurring zeolites, e.g. analcite, $\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. Such materials remove hardness from water by an exchange between the bases present, usually by substituting sodium for calcium or magnesium.

Water Spider (*Argyroneta aquatica*). The only British aquatic spider, which lives below the surface in clear ponds. About $\frac{1}{2}$ in. long, the male is unusual in being larger than the female. Members of the two sexes make shelters of silk and plant material in which they live. They swim to the surface and take down bubbles of air attached to the end of their bodies; these bubbles they discharge into the shelter, where they are used for respiration. When swimming the body is coated with a large number of small bubbles of air which cling to its hairs and impart to it a silvery appearance. The spider carries living and dead insects to its shelter for consumption.

Waterspout. Term applied to the ocean counterpart of the tornado, of which it is usually a much less violent form. It occurs with heavy, thundery cumulonimbus clouds, from whose lower surface a small funnel-shaped cloud begins to descend slowly. Beneath this point the surface of the sea becomes

disturbed and a cloud of spray forms. As soon as the spout dips into the spray, it assumes the appearance of a writhing, whirling column of water, generally between 20 and 30 ft., but sometimes as

much as 300 ft., in diam., and extending up to about 1,500 ft. in height. Waterspouts have been described as consisting of a hollow cylinder of water drops with a more or less transparent core, but a dark central core has also been observed, the whole strongly suggestive of spiral movements. The effects are purely local, the wind following a circular path around the vortex often being sufficiently strong to produce a rough sea. The duration is of the order of 10 mins. to half an hour, the waterspout breaking up at about one-third of its height from the base. Sometimes the phenomenon is not fully developed and the spout fails to reach the water surface; such pendants may also be seen during thundery weather over the land. Waterspouts occur most frequently in tropical waters in March, April, and Oct. In the North Sea six were reported by British observing ships during the 12 years 1920-31. One was seen off Beachy Head, Jan. 2, 1949. See Tornado.

Water Supply. Term commonly used for the water supplied by a local authority for consumption within its area. Under the Rural Water Supplies Act, 1944, and the Water Act, 1945, the minister of Health became responsible for providing adequate water, and for conserving resources; and every local authority in Great Britain has the duty of ascertaining the sufficiency and wholesomeness of water supplies in its area. So far as practicable it must provide water, and pipes to carry it, in every part of the area in which there are houses or schools, to a point from which the water can be taken to the houses or schools at reasonable cost. When a new house is to be built, the local authority must see that under the plans the occupants are provided with a reasonable supply of wholesome water for domestic purposes either by connecting the house to the main supply or, if that is not reasonable, by taking water into the house in some other way or, if neither of these courses is practicable, by providing a supply of water within a reasonable distance of the house. If houses already occupied have no sufficient supply for domestic purposes, the local authority may, if this is reasonable, require the owner to connect the house by pipes to the main supply, or to provide a supply in some other way either in or near the house as may be reasonable.

Charges for water for domestic purposes are usually made by a

rate based on the value of the premises. When water supplied for domestic purposes is used for a garden or for horses or for washing vehicles, an additional charge may be made if a hosepipe or outside tap is used. Charges for water for domestic purposes may be made by meter instead of by a water rate; charges for water for industrial and business purposes are usually by meter.

Steps in the process of purification and distribution of water, and disposal of water sewage, are described under Filtration; Plumbing; Reservoir; Sewage.

Water Table. In geology, the surface below which the rocks of the earth's crust are saturated with

Water Table. Diagram showing the relationship between the water table and the ground surface in summer and in winter. With the rising of the water table in winter, a spring develops in the valley on the left

water. It is not a level surface, but it reflects the topography; it stands high below hills, and is at zero where it meets the sea. The position of the local water table is shown by the level of water standing in wells. This varies seasonally, according to the rainfall; it also changes slowly with climatic variations. After a wet period it rises and may even reach the ground surface in a valley or re-entrant. This gives rise to the flowing of an intermittent seasonal spring orbourne. In districts underlain by limestone, where water can flow easily down solution channels, pot-holes, and caverns, the water table tends to be at a great depth; but where the rocks are less permeable and the flow is restricted it is usually nearer the surface. In desert areas the depth may be very considerable, and because of this rivers flowing into deserts soak away and disappear. See Karst; Spring.

Water Thyme (*Elodea canadensis*). Perennial aquatic herb of the family Hydrocharitaceae. It is a native of N. America, but has become naturalised in Europe. It has slender, brittle, jointed stems, as much as four feet long, which root at the joints. The plant made its appearance in Ireland in 1836, and in England seven years later. It spread rapidly all over the country, and choked many canals and streams. Later it appeared to

Waterspout. A remarkable example in the Mediterranean, 1943

Water Thyme. Leaves and flowers of the plant introduced from N. America. Inset, flower

have lost much of its colonising vitality, and is almost extinct in many places where it was a pest.

Watertown. Town of Massachusetts, U.S.A., in Middlesex co. A suburb of Boston, from the centre of which city it lies 6 m. W., it stands on Charles river, and is served by the Boston and Maine rly. Rubber articles, hosiery, paper, motor vehicles, and stoves are among the chief manufactures. Watertown was settled about 1630. The provincial congress met here in 1775, when the town was second in size to Boston. Pop. 35,427.

Watertown. City of New York, U.S.A., the co. seat of Jefferson co. It stands on the Black river, 73 m. N. of Syracuse, and is served by the New York Central and Hudson River rly. Wood pulp and paper are manufactured. Watertown was incorporated in 1816, and became a city in 1869. The town was named because of its water power. Here in 1878 the first Woolworth store was opened. Pop. 33,385.

Watertown. City of Wisconsin, U.S.A., in Jefferson and Dodge cos. It stands on the Rock river, 45 m. W.N.W. of Milwaukee, and is served by the Chicago, Milwaukee, and St. Paul rly. The chief industries are the manufacture of cheese, boots, flour, cigars, and lumber products. Stuffed goose is a famous export. Watertown was settled in 1835, incorporated in 1849, and chartered as a city in 1853. Pop. 11,301.

Water Turbine. Machine for converting the potential energy of waterfalls into kinetic energy. There are two types, i.e. the Pelton wheel and the Francis turbine, respectively for high, and for medium and low falls. In the Pelton wheel the supply water issues at high velocity from a nozzle which directs it on to a series of cup-shaped buckets surrounding the wheel. The impulse of the jet pro-

vides the driving force on these buckets. Speed is regulated by increasing or diminishing the area of the nozzle to suit an increased or diminished demand for power. Such wheels are capable of giving an efficiency of over 80 p.c. They can be adapted to any head of water exceeding about 100 ft., and for powers, for high heads, up to about 20,000 h.p. The maximum feasible size of jet is about nine inches in diameter, and where this is insufficient to give the required power a second jet may be arranged to play on the wheel at a point about 90° from the first jet. This method is, however, not altogether advisable, as there is some interference between the jets which reduces the efficiency.

Where, owing to the smallness of the head or the large power desired, the volume of water to be handled is very large, the Pelton wheel with its single or double jets becomes unsuitable, and for such cases the Francis turbine is used. This turbine consists of a wheel or runner carrying a series of curved vanes or buckets around its periphery. Water is supplied to the runner through a series of guide vanes or buckets entirely surrounding the runner and thus giving a large area of waterway. The guide vanes are so arranged as to direct the water almost tangentially into the vanes of the runner, and these latter are so shaped as to receive the water without shock, and to discharge it axially into the discharge pipe or draught tube. Under favourable conditions the efficiency of this type of turbine may exceed 90 p.c. It is adaptable to any head from about 400 ft. to as low as 1 foot. Most of the largest turbines as yet built are of this type, and will develop as much as 115,000 h.p. under a head of 400–500 ft.

Speed regulation is attained by the use of movable guide vanes. Each vane is pivoted about an axis near its centre, and all the vanes are operated by a common ring whose position is regulated by the governor. The movement of this ring varies the area of the waterway between the vanes.

Waterville. City of Maine, U.S.A., in Kennebec co. It stands on the Kennebec river, 80 m. N.N.E. of Portland, and is served by the Maine Central rly. Cotton and woollen goods are the leading manufactured products. Waterville was incorporated in 1802, and became a city in 1883. Pop. 16,688. Waterville is also the name of a watering-place in Kerry, Eire.

Water Violet (*Hottonia palustris*). Perennial aquatic herb of the family Primulaceae. It is a native of Europe and W. Siberia. It is a floating plant, the thick succulent branches rooting on the surface. The erect flower-stem stands out of

Water Violet. Flowers and leaves of the floating plant. Inset, flower

the water to a height of a foot or more, bearing the lilac, salver-shaped flowers.

Watervliet. City of New York, U.S.A., in Albany co. It stands on the left bank of the Hudson river, opposite Troy, which is reached by ferry and bridge, and is served by the Delaware and Hudson rly. The oldest U.S. arsenal (built 1807) is here, ironically, built on the site of the first settlement of the pacifist Shaker cult. The early settlement was called West Troy; it was incorporated as a village in 1836, and became a city in 1897. Pop. 16,114.

Water Vole (*Arvicola amphibius*). Species of vole, popularly known as the water rat. See Vole.

Waterways. Term sometimes applied to a system of artificially constructed navigable channels, usually linking up navigable rivers. See Canals.

Water Wheel. Wide, horizontal wheel turned by water caught in vanes parallel to the axis. Water wheels are the oldest means of utilising water power, and some are highly efficient.

The overshot wheel (Fig. 1, see next page) receives the water at the top at a velocity about half as great again as that of the wheel. The water acts by gravity.

Water enters a breast wheel (Fig. 2) below the top, and turns it by weight entirely if caught in buckets, or partly by its velocity if vanes are used. The breast fits the wheel as closely as possible to minimise waste of water.

The undershot wheel (Fig. 3) receives water at the bottom, and makes use of its momentum. In the Poncelet wheel the vanes are so

shaped that the water enters them tangentially, and comes to rest while travelling upwards over the

Water Wheel. Principal types in common use. 1. Overshot. 2. Breast. 3. Undershot. See text

faces. The spaces between the vanes are only partly filled, as the water issues from the gate in the form of a sheet considerably thinner than the pitch of the vanes. See Water Turbine.

Watford. Mun. borough and market town of Herts, England. It stands in the valley of the Colne, and has three rly. stations, the junction and one in High Street which are served also by the Bakerloo rly., and Watford West. There is communication with adjoining districts by bus and Green Line. The chief building is the Perpendicular church of S. Mary, restored 1870-71; it has two chapels and interesting monuments. Other buildings include the London Orphan Asylum, Salters' almshouses, and schools. Part of Cassiobury Park, formerly the seat of the earl of Essex, is now the property of the town. Many

industries have been established at Watford during the 20th century, such as printing works and factories for preparing food-stuffs. Brewing and milling are older industries. Watford, made a borough in 1922, elects an M.P. Market day, Tues. Pop. 67,070.

Wath-upon-Deerne OR

DEARNE. Urban dist. and market town of Yorks (W.R.), England. It is 6 m. by rly. N. of Rotherham and near the Dearne and Dove canal. Iron and coal are mined. Market day, Sat. Pop. 23,000.

Watkin, Sir EDWARD WILLIAM (1819-1901). A British railway director. Born in Manchester, Sept. 26, 1819, he became secretary of the Trent Valley rly. in 1845, and was next employed by the Manchester and Sheffield Co., of which he was chairman by 1864. He was also chairman of the South-Eastern and Metropolitan rlys. for many years. Watkin's most successful work was the conversion of the Manchester, Sheffield, and Lincoln into a great trunk line, the Great Central. Projects for channel tunnels to connect France with England, and to link Scotland with Ireland, occupied his attention, and he began the Watkin tower, modelled on the Eiffel tower, at Wembley. Liberal M.P. for Stockport, 1864-68, and for Hythe, 1874-95, Watkin was knighted 1868, and a baronet from 1880. He died April 13, 1901.

Watkins, Hubert George (1907-32). An English explorer. Educated at Lancing and Trinity College, Cambridge, he was chosen in 1927 to lead the university expedition to Spitsbergen, in which, and in an expedition organized by himself to Labrador next year, he proved a born leader of men. He led the British Arctic air route expedition of 1930 to Greenland, accomplishing valuable pioneer work, and receiving the founders' medal of the Royal Geographical Society. Returning to Greenland in 1932, he was accidentally drowned, Aug. 20. *Consult* Watkins's Last Expedition, F. S. Chapman, 1934; Gino Watkins, J. M. Scott, 1935.

Watling or Watling's Island. Alternative name for a small British island in the Bahamas,

Watford, Hertfordshire. The town hall, opened in January, 1940

West Indies, now believed to be the first landing-place of Columbus in 1492, and renamed San Salvador (formerly applied to Cat Island).

Watling Street. Early English name for a Roman road from Dover to Wroxeter. Utilising an older British track along the water-sheds, it was a reconstruction on Roman lines, as shown by its 11 straight sections with angular junctions. It ran through Canterbury, London, St. Albans, Dunstable, and Towcester to Wroxeter. See Britain.

Watson, Sir ALFRED HENRY (b. 1874). British journalist. He was born at Newcastle-on-Tyne, becoming a journalist at 16. In 1894 he was leader-writer to the Newcastle Leader, joining the Westminster Gazette in 1902 and becoming managing editor in 1921. During 1925-33 he was editor of the Statesman, Calcutta. He was knighted 1932. At home he was from 1940 a director of the periodical Great Britain and the East. He wrote for this Encyclopedia the article on modern India. His brother, Arthur E. Watson (b. 1880), was managing editor of the Daily Telegraph, 1924-50.

Watson, Sir ANGUS (b. 1874). British business man. He was born at Ryton-on-Tyne, Jan. 15, 1874, and educated privately. He founded the fish business of Angus Watson and co., Ltd., which eventually had branches in many countries and a capital of

Sir Angus Watson, British business man

£2,000,000. He also started a large fish-canning firm in Norway. He was president of the Tyneside council of social service, which did great work in alleviating unemployment distress in the Tyneside area during the 1930s. A

prominent Nonconformist, he contributed articles to the religious press. Watson was knighted in 1945. He published an Autobiography in 1937.

Watson, Sir Bertrand (1878-1948). British magistrate. He was born at Stockton, May 16, 1878, educated at Harrogate, and admitted solicitor in 1900. Nine years as deputy-coroner for Durham was followed by a spell on its council, 1912-19, and he was Liberal M.P. for his native town, 1917-23. From 1928 he was a metropolitan police magistrate, at N. London, Clerkenwell, and Lambeth courts, almost continually until 1941, when he was raised to the chief magistracy in succession to Dummett at Bow Street. Sir Bertrand, who was knighted in 1942, died Feb. 16, 1948.

Watson, Dr. John. The supposed narrator of all but three of the 60 Sherlock Holmes stories by Sir A. Conan Doyle. A former army doctor, wounded in Afghanistan, he is closely associated with Holmes in all the adventures, and in the earlier stories shares with the great detective the famous Baker Street apartments. The rock-like normality of his mind and temperament serves as a constant foil to Holmes's brilliant genius, and more than once his stolid common sense is made to look like stupidity; yet a genuine affection is shown to exist between the two, Holmes once having declared: "I should be lost without my Boswell." Most readers, too, acquire a peculiar fondness for Watson, and such details of his life apart from Holmes as can be deduced from references in the various stories have aroused the interest of the curious. He marries the heroine of *The Sign of Four*, but is later presented as a widower, and finally as remarried. See Holmes, Sherlock; consult Dr. Watson, S. C. Roberts, 1931.

Watson, John. Scottish novelist and divine who wrote under the pseudonym of Ian Maclaren (*q.v.*).

Watson, John Christian (1867-1941). Australian statesman. Born at Valparaiso, April 9, 1867, of Scottish parentage, he was taken to New Zealand, receiving his education at the public school of Oamaru. He went to Sydney and became a compositor, then took up politics, being chosen president of the Sydney trades and labour council. He was member of the N.S.W. legislative assembly, 1894-1901, becoming leader of the Labour party, and sat in the Com-

monwealth parliament 1901-10. In 1904 he was the first Labour prime minister of the Commonwealth of Australia. He died Nov. 18, 1941.

Watson, Robert (1746-1838). Scottish adventurer. Born at Elgin, Jan. 29, 1746, he fought under Washington in the American War of Independence, and after his return to England became secretary to Lord George Gordon (*q.v.*), whose life he wrote in 1795, and an irrepressible agitator. Watson was imprisoned in 1796 for conspiracy, wandered to Paris in 1798, became intimate with Napoleon, to whom he gave lessons in English, and was made principal of the Scots College in Paris. Later he settled in Rome, where in 1817 he made £3,600 by trafficking in Jacobite papers which he had bought for a few shillings. Eight years later he returned to London, where he committed suicide, Nov. 19, 1838.

Watson, Sir (John) William (1858-1935). English poet, born Aug. 2, 1858, at Burley-in-Wharfedale. While still at a Southport school he wrote much verse, and in 1880 published *The Prince's Guest*, but left all these poems out of his collected edition of 1928. By

Sir William Watson,
British poet
Russell

1892 Wordsworth's *Grave*, and a fine ode on Tennyson's death, *Lachrymae Musarum*, made Watson talked of as a likely poet laureate; but his lifelong opposition, already expressed, to imperialism, whether in Ireland or in the East, was no doubt a disqualification. Watson coined the name of Abdul the Damned in verses on the Turkish sultan's massacres of Armenians. One year, 1896, brought forth *The Purple East*, and *The Year of Shame*. Another splendid ode was written for Edward VII's coronation. Influenced chiefly by Wordsworth and Arnold, Watson had the gift of sonorous blank verse. His best-remembered short pieces include *The Great Misgiving*; the sonnets *Estrangement*, and *Voice and Vision*; April, April; Ode in May. "The last of the

Victorians," who was knighted in 1917, died Aug. 11, 1935.

Watsonia. Genus of bulbous herbs, also known as Bugle Lily (*q.v.*).

Watson's Bay. Seaside resort on Sydney Harbour, New South Wales, Australia. It is 4 m. E. of the city, inside South Head, which has a powerful lighthouse and is fortified. Pop. est. 1,600.

Watson-Watt, Sir Robert Alexander (b. 1892). British inventor. He was born April 13, 1892, and educated at Brechin high school, Dundee university college, and St. Andrews university. After serving in the meteorological office and the department of scientific and industrial research, he was during 1933-36 head of the radio department of the national physical laboratory. In 1935 he first suggested the possibility of radar (*q.v.*) as a means of detecting distant aircraft, and before the Second Great War was director of communications development at the Air ministry, later transferring to the ministry of Aircraft Production. He continued to advise on telecommunication to the Air ministry, and was knighted in 1942 for his work in all these spheres. After the war he turned his attention to the problems of television in cinemas, forming the firm of Sir Robert Watson-Watt and Partners, Ltd., to carry on experimental work in this and cognate matters.

Sir Robert
Watson-Watt,
British inventor

Watt. Unit of electrical power. It is the energy expended per sec. between two points in a circuit which differ by one volt when a current of one ampere flows, *i.e.* watts = amperes \times volts. One horse-power is 746 watts. For convenience, large amounts of power are rated in kilowatts (one thousand watts) and megawatts (one million watts), and very small amounts in milliwatts (one-thousandth watt) and microwatts (one-millionth watt). The watt-hour, a power of one watt for one hour, is a measure of electrical energy, and one kilowatt-hour is the standard board of trade unit by which electricity is sold. Wattless current is that part of the current in an A.C. circuit which may be regarded as being 90° out of phase with the circuit voltage, and does not, therefore, contribute

to the total power in the circuit (see Power Factor). A pure inductance which contained no resistance would draw a completely wattless current. Actually, since resistance cannot be escaped, there will be a small power component of the current due to resistance losses. Since even wattless current loads up a conductor, it is customary to rate apparatus such as transformers not in kilowatts but in kilovolt-amperes.

Watt, JAMES (1736-1819). Scottish engineer. Born at Greenock, Jan. 19, 1736, a merchant's son,

After Sir W. Beechey *James Watt*

he was extremely delicate in youth. He learnt the use of wood and metal working tools, studied mathematics, and at eighteen went to London as assistant to an instrument maker. Ill-health compelled a return to Glasgow. In 1764, when maker of mathematical instruments to Glasgow university, he repaired a model of the Newcomen steam engine, and turned his attention to avoiding the waste of steam in such engines. Next year he patented the epoch-making method of external condensation of the steam away from the cylinder. Watt met his future partner, Matthew Boulton, in 1768, and in 1774 an experimental engine was completed embodying the essential features of the modern steam engine. To Watt was due the contrivance of sun and planet gear wheels for changing reciprocating into rotary motion; the well-known centrifugal governor as applied to the steam engine; the water gauge, and the incorporation of the principle of parallel motion, one of the most useful of all.

Watt had a remarkably prolific mind, though in many respects an

extremely limited one; he laughed at the idea of a steam locomotive, and scoffed at Trevithick (*q.v.*). Yet to Watt we owe the invention of duplicating letters by specially prepared ink; the discovery of the composition of water; the invention of a micrometer and the hydrometer for quickly ascertaining the specific gravity of liquids; the marine screw propeller, etc. He was a fellow of the Royal Society and that of Edinburgh, and one of the eight foreign members of the Institute of France. In 1800 he retired to his estate at Heathfield Hall, Birmingham. He died Aug. 25, 1819. See Parallel; Steam Engine.

Bibliography. Origin and Progress of the Mechanical Inventions of James Watt, J. P. Muirhead, 1854; Life of Watt, J. P. Muirhead, 1858; Lives of Boulton and Watt, S. Smiles, 1865; James Watt, T. H. Marshall, 1925; J. W. and the Steam Engine, H. W. Dickinson and R. Jenkins, 1927.

Watteau, JEAN ANTOINE (1684-1721). French painter. The son of a plumber, born at Valenciennes, Oct. 10, 1684, he studied under a local teacher and then made his way to Paris, where he entered the studio of Gillot, a decorative painter. While thus employed, he was thrown much into the society of theatrical people. He left Gillot to become assistant to Audran, keeper of the Luxembourg, where he studied the old masters. After a brief visit to Valenciennes, he set up for himself in Paris, under the patronage of the marquis of Tugny, then the chief collector of pictures. Watteau came second in the competition for the prix de Rome, 1709, and became an asso-

ciate member of the Academy, 1712. For Tugny, with whom he lived,

J. Antoine Watteau,
French painter

he painted *The Seasons*, *Les Charmes de la Vie*, *Les Noces*, and the celebrated *Conversations*, based on scenes noted in the Luxembourg gardens, and many *fêtes galantes*. He was made full member of the Academy, 1717, his diploma picture being the famous *Embarkation for Cythera*, now in the Louvre. Recognition came too late, for he was already suffering severely from consumption. In 1719 he visited England for medical advice, painting for his doctor *Les Comédiens Italiens* and *L'Amour Paisible*. On July 18, 1721, he died.

Watteau opened a new period in French art. Following his leadership came Lancret, Boucher, and Fragonard. His work, delicate and poetic, represented a reaction against the classical style. He introduced new scenes and new figures: the clown, the Italian singer and guitar-player; beautiful ladies and elegant gentlemen hunting and picnicking; and soldiers on the march. His *fêtes champêtres* began a vogue which has never entirely died out; but his representations of country lovers, shepherds, and yokels showed equal skill and sympathy. As a technician he is a forerunner of the Impressionists in his treatment of light and colour. In the Wallace Collection, London, he is

Jean Antoine Watteau. *The Music Party*, a characteristic group of courtiers placed in a landscape typical of the artist's style

well represented. The championship of E. de Goncourt restored him to favour about 1875. The best Life in English is by C. Phillips, 1895.

Watterson, HENRY (1840-1921). American journalist. He was born Feb. 16, 1840, at Washington, where his father was a member of congress. After an informal schooling he became a reporter. On the outbreak of the Civil War he served in the Confederate army. In 1868, when two journals were consolidated in the Louisville Courier-Journal, Watterson was appointed first editor, and until his retirement in 1918 he exerted through its columns a powerful influence on politics, a series of attacks on The Man on Horseback (Theodore Roosevelt) attracting wide attention. In 1918 he was awarded a Pulitzer prize for editorials acclaiming America's declaration of war. Marse Henry, his autobiography, appeared in 1919. He died Dec. 22, 1921.

Wattignies, BATTLE OF. Victory won by the French Revolutionary armies under Carnot and Jourdan against the Allies, principally Austrians, under Coburg, Oct. 16, 1793. Wattignies is a hamlet in Nord dept. of France, 5½ m. S.S.E. of the fortress of Maubeuge, which was being besieged. The French were 43,000 against 23,000. Their premature attack on the 15th was beaten off, but in the night Carnot moved 8,000 troops across to his right against Wattignies, where the heights were insufficiently defended. In the forenoon this place was taken by the French, who held it just long enough for victory to be achieved on the central plateau. Coburg retreated across the Sambre in good order, having lost 2,500, his assailants rather more. On this battlefield, declares Hilaire Belloc, "more was done to affect both military and general history than on any other"; for the fall of Maubeuge might have entailed that of Paris, and Wattignies witnessed the beginning of new tactics devised by Carnot and later perfected by Napoleon.

Wattle (A.S. *watel*, twig). Term used in architecture to denote one of the earliest materials employed in erecting human dwellings. In its most primitive form the wattle occurs as a leafy wind-screen, as in aboriginal Australia and Tierra del Fuego. In Neolithic Europe huts of interlaced osiers were clay-daubed or turfed, and in Swiss lake-dwellings burned wattle-and-

daub fragments have been preserved. Similar structural methods occurred in oldest Crete, Mesopotamia, and Vedic India; they survive in Africa, especially among the Nilotic peoples. Wattle-and-daub survived throughout Roman Britain, as at Silchester, into Anglo-Saxon England. See Africa.

Wattle. Name applied to various Australian species of acacia (*q.v.*). Wattle day is the name given to the day (Jan. 26) on which Sydney was founded in 1788. It is kept as an anniversary.

Wattle Bird (*Anthochaera carunculata*). Species of honey eater, found only in Australasia. These

Wattle Bird. The Australasian honey eater

birds are notable for their long tongue, which resembles a brush at the tip, and is used for extracting nectar from flowers. The large wattles, depending from the side of the head, give the species its name.

Wattmeter. Instrument for measuring electrical power. It consists essentially of a fixed rectangular flat coil through which the main current passes; a movable coil within the fixed one, with a shunt connexion to the fixed coil circuit; a resistance inserted in series with the movable coil; and a spiral spring and a silk thread by which the movable coil is suspended, and a dial indicator. When the wattmeter is suitably connected into the electrical circuit under test the current in the fixed coil will be that flowing in the test circuit, while the current in the high resistance movable coil will be a measure of the electrical potential difference across the circuit. Since the force between the coils will be proportional to the product of the currents in them, it follows that the rotation of the suspended coil will be a measure of the electrical power developed in the circuit. This

movement is indicated by a hand or pointer on a dial or scale.

Watts, GEORGE FREDERIC (1817-1904). British painter. He was born in London, Feb. 23, 1817, of a Herefordshire family, and in 1835 entered the R.A. schools. He also frequented the studio of Behnes the sculptor, from whom he obtained ideas concerning the nobility of Greek art. At the very outset of his career he painted good portraits, two of which were exhibited at the R.A. in 1837, together with a picture called The Wounded Heron. His portrait of Mrs. Ionides, exhibited 1840, drew public notice to his work.

Gaining a premium shortly afterwards for a cartoon for the decoration of the palace of Westminster, he went to Italy in 1844 and remained until 1847, employing himself in painting portraits of the English who passed through Florence. From 1848 he became one of the best-known portrait painters in England. After about ten years of hard work, he developed a patriotic desire to paint the portraits of leaders of the intellectual movement in England, and eventually to present them to the nation. He made over the first of these gifts in 1883, and continued to make additions to his gallery until his death, enriching the National Portrait Gallery with a series representing Manning, J. S. Mill, Lord John Russell, Tennyson, Browning, Carlyle, Gladstone, Max Müller, Morris, Rossetti, and many others.

q.v. note

Towards the middle of his life, he began the creation of an extraordinary series of symbolic pictures, e.g. Time, Death, and Judgement; Love and Life; Mammon; Love and Death; Faith; Hope; to these he devoted an enormous amount of attention, intending

that most should remain in the possession of the nation, and set forth his ideas of religion to those who followed. He also attained eminence as a sculptor, and his colossal group called *Physical Energy* was adopted as a fitting memorial of Rhodes, for erection on his grave in S. Africa. A replica of it stands in Kensington Gardens.

Striking as Watts's symbolic paintings are, it is by his great portraits that he is more likely to live, for his emblematic pictures are difficult of comprehension. They are, however, examples of mastery of material and technique. In 1891 he built himself a country house at Compton, Surrey, which he named *Limnerslease*, and designed and carried out for the parish a wonderful cemetery chapel, which sets forth, in strange imagery, his ideas respecting life and death. Close to his house

George Frederick Watts. His picture *Love and Death*, now in the Tate Gallery, London

stands a picture gallery, founded by his wife, and containing some of his greatest works. The O.M. was conferred upon Watts at its inception in 1902, and although he declined other honours, he was regarded during later life as the chief of English artists. He died at Compton, July 1, 1904. He was twice married, first to Ellen Terry,

from whom he afterwards separated, and then to Miss Fraser-Tytler, whom he married in 1886, and who survived him. See Arnold, M.; Browning, R.

Bibliography: *Lives*, J. Cartwright, 1896; Mrs. Russell Barrington, 1906; J. E. Phythian, 1906; G. K. Chesterton, 1909; M. S. Watts, 3 vols., 1912; E. R. Dibdin, 1923; E. H. Short, 1925; *The Laurel and the Thorn*, R. Chapman, 1945.

Watts, ISAAC (1674-1748). An English divine and hymn writer. He was born at Southampton

(where Watts's Park, with statue, commemorates him) and attended an academy for dissenters at Stoke Newington. In 1697 he was chosen assistant pastor of an Independent church in Mark Lane, succeeding to full charge in 1702. For 36 years he resided with the Abney family at Theobalds and Stoke Newington, dying Nov. 25, 1748. Watts was a noted preacher, a writer on logic, and is represented in the Oxford Book of English Verse, but his fame rests on hymns, and to a lesser extent on *Divine and Moral Songs*, for children, 1713. He wrote (among some 600 hymns) *Our God, our help in ages past; When I survey the wondrous Cross; There is a land of pure delight; Come, let us join our cheerful songs; Jesus shall reign.* In work of the second category Watts achieved household words with *How doth the little busy bee; Let dogs delight to bark and bite; 'Tis the voice of the sluggard;* which all proved gifts to parodists. See *Hymns. Consult Lives*, E. P. Hood, 1875; A. P. Davis, 1948; *The Hymns of Wesley and Watts*, B. Manning, 1932.

Watts, WILLIAM WHITEHEAD (1860-1947). English geologist. Born at Broseley, Shropshire, he went to Denstone school and Sidney Sussex College, Cambridge. A university extension lecturer during 1882-91, he next joined the staff of the geological survey. Assistant professor of geology at Birmingham from 1897, he transferred to the chair in that subject at the Royal (later Imperial) College of Science, retiring 1930. F.R.S. in 1904, and president of the British Association in 1935, Watts wrote copiously on geology, and did much original work on the ancient rocks of the Midlands. He died July 30, 1947.

Watts-Dunton, WALTER THEODORE (1832-1914). British critic and poet. Born Oct. 12, 1832, at St. Ives, Hunts, he was educated privately and became a solicitor. In London he abandoned that profession for literary work

Walter Watts-Dunton

and made the acquaintance of Rossetti, Morris, and Swinburne. Another intimate friend was Borrow, like whom he had wandered and learned a good deal about gipsy life, and whose *Lavengro* and *Romany Rye* he edited. The bulk of Watts-Dunton's writings appeared in *The Examiner* and *The Athenaeum*, and secured his reputation as the leading literary critic of the time, whose criticisms of poetry especially were marked by deep insight. His first published book was a volume of poems, *The Coming of Love*, 1897, characterised by the exquisite technical perfection that marked all his work. In 1898 appeared *Aylwin*, a long prose romance of *Romany* life. His other works include *The Renaissance of Wonder*, 1903; *Studies of Shakespeare*, 1910; and the posthumous *Old Familiar Faces*, 1916. He died June 6, 1914. In later years he added his mother's maiden name of Dunton to his own. He reformed Swinburne and for 30 years looked after him in his house at Putney. See Swinburne. *Consult Lives*, James Douglas, 1904; T. Hake and A. Compton-Rickett, 1916.

Watusi or **BATUŚI**. Pastoral people, partly in Ruanda, Belgian Congo, and partly in the adjacent portions of Tanganyika Territory. Of Bantu speech, they are the southernmost offshoot of the Uganda Bahima, but their Hamitic blood has been mingled with negroid elements by contact with the Bahutu and cognate aboriginal tribes. Of aristocratic mien and temperament, they wear loosely draped cotton kangas, with heavy ornaments of metal wire, occupy beehive huts of grass, and procure their ironwork and vegetable produce from the subject Bahutu.

Wauchope, SIR ARTHUR GREENFELL (1874-1947). British soldier and administrator. Son of an Edinburgh citizen, he was born March 1, 1874, and educated at St. Ninian's and Repton. Joining the

Isaac Watts

Black Watch at 22, he fought in the S. African War under his relative, Gen. A. G. Wauchope, who was killed leading the Highland brigade at Magersfontein. The First Great War took him to the battle of Loos and through the Mesopotamian campaign. Wauchope then constituted himself the historian of the Black Watch. He had a brigade in Silesia, 1921-22, and was promoted major-general in 1923. Next year he was British chief on the Allied control commission in Berlin. In 1929 he received the N. Ireland command. Knighted in 1931, Lieut.-Gen. Wauchope was sent out as high commissioner and c.-in-c. for Palestine and high commissioner for Transjordan, which he controlled until ill-health caused his retirement in 1938. He died Sept. 14, 1947. *Pron.* Waukup.

Waugh. Name of a British family of distinction in the literary world. Arthur Waugh (1866-1943), publisher and *littérateur*, who was born Aug. 24, 1866, and educated at Sherborne and New College, Oxford, gained the Newdigate prize for a poem, *Gordon in Africa*. He began his career as a critic and editor, then joined the firm of Chapman and Hall, of which he was managing director 1902-30, chairman 1926-36. He edited Johnson's *Lives of the Poets*, 1896, and the Biographical edition of Dickens's works, 1902-03. In 1930 he published *A Hundred Years of Publishing*, to celebrate the centenary of his firm. He died June 26, 1943.

His elder son Alexander Raban (Alec Waugh) was born at Hampstead, July 8, 1898, educated at Sherborne and Sandhurst, and served in both Great Wars. He made a reputation with *The Loom of Youth*, 1917, a frank study in the form of a novel of public school life, and followed it with many novels of varying popularity and merit, e.g. *Clouded Summer*, 1949. During the 1920s and '30s he travelled extensively, and *The Coloured Countries*, about the South Seas, appeared in 1930. His travel sketches in *The Sunlit Caribbean*, 1948, gave a vivid picture of life in the W. Indies.

The second son, Evelyn Arthur St. John (b. 1903), was educated

at Lancing and Hertford College, Oxford. After writing a study of Rossetti, he published *Decline and*

Evelyn Waugh,
British author

Fall, 1928, and with *Vile Bodies*, 1930, he achieved a public for his satires on society and contemporary manners. Later novels were *Black Mischief*, 1932; *Handful of*

Dust, 1934; *Put Out More Flags*, 1942. In *Brideshead Revisited*, 1945, he displayed emotional power and psychological insight. *The Loved One*, 1948, satirised embalming at Hollywood. A serious study of Edmund Campion, 1935, was awarded the Hawthornden prize. **Waugh, BENJAMIN** (1839-1908). British philanthropist. Born at Settle, Yorks, Feb. 20, 1839, and educated at Airedale College, Bradford, he was a Congregational minister at Newbury and Greenwich, 1865-87, and edited *The Sunday Magazine*, 1874-96. Having helped Hesba Stretton (*q.v.*) to found the London Society for the Prevention of Cruelty to Children, 1884, he established it on a national basis. He died March 11, 1908. *Consult* Life, Rosa Waugh, 1913; *Centenary Memoir*, R. Hobhouse, 1939.

Waugh, EDWIN (1817-90). An English poet. Born at Rochdale, Jan. 29, 1817, son of a shoemaker, he received little education except what he could pick up for himself while employed by a local bookseller and printer. His first sketches of Lancashire life attracted the notice of Carlyle. Even greater success awaited his first lyric, *Come whoam to the childer an' me*. This was followed by a long succession of poems and sketches in the broad dialect of his native county that earned for their author the title of the Lancashire Burns. He died April 30, 1890.

Waukegan. City of Illinois, U.S.A., the co. seat of Lake co. It stands on the W. side of Lake Michigan, 36 m. N. of Chicago, and is served by the Chicago and North-Western rly. It has a good harbour and is visited as a health and bathing resort. Pop. 34,499.

Waukesha. City of Wisconsin, U.S.A., the co. seat of Waukesha co. It stands on the Little Fox river, 18 m. W. of Milwaukee, and is served by the Chicago, Milwaukee, and St. Paul and other rlys. Settled in 1834, Waukesha was incorporated in 1852, and became a city in 1896. It has mineral springs and is favoured as a health resort. Iron and steel working, manufacture of agricultural implements, and preparing mineral waters are the chief industries. Pop. 17,176.

Wausau. City of Wisconsin, U.S.A., the co. seat of Marathon co. It stands on the Wisconsin river, 180 m. N.W. of Milwaukee, and is served by the Chicago, Milwaukee, and St. Paul rly. The Big Bull Falls provide water power. Papermaking is the chief industry. Settled in 1838, Wausau was incorporated in 1858, and became a city in 1880. Pop. 23,758.

Wave. Type of vibrational disturbance in an elastic medium. Wave motion may exist in any solids, liquids, gas, or ether. The most familiar kind of waves are those of the sea. In such waves the water moves up and down and lightly backwards and forwards, though the effect of the wave motion is to give an impression that the water itself is moving forward. *See* Wave Motion.

Wave Action. Sea waves are powerful agents of erosion, transportation, and construction. Short choppy waves which break steeply on to the shore tend to comb it down and wash the detritus away to sea; but slower waves with greater distances between crests have a powerful forward movement and sweep material up the beach, so tending to build the land seawards. Wave action on a steep shore or cliff is predominantly destructive. The plunge of the breaker compresses air in the crevices and joints of the rocks so that fragments are loosened or forced out as the wave recedes. Loose rocks are picked up by the waves and hurled back against the cliffs so that both are battered. Thus cliffs are undercut between high and low tide levels and broken down and eroded.

Soft beds of rock, lines of joints, or fissures are picked out by wave action so that narrow chasms, inlets, blow-holes, and caves are carved out. Sea stacks or rock pinnacles are left standing where the waves have followed lines of weakness and so cut through behind a more resistant rock-mass. Greater alteration to a coastline may be accomplished

Alec Waugh,
British author

Edwin Waugh,
Lancashire poet

in one big storm than by the prolonged action of weaker waves. The most powerful storm waves are produced by winds travelling over the longest stretches of open water, i.e. having the longest "fetch." Wave action is not confined to the zone of breakers, but extends to depths equal to the distance between successive waves. See Coast; Tsunamis.

Wavelength. The distance from crest to crest or from trough to trough of two adjacent waves. See Ray; Wave Motion.

Wavell, ARCHIBALD PERCIVAL WAVELL, 1ST EARL (1883-1950). British soldier. Born May 5, 1883, he was educated at Winchester and Sandhurst and commissioned in the Black Watch in 1901. He served in the S. African War, and on the N.W. frontier of India. In the First Great War he was in France until 1915, when he was wounded and lost the sight of an eye. After his recovery he was with the home forces, and then, 1916, British military attaché to the Russian army in the Caucasus. He became liaison officer between the war office and the Egyptian expeditionary force, and in 1918 brig.-gen. on the B.E.F. general staff.

Promoted maj.-gen. 1933, Wavell commanded the British in Palestine during the Arab revolt of 1937-38. Then he was promoted lieutenant.-gen. and given the southern command. In July, 1939, he was appointed c.-in-c. Middle East (h.q. at Cairo). When, in May, 1940, it seemed likely that Italy would enter the Second Great War, Wavell, promoted full general, moved the British and Egyptian troops to war stations, and quickly built up a small and efficient army of Imperial troops.

With troops in the Middle East totalling 86,000 he swept the Italians out of Cyrenaica, 1940-41, and took 120,000 prisoners in one of the most rapid advances in history. He conducted with equal success the operations in British Somaliland, Italian Somaliland, Eritrea, and Abyssinia, all in 1941. At no time did his army in the field exceed 12 divs., of which only two were armoured, and it was much below establishment in vehicles, yet it defeated well-equipped Italian armies totalling more than 400,000.

The German invasion of the Balkans obliged the British govt. to fulfil its promise of aid to Greece. Wavell had to transfer a large part of his army there, while reinforcements destined for him were

diverted to the new theatre. Wavell was ordered to form a defence line with his remaining troops and undertake no operations beyond the W. frontier of Cyrenaica. With the landing in N. Africa of German forces under Rommel, his army was forced to retreat. In spite of what he had achieved against the Italians, Wavell was officially held responsible for Rommel's success, and was relieved of his command on July 1.

Dispatched immediately to India as commander of British forces there, Wavell found this office one of great responsibility, not only in India itself, but westward to reinforce the 10th army in Persia and Iraq, and eastward to meet the

1st Earl Wavell, British soldier

threat from Japan. At an Allied conference at Chungking on Dec. 23, following the entry of Japan into the war, Burma was added to the same command. In Jan., 1942, Wavell was appointed supreme commander in the S.W. Pacific area. The command was abolished on March 2, with the end of effective Allied control in that area, and Wavell reverted to his post as c.-in-c. India, and was appointed to the viceroy's executive council. He assisted Sir S. Cripps in the negotiations with the Indian Nationalist parties, and won the confidence of Indian leaders. On June 19, 1943, he was simultaneously promoted field marshal and appointed, in succession to Lord Linlithgow, viceroy of India, the second professional soldier to hold that office; and on July 23 was created Viscount Wavell of Cyrenaica and of Winchester. He took office at a critical period. In the N.E. the Japanese were at the frontier; Bengal was in the grip of famine; and the Indian people, anxious for independence, were unable to agree on the structure of the future Indian

state. The new viceroy tackled the problems with energy; within four days of installation he was in Calcutta and personally supervised the famine relief measures. Then followed a tour of all India in an attempt to enlist the cooperation of the provincial govts. Whilst sympathising with India's claim to independence within the Commonwealth, Wavell was opposed to partition, believing that it would weaken the sub-continent's ability to defend itself. He convened the Simla conference of 1945 and later attended the London parleys on Indian independence. With the acceptance of the policy of partition, he resigned the viceroyalty, in Feb., 1947, and was created an earl the following May. Made constable of the Tower of London, 1948, he died May 24, 1950. His body was carried by river from the Tower to Westminster Abbey, June 7, and was buried at Winchester College.

Wavell earned distinction as an author. His books include *The Palestine Campaigns*, 1928; *Generals and Generalship*, 1941; *Studies of Allenby*, 1940 and 1943; *Speaking Generally*, 1946; *The Good Soldier*, 1948. *Other Men's Flowers*, 1944, is a verse anthology; Wavell was vice-president of the Poetry Society.

Essentially an opportunist in tactics, Wavell was one of the few British commanders who fully appreciated at the start that the Second Great War would be one of movement and not a repetition of the static conflict of 1914-18. His victories were due to his policy of striking successive blows at the enemy, abandoning the recognized policy of building up his own forces before launching the next assault. This entailed risks and frequently caused his troops to outrun their communications, but the risks had been calculated and were fully justified by results. These tactics in Cyrenaica established the model for all later campaigns in N. Africa. See *E. Africa Campaign*; *India*; *N. Africa Campaigns*. Consult Wavell's dispatches on the Middle East, 1939-1941; *E. Africa*, 1940-41; *Iraq, Syria, and Persia*, 1941-42; *India and Burma*, 1942; Wavell, R. H. Kiernan, 1945; *Life*, R. V. Collins, 1945; *Great Soldiers of the Second Great War*, H. A. De Weerd, 1946.

David Le Roi

Wavellite. In mineralogy, a complex hydrated phosphate of aluminium, sometimes containing fluorine and iron oxide.

Wave Mechanics. In physics, a theory originally evolved by Louis de Broglie (*q.v.*). Starting from the principle of the equivalence of mass and energy, it postulates that waves are associated with the mass-particles of any mechanical system. Just as Huygens's wave theory is necessary to explain diffraction effects with light, wave mechanics is necessary to solve problems connected with atomic and sub-atomic particles. De Broglie postulated that the waves associated with a particle of mass m and velocity v have a wavelength given by $\lambda = h/mv$, where h is Planck's constant. Experimental work on electrons, carried out by Davisson and Germer in America and G. P. Thomson in Great Britain, confirmed the theoretical suggestions of de Broglie. They obtained interference patterns from electrons by using the surface layers of crystals as diffraction gratings.

Wave Motion. The propagation of waves in a medium is the process whereby energy is transferred from one point to another without the medium itself travelling as a whole. An example is the up-and-down motion of a moored boat, by waves generated by a passing ship, or alternatively the resonance of a hollow box when struck by sound-waves from a distant source. The theory of wave motion is necessary for the explanation of many physical phenomena; there are, however, few natural examples of it which are directly observable except water waves and ripples, both complex wave motions.

Essentials of wave motion can best be grasped by considering the waves generated along a piece of rope, tied at one end, the other end being rapidly moved up and down. A wave of definite profile appears to start at one end and move down the rope until it disappears at the other. Actually, however, each part of the rope moves up and down in a regular manner, repeating its motion continuously. If each particle of rope is considered separately, it will be found that some are making the same kind of movement at the same time, *e.g.* those which form the crests of waves at one moment will subsequently form troughs at a given instant. The distance between two particles which are making exactly similar movements is called a wavelength; thus the distance between two adjacent crests or two adjacent troughs is the wavelength.

The speed with which the motion of the particles is transmitted from one to another, *e.g.* the velocity at which a crest moves forward, is known as the wave velocity. The number of times any particle moves up and down in a given period is called the wave frequency, and the extreme distance of displacement from a mean position is called the amplitude of the motion. The vertical distance between a crest and a trough is thus double the amplitude.

The connexion between wave velocity v , wavelength λ , and frequency ν is expressed by the equation:

$$v = \lambda \nu.$$

The period of a wave is the time a particle takes to complete a movement, and the wave number is the number of waves contained in one unit of length.

The type of wave motion already described, *i.e.* in a rope, is known as transverse, because the motion of the particles is in a direction at right angles to that of the wave itself. The propagation of light can largely be explained by considering it as a transverse wave motion travelling in a hypothetical ether. Instead of the displacement of material particles, as in the rope, here the strength of the electric and magnetic fields in the ether is the varying quantity.

Another type of wave propagation is that in which the particles are displaced from their mean positions in the direction of the wave. This is longitudinal wave motion. Its mechanism can best be understood by considering a model consisting of a number of balls hanging by cords, with springs fixed between them. If the end ball is given a blow, there ensues a to-and-fro motion which is imparted to all the other balls in succession. A wave of compression (when the balls are closely spaced) travels up the series, followed by one of rarefaction (when they are far apart). Sound is the best example of longitudinal wave motion. The molecules of the solid, liquid, or gas in which sound waves travel correspond to the spring-tensioned balls of the model; the wave is one of local compression and rarefaction in the medium.

Earthquake shocks are transmitted to surrounding parts of the earth by a variety of types of waves, some of which are transverse and some longitudinal. These seismic waves travel with different velocities and are received at

different times by a distant recording station.

Waves in water are more complex. By placing a cork on the surface of the water, the motion of its particles when a wave passes may be studied. First the cork is lifted up, then pushed forward, next let down, and finally pulled back. The motion is in fact approximately circular in the vertical plane containing the direction of motion of the wave. Water waves can thus be thought of as a combination of the transverse and longitudinal types.

The speed of waves varies widely, and often changes with the wavelength. Long sea waves on deep water, for instance, travel faster than short ones; but all other waves travel through space at the same speed, 186,000 m. per sec. Through transparent materials the speed of other waves is lower, and is also dependent on wavelength, which gives rise to the phenomenon of dispersion (splitting up of light into a spectrum). Sound waves travel through a substance at a speed depending on its compressibility and density, but independent of wavelength. Through air the speed is about 1,090 ft. per sec. at ground level, decreasing at higher elevations; through water its speed is 4,700 ft. per sec., this high value being due to the small compressibility of water.

Waveney. River of England. It rises in Norfolk near Bressingham, and flows past Diss, Bungay, and Beccles until it joins the Yare 4 m. above Yarmouth. In almost all its course of 50 m. it forms the boundary between Norfolk and Suffolk. It is navigable for barges as far as Bungay.

Waverley OR 'TIS SIXTY YEARS SINCE. First of the Waverley Novels by Scott. Begun in 1805, it was laid aside and published anonymously in 1814. With the Jacobite rebellion of 1745 for background, it contains memorable word-pictures of the Young Chevalier and his court at Holyrood, the battle of Prestonpans, and Highland manners, customs, and scenery. The title *Waverley* is derived from that of the hero, whose home was Waverley Honour, in Surrey.

Waverley Abbey. Ruined Cistercian monastery near Farnham, Surrey. Founded on a site by the banks of the Wey by William Giffard, bishop of Winchester, in 1128, it took many years to build, the church not being dedicated

Waverley Abbey, Surrey. Ruins of the 12th century monastery, the first Cistercian foundation in England

until 1278. The first Cistercian house erected in England, it was one of the largest, its precincts covering 60 acres. It was dissolved in 1536.

Waverley Novels. Collective name for the series of historical romances by Scott, of which Waverley in 1814 was the first and Castle Dangerous in 1831 the last. Some of them appeared anonymously, and others were grouped, e.g. as Tales of My Landlord. Their respective merits are suggested in the article on Scott, and each novel has its individual entry.

Wavre. Town of Belgium, in the prov. of Brabant. It lies on the river Dyle, 15 m. by rly. S.S.W. of Louvain, and has miscellaneous industries in metal working, paper and soap making, brewing, etc. Roman remains exist in the neighbourhood. Wavre was made a commune by John I of Brabant in 1293. Considerable damage to the town was done by the Germans in 1914.

Wavy. In heraldry, a line of division used on a shield or the outline of an ordinary (*q.v.*). It is undulating, possessing regular up-and-down curves to represent waves. See Heraldry colour plate.

Wax. Natural substance consisting essentially of esters formed by the combination of fatty acids with the higher monohydric alcohols. For example, beeswax contains large quantities of the esters formed by myricyl alcohol, $C_{30}H_{61}OH$, with palmitic acid, $C_{15}H_{31}COOH$, and with melissic acid, $C_{30}H_{61}COOH$. The waxes therefore differ from the vegetable and animal fats and oils in having no glycerine. All waxes are insoluble in water and are much less easily saponified by alkali than oils and fats. They are much harder than fats and have a characteristic smooth surface.

Paraffin waxes are entitled to the name only on account of their

oil is liquid at ordinary temperature; it is still used as a lubricant.

Of the animal waxes, beeswax has been valued from early times as a polishing agent, for modelling, and for candles. Wool wax (lanoline) is produced in large quantities in wool scouring; it is used in ointments and cosmetics, being easily absorbed by the skin. It also absorbs water readily to form a cream.

Of the vegetable waxes, carnauba from the Brazilian wax palm (*Corypha cerifera*) is the most important; very hard, it is used in polishes and candles.

Waxbill. Group of small finch-like birds (Estrelinae) occurring in Africa, S. Asia, and Australia. They are related to the weaver birds, and have rather long tails and glossy curved beaks.

Wax Chandlers. London city livery company. With records dating from 1371, it was granted a charter in 1483, arms in 1484 and 1536, and was founded to regulate the trade in wax candles, etc. The hall, at the corner of Gresham Street and Gutter Lane, rebuilt 1657 and 1852, was rendered unusable by German bombs in 1940.

Wax-flower or **HONEY PLANT** (*Hoya carnosa*). Climbing shrub of the family Asclepiadaceae. It is a native of Australia. The fleshy opposite leaves are oblong-oval; the pinkish, waxy-looking flowers are in umbels, whose common stalk starts from a lateral shoot.

Wax Moth. Name given to small moths of the genus *Galleria*. The best-known is *G. mellonella*, which has spread to many parts of the world including Australia. Its caterpillar is a pest of apiaries,

chiefly in weak or neglected colonies. It attacks the honeycomb by making silk-lined tunnels through the wax and feeds upon the latter.

Wax Palm (*Cerzylon andicolum*). A fine tree of the family Palmae. A native of Colombia, it grows to a height of about 150 ft., and has a spreading crown of leaves which may be 20 ft. in length. These are cut from the edges to the midrib into segments 2 ft. long and 1½ ins. wide. The trunk is coated with a mixture of resin and wax, and the natives scrape this off after cutting down the tree, each trunk yielding on the average

Wax Palm. Crown of leaves, and flower clusters of the tall palm

25 lb. of the highly inflammable wax. The name wax palm is also given to the Carnaúba Palm (*q.v.*).

Wax Plant (*Cerinth major*). Annual herb of the family Boraginaceae, native of central Europe. It has smooth, stem-clasping, heart-shaped, glaucous leaves, with white dots. The tubular flowers are yellow at the base and purple above, arranged in sprays.

Wax Tree, AMERICAN GAMBAGE, or GUITA-GUM TREE (*Vismia guianensis*). Shrub of the family Hypericaceae. A native of tropical America, it has four-sided stems, and opposite, oval-lance-shaped leaves. The yellow flowers are clustered at the ends of the branches. Its yellow resinous

Wax-flower. Leaves, and umbel of flowers. Inset, single flower

Wax Tree. Leaves and flower clusters of the American shrub that yields a resin similar to gamboge

juice yields a substance similar to true gamboge (*Garcinia*), with similar purgative properties.

Waxwing, SILKTAIL, OR BOHEMIAN CHATTERER (*Bombycilla*). Fruit-eating bird of the family

Waxwing. Crested bird occasionally found in Britain
W. S. Berridge, F.Z.S.

Ampe-
lian
idae,
native of N. Europe, but at rare intervals a winter visitor in flocks to Great Britain. Of a vinous brown colour, relieved by black and white markings, its distinctive characters are furnished by a handsome crest on the head and by curious red, wax-like appendages to the tips of the secondary wing-feathers and those of the tail. In Great Britain it affects hedgerows chiefly, feeding upon hips, haws, etc. The thick-walled nest is constructed of twigs, moss, lichens, and feathers, and contains five or six lilac-grey eggs with darker spots.

Waxworks. Effigies made of wax, generally beeswax. The ancient Egyptians fashioned fig-

ures of their deities in wax for funeral purposes, while the Greeks and Romans modelled wax figures for a variety of purposes. Wax dolls were common among the Greeks, while wax effigies of their ancestors placed in their houses were marks of distinction among the Romans. During the Middle Ages effigies of saints in wax, portraits, religious objects, and full-sized wax figures, some beautifully coloured, became common. From the 17th century onwards wax models for anatomical work and scientific work generally were much used.

The first waxworks show, depicting famous and notorious personages, appeared in the 17th century, the best-known of these early shows being that of Mrs. Salmon, opened in St. Martin's-le-Grand in 1690. The most famous modern waxwork show is Madame Tussaud's in London, which was opened in Baker Street in 1835. See *Bronze Statuary*; Tussaud.

Way, SIR SAMUEL JAMES (1836-1916). Australian statesman. He was born at Portsmouth, April 11, 1836, and settled as a lawyer in S. Australia, taking silk in 1871. He was appointed attorney-general in 1875 and lord chief justice the following year, and in 1891 became the first lieutenant governor of S. Australia. Sworn of the privy council in 1897, he was made a baronet two years later. He lived until Jan. 6, 1916.

Way Bill. Document containing a list of passengers and goods carried by a public company.

Waycross. City of Georgia, U.S.A., the co. seat of Ware co. Situated 95 m. S.W. of Savannah, it is served by the Atlantic Coast Line and others, being the converging point of nine rlys. It has large rly. workshops, and manufactures lumber products, cold storage machinery, and naval stores. Alligator hides from nearby swamps are cured here for the market. Settled in 1870, Waycross was incorporated in 1874, and became a city in 1909. Pop. 16,763.

Wayfaring Tree (*Viburnum lantana*). Small tree or shrub of the family Caprifoliaceae. It is a native of Europe, N. and W. Asia, and N. Africa. The unripe wood and the leaves are rough with stellate hairs. The large, opposite leaves are heart-shaped, with toothed edges. The white funnel-shaped flowers are in large flat-topped clusters at the ends of the branches. The bark has acrid, blistering properties.

Wayland the Smith (Old Low Ger. *weland*, craftsman). In Teutonic mythology, a wonder-working smith, lord of the elves. The son of the sailor-hero Wade or Wate and a mermaid, he is the maker of a magic boat, a winged garment, and many famous swords. The Old Norse *Völundarkvitha* relates the story of his capture of a swan-maiden and his fight with the smith Amilias. His deeds are represented on the Franks casket in the British Museum. Wayland Smith's forge is a cave in the Vale of the White Horse, near Ashbury, Berkshire.

Wayleave. In law, permission granted by an owner of property to enter the property for some specified purpose at reasonable hours. See *Easement*.

Wayne, ANTHONY (1745-96). American soldier. Born in Pennsylvania, Jan. 1, 1745, he was associated as a surveyor with Benjamin Franklin. During the War of Independence he fought with distinction at Brandywine, Germantown, Valley Forge, and Monmouth. In 1779 he stormed Stony Point, and afterwards was with Lafayette in Virginia, and at the siege of Yorktown. After leaving the army in 1784, Wayne was a member of the legislature of Pennsylvania, and sat in congress for Georgia. In 1792 he was made commander-in-chief, directing the operations against the Indians until his death, Dec. 15, 1796. He was popularly known as Mad Anthony. Consult *Mad Anthony Wayne*, T. Boyd, 1929; *A Gentleman Rebel*, J. H. Preston, 1930.

Anthony Wayne, American soldier
After J. Herring

Wax Plant. Spray of leaves, tubular flowers, and fruit. See facing page

Wayfaring Tree. Flower cluster and leaves. Left, ripe fruit

Ways and Means. In British parliamentary procedure, a committee of the whole house of commons to consider proposals for financing the country. Such a committee debates the budget proposals and votes sums of money from the consolidated fund to meet supplies granted for the public services during the financial year. Its chairman is normally the deputy speaker. *See* House of Commons; Parliament.

Wayzgoose. Name given to the annual outing and dinner once general in connexion with English printing offices. The word means stubble-goose, or young goose suitable for a feast. The Wayzgoose is the title of an early poem by Roy Campbell. *See* Beanfeast.

Wazirabad. Town of Pakistan, in the Gujranwala dist. of W. Punjab. It is on the left bank of the Chenab, and on the rly. about 20 m. due N. from Gujranwala. A fine rly. bridge, the Alexandra, here crosses the river; originally 3,000 yds. long, it was reduced to 800 in 1927. A trunk road also crosses the river. Founded by Wazir Khan in the reign of Shah Jehan, the town was rebuilt under Ranjit Singh. Boats are built, cutlery is made, and Wazirabad swords, sticks, and tennis racquets are famous. Pop. 27,079.

Waziri. Pathan tribe of the Pakistan-Afghan frontier. They speak a S. Pushtu dialect, are of democratic nature, and formerly waged implacable warfare against the Ghilzai. Much fighting took place between the tribesmen and the British at various times.

Waziristan. Region between the Durand line (Afghan frontier) and the Trans-Indus administered districts of the N.W. Frontier province, Pakistan. It averages 60 m. from E. to W. and 160 m. from N. to S. The W. half consists of the Suleiman Range, gradually rising up to 10,000 ft. It is tribal territory with rugged ravines, fiercely hot in summer and bitterly cold in winter. It is bounded in the S. roughly by the Gomal river, and in the N. by the Kurram river valley. The country is sparsely covered by grass on the lower plateaux, and in the submontane tracts from the hills to the Indus varies from highly cultivated and irrigated land to desert.

The inhabitants are chiefly Waziris and Mahsuds. Once the Waziris were the chief inhabitants, and the country takes its name from a chieftain called Wazir, whose grandsons were the actual founders of the race. The Mahsuds,

themselves of Waziri descent, have been the more vigorous of these two Pathan tribes. They are constantly torn by inter-tribal feuds and unite only when some religious war gives them a common cause in their Islamic faith. At the end of the First Great War the breakdown of the frontier militia led to serious operations in Waziristan, and eventually the British decided to establish posts in the country and by means of a circular road to combine non-interference with the tribes in their villages with swift action when they ventured to attack the settled districts of the province. Razmak, within sight of Makin, the Mahsud capital, was created a strong military headquarters, and an outpost in S. Waziristan was Wana.

To help in the pacification of the country local inhabitants were enrolled as khassadars, who received allowances for policing the roads, but this system broke down in 1937. During the Second Great War the outposts in Waziristan had to be supplied under active service conditions owing to the restlessness of the tribesmen. When in 1947 the transfer of power brought Waziristan under the control of Pakistan, that govt. withdrew troops from the interior of the country but maintained the allowances to the tribesmen.

The basic problem of Waziristan is economic. The land breeds faster than it feeds. Primitive methods of irrigation in the precariously poised reaches where crops are grown are not sufficient to cope with occasional onslaughts from nature. The swift-running mountain streams, such as the Tak-i-Zam, may suddenly be swollen into torrents, and the resulting spate deprives the tribesmen of the fruits of his labour; so raiding is an important secondary occupation for these hardy, and not unattractive, hillmen. They have also been accustomed to move into the Punjab at certain seasons of the year to work on canal and road building.

Edwin Haward

Wazzan. Town of Morocco. About 56 m. N.N.W. of Fez, with which there is rly. connexion, it contains the tomb of Idrisi Sherif, and is a place of pilgrimage. Pop. 16,442.

Weald (A.S., a forest tract). Term meaning any forest or woodland. Specifically the Weald is that district in Kent, Surrey, and Sussex that lies between the N. and the S. Downs, and extends from the borders of Hampshire to the English Channel, being about 120 m.

long and 30 wide. Formerly covered with forests, of which there are remains in Ashdown and St. Leonards Forests, and known as Andredsweald, it was the chief centre of the iron industry, wood being used for smelting the ore.

Wealden Deposits. In geology, series of deposits of the Lower Cretaceous, so named from their typical appearance in the Weald, England. The series is subdivided into two main groups, Hastings Sand and Weald Clay. The former is further split up into basal Fairlight clays, Ashdown sands, Wadhurst clay, and Tunbridge Wells sand. The Wealden beds as a whole were laid down in a great lake of fresh or brackish water, the N. edge of which lay roughly below or a little N. of the line of the North Downs.

Wealdstone. Parish and rly. station of Middlesex, England. It is part of the urban dist. of Harrow (*q.v.*).

Wealth (O.H.G. *welîtha*). Originally the state of being well, an idea surviving in the words commonweal, commonwealth. Now the word is ordinarily used to denote things that are thought conducive to well-being, particularly money, property, possessions, great possessions of non-material things (*e.g.* wealth of friends, of knowledge), etc. The natural wealth of a country is its store of minerals, source of water-power, fertility of soil, conditions of climate, and other circumstances that may make it productive.

Economics has been called the science of wealth; but most economists have used the term wealth in a somewhat narrower sense to denote (*a*) all commodities that satisfy wants directly or indirectly but are limited in quantity and hence can be exchanged for other things; and (*b*) rights to share in such things (*e.g.* contracts conferring a right to payments). All desirable things may be called goods. Air and the light as one walks along the road are freely available; they are called free goods. Fresh air and light in an underground rly. require expenditure to make them available; they are economic goods. Wealth in the sense (*a*) mentioned above means economic goods taken collectively. As Taussig pointed out, "A community is better off, the more free goods it has and the less the range of things that come within the category of wealth." A free good of one person or community may be an economic good and part of the wealth of another; *e.g.* the

scenery of Scotland or Switzerland, free to the inhabitants, is costly to others. According to interpretation (a), money is not wealth (except to a miser, to whom it may have a high capacity to satisfy a want), but merely a right or claim to wealth; interpretation (b) includes, as part of wealth, money and all such "representative goods" as mortgages, marketable securities, govt. stocks.

For this reason it is convenient to distinguish between individual wealth and social wealth. The latter includes all economic goods owned by individuals, companies, corporations, local govt. authorities, public bodies, and the crown (including such communal property as roads, schools, museums, hospitals, harbours, fire brigades, etc.); and if section (b) is included within the definition, all oversea investments and loans held within a country, less all investments in the country by foreigners. Individual or private wealth consists of all economic goods privately owned; and admitting section (b), all property rights having an exchange value. The social income may be considered as the total satisfactions that flow from social wealth and from economic activity during any period. It is commonly measured in terms of money, but only inadequately. The share of the social income enjoyed during a period by an individual is his real private income; this also is quite inadequately indicated by his money income, since much real income flows from social wealth used free of charge.

Although wealth consists of things that have an exchange value, value creation is not the same as wealth production. The latter denotes an addition to the quantity or the number of economic goods; the former, an increase in the power of some economic goods to exchange for others. A person who created a scarcity of corn by burning some might give to the remaining corn a total value greater than the whole stock of corn previously held; but he would have lessened, not increased, wealth. Wealth is produced only by organizing the use of land, labour, and usually capital to increase either the quantity of commodities (material or non-material) or their utility, i.e. their capacity to satisfy human wants, by altering their form or physical qualities; or by making them available at some other time or place. Wealth is produced by industry and trade, but not all industrial and com-

mercial activities add to social wealth. For this reason economics is largely a study of the relation between individual wealth and social wealth.

The belief that money is wealth, indeed "wealth in a fuller sense than anything else," has profoundly affected human history. This idea of the mercantilists, developed from the 15th century and dominant until the end of the 18th, led to the attempt by individual nations to achieve a surplus of exports, so that the balance might be received in "treasure," or gold and silver. A balance of trade was favourable when exports exceeded imports. The notion still lingers. It partly explains why the U.S.A. came to accumulate between the Great Wars about four-fifths of the world's stock of gold, which it was considered necessary to isolate from world economy by storing it in Fort Knox, Ky. *See* Balance of Trade; Capital; Economics; Mercantile System; Value.

Bibliography. *Wealth of Nations*, Adam Smith, 1776; *Unto This Last*, J. Ruskin, 1862; *Distribution of Wealth*, T. N. Carver, 1904; *Principles of Political Economy*, D. Ricardo, rev. ed. 1908; *Principles of Economics*, A. Marshall, new ed. 1910; *Wealth*, E. Cannon, 1914; *The Science of Wealth*, J. A. Hobson, 1918; *Three Studies on the National Income*, A. L. Bowley and Lord Stamp, 1938; *Economic Survey*, 1948, H.M.S.O.

Wealth of Nations. Work on political economy by Adam Smith (*q.v.*), the most famous of its kind. It appeared in 1776, and ranges over the whole field of economics. It is divided into five books. Book I deals with the product of labour and its distribution; II with the native accumulation and employment of stock; III with the progress of the various nations in wealth; IV with systems of political economy; V with national revenue. The book still forms the starting-point of the study of political economy, although some of its theories have been discredited. Many editions have appeared.

Wear. River of co. Durham, England. It rises E. of Cross Fell and flows 65 m. by a S. curve to the North Sea at Sunderland. Its basin of 456 sq. m. contains the S. portion of the Durham coalfield. Barges can ascend as far as Durham. Other places on the banks are Bishop Auckland and Chester-le-Street. In its upper course the Wear flows through

much beautiful scenery. *Prom. Weer.* *See* Durham; Sunderland.

Wearing of the Green, THE. Irish national song. The music is more than half a century older than the words, to which it was not adapted until 1797. The origin of both is unknown.

Weasel (*Mustela nivalis*). Small carnivorous mammal. It is found throughout Europe, N. and Cen-

Weasel. Small predacious mammal, common to most countries of the Northern hemisphere

tral Asia, and in parts of N. America, being common in England and Wales and S. Scotland, but is absent from Ireland. It is about 9 ins. long, and has bright reddish-brown fur on the upper parts, with white beneath. In cold regions the animal turns white in winter, but this does not occur in Great Britain except occasionally in the Scottish Highlands. It makes its home in holes in banks—sometimes utilising a deserted rabbit burrow—and here a nest of grass and leaves is made for the young, of which there are usually two broods in the year. Predatory in habit, it kills rats, mice, voles, rabbits, game birds, poultry, etc. The weasel hunts by scent, and will follow a prospective victim unweariedly until the latter is worn out. *See* Glutton; Protective Colouring.

Weather. Term denoting the appearance of the sky, the occurrence or otherwise of rain, snow, or other precipitation, the presence of fog, mist, etc. In its widest sense it refers to all the meteorological factors which affect human beings. Thus, in order to describe fully the state of the weather at any particular time or during any particular day, the observations must comprise temp., humidity, direction and speed of the wind, precipitation, visibility, clouds, optical phenomena, e.g. rainbows, halos, etc. Barometric pressure, although not included in the general use of the term, is of fundamental importance in meteorology and is recorded with the more commonly understood elements of weather. Most of the observations are made by instruments designed specially for the purpose, the remainder being

personal estimates. Weather represents the combination of all the elements at a given instant of time; climate, day-to-day weather conditions averaged over a year.

For conciseness, a code of letters indicating the state of the weather, and originally intended for use at sea, was introduced in the 19th century by Admiral Sir Francis Beaufort. With certain additions and extension to land stations, it is used in the British meteorological services. There is also in use an international system of symbols. The principal Beaufort letters and international symbols are given in the table.

BEAUFORT LETTERS AND INTERNATIONAL SYMBOLS

blue sky	b	squall	q	^
cloudy	c	drizzle	d	•
overcast	o	sleet	rs	*
gloom	g	thunder	t	τ
line squall	kq	thunderstorm	tl	⊥
gale	∧	mist	m	≡
rain	r •	dew	w	^
snow	s *	rime		v
hail	h ^	snow lying		⊞
lightning	l <	lunar halo		⊂
fog	f ≡	aurora borealis		⊃
haze	z ∞	solar halo		⊙
hoar frost	x ∟	rainbow		∩
glazed frost	∞	zodiacal light		∪

A capital letter is used to denote heavy intensity and the small suffix o for slight intensity. Continuity is indicated by repetition of the letter. The prefix i indicates "occasional" or "intermittent," and p applied to rain, snow, etc., indicates "passing showers." If the international symbols are used, the exponent 0 or 2 is added to distinguish slight or heavy intensity, respectively, from moderate. Hence, continuous heavy rain, in one system, is represented by R.R. and, in the other, by $\bullet^2 \bullet^2$. Certain additional symbols are used for plotting weather on synoptic charts. (See *Climate; Meteorology; Weather Ship. Consult The Drama of the Weather*, Sir W. N. Shaw, 1938.)

WEATHER FORECAST. This is a studied prediction of the nature of forthcoming weather. Forecasting personnel of an official meteorological service are therefore mainly concerned with: (a) detailed short-period forecasts for aviation; (b) forecasts covering periods of 24 hrs. for the general public; (c) further outlooks, in more general terms, for as long ahead as possible; (d) notification of short spells of fine weather; (e) warning

of gales, snowstorms, thunder, fog, and cold weather; (f) special forecasts for industrial and technical purposes. No sufficiently trustworthy method has been developed for inferring the weather to be expected some days, weeks, or months ahead. Some success, however, has been claimed in India with seasonal forecasts of the monsoon rainfall.

In the forecast room at a meteorological station (see under *Meteorology*) all the observations available are plotted by an elaborate system of symbols on large-scale charts, and the isobars, or lines of equal barometric pressure, are drawn in. These lines resemble the contours of an ordnance survey map, forming, in effect, hills and hollows, valleys and ridges; in some places the gradients are steep and in others gradual. If drawn over a sufficient area, the isobars appear as closed curves enclosing centres of low or high pressure.

The region around the centre is termed, respectively, a depression or an anticyclone. To the intervening regions special names such as trough and ridge are sometimes given. Study of synoptic charts, however, is chiefly devoted to consideration of the characteristics of the different air masses, i.e. masses of air each of which is fairly uniform in itself but differs, often markedly, from its neighbours, owing to its place of origin and the path along which it has travelled. The boundary lines, or fronts as they are called, which indicate the transition from one air mass to another are of particular importance in understanding current weather and in making a forecast of the weather for the immediate future.

Before the Second Great War forecasting was generally based upon surface weather charts only, but development of radio sonde and radar apparatus has resulted in a three-dimensional representation. These techniques also provide a much more accurate means of assessing e.g. the winds an aircraft is likely to meet during a flight, and likelihood, or otherwise, that ice may form on it. Radio

receivers, used to track thunderstorms, and the network of ocean weather ships, inaugurated in the Atlantic in 1947, also proved valuable aids to the forecaster. (See *Anticyclone; Cold Front; Depression; Warm Front.*)

WEATHER LORE. This term applies to rules, maxims, proverbs, etc., in folklore, which purport to foretell the weather. In general, there is little truth in most of these sayings, especially where an attempt is made to predict weather an appreciable time ahead. For example, by examining the rainfall which actually occurs in the month or so following S. Swinburn's day (July 15) over a number of years, it is easy to demonstrate the unreliability of the proverb, If S. Swinburn's greets the weather will be foul for 40 days. The belief that "January commits the fault and May bears the blame," i.e. a mild Jan. will be followed by a wintry spring and a cold May, was shown to have no particular significance in an investigation by D. Brunt into 100 years' record of London temps.: of the springs which followed the 18 warmest Jans. in the period, seven were warm, four cold, seven average; four Mays were warm, eight cold, six average. A similar test revealed that no reliance can be placed upon the statement that a wet summer nearly always precedes a cold stormy winter.

Of the maxims which relate weather to the appearance of the sky, the best known is

Red sky at night, shepherd's delight;
Red sky at morning, shepherd's warning;

which has Biblical authority (Matt. 16, 2-3). Such predictions are more reliable. Weather usually travels from W. to E., and a red sunset indicates the absence of clouds and the presence of dry air to the W.—hence the possible approach of fine weather; on the other hand, a red morning sky may be due to clouds of threatening, bad weather being illuminated from below. The maxim "a nor-wester is not often long in debt to a sou-wester" is frequently true, since there is a tendency for depressions to follow one another closely in families across the Atlantic. In Yorkshire it is said, "Do business with men when the wind is in the N.W.": except when it occurs in the rear of a depression, the N.W. wind gives bright sunny mornings and perhaps showery afternoons, but seldom long-continued rain. One of the most extraordinary of

weather phenomena is the frequent occurrence of exceptionally good visibility before rain, giving rise to the Cornish saying, "When the Lizard is clear, rain is near." Rainbows, too, are often quoted as signs of coming weather. Haloes can be found on high clouds after the passage of depressions as well as at their fronts, and therefore can be associated with good or bad weather. There is no truth in the weather lore which is concerned with the changes of the moon. See Meteorology.

A. J. Drummond, F.R.Met.S.

Weathercock. Vane for showing the direction of the wind. It is a thin vertical plate of metal, or wood, pivoted on a vertical rod, and is generally gilded, and made in some decorative or fanciful form, often that of a cock, the emblem of vigilance, though many other designs have been used. It is placed on a staff or above a spire, steeple, or roof. The original weathercock is said to have been the brazen Triton on the tower of the winds in Athens, erected about 100 B.C.

Weatherhead, LESLIE D. (b. 1893). British divine, born in London, and educated at Rich-

Leslie D. Weatherhead, British divine

mond theological college and London university. After serving as a chaplain in the First Great War, he took charge of a Methodist church at Madras. Minister of Brunwick Methodist church, Leeds, 1925-36, he then moved to the City Temple, London. He taught and lectured on psychology and was an examiner in that subject for Wesleyan Methodist ordination candidates, but is best known for books on religion addressed to the man in the street: e.g. *After Death*, *The Mastery of Sex*, *Jesus and Ourselves*, *Thinking Aloud in Wartime*.

Weather Helm. In nautical language, condition of the helm when put or held slightly toward the weather side. The tendency of a sailing vessel to come up into the wind makes it necessary to put the helm up.

Weathering. Process of decomposition which occurs in the superficial layers of built structures, or in natural features like rocks, when exposed to atmospheric influences.

In geology, weathering may be physical (rock breaking) and chemical (rock decay). The two processes commonly operate together. Climate strongly influences the type of weathering: in Arctic or sub-Arctic regions frost action only is at work. In temperate regions, e.g. the British Isles, frost action and chemical processes are both active. In desert areas the mechanical breaking of rock by changes in temperature and the wearing away by sand-blast action of the wind are predominant. Frost action and temperature change are the two most important processes of mechanical weathering. Water freezing in cracks and pores in the rocks expands and enlarges the cracks; when the ice melts pieces fall away. Scree slopes are thus formed at the foot of cliffs. Diurnal heating and cooling of rock surfaces cause uneven thermal expansion and contraction in the mass; the daily repetition of this strain on the rock causes it to crumble, or the surfaces to flake off (exfoliation).

Chemical weathering is brought about by the percolation of rain into the rocks and the action of water, as well as oxygen, carbon dioxide, and sulphur dioxide, in solution. Silicate minerals may thus be broken down, and alkalies, lime, and magnesia removed in solution. In big cities where the atmosphere is polluted by sulphurous smoke, the rainwater is relatively acid, and has a

deleterious effect on building stones not carefully chosen. Chemical weathering changes the hard original rock-forming minerals to soft hydrated clay minerals, an exception being quartz. (See Erosion; Geology; Rock.)

WEATHERING OF BUILDINGS. Driving rain, charged with sulphurous acids, in industrial towns, sets up chemical action which gradually eats away limestone facings. Dust-laden wind also attacks buildings, particularly cornerstones which receive the full force of the wind from more than one direction. Clinging mosses and parasitic vegetation have a disintegrating effect on buildings as they retain moisture; where there is heavy growth they crack the structure to which they cling. Iron cramps, dowels, and rods cause weathering through the expansion of the metal during oxidation. When limestone and sandstone are used together, chemical reaction between the two will induce weathering.

All building stones should be laid on their natural beds, particularly on projecting courses. Tops of cornices, sills, etc., are sloped to throw off water and snow and so prevent moisture seeping into the structure. Window sills, thresholds, and other openings of wood or metal have their sloping tops covered with an impervious material such as lead or asphalt. Such protective devices should terminate in a drip carried some distance beyond the structure to which it is attached. Slate and tiled roofs are arranged to prevent weathering where the slates or tiles abut against walls or chimneys. In the building industry, in fact, the term weathering generally denotes prevention rather than effect.

METALLURGY. Weathering describes a method for detecting surface defects in steel or iron by exposing the metal in the open air. Rusting tends to be more severe in the vicinity of a defect. The process has been superseded almost completely by the faster method of pickling (q.v.).

Weatherly, FREDERIC EDWARD (1848-1929). British lyric writer. Born at Portishead, Somerset, Oct. 4, 1848, he was educated at Hereford and Brasenose College, Oxford, and called to the bar at the Inner Temple in 1887. He wrote the words for such popular songs and ballads as *Nancy Lee*, *The Deathless Army*, *The Old Maids of Lee*, *To-morrow will be Friday*, *The Holy City*, *Up*

Weathercock. Ornamental vanes of varied design and shape, from old English buildings

From drawings by G. G. Harper

from Somerset, Roses of Picardy. Many of his most successful lyrics were set to music by Sanderson.

F. E. Weatherly,
British lyric writer

Weatherly wrote Muriel and Other Poems, 1870; The Rudiments of Logic, 1879; many children's books; and English versions of Cavalleria Rusticana, 1892, and Pagliacci, 1893. His reminiscences, Piano and Gown, appeared in 1926. He died Sept. 7, 1929.

Weather Ship. Vessel designed and equipped for the collection of meteorological data in mid-ocean. By an international agreement reached at London in 1949, ten ocean weather stations were established in the N. Atlantic. Four are entirely maintained by the U.S.A., in addition to one in co-operation with Canada and another with the Netherlands; Great Britain operates two, one of them in cooperation with the Netherlands; Norway operates one, with financial help from Sweden, Belgium, and Denmark;

France is responsible for one in cooperation with the Netherlands. Most of the vessels are of a small naval type, the British vessels being converted wartime corvettes, each manned by 53 officers and men. Upper-air observations are carried out by means of radio-sonde (*q.v.*), and, together with sea surface weather data, are transmitted to shore stations every three hours. Weather ships also make meteorological and hydrological research, supplement the work of the international ice patrol, provide radio beacons for ships and aircraft, and go to the rescue of ships or aircraft.

Weaver. River of Cheshire, England. It rises in the Peckforton Hills, in S.W. Cheshire, and flows mainly N. past Nantwich and

Northwich for 50 m. to the Mersey near Frodsham. Below Northwich for the lowest 20 m. of its course the embanked river becomes the Weaver Navigation, used by steamers and barges connected with the trade in chemicals and salt, the necessary locks having been begun in 1720. It is connected with the Trent and Mersey canal, vessels being raised by a lift to the level of the canal.

Weaver Bird. Popular name applied to several genera of small birds whose nests are covered by grass-woven bags. Of bottle or flask shape, the entrance to the nest is at the bottom or low down at the side. The Baya sparrow or weaver bird (*Ploceus baya*), of India and Ceylon, attaches its hour-glass- or retort-shaped nest to the fronds of palms, weighting them with clay to prevent inordinate swaying. A South African species (*Phopasser mahali*) constructs a nest shaped like a Florence flask inverted. Somewhat similar nests are fashioned by the weaver finch (*Hyphantornis pensilis*) of Madagascar, and other

species. The social weaver birds (*Philetaerus socius*) of S. Africa combine to load an acacia tree with bushman grass, weaving some of it into a roof. In hollows of the in-

Weaver Bird.

Left, Jackson's Whydah Bird, one of the weavers. Right, typical bag, woven of long grasses, to protect the nest

terior dozens of pairs of the birds construct their nests.

Weavers' Company. City livery co. of London. It existed from the 12th century, the first of its 12 charters, signed by Thomas Becket, being granted by Henry II, and the last by Queen Anne. The hall in Basinghall Street was taken down in 1856. The

Weavers' Co.
arms

office of the company is at 7, Queen Anne's Gate, S.W.1.

Weaving. Operation performed by means of a loom in which two sets of threads are interlaced at right angles to form a fabric. The most primitive loom had a series of threads hanging vertically from a wooden bar, and the crossing threads were passed through from one side to the other, alternately in front of and behind the hanging threads. Probably the addition of a second wooden bar at the bottom of the hanging threads, to keep them taut, was a very early improvement. To give a coherent simple woven fabric, the crossing thread (weft) is threaded through the hanging threads (warp) so as to pass in front of all odd-numbered threads and behind all even-numbered threads as it is moved from left to right, and behind all odd-numbered threads and in front of all even-numbered threads in the return movement from right to left. Hand-operated looms in which the warp hangs vertically are still in use in parts of Asia, but

Weather Ship. Releasing a meteorological balloon from the Weather Observer, the first of the weather ships to be completed. The balloon's storage hangar is on the left. The map illustrates the positions of the ten vessels maintained in the North Atlantic (1949)

the early Egyptians used a primitive loom with the warp threads held horizontally, and this variation was necessary before any attempt could be made to increase the size of the article woven beyond a few square feet. In a primitive loom the newly-inserted weft thread was pressed up against its predecessor with a comb-like instrument held in the weaver's hand. The labour of passing a ball or spool of thread alternately above and below a series of warp threads, which even in a narrow coarse cloth may be 200 or more in number, is obvious, and the device called the heddle was invented very early; in its primitive form it consisted of two bars containing holes, all odd-numbered threads being passed through the holes in one, and all even-numbered threads through the holes in the other. By lifting one heddle, all odd threads are raised, and the spool of weft can be pushed through from one side to the other. That heddle is then released, and the other one raised for the return traverse of the weft. Further progress varied from place to place, but certainly by the 15th century in England the horizontal loom had been developed into a framework on which comparatively long lengths of warp threads were wound on to a roller or "beam" whence they passed to the heddles, and on to a second roller at the front, on which the woven cloth was wound, while the weft yarn was contained in a boat-shaped shuttle with pointed ends, which was easier to thread through than a simple spool or ball of thread. This form of loom remained virtually unchanged for several centuries, and is still made in a small form for hand weaving scarves and handbags lengths.

Invention of Loom Box

In 1733 John Kay of Bury fitted on either side of the loom boxes to hold the shuttle; by means of a cord these boxes could be given a sudden jerk, causing the shuttle to be thrown across the loom into the box at the other side. For this to succeed, one set of threads had to be held firmly against a transverse board (shuttle-race), while the other was lifted sufficiently to allow space for the shuttle to "fly" across. A "sley" the full width of the fabric, containing a "reed" of parallel wires mounted in a frame, so arranged that two threads lay between each pair of wires, the whole pivoted on the loom, replaced the hand-comb; the sley, swung behind the shuttle-race

until the shuttle had been thrown across, and then swung forward, pressed the whole of the new weft "pick" into place in the "fell" of the cloth in one easy motion. In 1760, Robert Kay invented the "drop-box," in which there were three or four shuttle boxes instead of one, and any one of these could be raised to the level of the race, as desired. Each could be charged with a different colour or kind of weft, so that weft-way stripes of different colours and designs, such as checks, could be woven.

Weaving of Patterns

Meantime, the simple pair of heddles had been replaced by a number of "shafts" containing wires with an eye in the centre, through which the warp threads passed. Using four shafts, with one quarter of the warp threads passing through the eyes or "mails" of each, it becomes possible to raise the first, fifth, ninth, etc., warp thread by raising one shaft; the second, sixth, tenth, etc., by raising the next; the third, seventh, eleventh, etc., by raising the third; and so on, thus permitting the weaving of simple twills and similar designs. The number of shafts that can be raised as required by a simple mechanism is limited to about eight, permitting the weaving of satins and many fancy cloths. On power looms, up to 24 shafts can be used.

In 1785-87 the power loom was patented by Cartwright, and its introduction during the ensuing years was violently opposed by the hand-loom weavers. In 1804, Jacquard invented an arrangement whereby instead of lifting warp threads in sets by shafts, each single warp thread could be lifted independently, if desired, the whole having a control mechanism worked by punched cards and feeler wires; on this loom very elaborate patterns such as damasks, brocades, etc., can be woven comparatively simply.

The hand loom also had become a more elaborate machine, with the shafts or Jacquard mechanism worked by a foot treadle, and the cords from the shuttle boxes joined together at a small handle, which was simply jerked first to the left and then to the right. Hand looms of this type are still used in village industry and to teach students the principles of weaving. They were preferred for some purposes long after the power loom had been established, e.g. most Paisley shawls were woven at home on hand looms. But the comparative slowness of the hand loom, and the

skill required for its use, gradually ousted it, since it could not meet the demand for cheapness and rapid production, though some hand-woven fabrics have a quality and individuality which cannot be imitated by the power loom. *See Loom; consult also Handicraft Art of Weaving, T. Woodhouse, 1921; Weaving with small Appliances, L. Hooper, 1922; Weaving, Crankshaw, 1935; Textile Design and Colour, W. Watson, 1947.*

Webb, Sir Aston (1849-1930), English architect. Born May 22, 1849, the son of Edward Webb,

Sir Aston Webb,
British architect

a painter, he became an architect. He designed the Victoria and Albert Museum, the Imperial College of Science and Technology, S. Kensington, Admiralty Arch, and the new front of Buckingham Palace. In ecclesiastical design his best achievement was the scholarly restoration of S. Bartholomew the Great, Smithfield. Elected A.R.A. in 1899, he was chosen R.A. in 1903 and was knighted in 1904. From 1919 to 1924 he was president of the R.A.; he was also president of the architectural association. He died Aug. 21, 1930. *See Admiralty Arch.*

Webb, Mary (1881-1927), British novelist. Mary Gladys Meredith was born at Leighton, Shropshire, March 25, 1881, and became a journalist in youth. She married a schoolmaster, Henry Bertram Webb, in 1912, and her first novel, *The Golden Arrow*, appeared in 1916. Later novels, *Spring of Joy*, 1917, *Gone to Earth*, 1917, *The House in Dormer Forest*, 1920, and *Seven for a Secret*, 1922, passed almost unnoticed; but with *Precious Bane*, 1924 (awarded the Femina-Vie Heureuse prize), she attracted wide attention, partly through the public praise of Stanley Baldwin, then prime minister. Her last novel, *Armour Wherein He Trusted*, 1926, was her most mature work. She died at St. Leonards, Oct. 8, 1927.

Mary Webb,
British novelist

Mary Webb possessed Hardy-esque qualities. Her novels, set in the dour country of Shropshire or

the Welsh marches, are imbued with a sense of implacable fate. She excelled in descriptions of country life, of which her knowledge was accurate and immense; her characters were vivid, though primitive. A dramatised version of *Precious Bane* was performed in London in 1932. A selection of her poems was published, 1947. *Consult Lives* by H. Addison, 1931; T. Moulst, 1932.

Webb, MATTHEW (1848-83). English swimmer, popularly known as Captain Webb. He was born at

Matthew Webb,
English swimmer

Dawley, Shropshire, Jan. 18, 1848, and when a boy saved his brother from drowning in the Severn; later he rescued a companion who had fallen overboard from a steamer in the Mersey. He served in the mercantile marine and was awarded the first Stanhope gold medal by the Royal Humane Society in 1874. On Aug. 24-25, 1875, he swam the English Channel from Dover to Calais in 21½ hours. He lost his life in an attempt to swim the whirlpool and rapids below the Niagara Falls, July 24, 1883.

Webb, SIDNEY AND BEATRICE. The work of these British sociologists is described under his title, *Baron Passfield*.

Webb City. City of Missouri, U.S.A., in Jasper co. It is 10 m. S.W. of Carthage, and is served by the St. Louis and San Francisco and the Missouri Pacific rlys. Incorporated in 1876, it became a city a year later. Mining zinc and lead affords the chief occupation; flour-milling and the manufacture of machinery are carried on.

Weber. Practical unit of magnetic flux. It is equal to 10^9 maxwells (C.G.S. units), and is named after Wilhelm Eduard Weber (1804-91), German physicist, who devised an absolute system of electrical units and developed a molecular theory of ferromagnetism.

Weber, ALFRED (b. 1868). German sociologist. He was born at Erfurt, July 30, 1868, brother of Max Weber (1864-1920), who was a political leader of the early Weimar republic. Alfred was professor of economics successively at Berlin, Prague, and Heidelberg from 1899 to 1933, then being dismissed by the Nazis. On the collapse of the Hitler regime in

1945 he re-emerged as an original thinker, and his writings on the social mission of economics exercised influence on German thought.

Weber, CARL MARIA FRIEDRICH ERNST VON (1786-1826). German composer. Of noble family, he was

Carl von Weber,
German composer

born at Eutin, Oldenburg, Dec. 18, 1786. His father, Franz Anton, was an able musician; his mother had been a Viennese singer. On her death in 1798 the family moved to Vienna, where Carl's Six Fughettas were published. Having already written Peter Schmolli and other operas, in 1803 he studied under Abt Vogler and became director of the Breslau opera. He left there in 1806 for a court appointment in Stuttgart, but became involved in trouble which necessitated his removal to Darmstadt, where in 1811 he composed *Abu Hassan*.

During 1813-16 Weber was director of the opera at Prague, and wrote much excellent piano music; then he obtained a similar post at Dresden, where he wrote his masterpiece, *Der Freischütz*, which was produced in Berlin, June 18, 1821. Four days earlier his *Preciosa* had appeared in the same city, and the two operas had an enormous success. His next work was *Euryanthe*, brought out in Vienna, Oct. 25, 1823. In 1825 he began *Oberon*, specially written for Covent Garden Theatre, himself learning English so that the music should fit in with the English accentuation and style of declamation. He visited London early in 1826 and produced the opera on April 12. But he was far gone in consumption, the strain of producing proved too great, and he died on June 5. In romantic opera Weber was the forerunner of Wagner; his music lacked nothing in drama or melody, but is uneven in arrangement. His *Life* was written by his son, M. M. von Weber, 1864-66.

Weber, ERNST HEINRICH (1795-1878). German physiologist. Born at Wittenberg, June 24, 1795, he early acquired a reputation as a brilliant theoretician, and became professor of anatomy, 1818, and of physiology, 1840, at Leipzig. One of the pioneers in the territory between physiology and psychology, he propounded Weber's law, that the amount of stimulus needed to produce a given sensa-

tion depends on its proportion to the immediately preceding stimulus. He died Jan. 26, 1878.

Webster, BENJAMIN (1864-1947). British actor. Grandson of a well-known actor-manager of the same name (1797-1882), he was born June 2, 1864, and educated at Stationers' school and King's College, Cambridge. A barrister, he gave up the law to join the Hare and Kendal management at the St. James's Theatre, making his début in *Clancarty*, 1887. He was associated with Irving and Alexander, and toured with Ellen Terry in 1898. He played the caliph in the original *Chu-Chin-Chow*.

Ben Webster,
British actor

Later memorable performances were in *Symphony in Two Flats*, 1929; *Richard of Bordeaux*, 1933. He married May Whitty (q.v.) in 1892, and their daughter Margaret Webster (b. 1905) became an actress and producer in New York. Ben Webster, who was also in films, e.g. *The Old Curiosity Shop*, and *Drake of England*, died in Los Angeles, Feb. 26, 1947.

Webster, DANIEL (1782-1852). American orator, statesman, and lawyer. Born at Salisbury (Franklin), N.H., Jan.

Daniel Webster,
American orator

18, 1782, he was called to the bar in 1803. He sat in the house of representatives, 1813-17 and 1823-27, and was senator, 1827-41 and 1845-50. In 1816 he set up in practice as a lawyer in Boston. At first an opponent of protection, he afterwards supported the high tariff called the tariff of abominations. He failed thrice to secure the Whig nomination for the presidency. Refusing the vice-presidency, he held the secretaryship of state, 1841-43 and 1850-52. Although opposed to the war with Mexico and the extension of slavery, he regarded the latter as preferable to endangering the Union. In 1852 he retired to Marshfield, Mass., where he died Oct. 24.

In spite of undoubtedly great administrative powers, it is on oratory that Webster's reputation chiefly rests. Among his most

famous speeches were addresses on the bicentenary of the landing of the Pilgrim Fathers at Plymouth, on the deaths of Adams and Jefferson, and on the laying of the foundation and the dedication of the Bunker Hill monument. *Consult* Writings and Speeches, 18 vols., 1903; Lives, S. G. Fisher, 1911; F. A. Ogg, 1914; D. W. as an Economist, R. Carey, 1929.

Webster, JOHN (c. 1580–1625). English dramatist. The son of a London tailor, he became a free-man of the Merchant Taylors' company. He wrote for Henslowe, collaborated with Drayton, Munday, Middleton, Dekker, Heywood, and others, and completed Marston's *The Malcontent* for the stage. His independent work includes a romantic comedy, *The Devil's Law Case*, and three tragedies, *Appius and Virginia*, *The White Devil* (or *Vittoria Corombona*), and *The Duchess of Malfi*. The last two show Webster as a conscientious craftsman, a master of pathos and the portrayal of gloom, grisly horror, and sardonic humour. He raised melodrama almost to the pitch of tragedy, and touched it with lyric beauty in some of the most moving dirges in the language; but he was without humour and his plots lack unity of action and his characters consistency.

The best edition of his Works is by F. L. Lucas, 1927; E. E. Stoll produced a *Life*, 1905; *consult* also J. W. and the Elizabethan Drama, R. Brooke, 1913.

Webster, JULIA AUGUSTA (1837–94). British poet. Born at Poole, Dorset, daughter of Vice-

Julia Webster,
British poet

Admiral George Davies, she married in 1863 Thomas Webster, fellow of Trinity, Cambridge. Her works include translations from the Greek tragedians, *Dramatic Studies*, 1866; *Portraits*, 1870; and *A Book of Rhyme*, 1881, modelled on Italian peasant songs. She also wrote the poetical dramas, *The Auspicious Day*, 1872; *Disguises*, 1879; and *The Sentence*, 1887, perhaps her best work. She died Sept. 5, 1894.

Webster, NOAH (1758–1843). American lexicographer. Born at Hartford, Conn., Oct. 16, 1758, he was educated at Harvard. He became a teacher and political pamphleteer, but also found time

to study law and write books. The success of his Grammatical Institute of the English Language, 1783–85, and other works on grammar, led him to project the great American Dictionary, of which the first of many editions appeared in 1828. Webster died May 2, 1843.

Webster, TOM (b. 1890). British cartoonist. Born July 17, 1890, at Wolverhampton, and there educated, he first published work in the *Birmingham Weekly Post*, which offered a weekly prize for a humorous drawing. After four years as sporting cartoonist on the *Birmingham Sports Argus*, Webster joined *The Daily Citizen* as political cartoonist. From 1919 to 1940 his sports cartoons and caricatures of sporting personalities appeared regularly in the *Daily Mail*. From 1944 he worked for *Kemsley* newspapers. Webster's popular drawings were collected and published annually.

Weddell Sea. Bay of Antarctica. It lies S. of the Atlantic Ocean between Hearst Land on the W. and Coats Land on the E. Bruce, Morrell, Filchner, Weddell, and Shackleton contributed to the still incomplete knowledge of its coasts and waters. In 1915 the *Endurance* was crushed and sunk in the N.W. corner.

Wedding Anniversaries. The best-known of these, with the presents traditionally regarded as acceptable, are mentioned under *Golden Wedding*.

Wedding Rites. Ceremonial observances attending entry upon matrimony. They often embody survivals of primitive custom. There may be meal communion, mutual feeding with rice, mutual drinking of clam-broth or saki, breast-sprinkling with bullock-blood, head-sprinkling with coconut milk, hand-sprinkling with water, and forehead-marking with blood, or symbolically with vermilion. The bridegroom may wear a hat woven from ancestral hair, as in Korea. The rite may be preceded by an exhibition of prowess, such as capturing a bullock or cutting a tree. Placation of spirits, or mutual worship of ancestors, may be obligatory, as in Annam. When some Hindus marry into a lower caste they are represented at the ceremony by an inanimate proxy. In some castes the binding rite consists in hand-tying with a turmeric-dyed thread.

The bride may wash the bridegroom's feet, or be carried across the bridegroom's threshold, or

carry fire to her husband's hut or have her ears boxed by the bridegroom. The bridal pair may walk round the family altar, the custom in ancient Rome, or round the house pillar; the bride may pass thrice round the hearth. The normal Hindu token is a neck-pendant, retained by Christian converts; crowns are placed upon the head. The Roman betrothal ring passed into the wedding ring of Christendom. *See* Marriage.

Wedekind, FRANK (1864–1918). German dramatist. Born at Hanover, July 24, 1864, he studied law, and, turning to literature and the drama, lived chiefly in Munich. The harsh satire and often repulsive realism of his plays roused controversy, and Wedekind was for a time imprisoned for *lèse-majesté*. Among his works, in many of which is seen the influence of the Scandinavian dramatists, are *Frühlings Erwachen*, 1891; *Der Erdgeist*, 1895; *Der Kammersänger*, 1899; *Der Marquis von Keith*, 1904; *Totentanz*, 1906; *Bismarck*, 1916; *Herakles*, 1917; *Überführtenichts*, 1918. He died in Munich, March 4, 1918.

Wedge. One of the simple mechanical powers, in effect a double inclined plane. The power is applied at right angles to the base of the wedge, and the resistance of the material which is to be divided acts as a pressure on the two faces. *See* Masonry; Plane.

Wedge. In meteorology, a ridge of high pressure which frequently develops between two depressions, the shape of the isobars resembling a V with a rounded point directed usually, in the N. hemisphere, towards the north. As the first depression retreats pressure rises, but as the second advances it begins to fall. The weather in the front and central zones is often brilliant, but deteriorates in the rear, and rain frequently follows. Rapid clearing of the weather after the passage of a depression may thus indicate that a wedge has formed, and the period of comparatively fine weather will be perhaps only a few hours. The opposite effect is termed a trough of low pressure.

Wedge Furnace. Type of roasting furnace widely used in the treatment of ores during the extraction of non-ferrous metals. Often it is necessary to remove sulphur from an ore, and this is done by heating in air. Good roasting may be effected in multiple-hearth roasters, of which the wedge furnace is typical. This has a series of circular hearths

placed one above the other with a rotating air-cooled rabbling arm above each. The ore is dropped on to the top hearth and rabbled across it until it falls through a hole on to the next hearth, where the process is repeated. The ore travels across each successive hearth to the bottom, while a current of gases travels in the opposite direction, burning the sulphur as it comes into contact. *See Roasting; See Refractory Furnace.*

Wedgwood, JOSIAH CLEMENT WEDGWOOD, 1ST BARON (1872-1943). British politician. Born

1st Baron Wedgwood, British politician

March 16, 1872, a descendant of the famous potter, he was educated at Clifton and the R.N.C., Greenwich. Assistant constructor in Portsmouth dockyard, 1895-96, he was a naval architect in Elswick shipyard, 1896-1900. He served in the S. African War, and then was two years a resident magistrate in the Transvaal. Wedgwood was Liberal M.P. for Newcastle-under-Lyme from 1906 continuously. He was a foremost advocate of the taxation of land values. In the First Great War he was a sub-lieut. in the R.N.D., rendered special services with the armoured car section in Belgium, was in 1917 assistant director of trench warfare, and in 1918 went to Siberia as a colonel. Then he joined the Labour party, and was chancellor of the duchy of Lancaster in 1924. Chairman of the commons records committee from 1929, he planned and himself wrote two vols. of a history of parliament. He also wrote on his ancestors' industry, and *Memoirs of a Fighting Life*, 1940. Raised to the peerage in 1942, he died July 26 next year, the title going to his son Francis (b. Jan. 20, 1898).

Wedgwood, JOSIAH (1730-95). British potter. Born at Burslem, July 12, 1730, he was apprenticed to his brother Thomas, and as partner of Thomas Whieldon of Fenton produced the melon and cabbage patterns of earthenware. He

Jos. Wedgwood
After a bust by J. Flaxman

became a master-potter at Burslem, 1759, was appointed queen's potter, 1762, and opened the great Etruria works in 1769. He raised ornamental pottery to the status of a fine art and introduced many technical improvements. Wedgwood employed Flaxman and accepted designs by Reynolds, Roubillard, and Stubbs. He was elected to the Royal Society in 1783, to the Society of Antiquaries in 1786, and died at Etruria Hall, Jan. 3, 1795. *See Burslem; Pottery; Wedgwood Ware. Consult J. W. and His Pottery, W. Burton, 1922.*

Wedgwood Ware. Artistic earthenware and porcelain produced by Josiah Wedgwood at Burslem and Etruria, Staffs, and made since his time at the Etruria potteries, later at Barlaston. At Burslem, Wedgwood made green glaze and cream-coloured ware with fine and light body and brilliant glaze, known as Queen's ware. At Etruria, Wedgwood imitated Greek and Etruscan vases, employing Flaxman and other artists to design the figures. He made black basalt as well as cream ware and invented the beautiful jasper ware by which he is best known. Other kinds were pierced cream-coloured basket ware, fine red pottery, and silvery lustre ware. Lavender ware was made in 1850, and later decorated with white slip. Golden and red copper lustres have been used. Porcelain was manufactured at Etruria, 1809-15, and again after 1870, and to this class of

Wedgwood Ware. Vase made at the Wedgwood pottery works, Barlaston, Stoke-on-Trent

pottery Chinese powder-blue has been applied. *See Etruria; Jasper; Majolica; Pottery; Toby Jug.*

Wedmore. Village of Somerset, England. It is 8 m. W. of Wells, and gives its name to a treaty made between Alfred the Great and the Danes in 878. At Ethandune Alfred defeated the Danes, who sued for peace, terms being arranged at Chippenham. The arrangement which divided England between the English and the Danes, although sometimes associated with Wedmore, was

really made some years later. *See Danelagh; English History.*

Wedmore, SIR FREDERICK (1844-1921). British art critic and novelist. Born at Clifton, July 9, 1844, and educated at Weston-super-Mare, Lausanne, and Paris, he became a journalist and art critic for *The Standard*. He lectured widely in Great Britain, and in the U.S.A. in 1885. Among his many works are *Studies in English Art*, 1876; *Four Masters of Etching*, 1883; *Méryon*, 1889; *Life of Balzac*, 1890; *Whistler and Others*, 1904; *Painters and Painting*, 1913. *Pastorals of France*, 1877, was a novel of French provincial life, and *Orgeas and Miradou*, 1896, a volume of delicate short stories. Other novels were *The Collapse of the Penitent*, 1900, and *Brenda Walks On*, 1916. Sir Frederick published his *Memories* in 1912, the year he was knighted, and died Feb. 25, 1921.

Wednesbury. Mun. bor. and market town of Staffs, England. In the heart of an industrial district 8 m. N.W. of Birmingham and 121 m. from London, it is on two rlys., while town and neighbourhood are served by bus. The parish church of S. Bartholomew occupies the site of a temple of Woden, from whom the town takes its name, and is a Perpendicular building. Other edifices include the town hall, art gallery, and public library. The principal manufactures are rails, boiler-plates, steel, iron, wrought iron, and tools, while constructional engineering is carried on. Wednesbury was made a borough in 1886, and has sent a member to parliament since 1867. Market days, Fri. and Sat. Pop. 33,690.

Wednesday. Fourth day of the week. The name comes from the A.S. god Woden. The Romans identified Woden with Mercury, and called Wednesday *Dies Mercurii* (day of Mercury), whence the French *mercredi*. *See Ash Wednesday; Sheffield Wednesday.*

Wednesfield. Urban dist. and town in the parl. bor. of Wolverhampton, Staffs. It takes its name from the A.S. god Woden and is historically interesting as the site of a battle fought in 910, when Edward the Elder drove back the Danish settlers who had rebelled against him. Wednesfield is now the centre of the

Wednesbury arms

lock and key industry, and makes steel tubes, sheet metal, and traps for vermin. It has a rly. station. The old pron. of Wedgfield is dying out. Pop. 16,880.

Weed. Name given by the farmer or gardener to a plant which interferes with cultivated crops. Weeds are plants out of place, and, like other plants, are propagated principally by seeds. Thistles, dandelions, etc., have seed which fly through the air, and are thus spread over large areas. Other seeds are washed into rivers during heavy rains or floods, and so may be carried far; while man himself is responsible for the spread of some through the sale and planting of commercial seeds which are contaminated by weed seeds. Some weeds are extremely difficult to exterminate. The seeds of charlock, for instance, may be buried deep in the soil for many years, yet will germinate when brought to the surface. The most troublesome weeds are perennials, such as couch grass, which constantly invades new ground by means of its creeping underground stem.

The losses caused to agriculture by weeds are very much heavier than imagined. Yellow mustard, charlock, and runch cut wheat crops in many districts by 30 to 50 p.c. Garlic mustard and chamomile affect stock, giving milk and butter an unpleasant taste. Meadow saffron is actually poisonous, and kills outright animals that browse upon it. Many weeds, again, act as hosts to fungi, which cause some of the worst diseases in crops. In this way charlock becomes the cause of the finger and toe disease in turnips, while shepherd's purse is the source of the infection of white rust in cabbages.

Various chemicals are used by gardeners and horticulturists for killing weeds. Some, e.g. arsenic, are poisonous; others, e.g. ammonium sulphate, are comparatively harmless. Sodium chlorate is regarded as a most effective non-poisonous weed-killer for thistles as well as many germinaceous weeds; it is particularly useful for destroying weeds in garden paths. Tar is effective in freeing paths and roads from weeds. Weed control by selective action is now practised on a large scale. The chemical used is the sodium salt of 4-chlor-2-methylphenoxyacetic acid, by which charlock, wild radish, pennygrass, corn buttercup, and fat hen can be eliminated from cereal crops.

Weedon. Village and parish of Northants, England. Situated on the A6 road and the main rly to Rugby, 8 m. W. of Northampton, it has a sub-depot of the Royal Army Ordnance Corps, with barracks and buildings for a large quantity of stores. The royal pavilion, subsequently used as an officers' mess, was built for George III. Pop. 1,753.

Week. Period of seven days, a sub-division of the month. Probably it was based on the four phases of the moon, each of which approximates to seven days; but it has also been suggested that the number seven was derived from the sun and moon and the five planets. The Egyptians named the days of their week after the planets, and this nomenclature spread to the Greeks and Romans, and thence to the Teutonic and Celtic peoples. The origins of the English names of each day of the week are described separately. The seven-day week has not always been universal. Five-, six-, and eight-day weeks exist in Africa, based on market days; the Greeks originally had a month divided into three decades and the Romans an eight-day week; and the French Revolutionary calendar had months in three ten-day sections. See Calendar.

Weeks, FESTIVAL OF. Jewish festival (Lev. 23, vv. 15-21). Held at the conclusion of seven weeks (i.e. a week of weeks) after the opening of Passover (q.v.), and called in Greek Pentecost (q.v.), it is also known as the Feast of Harvest (Ex. 23, v. 16). See Whitsunday.

Weem (Gael. cave). Primitive underground structure of the early metallic age in Scotland. A type of earth-house (q.v.), weems are distinguishable from surface erections beneath artificial mounds. They are sometimes called Picts' Houses (q.v.). Weem is the name of a village near Aberfeldy, Perthshire.

Wee MacGregor. Character in a story of the same name by J. J. Bell, first published in 1902. He is a small Glasgow boy ever asking questions and getting into childish scrapes. He and his family form a delightfully natural group.

Weenen. Village and district headquarters of Natal, South Africa. It is 29 m. by rly. N.E. of Estcourt, at an alt. of 2,940 ft. In the vicinity many Boers and their families, estimated to total 347 souls, were massacred by the Zulus under Dingaan, Feb. 6, 1838. The neighbourhood was later given

its name of Weenen (weeping). The Zulus being defeated, the village was settled in 1839, the second oldest in Natal.

Weever (*Trachinus*). Genus of marine fish, of which two species occur around the British coasts.

Weever. The larger species of the British fish, *Trachinus draco*

The greater weever (*T. draco*) is about a foot long; while the lesser weever (*T. vipera*) is just half as large. They are popularly known as Sting Bulls, from the numerous spines on the back, which are capable of inflicting a poisoned wound.

Weevil. Name given to beetles of the family Curculionidae, numbering about 40,000 known species, of which 450 kinds occur in Great Britain. They are easily recognized by the shape of the head, which is prolonged into a beak or rostrum bearing the mouth-parts at its extremity. In some species, such as the nut weevils, this is very long and slender. The antennae are elbowed and usually end in a club. Weevils and their larvae, being vegetable feeders, are often great pests of the farmer and horticulturist. The granary weevil (*Calandra granaria*) and the rice weevil (*C. oryzae*) are almost cosmopolitan; the Mexican cotton boll weevil (*Anthonomus grandis*) is highly destructive to the cotton crop in the U.S.A., while the apple blossom weevil (*A. pomorum*) and the pine weevil (*Hyllobius abietis*) are notable pests. Species of *Apion* and *Sitona* attack leguminous crops, and *Ceuthorynchus pleurostigma* is the cabbage gall weevil known to gardeners. See Beetle.

Weft. Name for the transverse threads in woven cloth. See Weaving.

Wegg, SILAS. Character in Dickens's novel *Our Mutual Friend*. A wooden-legged ballad-monger and fruit-stall proprietor, he is engaged by Mr. Boffin to read aloud Gibbon's *Decline and Fall*, and attempts blackmail without success. He has a trick of using snatches of ballads in his conversation, the words slightly amended to suit the occasion.

Wehberg, HANS (b. 1885). German jurist, born Dec. 15, 1885, at Düsseldorf. After studying at Jena, Göttingen, and Bonn, he became an assistant judge, and was released from war service in 1917

to work at Kiel university. In 1919 he was legal adviser of the German League of Nations union; in 1921 of the Reichstag committee investigating the causes of the First Great War. Like his teacher Walther Schöcking, Wehberg had become an active pacifist even during the war, and was a protagonist of the League from the beginning. They published together in 1921 the standard work on the covenant of the League. From 1928 Wehberg was at Geneva university institute of international studies as professor of international law.

Wehrmacht (Ger., defence power). Term officially adopted under the Nazi regime for the German armed forces, *Reichswehr* (empire defence) being the term used for the republican professional army of 100,000 and small navy. The Wehrmacht comprised all regular units of the army, the navy rebuilt under the 1935 naval agreement with Great Britain, and the Luftwaffe (air weapon) created 1933-39 in contravention of the treaty of Versailles. The Wehrmacht was disbanded and proclaimed illegal, and its reconstitution under any guise forbidden, by the Allied control council Aug. 29, 1946.

Wei Chi (encircle piece). Ancient Chinese game for two. Traditionally supposed to have been invented before 2000 B.C., it is mentioned by Confucius. It is played on a square board with 19 parallel lines running in each direction to form 361 intersections on which, in the course of play, stones or pieces are placed by the antagonists, white and black alternately. The object of each player is to occupy the largest possible territory with the fewest stones of

his own colour. No stone is moved once it has been placed, except to be taken off the board if completely surrounded by the opponent's stones, having no contact vertically or horizontally with another stone of its own colour. It follows that no stone may be placed in territory entirely surrounded by the enemy. Tournaments have been held for centuries in China, and the game has found favour in Japan. The simplest of games to describe, Wei Chi is one of the most mentally exacting to play.

Weighing Machine. Apparatus for ascertaining the weight of an object. The term thus includes such appliances as the common balance, spring balance, and steelyard; but applies more particularly to (1) larger apparatus such as the weighbridge and similar machines (e.g. for weighing cattle at markets); and (2) indicating machines for weighing commodities in retail shops.

A diagram of a weighbridge is given: the loaded vehicle (of which the tare or unloaded weight is known) is run on to the platform, and the weight of the load is registered through a system of levers—either directly on a dial or by means of a subsidiary appliance of the steelyard type. In the second class of machine the weight is shown directly on a clock-face dial or on a drum which passes an opening in the casing. To obtain something like a dead-beat action, some form of damper is included in the mechanism to cancel out excessive vibrations of the pendulum or other main moving parts.

of the appropriate coin permits the recording or indicating mechanism to operate; weighing is done in the act of stepping on to the platform. In simple machines the weight of the user, acting through the platform, supplies the power to work the appliance. Machines which issue a printed ticket, or even announce one's weight, are operated by electric motors switched on by inserting the coin. In many factories manufacturing or packing foodstuffs, drugs, etc., automatic machines weigh the products and apply checks if short weight is registered, or bring the filling or packing machines to a stop by electronic devices.

Weights and Measures. Standards of magnitude, weight, and value. Early weights and measures were based upon natural measures of length, e.g. the cubit, the length from the elbow to the tip of the longest finger, and varied within wide limits. A cubit, for example, might be anything from 18 to nearly 21 ins. Many earlier measures of volume and weight were haphazard, not even depending upon such natural measures as the cubit. In the 12th century in England a grain of wheat or barley was taken as a standard of weight; on the Continent, as late as the 18th century, every little principality had its own measures.

The advantages of standardising weights and measures were early realized, however. Such standards were in force in the Roman empire, the actual standards from which others were derived being kept in a Roman temple. In England Saxon standards were kept at Winchester, and after the Norman conquest at Westminster. In the 13th century it was enacted that 3 barleycorns should be reckoned as 1 inch, 12 ins. 1 ft., 3 ft. one ell, and 5½ ells 1 perch.

All the weights and measures which have become slowly standardised through centuries suffer from having subdivisions or multiples which do not lend themselves to easy calculation, e.g. 12 ins. to a foot, 112 lb. in a hundredweight, etc. The sole advantage of this duodecimal basis is that 12 is a multiple of 4 and 3. The introduction of the metric system (*q.v.*) has so simplified calculations and connected linear, square, and cubic measures in a logical way, that it has been made the legal system in many countries.

In Great Britain the legal unit of length is the yard; of weight, the pound; and of volume, the gallon.

Weighing Machine. Diagram of an automatic weighbridge which records the weight of a load on a ticket. Top picture shows the weighing of a lorry.

The yard is defined as the distance between central hairlines on each of two gold plugs sunk into a bar of iridio-platinum in the custody of the standards department of the board of trade. Copies of the bar exist in a number of towns. The standard avoirdupois pound is one of 7,000 grains, the Troy pound 5,760 grains; the former being related to the standard yard by the fact that 1 cu. ft. of distilled water at standard temperature and pressure weighs 62·321 lb. avoird. The standard pound is a cylindrical-shaped piece of platinum kept at the board of trade. Length and weight are fixed at a temp. of 62° F. in air with a barometric pressure of 30 ins. at sea level. Existing British standards of length being subject to slight variations due to the natural shrinkage of metal, experiments have been made at the National Physical Laboratory to establish an immutable standard of length based upon the wavelength of light emitted by a cadmium filament.

The gallon is the volume occupied by 10 lb. of distilled water at 62° F. and 30 ins. barometric pressure, and is equal to 277·274 cu. ins. From the yard, pound, and gallon all other divisions and multiples in use, e.g. the inch, ounce, pint, etc., are derived. The chief British weights and measures are:

MEASURES OF LENGTH.

12 inches	= 1 foot.
3 feet	= 1 yard.
5½ yards	= 1 rod, pole or perch.
40 poles	= 1 furlong.
8 furlongs	= 1 mile.
100 links	= surveyor's chain.
	= 22 yards.
6 feet	= 1 fathom.
608 feet	= 1 cable.
10 cables	= 1 admiralty mile.
6,082·66 feet	= 1 nautical mile.

MEASURES OF AREA.

144 sq. inches	= 1 sq. foot.
9 sq. feet	= 1 sq. yard.
30½ sq. yards	= 1 sq. pole.
40 sq. poles	= 1 rood.
4 roods	= 1 acre.
10 sq. chains	= 1 acre.
640 acres	= 1 sq. mile.

MEASURES OF CAPACITY.

Cubic Measure.

1,728 cubic inches	= 1 cubic foot.
27 cubic feet	= 1 cubic yard.

Dry Measure.

4 gills	= 1 pint.
2 pints	= 1 quart.
4 quarts	= 1 gallon.
2 gallons	= 1 peck.
4 pecks	= 1 bushel.
8 bushels	= 1 quarter.
36 bushels	= 1 chaldron.

There are a number of local bushels. A bushel of English wheat is 60 lb., of foreign wheat 62 lb., of English barley 50 lb., oats 39 lb., rye and maize 60 lb.

Wine Measure.

2 pints	= 1 quart.
4 quarts	= 1 gallon.
42 gallons	= 1 tierce.
1½ tierces	= 1 hogshead.
1½ hogsheads	= 1 puncheon
1½ puncheons	= 1 pipe.
2 pipes	= 1 tun.

1 hogshead of claret=46 gallons;
1 butt of sherry=108 gallons; 1
pipe of port=115 gallons; of
madeira=92 gallons; 1 hogshead
of brandy=45-55 gallons, usually
46 gallons. An anker=10 gallons.
A bottle of wine usually contains
about one-sixth of a gallon.

Ale and Beer Measure.

4 gills	= 1 pint.
2 pints	= 1 quart.
4 quarts	= 1 gallon.
9 gallons	= 1 firkin.
2 firkins	= 1 kilderkin.
2 kilderkins	= 1 barrel.
1½ barrels	= 1 hogshead.
2 hogsheads	= 1 butt.
2 butts	= 1 tun.

MEASURES OF WEIGHT.

Avoirdupois Weight.

16 drams	= 1 ounce.
16 oz.	= 1 pound.
14 lb.	= 1 stone.
2 stones	= 1 quarter.
4 quarters	= 1 hundredweight.
20 cwt.	= 1 ton.
7,000 grains	= 1 pound.
437½ grains	= 1 ounce.
1 cental	= 100 pound.

Troy Weight.

24 grains	= 1 pennyweight.
20 pennyweights	= 1 ounce.
12 ounces	= 1 pound.
5,760 grains	= 1 pound.

The Troy pound is not now used.

Apothecaries' Weight.

20 grains or minims	= 1 scruple.
3 scruples	= 1 drachm.
8 drachms	= 1 ounce.
12 ounces	= 1 pound.

Apothecaries' Liquid Measure.

60 minims	= 1 fluid drachm.
8 fluid drachms	= 1 fluid ounce.
20 fluid ounces	= 1 pint.

A drop is practically a minim. The corbyn, containing 40 fluid ounces, and the Winchester quart of 80 fluid ounces, are two standard bottles used in the drug trade.

Jewel Measures.

1 metric carat = 200 milligrams,
is the standard used.

The London, Paris, and Amsterdam carat weighs 3·163 grains; the South African carat 3·174 grains. For diamond and pearl weights an ounce troy is often taken as 151½ carats. For gold and silver 240 grains=1 carat, and 24 carats = 1 lb.

Fish Weight.

1 barrel (anchovies)	= 80 lb.
1 quintal	= 112 lb.
4 fish	= 1 warp.
33 warps	= 1 long hundred.
10 long hundreds	= 1 thousand.

10 thousand	= 1 last.
37½ gallons	= 1 cran of fresh herrings.
26½ gallons	= 1 barrel of cured herrings.

PAPER MEASURES.

Writing Paper.

24 sheets	= 1 quire.
20 quires	= 1 ream.

Printing Paper.

516 sheets	= 1 ream.
2 reams	= 1 bundle.
5 bundles	= 1 bale.

The following are special measures in use for different articles:

Cocoa (bag)	= 1 cwt.
Coffee (bag)	= 1½-1¾ cwt.
Cotton (bale) American	= 400-500 lb.
Egyptian	= 700-740 lb.
Indian	= 500-600 lb.
Flour (peck)	= 14 lb.
Flour (sack)	= 280 lb.
Glass (stone)	= 5 lb.
Gunpowder (barrel)	= 100 lb.
Meat (butcher's stone)	= 8 lb.
Tar (barrel)	= 25 gallons.
Tobacco (hogshead)	= 12-18 cwt.
Wood (cord)	= 128 cubic ft.
Firkin of butter	= 56 lb.
Firkin of soap	= 64 lb.
Last of pitch	= 14 barrels.
Last of wool	= 12 sacks.
Mineral oil (barrel)	= ½ metric ton.
Sack of wool	= 364 lb.
Load of earth	= 1 cubic yard.
Load of hay or straw	= 36 trusses.
Rice (bag)	= 168 lb.
Sago (bag)	= 112 lb.
Biscuits (bag)	= 102 lb.
Sugar (bag)	= 224 lb.
Gold (bar, mint)	= 400 oz. troy
Silver (bar, mint)	= 1,000-1,100 oz. troy

British weights and measures are governed under various Acts. The Weights and Measures Act, 1878, bases all legal measures on the standard yard and pound, the gallon being based in turn on the latter. Under the Act the divisions of the inch by the Birmingham gauge became standard after Nov. 1, 1914. In Great Britain contracts expressed in weights and measures other than the imperial are in general void. The metric weights and measures may be void in contracts relative to foreign trade.

Certain trades in the United Kingdom have legal measures of their own, e.g. the cran for herrings sold by weight.

FOREIGN WEIGHTS AND MEASURES.

The metric system has been adopted by most European countries and many in Asia. In addition many countries still use many of their own historical weights and measures locally, though they have seldom been standardised. Australia, New Zealand, and S. Africa use the British system, but in Canada both the British and metric systems are used. In the U.S.A. weights and measures are the same as those in the U.K., except that the short ton of 2,000 lb. and the long ton, 2,240 lb., are both in use, and the cental of 100

lb. The measures of capacity are the old Winchester measures.

See under the names of various weights and measures, coins, etc.; Coinage; Metric System. Consult Outlines of the Evolution of Weights and Measures of the Metric System, Hallock and Wade, 1906; Law Relating to Weights and Measures, G. A. Owen, 1947.

Weihaiwei. Former British colony in China. It is situated on the N. coast of the promontory in the E. of Shantung province. The territory, which was leased to Great Britain by China in 1898, comprised Weihaiwei city, the island of Liukung, all the islands in the Bay of Weihaiwei, and a belt of land 10 m. wide along the coastline. The total area was 285 sq. m. In addition to the leased territory there was a sphere of influence which comprised that portion of Shantung lying E. of the meridian of 121° 40', an area of 1,500 sq. m. The territory was administered from Port Edward by a commissioner. The bay was used as a naval base and summer exercising ground for the China Squadron. As a result of the Washington conference in 1922, Weihaiwei was handed back to China. The native city is walled, and the territory supports farmers and fishermen. Pop. 178,915.

Wei-ho. River of China in Kansu and Shensi provs. It rises W. of Kungchangfu, and flows almost due E., past Sianfu, to join the Hwang-ho, of which it is the longest affluent, at the great bend.

Weimar. A town of Central Germany. Until 1918 it was capital of the grand duchy of Saxe-

Weimar arms

Weimar-Eisenach; then of Thuringia. Situated 13 m. E. of Erfurt, on a height of about 720 ft. at the foot of the Ettersberg, and on the river Ilm; it is a junction

on the Berlin-Frankfurt rly., and had an airport. Industry included engineering, vehicle building, shoe and textile factories, and seed growing, but in the main Weimar preserved its character as a place for residents and tourists. Pop. approx. 67,000.

The town church of SS. Peter and Paul (1499, renewed 18th cent.) where Bach played the organ and Herder preached, contains the tombs of former rulers, and that of the elder Lucas Cranach, whose altar-piece is one of his great works. In the court church

Weimar, Germany. The National Theatre, showing the Goethe and Schiller monument on the left

(1713) Goethe's wife is buried, while he and Schiller rest with the grand dukes in the dynastic mausoleum. The palace (1790-1803), two old castles, now government buildings, and the library (1563, restored 1760) deserve mention. The main interest, however, is in buildings connected with Goethe (*q.v.*); his own house is preserved as a museum. Less ambitious houses and museums are devoted to Schiller and Liszt. The national theatre, with the Goethe-Schiller monument in front, was in 1919 the seat of the assembly which created the Weimar republic (*v.i.*). There are also a valuable museum with fine medieval and Renaissance paintings, a modern art museum, and the Goethe-Schiller archives containing, apart from works and letters of these two, those of many important men of their time and the 19th cent. Weimar has long been the home of learned and art societies, colleges, and schools.

Known since 975, it received urban rights in 1253, and from the 15th century was the residence of rulers. These in the 18th and 19th centuries made it a centre of German spiritual and artistic life and its name synonymous with all that was opposite to Potsdam. Charles Augustus (1758-1828), the Maecenas of Goethe, Schiller, Wieland, and Herder, was the best-known ruler. During the Second Great War Weimar was surrendered by the burgomaster to U.S. forces without opposition April 12, 1945. After Germany's surrender it lay in the Russian zone of occupation. *Pron.* Vi-mar.

Weimar Republic. Colloquial term for the German Reich under the democratic parl. govt. and republican constitution which existed from William II's flight to the Netherlands, Nov. 10, 1918, until Jan. 30, 1933, when Hitler, appointed under that constitu-

tion chancellor of a coalition govt., started to abolish the regime. The name is used more frequently abroad than in Germany; it is derived from the fact that a national assembly, elected Jan. 19, 1919, sat in the theatre at Weimar for over a year, apart from a short interlude

at Berlin, and there approved the constitution on Aug. 11.

Weingartner, (PAUL) FELIX (1863-1942). Austrian conductor, composer, and writer. Born at Zara, Dalmatia, June 2, 1863, he studied at Graz and Leipzig, and at Weimar enjoyed the friendship of Liszt. Here his first opera *Sakuntala* was produced in 1884, followed by six others which had some success in Germany. He

Felix Weingartner, Austrian conductor

was an able pianist, often accompanying singers of his own works. He made his debut as conductor in London in 1898, and in 1906 introduced at a Philharmonic

concert the first of his five symphonies. Next year he succeeded Mahler as musical director at the Vienna opera. Director of the early Mozart performances at Salzburg, he continued to take part in festivals there until 1937. From 1905 he frequently visited the U.S.A. An outstanding conductor, especially of Beethoven, he also did much to initiate a revival of Berlioz, collecting that composer's works in collaboration with Charles Malherbe. Weingartner wrote libretti, poems, books on musical problems, and in 1929 his reminiscences (Eng. trans., Buffets and Rewards, 1937). He died at Winterthur, Switzerland, May 7, 1942.

Weir (A. S. *wer*, from *werian*, to defend). Structure for impounding or diverting water, over which flood waters are made to flow without endangering it. Weirs are usually built across rivers or water courses to divert the flow into a canal, while permitting surplus water to pass down the river channel. In designing dams, weirs allow for the safe discharge

Weir. The weir at Pangbourne, on the upper reaches of the Thames

of flood water which might destroy embankments or erode foundations. A closed weir is built solidly across the river, but an open weir usually has piers at intervals between which are movable weirs so built that the height of water is under control. The weir must be designed to deal with the maximum expected flood; where sudden floods may occur, it needs gates that open automatically. Masonry weirs, when possible, are built on solid foundations, but if rock is not available near the surface, piling or cut-off trenches are resorted to.

In hydraulics, weirs measure the flow of water. By forming a restriction across a water course, and introducing a properly made weir, usually of metal with a rectangular or V-shaped notch, the flow can be calculated by measuring the depth of water passing over the notch.

Weir, WILLIAM DOUGLAS WEIR, 1ST VISCOUNT (b. 1877). British business man and politician.

Viscount Weir, British engineer

He was born May 12, 1877, and in youth joined the family business of G. and J. Weir, Glasgow engineers, eventually becoming chairman. During the First Great War he occupied posts in the ministry of Munitions, and in 1918 was Air minister, being made a baron. In 1925 Weir advanced a scheme for easily built steel houses, the first suggestion for pre-fabricated houses in Great Britain; but the idea was dropped. On the outbreak of the Second

Great War, having been raised to viscount in 1938, he became director-general of explosives, ministry of Supply, and in 1942 chairman of the tank board.

Weir-Mitchell Treatment.

Form of treatment for neurasthenia, originally adopted by an American physician, Dr. S. Weir-Mitchell. It is not now much in favour. The essential features were to guard the patient from every form of worry, to give him complete mental and bodily rest, and to supply him with a superabundance of nourishment. The patient was kept in bed under supervision in a nursing home for a period of from four to five weeks, and was not allowed to receive friends or read newspapers or letters. The cure was much used if nervous disorder had led to physical disorder.

Weismann, AUGUST (1834-1914). German scientist. Born at Frankfort-on-Main, Jan. 17, 1834,

he became a physician at Frankfort, but abandoned practice for the study of zoology, and in 1866 was made professor of zoology at Freiburg. He remained there until 1912 and died in Berlin, Nov. 6, 1914. Weismann's great work was done in the field of evolution. He accepted Darwin's teachings at once, and on them built up the theory that heredity is a question of the continuity of the germ-plasm, that external changes in the life of an individual cannot be transmitted to descendants. These views aroused the opposition of some of Darwin's

August Weismann, German scientist

followers, though not of Darwin himself. Some of his many works have been translated into English, among them *Studies in the Theory of Descent*, 1882; *The Germ-plasm, a Theory of Heredity*, 1893; and *The Evolution Theory*, 1904. See Darwinism; Heredity.

Weissenburg. Town of Bavaria, Germany. It lies on the Swabian Rezat 27 m. S.E. of Ansbach. A free imperial city of the old German empire, it has medieval buildings, and part of its old walls stand. It has varied manufactures. After the Second Great War it lay in the U.S. zone of occupation. Pop. 14,050.

Weissenburg is also the German form of the name of the French town of Wissembourg (*q.v.*).

Weissenfels. Town of E. Germany, in the *Land* of Saxony-Anhalt. It stands 16 m. S.W. of Leipzig on the right bank of the Saale. There are several churches, including S. Mary's (1303), but the chief building is the former residence of the dukes of Saxe-Weissenfels, a duchy that existed 1556-1746. There were foundries, sugar refineries, shoe factories, tanneries, and machine shops. After the Second Great War it came within the Russian zone of occupation. Pop. 50,000.

Weisshorn. Pyramidal peak of the Pennine Alps, Switzerland. It rises to 14,804 ft., 5 m. N.W. of Zermatt. The first ascent was achieved by Tyndall in 1861. Other Alpine peaks of the same name are the Arosar W. (8,710 ft.), the W. (10,130 ft.) N. of the Flüela Pass, both in Grisons, and the W. (9,875 ft.) in the Bernese Alps S. of Lenk.

Weissmuller, JOHNNY (b. 1904). American swimmer and film actor. He was born at Chicago, June 2, 1904. On April 5, 1927, he swam 100 yds. in 51 secs., a world record, and soon claimed the best times for all distances up to 500 yds., as well as those for 100 and 400 metres in the Olympic games. He became one of the finest exponents of the "crawl." He appeared on the screen in 1932 in *Tarzan the Ape Man*, first of a succession of films in which his prowess as a swimmer was demonstrated. His second marriage, in 1933, was to the film actress Lupe Velez (1910-44).

Johnny Weissmuller, American swimmer and film actor

Weizmann, CHAIM (b. 1874). First president of the republic of Israel. He was born at Motol, Russia, Nov. 27, 1874, and educated at Pinsk, and in Germany. A research chemist, he was for a time a lecturer in Geneva and reader in biochemistry at

Chaim Weizmann,
President of Israel

Manchester university, and during the First Great War was in charge of the Admiralty laboratories. An enthusiastic Zionist, he was president of the world Zionist organization, 1921-31 and 1935-46, and in 1932 became chairman of the Jerusalem Hebrew university. On May 16, 1948, he was elected president of the provisional council of Israel, and on Feb. 17, 1949, first president of the republic. His autobiography, *Trial and Error*, appeared the same year.

Welbeck Abbey. Seat of the duke of Portland, in Notts, England. It is 4 m. S.W. of Worksop, and includes 25 acres of fruit and flower gardens and a park, once part of old Sherwood Forest, about 10 m. in circumference. Built on the site of a Premonstratensian abbey, founded in 1154, the house dates for the most part from the 17th century, but the Oxford wing was rebuilt after a fire in 1900. The underground rooms and tunnels, in all about 1½ miles long, were constructed in the time of the 5th duke of Portland, into whose family the estate passed in 1734. In the park is Serpentine Lake, 93½ acres. The duke of Newcastle entertained Charles I at Welbeck in 1633. Some of the buildings, including the underground ballroom, from 1945 housed the No. 2 (Northern Command) formation College, designed to give selected men and women in the army intensive courses of study. See Dukeries; Portland, Duke of.

Welch, JAMES (1865-1917). A British actor. Born at Liverpool, Nov. 6, 1865, he made his first appearance on the London stage in 1887. Welch developed as a successful comedian and made his greatest hit as Sir Guy de Vere in *When Knights Were Bold*, which he brought to London from Nottingham in 1906. In this play he acted continuously until 1911, frequently reviving it and appearing in a silent film version. He died April 11, 1917.

James Welch,
British actor

Welch Fusiliers, ROYAL. Regiment of the British army. Originating in independent companies formed in 1686 for police duties in the Welsh marches, it was taken on to the establishment in 1689 as the 23rd Foot. The regt. served under William III in Ireland, and won its first battle honour at Namur in 1695. With Marlborough it fought at Blenheim, Ramillies, Oudenarde, and Malplaquet. At the end of the Flanders campaign it received the title Prince of Wales's Own Royal Regiment of Welch Fusiliers, commemorated in the central motif of the existing regimental badge.

The regt. fought at Dettingen and was one of the select few at Minden. Serving throughout the American War of Independence, it formed part of the army compelled to surrender at Yorktown. Its next action was with Abercromby in Egypt in 1801, and it took part in the capture of the Cape of Good Hope. In the Napoleonic Wars, a second bn. was formed and drafted to the W. Indies, where it won the battle honour Martinique, 1809. The 1st bn. with Moore gained the honour Corunna. Both

bn. were part of the fusilier bde. at Albuera, and in all won nine Peninsular honours before going on to fight at Waterloo. In the Crimean War, the Royal Welch Fusiliers were at the Alma, Inkerman, and Sevastopol, and in the Indian Mutiny helped to relieve Lucknow. Next followed service in the Ashanti War and the Burma War. The 1st bn. served throughout the S. African War of 1899-1902, and the 2nd was at the relief of Peking in 1900.

Forty-two bn. were raised for service in the First Great War, when 77 battle honours won included: Marne, 1914; Ypres, 1914, '17, '18; Somme, 1916, '18; Hindenburg Line; Vittorio Veneto; Dorian, 1917, '18; Gallipoli, 1915; Egypt, 1915-17; Gaza; Bagdad. In the Second Great War, the 1st bn. was in France 1939-40, then in Burma; the 2nd took part in Madagascar landings, then joined the 1st; the 4th, 6th, and 7th fought throughout the 1944-45 campaign on the Continent.

The regimental depot is at Wrexham. All ranks wear the distinctive flash, or bunch of black silk ribbons attached to the back of the tunic or battle-dress blouse collar. This flash is a relic of the period when all soldiers wore greased pigtailed and needed to protect their collars. Through a War office oversight the order to remove pigtailed did not reach the Royal Welch Fusiliers. The flash is not, as often supposed, a mark of mourning for Moore.

Welch Regiment. Unit of the British army. Raised in 1719 from out-pensioners of Chelsea Hospital, it was originally a home defence unit, known as The Invalids, until 1787, when it was reformed as a line regt. (41st Foot). One of its officers was the future duke of Wellington. The first battle honour was gained at Guadeloupe in 1797, and the second during service as marines with Nelson's fleet at St. Vincent. In America there accrued the honours Miami and Detroit. Between 1820 and 1850 the 41st Foot saw service in Burma and Afghanistan.

In 1881 the 41st and 69th Foot were amalgamated to form the 1st and 2nd bn. of the present Welch Regiment. The 69th had been raised in 1756 as the 2nd bn. of the 24th (S. Wales Borderers) Foot, but in 1758 was constituted

Welch
Fusiliers
badge

Welch Regiment
badge

Welbeck Abbey, Nottinghamshire. Country seat of the dukes of Portland, built on the site of an ancient abbey, seen from the lake in the grounds

a separate regt. and affiliated to S. Lincs. It ranked as marines until converted back to infantry to join Wellington in the Peninsula. It was at Waterloo, and in the Crimean War gained three honours. The Welch Regiment fought throughout the S. African War, and later went on garrison duty on the N.W. Frontier of India.

Thirty-four bns. were raised for the First Great War, and gained the battle honours: Aisne, 1914, '18; Ypres, 1914, '17, '18; Gheluvelt; Somme, 1916, '18; Pilkem; Cambrai, 1917, '18; Macedonia, 1915, '18; Gallipoli, 1915; Palestine, 1917, '18; Mesopotamia, 1916, '18. In the Second Great War, bns. fought in France (1939-40), Italy, and N.W. Europe. The regimental depot is at Cardiff.

Weld, **YELLOW WEED**, OR **DYER'S ROCKET** (*Reseda luteola*). Annual or biennial herb of the family Resedaceae. It is a native of Europe, W. Asia, and N. Africa. It has an erect, smooth, branched stem, 2-3 ft. in height, with slender lance-shaped leaves, and ends in a long, spike-like spray of yellow-green flowers. The fruit is a capsule, open before the black seeds are ripe. Weld was formerly used by dyers to obtain a yellow dye, but this was not sufficiently permanent, though the plant is still the source of the artists' colour Dutch Pink. See Mignonette.

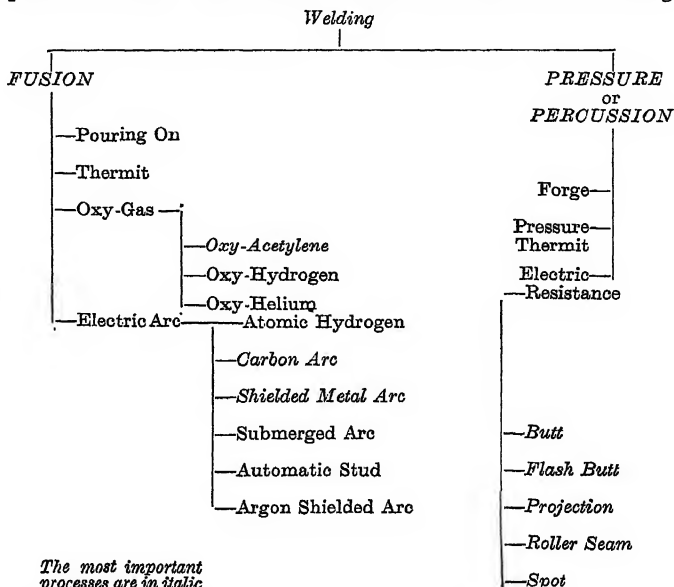

Welding. Process by which two pieces of metal are joined. Both surfaces to be joined have to be raised to a plastic or liquid condition by the application of heat with or without the application of pressure. Though primarily applicable to metals, the term welding is sometimes applied to analogous processes for joining plastic materials. The use of welding greatly increased during the 20th century, becoming, with casting, forging, riveting, and bolting, one of the chief means for fabricating metals, some of which, however, cannot be welded.

Fusion welds are produced by a melting, or melting and casting process; pressure or percussion welds by mechanical pressure with or without melting. The principal processes and their relationships in these groups are indicated in the table in this page.

When similar metals are joined directly into each other, actual alloying or atomic combination of the two metals takes place. As in soldering and brazing, however, a dissimilar metal can be used to form the junction by adhesion with or without some degree of alloying.

In alloying an intermediate solid solution or an inter-metallic compound is formed; but with ad-

formation of a weld. Should the amount of heat required be excessive, or its effect on surrounding

hesion there is a clearly marked separation line between the two metals and the strength of the joint is attained by the hooking up of some of the free atomic linkages which are exposed at the surface of any clean crystal structure such as unoxidised metal. There is also some degree of keying of one metal into the surface irregularities of the other.

The presence of an oxide film on the surface of one or both of the adjoining metal faces is the main hindrance to effective union whether by alloying or adhesion, since this condition prevents that intimate contact between the atomic surfaces which is essential if a good weld is to be made. Various methods are adopted for breaking down these oxide films and carrying them clear of the joint. In most fusion welds a chemical flux is applied to the joint faces either before welding starts or during the process. Such fluxes dissolve the oxides and then float themselves and the products of their action, in the form of slag, to the outer surface of the molten pool. Many of these fluxes and their products are strongly corrosive and need to be removed carefully and as soon as possible after the completion of a weld. Others are extremely tenacious and difficult to remove after solidification.

Melting alone, with a flux, is usually sufficient to give the intimacy of contact essential to the

metal structure or finish harmful, or should the cast structure which is produced be undesirable, pressure might be used in conjunction with heat to give more suitable welding conditions. Here the heat serves to soften the metal and also to speed up the rate of recrystallisation so that, as the pressure crushes the two faces closely together, grain growth can take place between them, across the interface, without actual melting of the metal. Usually the greater the pressure the less the necessary external application of heat and vice versa.

When pressure is used, often to give suitable conditions for heating rather than to assist actual union (e.g. in spot welding), a flux could be used to assist deoxidation, but more often some form of deoxidation such as wire brushing, machining, or pickling would be performed immediately before welding and the pressure relied on to squeeze out, or render ineffective, any remaining harmful oxide.

Most welding processes have developed from the adoption of new methods for heating metal. Earliest heating was by charcoal fire, used for forge welding; then the gas and pressure air flame, and, later, the gas and pressure oxygen flame, were used to give more concentrated and intense heating, leading to oxy-acetylene welding. Arc welding processes grew from the attempt to use the concentrated

heat from the carbon arc. Further development took place with adoption of resistance heating,

Welding. Stud weld (arc type) before and, bottom, after welding

leading to butt welding, spot welding, flash butt welding, etc. Use of the intense heat from the combustion of thermit led to the development of the thermit processes; the use of the heat of recombination of atomised hydrogen led to the atomic hydrogen process; and so on. Development of techniques for control of the rates of heating and cooling made it possible to weld more metals.

All fusion welding processes are basically casting processes, so that a metal that will not cast easily will not as a rule weld easily by a fusion process. The simplest method of fusion welding is by pouring on. The joint is prepared in position within a mould of suitable size and shape. Super-heated molten metal is then poured into the mould, the volume of metal and degree of super-heat being adjusted so that there is sufficient heat to melt the joint faces and ensure effective union. It is a wasteful process, uncertain in its action, and requires considerable finish dressing. In thermit welding, applicable to iron and some steels, the melting and casting

are performed almost simultaneously under the influence of the heat and molten metal from burning thermit. This method was frequently used for joining tram rails; it is suitable for repair work on large cast iron parts.

In the oxy-gas processes oxygen and a combustible gas are mixed and burned under pressure, the intensely hot flame which results being used to produce localised melting and fusion of the joint faces assisted, possibly, by the addition of extra metal melted simultaneously from a separate filler rod. The process can be very economical and the resulting finish pleasing. Most welding of this type is done with a mixture of oxygen and acetylene gas in an Oxy-acetylene Blowpipe (*q.v.*); an

Welding. Smith weld before and, bottom, after welding

oxygen-helium mixture is used for welding light alloys.

Brazing and other similar methods in which a sandwiched, relatively low melting point, dissimilar metal is used to make the joint are most frequently done with the oxy-acetylene flame, though other means of heating can be used. The parent metal is not melted by the heat, but is raised to a sufficiently high temp. to permit its alloying with the molten joining metal, or to allow "wetting" of the joint face with the latter by adhesion.

Electric welding, covering an important group of fusion welding processes, is described under that head. Its most important forms are shielded metal arc welding, carbon arc welding, and argon shielded arc welding. The arc method has been adapted to a method for automatic stud welding, differing from the projection method for stud welding. Developed from the shielded metal arc method is the automatic process called submerged arc welding. For this the flux coating of the metal filler wire electrode is replaced by a loose powder heaped around the

joint edges. The electrode tip is submerged in this powder and the arc is struck through it between the electrode tip and the work-piece. Unfused powder can be swept up after welding and used again. The method is applicable only to straight seams in the horizontal underhand position.

In still another fusion process, atomic hydrogen welding, the intense heat of recombination of atomised hydrogen is used for welding. Molecular hydrogen (H_2) is passed from a jet through an electric arc which causes the gas to separate to the simple atomic form (H). As it leaves the arc the hydrogen recombines, giving off intense heat in the process, before burning in the surrounding air. This process has a considerable field of usefulness in welding, *e.g.* heat-resisting alloys.

The oldest method of welding is the pressure method used, for butt welds, by the village blacksmith. In this the hammering gives the necessary intimacy of contact between the joint faces, and simultaneously drives some of the oxide to the outside of the joint, sometimes being assisted by a flux made from silver sand and burnt borax.

From the forge weld it is a simple development to butt welding and flash butt welding, processes in which the butting faces must be of identical shape and area. For butt welding each contact surface must

Welding. Flash welded pipe before and, bottom, after welding

Welding. Flash butt weld before and, bottom, after welding

be highly finished, to ensure uniformity of contact as the two faces are held together in the machine under pressure and electric current passed from one side to the other. Since the electric resistance at the interface is higher than in the rest of the circuit, heat is generated until the parts are hot enough to deform plastically under the pressure and a weld is formed between them. Very heavy currents are needed. Flash welding requires less current and less accurate machining.

In spot welding, used for localised unions between overlapped plates, the applied pressure is used chiefly to give suitable heating conditions. Localisation of pressure and current in projection welding is secured by raising suitably shaped projections on the inner face of one or other of the two lapped plates before placing them in the machine. The plates are held together between two flat platen electrodes and current is passed from one to the other via the contacts with the tops of the projections, in which localities the heating takes place. This method is used for a form of stud weld in which the stud end forms the projection. In seam or roller seam welding the two spot welding electrodes are replaced by roller disks which revolve and feed the lapped joint through at a constant speed. Spot welds are made by switching the current on and off at regular intervals. These spots can be made to overlap and so produce a continuous gas- and water-tight joint which is a true seam weld.

The tendency in pressure welding is to use higher pressures with correspondingly less heat; e.g. to produce aluminium clad duralumin sheet, a thick slab of duralumin is hot rolled between two thinner slabs of aluminium, the slabs being welded to each other as the thickness is reduced to plate dimensions.

When wide use of welding began there was a general tendency to forget the mechanically rigid nature of a welded joint and to treat a design as if it had been bolted or riveted, with the result that, very often, disastrous stresses developed in what was nominally a safe structure, and welding was blamed. Once design was adapted to the process, the results were often revolutionary. Perhaps the best example of this was the development of the arc welded portal frame system for engineering structures by which spacious halls

and factories can be constructed without internal pillars and with little or no truss work. This type of welded construction was also adopted for use with reinforced concrete. Flash butt welding was used on high tensile steel structures to make shapes and attain strengths otherwise obtainable only by complicated forging or casting operations.

The various processes each have applications to which they are particularly suited; and different processes might each be economically used in different parts of one whole; e.g. in a normally designed aircraft argon arc welding, atomic hydrogen welding, brazing, flash butt welding, oxy-acetylene welding, projection welding, seam welding, shielded metal arc welding, soldering, and spot welding might all be present in different parts of the machine.

G. G. Tweeddale

Welfare. Term used to describe the care of employees customarily taken in large works over and above the provision imposed by law of adequate air, warmth, rest periods, etc. Welfare officers, specially trained to deal with human beings and with the duty to promote the health and happiness, and thereby the efficiency, of the workers, are appointed in many factories and other large industrial concerns.

Welhaven, JOHAN SEBASTIAN CAMMERMEYER (1807-73). Norwegian poet. Born Dec. 22, 1807, he was professor of philosophy at Christiania (Oslo), 1846-67, and died there Oct. 21, 1873. His first poem was a sonnet sequence, *The Twilight of Norway*, 1834. This was greeted with scorn by rival poets, and denounced as unpatriotic and unbalanced by others. It was nevertheless an epoch-making event in Norwegian literature, and Welhaven is now recognized as one of the finest modern Norwegian poets. His later volumes (1839, 1845, 1851, 1859) contain some of the most beautiful lyrics in the language. Many have been set to music by Kjerulf and others, and a few have been rendered into English by Johan Dahl in his collection of Norwegian and Swedish Poems, 1872.

Well. Artificial boring made in order to obtain water from the earth. This method of getting water is a very ancient one, and there are many references to wells in the Bible and in other early literature. The waters of many wells were believed to possess miraculous properties; hence the many

holy wells in various countries. Others were wishing wells, or were believed to possess powers of other various kinds.

Well sinking is among the most ancient branches of engineering. Until the end of the 18th century, all wells were dug or otherwise excavated; and, with few exceptions, were not of great depth. Some very large dug wells contribute to the water supply of London. These are sunk into the chalk, and from their bottoms horizontal headings are driven to great distances to obtain a large surface for percolation. Most wells today are driven or bored. Sinking a driven well consists of forcing down into the ground a jointed pipe until water is reached. More commonly, and always for great depths, the well is bored and lined with wrought iron. Bored wells are commonly called Artesian wells. Drilling is done either with rotating or with percussive tools. Oil wells are sunk and lined in the same way as water wells. *See* Artesian Well; Boring; Drilling.

Welland. River of England. It rises in Northants, and flows mainly N.E., forming the boundary between that county and Leics, and then Rutland. Near Crowland it enters Lincs, across which it flows to the Wash. It is about 70 m. long, and is used by small vessels as far as Market Deeping. This is one of the few English rivers which has an aegir (bore).

Welland. Town of Ontario, Canada. It is situated on the river and ship canal of the same name, 20 m. W. of Buffalo, and has stations on the C.P.R. and C.N.R. Its industries include the manufacture of farming machinery, forgings, shoes, and textiles. Pop. 15,780.

Welland Ship Canal. Canadian waterway connecting Lakes Erie and Ontario. First built 1824-29 as a small canal, having 40 wooden locks with a depth of 8 ft., it has undergone a series of developments culminating in 1914-29 in the construction by the dominion govt. of the present ship canal. This extends from Port Weller on Lake Ontario to Port Golborne on Lake Erie, a distance of 25 m., and represents one of the great engineering feats of the world. The 325-ft. difference in elevation between the levels of the two lakes is overcome by 7 locks each with a lift of 46½ ft.; at Thorold the flight locks, built double, have a combined lift of 139½ ft. Each lock is 859 ft. long and 80 ft. wide. The guard lock at

Welding. Projection weld before and, bottom, after welding

Humberstone is 1,380 ft. long. The canal, which in an eight-month season carries some 12,000,000 tons of cargo, is an integral part of the Great Lakes-St. Lawrence river route from the Atlantic to the heart of North America.

Welldon, JAMES EDWARD COWELL (1854-1937). A British schoolmaster and divine. Born

J. E. C. Welldon,
British schoolmaster
and divine

at Tonbridge, Kent, the son of a schoolmaster, he was educated at Eton and King's College, Cambridge. Having graduated as senior classic, he was fellow and tutor of King's before being appointed in 1883 headmaster of Dulwich. Two years later he became headmaster of Harrow, and was then bishop of Calcutta, 1898-1902. Next Welldon was chosen canon of Westminster, in 1906 dean of Manchester, and in 1918 dean of Durham. Distinguished as scholar, lecturer, and preacher, he published translations of Aristotle, sermons to boys, and *The Hope of Immortality*, 1898; *The Gospel in a Great City*, 1910; *Time and Eternity*, 1928; *Forty Years On*, 1935. He retired in 1933, and died June 17, 1937.

Welle. River of the Belgian Congo. It rises near the border with Kenya, W. of Wadelai, and flows W., forming the upper portion of the Ubangi (*q.v.*).

Weller, SAMUEL. Character in *The Pickwick Papers*, by Dickens. Sam is Mr. Pickwick's most devoted servant, a light-hearted, good-natured, humorous, shrewd cockney. The immense success of *The Pickwick Papers* on its original appearance in monthly parts dated from the first appearance of Sam in the 4th number, from which point onwards he figures in almost every scene, and becomes a leading character. The character, especially in respect of the tricks of speech which came to be known as Wellerisms (*e.g.* "Out vith it, as the father said to the child when he swallowed a farden"), is said to be based on that of an actor called Sam Vale. Sam's father, Tony, makes a later appearance in the book. He is a stout old coachman, full of quaint anecdote, and is also landlord of the Marquis of Granby, Dorking.

Welles, (GEORGE) ORSON (b. 1915). American actor and film director. Born at Kenosha, Wis., May 6, 1915,

he went to high school at Woodstock, Ill., and made a stage debut in 1931 at the Gate Theatre, Dublin. He toured the U.S.A. with Katherine Cornell, and in New York founded the Mercury Theatre and was director of the Negro People's Theatre. In 1938 his broadcast adaptation of Wells's *War of the Worlds* created mass panic. As film director he made screen history with *Citizen Kane*, a masterpiece of satire, shown in England in 1942. Other expressions of a sombre personality were *The Magnificent Ambersons*, and *Journey into Fear*; he acted Rochester in *Jane Eyre*, and Harry Lime in *The Third Man*.

Welles, SUMNER (b. 1892). American politician. Born in New York, Oct. 14, 1892, he was

Sumner Welles,
American politician

educated at Groton and Harvard. After holding diplomatic posts in Tokyo and Latin America, he was Coolidge's representative in Honduras during the revolution of 1924. Assistant secretary of state from 1933, with a short period as ambassador to Cuba, he became under-secretary in 1937. Welles carried out a "fact-finding" mission for Roosevelt in Germany, Italy, and Great Britain at the beginning of the Second Great War. After the U.S.A. entered the war Welles held innumerable interviews with European and Asiatic diplomats, and headed a delegation to the Pan-American conference at Rio. A committee of which he was chairman drafted a document which with few changes emerged as the agreement of the Moscow conference, 1943. Differences on policy were reputed to have led to his resigning the under-secretaryship on Sept. 25 that year. Welles published *Naboth's Vineyard*, 1928; *The World of the Four Freedoms*, 1943; *Where Are We Heading?*, 1947; and edited an English trans. of the diary of Count Ciano.

Orson Welles,
American actor

Wellesley, RICHARD COLLEY WELLESLEY or **WESLEY, MARQUESS** (1760-1842). British administrator.

Born at Dangan Castle, Meath, June 20, 1760, he was a son of the earl of Mornington and elder brother of the duke of Wellington. Educated at Eton and Christ Church, Oxford, he succeeded to his father's Irish title in 1781, and in 1784 was elected an English M.P. In 1797, having held minor offices under Pitt, he went out to India as governor-general, and there he remained until 1805, greatly enlarging the authority of Great Britain, disposing of French rivalry, winning the Mahratta War, and proving himself in war and peace alike a capable and enlightened administrator, although his innovations in the civil service and attempts at introducing free trade were severely criticised. As a Tory politician and a marquess, created in 1799, Wellesley was foreign secretary 1809-12, and lord-lieutenant of Ireland 1821-28, supporting the movement for R.C. emancipation. He died without sons, Sept. 28, 1842. See India. *Consult* Lives, W. M. Torrens, 1880; W. H. Hutton, 1893; G. B. Malleon, 1905; India under Wellesley, P. E. Roberts, 1929.

Marquess Wellesley,
British administrator
After Sir T. Lawrence

Wellesley College. American college for women, at Wellesley, Mass. It was founded by Henry Durant (1822-81), Boston lawyer, business man, and evangelist, who with his wife, decided in 1870 to devote their country home and fortune to the Christian education of young women. It was greatly developed during 1882-87 under the presidency of Alice Palmer, who transformed it from a kind of boarding school to a genuine college. There are now 1,700 students, a teaching staff of 200, and an endowment of over \$13,000,000. Mme. Chiang Kai-shek is the best known of its students.

Wellhausen, JULIUS (1844-1918). German Biblical critic. Born at Hameln, Westphalia, May 17, 1844, he was educated at Göttingen. In 1872 he became professor of theology at Greifswald, in 1882 at Halle, and in 1885 at Marburg. During 1892-1913 he was professor of Oriental languages at Göttingen, and he died

Feb. 20, 1918. Wellhausen made his reputation by scientific critical works on The Bible, among which The Composition of the Hexateuch, 1889, is a standard work. See Criticism, Biblical.

Wellingborough. Market tn. and urban dist., giving its name to a co. constituency of Northants,

Wellingborough, Northamptonshire. Parish church of All Hallows and memorial cross to the townsmen who fell in the First Great War

England. It stands on a hill, near the Nene, 10 m. N.E. of Northampton, and has stations on the rly. The principal churches are All Hallows, an ancient building, and S. Mary's, modern. The town is a centre of agriculture, and of the boot and shoe industry. Beer is made, and there are foundries and smelting works. Wellingborough had a market as early as 1200, and at one time was known for its chalybeate waters. Pop. est. 28,571.

Wellington. Vessel moored on the Thames, at Temple Stairs on the Victoria Embankment, London. Acting as the livery hall of the honourable company of master mariners, she was formerly an Admiralty sloop and was converted at Chatham in 1948, arriving at her present berth on Dec. 9. The handsome court room occupies what was once the engine room. A double staircase came from the old passenger ship Viper.

Wellington. Type of British bomber aircraft. It was designed and built by Vickers-Armstrongs; it first flew in 1936, and delivery to R.A.F. squadrons began in 1939. The Wellington was the first military aircraft built on the geodetic principle, and eighteen versions were developed.

A midwing cantilever monoplane, the Wellington was powered by twin engines developing a total of 2,100 h.p. to give a speed of 300 m.p.h. The aircraft had a range of 2,550 m. and carried a crew of six. Armament consisted of six to eight .303 machine guns. Until the introduction of the four-engined bomber, the Wellington was the backbone of Bomber Command's striking force in the Second Great War. It first went into action at Wilhelmshaven the day after war was declared, and was in continuous service with Bomber and Coastal Commands, operating from bases in Great Britain, India, the Middle East, N. Africa, and Italy. It served on convoy protection, overseas reconnaissance, mine-laying, anti-submarine duties, and was used to detect and explode magnetic mines. Wellingtons with Coastal Command were equipped to carry depth charges, mines, torpedoes, and a Leigh Light. At the end of the war, 11,391 Wellingtons had been built and put into service. From this machine was developed the slightly larger Warwick, used for sea-air rescue work and as a transport. See Geodetic Construction.

Wellington. Prov. of New Zealand. Situated at the S. end of North Island, it has an area of 10,870 sq. m. It is traversed by several mountain ranges, with Ruapehu as the highest peak (9,068 ft.). The chief towns are Wellington and Wanganui. Agricultural, pastoral, and timber-growing industries support a pop. estimated at 367,500.

Wellington. Market town and urban dist. of Shropshire, England. It is 10 m. E. of Shrewsbury and 152 m. N.W. of London, being a rly. junction and also on a canal leading to the Severn. The chief church is All Saints, and

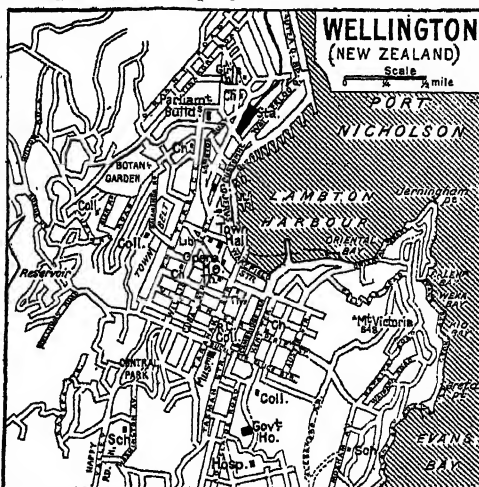

Wellington. An R.A.F. Wellington bomber as used in the Second Great War

industries include making agricultural implements and malting. Wellington was once important because of its position near the Welsh border. For parliamentary purposes it is included within the Wrekin division. Pop. est. 12,000.

Wellington. Market town and urban dist. of Somerset, England. It stands on the river Tone, 6 m. S.W. of Taunton, to which there runs a rly. The chief building is St. John's church, a fine Perpendicular edifice of the 15th century. There is a county school. Woollen textiles, furniture, and bricks are made. On the Blackdowns is a monument to the duke of Wellington, who took his title from this town. Pop. 7,128.

Wellington. Capital of New Zealand since 1865. Situated in Wellington prov., North Is., it stands on the W. shore of Port Nicholson, an inlet of Cook Strait. Gibbon Wakefield planted his first settlement here in 1840, naming it Britannia, this being later changed in honour of the victor of Waterloo. The chief feature is a magnificent harbour 6 m. long by 5 m. wide, from which are shipped to overseas markets large quantities of butter, cheese,

Wellington. Plan of the capital of New Zealand

Wellington, New Zealand. The Parliament buildings, showing, right, the statue of John Ballance, a former premier

mutton, beef, wool, apples, and timber. Most of the houses are still of the wooden bungalow type, mainly situated on the slopes of hills which enclose the town. There are fine public buildings, including Government House, the houses of parliament, and the university college, while the national museum is here. Building of a cathedral was destined to start in 1951. Wellington is the seat of an R.C. archbishop. There is little heavy industry, but many small establishments are engaged in the manufacture of soap, candles, ropes, and woollens; there are also some brewing, tanning, and shipbuilding. Wellington is connected by rly. with Auckland and Napier. Pop. est. 186,000.

Wellington. Mt. of Tasmania, Australia, 4,186 ft. high. It lies immediately to the W. of Hobart. A motor road to the summit, opened in 1937, has magnificent views. Mt. Wellington is a winter sports resort.

Wellington. Municipality in Wellington co., New South Wales, Australia. A gold-mining centre at the junction of the Bell and Macquarie rivers, it is 255 m. by rly. N.W. of Sydney. The surrounding area is a progressive farming and pastoral dist., one of the chief crops being onions. Near by are caves in the limestone rocks similar to the famous Jenolan Caves.

Wellington, DUKE OF. Title borne by the Wellesley family since 1814. Arthur Wellesley, the great soldier (*v.i.*), was raised through the peerage to a dukedom in 1814. On his death in 1852 he was followed by his son Arthur (1807-84), who in 1863 succeeded to the earldom of Mornington, another peerage in the family. He died without issue and was succeeded in turn by nephews. In 1943 the title came to Gerald Wellesley as 7th duke. He was born Aug. 21, 1885, and married Dorothy Violet

British soldier and politician. A younger son of Garrett Wesley (d. 1781), 1st earl of Mornington, an Irish peer, he was born in Merrion Street, Dublin, April 29 or May 1, 1769. His family had been settled in Ireland for about 200 years; its original name of Colley had been changed to Wesley and later became Wellesley. Educated at Eton, Arthur went afterwards to a military school at Angers. In 1787 he

Wellington

After Count D'Orsay, in the National Gallery, London

entered the 73rd Highlanders and in 1793 became a lieut.-col. in the 33rd Foot (now Duke of Wellington's Regiment). He also sat in the Irish parliament for Trim. In 1794 he saw active service in the Netherlands and in 1796 went to India, where his elder brother soon became governor-general. Arthur was made commander-in-chief in Mysore, and in 1803 conducted with marked success a campaign against the Mahrattas, his greatest exploit being the victory at Assaye, Sept. 23. For this he was knighted

and thanked by parliament. From 1805, when he left India, to 1808 he was fighting in Hanover and Denmark, while also M.P. for Rye and secretary for Ireland.

In 1808 Wellesley went to Portugal in command of a division. Though he won the battle of Vimeiro, superior officers did not approve of his actions and he returned to England. In 1809, however, he went back to Portugal in chief command, and until 1814 led the campaign against France which is described under Peninsular War. His rewards were considerable. The English king made him viscount in 1809, earl and marquess three years later, and in 1814 duke, while £100,000 was voted to him. Spain and Portugal each created him a duke. After the last battle, at Toulouse, Wellington was sent to Paris as ambassador, and he was at the congress of Vienna when the news of Napoleon's escape from Elba arrived. At once he took command of the British army and its allies, and won the decisive battle of Waterloo (*q.v.*). From 1815 to 1818 he was in France in command of the international army of occupation. Despite his moderation his popularity in France waned and attempts were made to kill him.

In 1818 the duke really began his career as a Tory politician; he became master-general of the ordnance under Liverpool. In 1821 he attended the congress of Verona. In 1826 he was made commander-in-chief, but next year resigned his offices owing to a dislike of Canning. He returned to the headship of the army on the latter's death, and in 1828 became prime minister. During his term of office he repealed the Test and Corporation Acts and was responsible for the emancipation of the Roman Catholics, but he would not assent to the proposed extension of the franchise, and in 1830 he resigned. In 1834-35 he was foreign secretary under Peel, and during 1841-46 was cabinet minister without portfolio. He died at Walmer Castle, Sept. 14, 1852, as warden of the Cinque Ports. He was buried under the dome of St. Paul's cathedral; a monument to him was erected in the nave.

Wellington has been called a lucky mediocrity; but it is fairer to say he achieved outstanding success by keeping both feet firmly on the ground and through his abundant common sense, conscientiousness, and complete integrity. He was no self-seeker; he was stiff, reserved, a profound

believer in the order of things, dividing the world into those who ruled and those who obeyed. The nickname of Iron Duke testifies to his stern discipline, and few commanders can have made troops perform such services without any mutual affection. He was not inhuman; he liked and was adored by children, and the marriage he made with Kitty Pakenham, daughter of Lord Longford, was romantically undertaken even if it largely failed. Many laconic remarks have come down as reminders of his sardonic humour.

Without strategic genius, he was probably unsurpassed even by Napoleon or Marlborough on the battlefield, while his organization of supplies and of the material welfare of troops was a model. His international outlook after the Vienna treaties was conciliatory; and in domestic politics, though a poor debater, though so much opposed to the Reform Bill that his windows were broken by the mob, he was ready to put public good before the party interest, and loyally backed the reforms of Peel. Prestige remained to the end: he was the man who had beaten Napoleon; and the grief shown at his funeral has seldom been equalled. The Wellington memorial stands at Hyde Park Corner

and near by in the park the Achilles Statue (*q.v.*) also commemorates the duke. Another statue is outside the Royal Exchange. And, as Guedalla said, "How many English streets, squares, monuments, and licensed premises bear the name of Wellington? His title has become one of the commonplaces of urban, and even imperial, topography." See Apsley House, also in N.V.; Strathfieldsaye; and articles on the various battles.

Wellington College, Berkshire. Main building of the public school opened in 1853

Guedalla, 1931; The Man Wellington, M. Wellesley, 1937; Napoleon and Wellington, C. O. Head, 1939; Wellington, R. Aldington, 1946.

Wellington Barracks. London barracks. Headquarters of the Foot Guards, they are at the S.W. corner of St. James's Park (*q.v.*), between Birdcage Walk, Buckingham Gate, and York Street. Built in 1834, they were enlarged in 1859. The Guards' Chapel (*q.v.*) was destroyed by a German flying bomb during a service, on Sunday, June 18, 1944.

Wellington College. English public school. It was founded as a memorial to the 1st duke of Well-

Wells, Somerset. West front of the cathedral, considered one of the best examples of Early English ecclesiastical architecture. It is ornamented with over 300 statues, many of which are perfect specimens of medieval sculpture. Upper picture, the 15th century gateway of the castellated bishop's palace, founded in 1088, from the moat. See p. 8506

Frith

ington, public subscriptions being obtained to establish a school for the education of the sons of deceased army officers. A site was secured near Wokingham, and the buildings were opened in 1859. There are a college proper and four houses, altogether holding about 620 boys, ninety sons of deceased army officers being received on the foundation at nominal fees.

Wellingtonia, REDWOOD, OR BIG TREE. Huge evergreen tree (*Sequoia gigantea*) of the family Pinaceae. A native of the mountains of California. It is one of the tallest trees, attaining a height of over 320 ft., with a trunk diameter of 35 ft. The leaves are small and like green scales, overlapping on the branches and twigs. The male flowers are single or several together at the ends of shoots; the female flowers at the tips of other shoots may be passed over as growth buds. The cones are oval with blunt ends, 2-3½ ins. long, consisting of comparatively few four-pointed scales, with a depression in the middle of each. By growth-rings, one specimen of which a cross-section has been obtained has been computed at over 3,000 years old.

Wells. City of Somerset, England. It lies low, being encircled by the Mendips, 20 m. S. of Bristol, and has rly. stations. The magnificent cathedral, built mainly in the 12th and 13th centuries, with a west front adorned with sculptured figures, is almost the finest in England, and has some fine stained glass, and a wonderful clock. Close by is the bishop's palace, surrounded by a moat. Vicars' Close contains old houses, forming a picturesque avenue, with a little chapel at the end. S. Cuthbert's is a fine church, spacious and with one or two interesting relics. In Wells is an important theological college for the Anglican ministry. The city owes its origin and its name to some springs dedicated to S. Andrew. It was made the seat of a bishop about 900, and in 1139, after continuous disputes with Bath, the see was given the name of Bath and Wells. Wells has long been a corporate town, and was represented in parliament until 1868. Formerly a market for cloth, it now has fairs and markets for sheep, cattle, etc. Pop. est. 5,900. See illus., p. 8505.

Wells arms

C. J. Wells,
British poet

latter's lectures, and practised for some years as a solicitor. His first

Wells, CHARLES JEREMIAH (c. 1798-1879). British poet. A Londoner, he became acquainted with Keats and Hazlitt, attending the

literary effort, *Stories After Nature*, 1822, was unsuccessful. Joseph and his Brethren, a dramatic poem, also failed when published in 1823, and was entirely lost sight of until 40 years later its merits were recognized by Rossetti and Swinburne. Meantime Wells had settled in France, amusing himself with field sports and with writing, but his reputation rests on Joseph and his Brethren. Wells died Feb. 17, 1879.

H. G. WELLS: WRITER AND PROPHET

Richard Church, Novelist, Poet, and Critic

An account of the life and works of the most prolific British writer of the years 1890-1940, whose powers of scientific and political prophecy were equalled by his genius for telling a story and his passionate enthusiasm for the idea of human rights. Many of his works are noted separately

Herbert George Wells, the most prolific and influential British writer since the death of Dickens, was born Sept. 21, 1866, at Bromley, Kent. His father was a professional cricketer who kept a retail shop, and his mother had been, and was to be again, in domestic service. One of a large family in a household suffering from chronic lack of prosperity, the boy's abnormal genius for speculation was early fastened upon the problem of economics, the effect of poverty upon a free and full functioning of the intellectual and moral endowment of the individual and consequently of society. Shaw called poverty a crime. Wells always looked upon it as a disease. Throughout the many phases, aspects, and forms of his literary output, this primary motive was at work, colouring his aesthetic nature, and shaping the direction of his scientific interests.

He was apprenticed to a draper in Hythe, but at 18 left the world of trade and became a pupil teacher. Thence he went to what became later the Royal College of Science at S. Kensington, where he followed the lectures of T. H. Huxley. From that time both emotional and mental emancipation marked this creature of perfervid genius. It expressed itself in many ways, one of them being his traffic with the Fabian society and the Labour party in their early days. But neither administrative methods nor political machinery satisfied him as instruments of the surgical process which was to cure society of its ills. For one thing, both organizations accepted the fact of class distinctions. Wells would have none of this, nor of the class warfare by which the Labour party proposed to remove those distinctions.

Wells's nature (and it was always the nature of an artist) led him to adopt the method and theory that were most direct, most simple, and most immediate. He believed that by scientific education, with emphasis upon biology, mankind could be brought to a consciousness that society too can be established upon a biological

H. G. Wells

basis, as a single living organism in which no member is more important than another, because all are complementary. In such a smooth-working and efficient unit, the finally integrated family of man, it would be as absurd to talk of one man being in a different social order from another as it would be, in a human body, to call the heart the seigneur over the kidneys.

It is no exaggeration to suggest that this was the lifelong argument maintained by Wells through all the chameleon forms of his vast literary output: novels, romances, pamphlets, short stories (The

Country of the Blind, one of the greatest short stories in English, is a direct allegorical exposition of this argument), histories, and social philosophies. This principle made him a devastating iconoclast. The Caesars, the Napoleons of history no sooner appear upon the scene of the human story than Wells retires to his laboratory methods, and with an air of calm detachment proceeds to attack such monumental figures with an unexampled intensity of venom. Vague self-aggrandisement, ego-centric mysticism; these were for him the capital enemy of scientific and efficient progress toward a society run on oiled economics.

Wells's Chief Books

After taking his science degree in London university, Wells began his writing career with a handbook of biology. Expanding his studies by the aid of his genius and powerful imagination, he wrote the scientific romances that rapidly made him famous. At 30 he was a successful author in a class of his own making. If he had any antecedents, they must have been the authors of *Utopia*, *Gulliver's Travels*, and *The Flying Indians*. But in the breadth of humanity, the keen observation, the vast range of good-humoured sympathy, by which even the earliest of Wells's romances are marked, this great social doctor must surely be indebted to a Kentish predecessor, Chaucer. Wells's most mature and characteristic work, *Tono-Bungay*, shows a full, Chaucerian capacity for laughter, that laughter which comes only from the depths of a giant appetite for life.

His early books included *The Time Machine*, 1895, *The Island of Doctor Moreau*, 1896, *The Invisible Man*, 1897, *The War of the Worlds*, 1898, *When the Sleeper Wakes*, 1899, *The First Men in the Moon*, 1901, *The Food of the Gods*, 1904, *In the Days of the Comet*, 1906, *The War in the Air*, 1908. These were published while the author was still busy with his pamphleteering strife among the Fabians, in the course of which he produced *This Misery of Boots*, 1907, *New Worlds for Old*, 1908.

Combining sociology and his more free imaginative excursions, he wrote *Anticipations*, 1901, *Mankind in the Making*, 1903, and *A Modern Utopia*, 1905. But the combination was not absolute, in an artistic sense, until those books appeared by which he is most likely to be remembered. They had been indicated by his early book *The Wheels of Chance*, 1896,

in which his constant and central figure, that of a meek, mild, obstinate little "common man" first appeared; the still, small critic of the monstrous growth of industrial society: its critic as well as its victim. That figure emerges in almost every one of his romances as well as his straight novels. Think of *Bert Smallways*, in *The War in the Air*. Think of *Kipps*, of *Mr. Lewisham*, of *Mr. Polly*. The same little figure is really the narrator of *The Outline of History*, 1920, that book which summed up the whole attitude of the small, technical iconoclast, the unit of modern society, the ferment at work today in this vast leavening process which was still more accelerated by the Second Great War.

The core of Wells's work was such full-blooded as well as intellectualised novels as *Love and Mr. Lewisham*, 1900, *Kipps*, 1905, *Tono-Bungay*, 1909, *Ann Veronica*, 1909, *The History of Mr. Polly*, 1910, *The New Machiavelli*, 1911, *The Passionate Friends*, 1913, and *Joan and Peter*, 1918. These are only examples, not a list, of his work in this kind.

Thereafter, he tended, from about the end of the First Great War, to use the novel with a more urgent social purpose. This robbed his work of the opportunity to present more memorable individuals such as *Mr. Polly*, and *Uncle Ponderevo* (in *Tono-Bungay*). After *The Outline of History*, 1920, he followed with variations upon that colossal text: *The Salvaging of Civilization*, 1921, *A Year of Prophesying*, 1924, *The Way the World is Going*, 1928, *The Open Conspiracy*, 1928, and innumerable smaller prophetic *Jeremiads*. He also produced, with *Julian Huxley* and his son *G. P. Wells*, *The Science of Life*, 1929; and, again alone, *The Work, Wealth, and Happiness of Mankind*, 1932. *Experiment in Autobiography* came in 1934; and in the last years of his life, when he was ill and tired and had almost lost hope in mankind, he still tried to prod the human race along the road to its salvation. He died in London, Aug. 13, 1946.

Like Tolstoy, Wells seems in later life to have become impatient of his earlier activities as pure artist (for Wells was an artist of high calibre). At first he was content to symbolise his emotional reactions to the evils of society through a gallery of characters in the Dickens tradition: comic, pathetic, even

tragic figures struggling against their own illiteracy and political ignorance, fighting to get out of the rut, to look around on the mess which the machine age was making of the fair world of nature. Gradually that struggle became an obsession with Wells. He joined in the struggle, and his novels became a stamping ground whereon his ideas wrestled with his indignation; and with Tolstoy, he took his mission so seriously that he professed to have no time for his art as a novelist. But his great work remained as salutary as his later sermons, and the more memorable. They made him, with Shaw, one of the most powerful influences in his time, a time which began to show its full features at the beginning of the 20th century, with the old political and religious forms breaking up, in preparation for those still to be established.

Apart from Wells's autobiography, there are not many books about his life; but *H. G. Wells: a Sketch for a Portrait*, by *G. West*, 1930, is useful.

Wells, WILLIAM (b. 1889). British boxer, known as *Bombardier Wells*. Born in London, Aug. 31, 1889, he enlisted in the army and won the All India boxing championship. His professional career was erratic; he won the heavy-weight championship of England by defeating *Iron Hague* in six rounds at the *National Sporting Club*, April 24, 1911, but was twice knocked out within one year (1913) by *Carpentier*, at *Ghent*, and at the *National Sporting Club*. On Feb. 27, 1919, he lost the English heavy-weight championship to *Joe Beckett* (q.v.). Defeats and victories continued to alternate until he retired in 1925.

Well-Worship. Ritual veneration of water wells, fountains, springs, and pools. The worship may be addressed to the waters themselves, because of their animation or mysterious powers, or to the deities or non-human spirits deemed to have in them their casual or permanent abode. Primitive well-worship associated with *W. Asian* pastoral nomadism is recalled by biblical references to *Beersheba*, *Shechem*, and *Bethlehem*.

In Neolithic times Iberian agricultural peoples carried to Britain and Ireland magico-religious usages, including the recognition of water-spirits. Survivals are traceable throughout Scotland, Ireland, Wales, and Cornwall. Wishing and healing wells, as at

St. Oswald's, Oswestry, and Worm Well, Durham, cover the marches of W. and N. England. *Consult Ethnology in Folklore*, G. L. Gomme, 1892; Lore of Holy Wells of England, R. C. Hope, 1893.

Wels. Town of Upper Austria. It stands on the Traun, 15 m. by rly. S.W. of Linz. The chief building is a Gothic church of the 15th century, the successor of an older one. There are a museum, a tower of the 14th century, and a building in which Maximilian I died in 1519. The town has some manufactures, but more considerable is its agricultural trade. A supply of natural gas is obtained by deep borings. The town occupies the site of the Roman Ovilaba, and was in the Middle Ages the capital of a duchy. Pop. 33,908.

Welsbach, CARL AUER, BARON VON (1858-1929). Austrian chemist. Born in Vienna, Sept. 1, 1858, he was the son of the inventor of the automatic printing press, Aloys von Welsbach (1813-69). He studied chemistry under Bunsen at Heidelberg, specialising in rare ores, and made technical inventions. Working at Vienna university from 1882, he discovered the elements neodymium and praseodymium. In 1885 he evolved the mantle for gas light; in 1900 the osmium lamp; in 1904 the pyrophoric alloys used later in cigarette lighters. Welsbach thus became instrumental in the creation of new and important industries, in which he also held material interests. He died Aug. 4, 1929.

Welsh, FREDERICK (1886-1927). British boxer. Born at Pontypridd, March 5, 1886, he won the English light-weight championship in 1909 by defeating Johnny Summers. Beaten by Matt Wells in 1911, he regained the title from him next year. He beat Hughie Mehegan for the championship of the British Empire at the National Sporting Club, Dec. 16, 1912; and became light-weight champion of the world by defeating Ritchie at Olympia, July 7, 1914. This last title he lost in 1917 to Benny Leonard, U.S.A. He died July 28, 1927.

Welsh Corgi. Small, sturdy, short-legged dog, originating in Wales, where it is used to drive cattle and on farms. The name is said to be derived from Welsh *cor*, dwarf; and *gi* or *ci*, dog. There are two varieties, the Pembroke and the Cardigan corgi. Both have fox-shaped heads, erect ears, rather long bodies, strong hind quarters, and an alert expression. The Pembroke corgi, slightly the larger, has short straight legs with feet like

those of a collie, a short erect tail, and a dense coat, red or red and white. The Cardigan corgi has slightly bowed front legs, large round feet, and a moderately long tail in a line with the back; its hard-textured coat may be almost any colour except pure white.

Welsh Guards. Regiment of the British army and a unit of the Guards bde. Formed in Feb., 1915,

Welsh Guards badge

from a nucleus of Welshmen with the Grenadier Guards, the regiment went to France in Aug. and served there for the rest of the First Great War. Among the battle honours awarded were: Loos; Ginchy; Flers Courcellette; Morval; Pilckem; Poelcappelle; Cambrai, 1917, '18; Bapaume, 1918; Canal du Nord; Sambre. In May, 1939, a second bn. was formed, and at the outbreak of the Second Great War both bns. went to France and fought through the campaign of 1940. Next year they joined the Guards armoured div. with which

Welshpool, Montgomeryshire. Parish church of S. Mary
Valentine

they served in the liberation of Europe (1944-45). A third bn. raised in 1942 became an armoured unit in N. Africa and Italy; it was disbanded in 1945, and the 2nd bn. in 1947.

Welsh Harp. Harp with three rows of strings. The two exterior rows were tuned in unison diatonically, and there was an inner row to supply the extra sounds necessary to complete the chromatic scale. It was unique in that the strings were on the

right hand of the comb, for which reason it was held on the left shoulder, the left hand playing the treble and the right hand playing the bass strings.

Welsh Harp. Name of two inns, the Old and the New (or Upper) Welsh Harp, W. of Golder's Green and Hendon, in Middlesex, England. Formerly popular resorts, they are in the Edgware Road, in a fork of the Brent Reservoir, now itself known as the Welsh Harp.

Welsh Marches. For these border territories, see Marches.

Welshpool. Mun. bor. and market town of Montgomeryshire, Wales. It is 15 m. S. by W. of

Welshpool arms

Oswestry and 182 m. N.W. of London, on the Severn and Montgomery canal and on the rly. Founded in the 12th century. It owes its existence to the neighbouring Powis Castle, the seat of the lords of Powis, and later of the Herbert family. The Gothic church of S. Mary was restored in

1871. Other buildings are the town hall, the Powysland museum of antiquities, and library. There is a trade in agricultural produce and some tanning. This is a good centre for angling and climbing. Welshpool was a borough under the lords of Powis before James I confirmed its charter in 1615. From 1536 to 1728 it sent a member to parliament. Market day, Mon. Population 5,700.

Welsh Poppy (*Meconopsis cambrica*). Perennial herb of the family Papaveraceae. A native of W. Europe, it has a stout rootstock, branching to form a tuft. The long, pale green leaves are cut in from the sides into lance-shaped segments. The large, four-petalled, long-stalked flowers are pale yellow in colour, and the fruit is a capsule of the usual poppy type.

Welsh Poppy. Pale yellow flower, seed capsule, and leaves

Weltpolitik (Ger., world policy). Term used in Germany before 1918 for the policy of making that country a world power. It is chiefly associated with the period covered by the reign of William II.

Welwitschia Mirabilis. Shrub of the family Gnetaceae. It is a native of arid places near Mossamedes and Haigamchab in S.W. Africa. Its "trunk" consists of a brownish yellow disk of hard wood only a few inches from the ground, from which proceed a solitary pair of leathery, ribbon-like leaves, each six feet or over in length, more or less split into slender thongs. These are the only leaves the plant ever puts forth, and they last throughout its entire life, which exceeds a century. The flowers are produced in small, erect, scarlet cones near the edge of the disk.

Welwyn. Rural dist. of Herts, England. It is in the valley of the Maran or Mimram, a trib. of the Lea, and is 22 m. by rly. N. of London. Edward Young, author of *Night Thoughts*, was rector here, 1730-65, and is buried in the parish church.

Near by, just off the Great North Road, is Welwyn Garden City, which was begun in 1920, being planned on a site of some four sq. m. as the first example in the U.K. of a satellite town. It was designed to accommodate some of London's surplus pop., and at the same time to develop its own industries on suitable sites, away from the main residential areas. Originally developed by a private co., the town was in 1948 taken over by the ministry of Town and Country Planning as a "new town." Hatfield (q.v.) came within

the same scheme of expansion, and was under the control of the same development corporation, although the two towns retained their separate identities. *Pron.* Wellin.

Wem. Market town and urban dist. of Shropshire, England. It is 11 m. N. of Shrewsbury, on the main rly. to Crewe. An agricultural town, it has cattle markets and other trades in the produce of the surrounding dist., while flour milling, cheese making, and brewing are carried on. The chief church is SS. Peter and Paul, with its Norman tower. Wem was at one time a corporate town, being governed by two bailiffs. In the neighbourhood is Hawkstone Hall, the old seat of the Hills, now used by an R.C. community. Market day, Thurs. Pop. est. 2,400.

Wembley. Municipal borough of Middlesex, England. Lying midway between Willesden on the E. and Harrow on the W., it includes Alperton, Kenton, Kingsbury, Preston, and Sudbury, and achieved the status of a borough in 1937. It has had two M.P.s since 1944. There are 15 stations on five rly. lines, including the Underground, and excellent connexion with London by bus, trolley bus, and Green Line, while the Grand Union Canal passes through Alperton. The parish church of S. John was designed by Sir Gilbert Scott; old S. Andrew's, Kingsbury, is the

Wembley, Middlesex. The Town Hall, municipal offices, and public library (left), built 1939

only church in Middlesex preserved from pre-Norman times. Municipal buildings in Forty Lane were put up in 1939. The Watkin tower was an unfinished curiosity. Wembley is overwhelmingly residential in character, but has motor, aircraft, electrical and chemical industries. Its development began with the planning of the British Empire Exhibition (q.v.) of 1924-25, after which it became a sporting centre, for the F.A. Cup and Rugby League finals are played annually in the stadium of that exhibition, while the Empire pool and sports arena holds big swimming, skating, ice hockey, boxing, and other contests. The athletic, swimming, and fencing events of the 1948 Olympic Games were held here, and there are dirt track and greyhound racing at the stadium. The name Wembley is first found in 825; for c. 1,000 years the old village belonged to the manor of Harrow. Pop. est. 132,870.

Wemyss. Name of two small towns in Fife, Scotland. West Wemyss stands on the Firth of Forth, 2 m. N. of Dysart; it has a rly. station and a harbour. In the neighbourhood is Wemyss Castle. East Wemyss is 2 m. S.W. of Backhaven, also with a rly. station.

Wemyss Bay is a small seaport and watering-place of Renfrewshire, Scotland, 31 m. W. of Glasgow. Near is Castle Wemyss, seat of Lord Inverclyde. *Pron.* Weemas.

Wemyss, EARL OF. Scottish title held by the Charteris family. The first holder was Sir John Wemyss, created a baron in 1628 and earl of Wemyss in 1633. After the death of James, 5th earl, the title fell into abeyance, as the heir, David, had been attainted for his share in the rebellion of '45. Francis, great-grandson of the 5th earl, was created Baron Wemyss in 1821, and five years later secured the reversal of the attainder, thus becoming 6th earl of Wemyss. From him the succession passed direct to Francis, 12th earl, who was born Jan. 19, 1912, and suc-

Welwyn, Hertfordshire. A view of Welwyn Garden City, a famous British example of modern town-planning

ceeded his grandfather in 1937. He is also 8th earl of March. The heir bears the courtesy title of Lord Elcho.

Wen. Popular name for a sebaceous cyst tumour which tends to grow most frequently on the scalp in adults and old persons. A wen is not dangerous, and can be excised by a simple operation. The Great Wen, or simply the Wen, was Cobbett's name for London.

Wenceslaus, VENCESLAS, OR VACLAV (d. c. 929). Bohemian saint and prince. Converted to Christianity, he received the tonsure in the church at Levy Hradec, founded 871. He founded many churches in Prague and elsewhere in the principality, his generosity to them causing some discontent among the nobles. He was assassinated by his ambitious brother, Boleslav, on his way to early Mass on Sept. 28, probably 929, at Stará Boreslav. In 939 his body was removed to the church of S. Vitus in Prague. He was canonised, and is being regarded as the patron saint of Bohemia, the anniversary of his death being his festival. He is the Good King Wenceslaus of the song.

Four kings of Bohemia bore this name, of whom Wenceslaus IV is noticed below.

Wenceslaus (1361-1419). King of Bohemia and Germany. Son of the emperor Charles IV, he was born at Nuremberg, Feb. 26, 1361. His father was also king of Bohemia, and made him ruler of that country before he was three years old. Wenceslaus was chosen German king in 1376, and two years later, when Charles died, he held sway over Germany and Bohemia. His indifference to public business caused an outcry from his neglected subjects, quarrels in Bohemia led to the humiliation of a short imprisonment in 1394, and in 1400 four of the German electors declared him deposed there. He became a prisoner in the hands of his half-brother, Sigismund, but recovered his throne in 1404, and remained king until his death at Prague, Aug. 16, 1419.

Wenchow. Former treaty port in the S. of Chekiang prov., China. A walled city intersected by many tidal canals, it was opened to foreign trade in 1877. Pop. 215,815.

Wends. German name for all inhabitants of the area between Oder and Elbe. Their ancestors immigrated in the 8th-9th centuries, and the people have preserved Slavonic characteristics. In its scientific application, the name means the Sorbian pop. of Lusatia,

on the upper and middle Spree. These number about 120,000, of whom over half were registered in 1925 as still speaking their own language. They preserved, rather artificially as an attraction for tourists, their colourful, old-fashioned clothing, the women wearing huge white, starched bow caps and a whole range of skirts. Their allegedly closer relation to the Serbs than to other W. and S. Slavs has no scientific justification; their language contains Polish and Czech elements. They were Christianised by the Danes in 1168.

Wendigo. Supernatural being in the folklore of the N. American Indians. Longfellow rendered the word in his *Hiawatha* merely as giant, but the wendigo is frequently referred to as a vague, malevolent creature of waste places and storm.

Wendover. Town and parish of Bucks, England. Picturesquely situated among the Chiltern Hills, it is 5 m. S.E. of Aylesbury and 3½ m. by rly. N.W. from London. The parish church of S. Mary was restored in 1869, and contains several interesting monuments. The market house, in High Street, dates from 1842. Wendover was formerly a borough sending two members to parliament, but was disfranchised by the Reform Act of 1832. Among former M.P.s was John Hampden. In the neighbourhood is Chequers (*q.v.*). Pop. approx. 5,000.

Wendy. The mortal sweetheart of Peter Pan in Barrie's fairy story of that name. Wendy Moira Angela Darling visits Peter in the Never-Never Land, acts as mother to the Lost Boys, and is provided with a log house in the wood. When she returns to her family after many adventures, she promises to revisit Peter for a week every spring. On the stage Hilda Trevelyan (*q.v.*) played the part many times from 1904.

Wener. Variant spelling for the Swedish lake Vänern (*q.v.*).

Wenlock. Mun. borough of Shropshire, England. It stands on the Severn, 14 m. S.E. of Shrewsbury, and is served by rly. The borough includes the market towns of Much Wenlock, Madeley, and Broseley. Its chief buildings are the church of Holy Trinity, a fine old building restored, and the guildhall, a half-timbered structure dating from 1589. There is an agricultural trade, and in the neighbourhood are coal and ironstone mines. Wenlock grew up around a religious house, and was made a borough in 1468. The present borough, however, which is

governed by a mayor and corporation, dates from 1835. Wenlock was given in 1468 the right to

Wenlock, Shropshire. The ancient half-timbered Guildhall, adjoining Holy Trinity Church
Frith

send two members to parliament, but lost one in 1867 and the other in 1885. There are remains of the church and chapter house of the abbey. Pop. approx. 15,000.

Near is the double limestone escarpment, 17 m. in length and 1,000-1,200 ft. alt., of Wenlock Edge; the steeper N.W. slopes are closely wooded, the gently sloping sides being farm land.

Wenlock Series. In geology, the middle division of the Silurian rocks of Great Britain. The rocks are typically developed in the W. of England, consist of limestones and shales, and are important sources of lime and flagstones. Fossil remains in the Wenlock series are numerous, including corals, trilobites, lamellibranchs, brachiopods, etc. See Silurian.

Wennerberg, GUNNAR (1817-1901). Swedish poet and composer. Born at Lidköping, Oct. 2, 1817, he was educated at Uppsala. In 1861 he went to Stockholm, and in 1870 became minister for education and public worship. Entering the Riksdag in 1875, he retained his seat till his death, Aug. 24, 1901. Wennerberg's chief interest lay in bettering national education, strengthening the defences, and in church reform. His strong personality and eloquence, added to his fame as a poet and musician, made him one of the most influential men of his day. He wrote and composed some of the finest patriotic songs in Sweden, and *Hear us, Sweden, Mother of us All*, has be-

come almost the national hymn of his country. His popular duets for baritone and bass called Gluntarne (The Boys), 1847-50, vividly describe life at Uppsala university.

Wensleydale OR **YOREDALE**. Valley of the river Ure (Yore) in the N. Riding of Yorks, England. It is unusual in taking its name not from the river, but from the grey stone village of Wensley, which has a 15th century bridge and an E.E. church. The dale begins below Jervaulx Abbey, is cultivated as far as Carperby, and preserves a pastoral character most of the way past Askrigg and Hawes to the Westmorland border.

Wensleydale Cheese. The upper valley of the Ure, Yorks, produces two cheeses. The lesser is a flat white cheese, eaten fresh, and made throughout the year. The greater is a worthy member of the family of lightly pressed, double-cream, blue-veined cheeses of which Stilton is the principal example. It is in cylindrical form, smaller than Stilton, and grows ripe slowly. The time for making it is summer and early autumn.

Wensum. River of Norfolk, England. It rises near Tattersett, in the N. of the co., and joins the Yare below Norwich, through which city it flows. Its course is mainly S.E., and its length is 30 m.

Wentletrap (Ger. *Wendeltreppe*, winding stairs). Popular name for marine snails of the large genus *Scalaria*, of which five species are found on the British coasts. The molluscs are cylindrical with a short squarish foot, the head with a retractile proboscis and slender tentacles, at the bases of which are the small eyes. When molested the creatures pour out a purple fluid from the mouth. They feed upon seaweeds, and are found chiefly in the warmer seas. See Mollusca.

Wentworth. Township of New South Wales, Australia. It stands at the junction of the Darling and the Murray, 720 m. W. of Sydney. An entrepôt for inter-state and riverine trade, it has an irrigation scheme to serve 10,000 acres under intensive culture.

Wentworth. Name of a famous English family, whose most distinguished member was the earl of Strafford (q.v.). Its founder was William Wentworth (d. 1308), of Wentworth Woodhouse. One of his descendants, Thomas (1501-51), was made a baron in 1529, being a court official of the Tudor sovereigns. Thomas, 4th baron, was made earl of Cleveland in 1626, but on his death in 1667 the earldom became extinct. Mean-

while the barony of Wentworth passed from one female to another. One of these was the wife of Lord Lovelace, and a later one was Anne, who married Byron. Their daughter, who became countess of Lovelace, inherited the Wentworth title, and from her death until 1906 it was held by the earls of Lovelace. On the death of the 2nd earl, the barony, separated from the earldom, passed to his daughter. She died in 1917, when Anne, daughter of the 1st earl of Lovelace and wife of the poet W. S. Blunt, became baroness; dying later in the year, she left the title to her daughter Judith, who married N. S. Lytton in 1899 (divorcing him in 1923). See Fitzwilliam, Earl; Wentworth Woodhouse.

Wentworth, WILLIAM CHARLES (1793-1872). Australian politician. Born Oct. 26, 1793, in Norfolk Island, and educated in England and Australia, he was called to the Sydney bar in 1823. He helped to found a journal, *The Australian*, in 1824, and became a leader in the agitation for self-government, being largely responsible for New South Wales gaining partial autonomy in 1842. The constitution of 1854 was likewise his work, and in 1861 he became president of the council. Retiring from politics next year, he died in England, March 20, 1872, his body being taken to Sydney and buried with public honours. He founded Sydney university.

Wentworth Woodhouse. Country mansion of Earl Fitzwilliam, in the W. Riding of Yorks, England. In the parish of Wentworth, 3½ m. N.W. of Parkgate rly. station, the mansion is in the Classic style, and stands in an extensive deer park. The building was designed by Flitcroft for the 1st marquess of Rockingham, and was erected on the site of an older house, once belonging to the Straffords; many Van Dycks

painted for the earl of Strafford are still exhibited in the modern mansion. The stables of the Fitzwilliam Hunt are in the grounds, as also are a mausoleum and a monument to Viscount Keppel. Open-cast mining on the estate, begun in 1943, yielded two million tons of coal before the ministry of Fuel in 1946 determined to continue operations close to the house, giving rise to bitter controversy on the question of amenities.

Weobley. Town and parish of Herefordshire, England. It is 8 m. S.W. of Leominster and 3 m. from Moorhampton rly. station. The parish church of SS. Peter and Paul, partly Norman, was restored in 1865. Black-and-white timber houses abound. The town formerly returned two members to parliament, but was disfranchised by the Reform Act of 1832. Pop. 625. Pron. Webley. See Porch.

Wepener. Town of the Orange Free State, S. Africa. Close to the border of Basutoland, it is 76 m. by rly. S.E. of Bloemfontein. The centre of an agricultural district, it dates from 1888. In 1900 it was defended against the Boers by a force of irregulars.

Werewolf (A.-S. *werewolf*, man-wolf; Ger. *Werwolf*). Person supposed to be able to transform himself into a wolf, and as such to prey upon human beings. Virgil describes a were-wolf in Eclogue 8. The belief is widespread (see Lycanthropy).

During the Allied advance into Germany in the Second Great War, an attempt to organize an underground movement called the Werewolf was made by the Nazi authorities. German broadcasting stations which pretended to be in the occupied territory, but were actually transmitting from the centre of Germany, called upon the civilian pop. to sabotage the Allied lines of communication. A few members of the Hitler Youth and similar bodies became active in Russian-occupied territory; otherwise the Werewolves did nothing.

Werfel, FRANZ (1890-1945). Austrian poet, novelist, and dramatist. Born of Jewish parents in Prague (then in Austria-Hungary),

W. C. Wentworth, Australian politician

Wentworth Woodhouse. East front of the Yorkshire mansion, built for the 1st Marquess of Rockingham

Sept. 10, 1890, he was educated at Prague and Leipzig universities. Publishing volumes of lyric poetry, he became a leader of the younger German writers. After serving in the First Great War he lived in Vienna. When Hitler seized power his books were banned in Germany and he was expelled from the Prussian academy of art. Going later to Lourdes, he derived inspiration for *The Song of Bernadette*, his most popular novel, written at Los Angeles in 1942, and successfully filmed in 1944. Werfel, who settled in California, died Aug. 26, 1945. His art went beyond Expressionism, penetrating to the deeper reality behind the facts. The dramatic trilogy, *Der Spiegelmannsch*, 1920, deals with the conflict in the human soul between aspiration and sensuality; a drama, *Paul Among the Jews*, 1926, suggested that Werfel had first abandoned Judaism and then avowed it again. His first important novel was *Verdi*, 1924. Between Heaven and Earth appeared in 1948. Werfel's poems were translated by Edith Snow, 1946.

Wergeland, HENRIK ARNOLD (1808-45). Norwegian poet. Born June 17, 1808, he began his career with a number of farces and plays. Among these are *Ah*, 1827; and *Irreparable Tempus*, 1828, which he wrote under the pseudonym of Sifuf Sifadda. In 1829 he published his *Poems*, first series, and in 1830 *Skabelsen, Mennesket og Messias* (Creation, Man, and the Messiah), a poem which was adversely criticised by J. S. Welhaven (q.v.). His dramas include *Camballerne* (The Campbells), and *Venetianerne* (The Venetians). He died July 12, 1845. English versions of his poems did not appear until 1930.

H. A. Wergeland,
Norwegian poet

Wergild (A.-S. *wer*, man; *gild*, payment). In A.-S. law, a fine inflicted as a penalty for murder or maiming. The amount, which had to be paid to the next-of-kin or gild brethren, in case of death, varied according to status, ranging from 7,200 shillings in relation to a king to 200 shillings for a ceorl.

Werner, ALFRED (1866-1919). Swiss chemist. He was born at Mulhouse, Alsace, Dec. 12, 1866, and educated at Zürich, where he became professor of chemistry in 1895. In cooperation with Hautsch

he did much brilliant research on stereo-chemistry, and evolved a theory of valency which was of great importance. For this he received the Nobel prize for chemistry in 1913. He continued as professor at Zürich until his death, Nov. 15, 1919.
